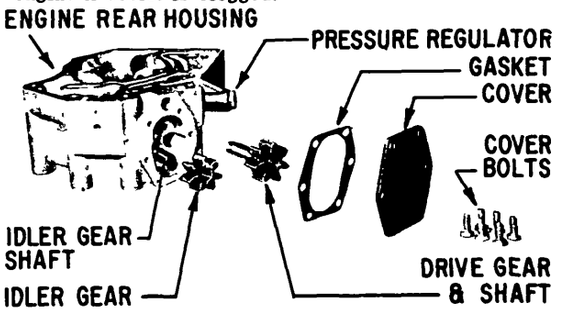
Rocker Arms, Pushrods, & Valves - Pushrods are hollow and are supplied with oil from hydraulic lifter (inertia valve in upper end of lifter permits oil to flow through hole in end of pushrod). Upper end of pushrod has a side hole which sprays the valve chamber (lifter and pushrod rotate in operation and this oil spray is directed around valve chamber) and a through hole in the end which lubricates pushrod socket and rocker arm ball (pushrod hole registers with hole in rocker arm once during each revolution directing oil upward to the rocker arm ball). Oil in rocker arm chamber is returned to crankcase through the tubular pushrod drain tubes.



OIL FILTER-GENERATOR ADAPTER (SEE OILING SYSTEM SIDE VIEW)

ENGINE REAR HOUSING (SEE OILING SYSTEM SIDE VIEW)

OIL FILTER: Full-flow type mounted on Filter & Generator Adapter at rear of engine. Bypass valve (10 lb. type) located in adapter (see illustration) permits oil circulation through engine if filter element is clogged.

OIL COOLER: Finned cooler mounted on side of Engine Rear Housing in the engine cooling air stream. Bypass valve (10 lb. type) located in Filter & Generator Adapter (see illustration) permits oil circulation through engine if cooler is clogged.

CORVAIR OIL PUMP

OIL PUMP: Disassembly - Drain crankcase, remove rear grille, center shield and engine rear mount (support engine). Remove oil pump cover. Remove oil pump drive gear and shaft and idler gear from rear housing. Remove pressure regulator valve plug, gasket, spring,

Reassembly: Lubricate gears with engine oil. Install idler gear on idler shaft and make sure shaft is 010-.020" below housing gasket surface Insert drive gear and shaft in housing. Clearance between gears and housing should be .002-.005". Gear backlash should be .002-.008". *NOTE - Oil pump gears should extend .0025-.0045" above housing gasket surface for il pump prime. Gears of .001" oversize thickness are available.* Install oil pump gasket and cover and pressure regulator valve assembly.

ELECTRICAL NOTES

GENERATOR INSTALLATION: *CAUTION - If preload on generator exists, end frame will break. To pr vent this condition, use following installation procedure exactly.* Tighten generator-to-adapter bolts to 15-22 ft. lbs. and loosely assemble mounting bracket-to-generator bolt and nut (at commutator end of generator). Bracket must be able to move. Tighten generator bracket-to-cylinder head bolts finger tight. Now tighten bracket bolt at commutator end of generator to 8-11 ft. lbs. Tighten front bracket-to-cylinder head bolt to 15-22 ft. lbs. and rear bolt to same torque.

STARTER REMOVAL: *Following procedure is recommended as easiest method of removal and installation.* Disconnect battery and raise and support car. Disconnect rear throttle control rod from transmission bellcrank, and from carburetor cross shaft. Disconnect starter solenoid wires (use ¼" drive midget socket set). With 3/8" drive, 9/16" shallow socket on a 9" extension with ratchet, remove upp r starter mounting bolt. Then remove lower bolt. Pull starter forward and remove from engine compartment.

►*JACKING & HOISTING CAUTION (ALL MODELS) Before jacking or hoisting, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section*

►*1961 MONZA & HIGH PERFORMANCE ENGINES PRODUCTION CHANGE Later production Monza 2-Door engines with Powerglide, and all Monza 4-Door engines with Powerglide have compression ratio of 9 0-1 (changed from 8 0-1) Later production High Performance engines (see "Engine Suffix Table" below for serial numbers) also have 9 0-1 compression ratio (changed from 8 0-1) These engines are basically the same as previous Std and Hi Perf engines except for some differences which will be listed below In the following data, engines will be designated as Std (8 0-1), Std (9 0-1), Hi Perf (8 0-1), Hi Perf (9 0-1)*

MODEL IDENTIFICATION

Model	Body Style	Series	Series Prefix
527	Std 2-Dr Club Cpe	500	0527
535	Std 4-Dr Sta Wgn	500	0535

TUNE-UP

►*AIR CONDITIONED CAR ENGINE ACCESS PROCEDURE For access to engine for tune-up and other engine service on air conditioned cars without disconnecting refrigerant lines or purging system, use the following procedure* 1) Remove compressor mounting bracket pivot bolt nut and compressor-to-adjusting bracket attaching parts Remove compressor belt Disconnect wiring from compressor Remove triangular bracket from front of compressor Work mounting bracket pivot bolt forward until threaded end of bolt is out of compressor rear mounting boss Reposition compressor in engine compartment

2) Remove condenser and shroud assembly-to-bracket attaching screws Carefully lift assembly from engine and rotate toward right rear of car as far as refrigerant lines will permit

►*1961 CORVAIR (ALL SERIES) ERRATIC IDLE OR PERIODIC MISS CORRECTION* If smooth idle not obtained after correct adjustment of accelerator linkage and carburetor synchronization (with correct fast idle setting of 045"), throttle plates may be drilled *See 'Rochester H Carburetors" in Carburetion Section.*

COMPRESSION PRESSURE: 130 lbs minimum at cranking speed Variation between highest and lowest cylinders must not exceed 20 lbs

VACUUM READING: 14-18" maximum at idle speed

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters

Hydraulic Lifter Adjustment (Engin Running) - With engine at normal operating temperature and running at idle speed, back off rocker arm stud adjusting nut until rocker arm clatters against valve stem, then turn adjusting nut until clatter just stops Stop engine and turn adjusting nut an additional **1 full turn.** *NOTE - This adjustment applies to both "long travel" and "short travel' lifters*

MANIFOLD HEAT CONTROL: None used

POSITIVE CRANKCASE VENTILATION: Clean hose and pipe at 10,000 mile intervals or sooner if needed, and check cleanliness of system before performing a "Tune-Up" for ignition and carburetion troubles

IGNITION

FIRING ORDER: 1-4-5-2-3-6
Cylinders - RIGHT BANK 1-3-5 LEFT BANK 2-4-6
NOTE - Right rear cylinder is No 1 and l ft rear cylinder is No 2 Engine rotation, as viewed from rear of car, is counterclockwise

SPARK PLUG GAP: 035"
Spark Plugs - AC. 14 mm Torque to 20-25 ft lbs Used as follows

Engine	Standard	Cold r
Std (8 0-1)	46FF	①
Std (9 0-1)	44FF	42FF
Hi Perf (All)	44FF	42FF

① - 44FF (Heavy Duty), 42FF (Road Racing)

COIL: Delco-Remy 1115135.
Ignition Current - 1 8 amps idling, 4 0 amps stopped
Resistor - Resistance type cable (1 8 ohms resistance) used in harness between instrument panel disconnect plug and rear wiring harness connector Bypassed during cranking by lead from starter solenoid to coil

DISTRIBUTOR: Delco-Remy. Special "Window" type without external adjustment Used as follows

Engine & Transmission	Delco-Remy No.
Std (8 0-1) Synchro-mesh	1110258
Std (8 0-1) Powerglide	1110259
Std (9 0-1) Powerglide	1110275
Hi Perf (All)	1110260

Condenser - Delco-Remy 1928111 **Capacity** - 18- 23 mfd
Contact Point Set - 1945376
Breaker Gap - 019"(new points), 016" (used points)
Cam Angle - 31-35° Set at 33°
Breaker Arm Spring Tension - 19-23 ozs
Rotation - Clockwise viewed from above

IGNITION TIMING

Ignition Timing Specifications

Distributor	ℂ Std. Setting	Allowable Range
1110258	4° BTDC	4-10° BTDC
1110259, 260, 275	13° BTDC	13-18° BTDC

ℂ - At idle speed without disconnecting vacuum advance hose.

CARBURETOR

►*CARBURETOR APPLICATION: Two Rochester Model "H" single barrel carburetors used.*

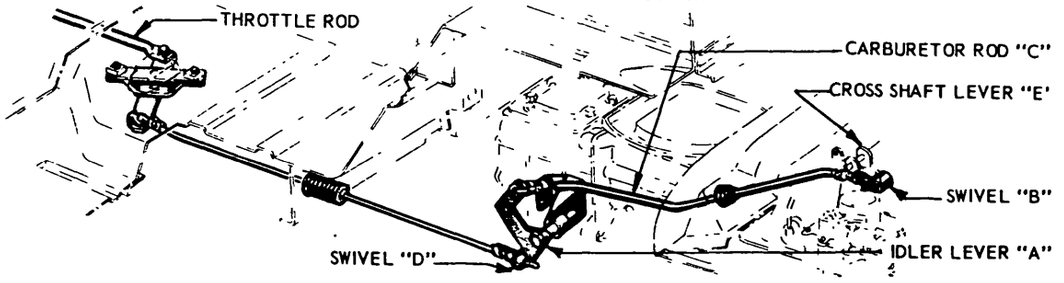
►*1961 CORVAIR (ALL SERIES) ERRATIC IDLE OR PERIODIC MISS CORRECTION:* If smooth idle not obtained after correct adjustment of accelerator linkage and carburetor synchronization (with correct fast idle setting of .045"), throttle plates may be drilled. *See "Rochester H Carburetors" in Carburetion Section.*

►*1961 CORVAIR ENGINE SURGE CORRECTION (Carburetors 7019100 & 7019107):* Install new main metering jet, venturi cluster, and other parts. *See "Rochester H Carburetors" in Carburetion Section.*

►*1961 CORVAIR FAST IDLE SETTING CHANGE:* Fast idle setting (clearance between fast idle speed screw and tang on throttle lever) has been changed from .030" (Synchro-mesh), .010" (Powerglide), to .045" for all carburetors.

►*1961 CORVAIR EXCESSIVE FAST IDLE RPM DURING COLD WARM-UP CORRECTION:* Readjust fast idle setting (clearance between fast idle speed screw and tang on throttle lever) to .045". This change made in production on later cars.

►*1961 CORVAIR FLAT SPOT ON ACCELERATION CORRECTION (Carburetor 7019100):* If this condition exists on carburetors with two holes in accelerating pump actuating lever, check if pump is on index (scribe mark on accelerator pump shaft lever in line with cast tang on carburetor bowl cover). If pump is on index, proceed as follows to correctly adjust pump stroke: Disconnect pump rod from inboard hole in lever and connect rod to outboard hole, then bend pump rod to align index mark with cast tang. Disconnect rod from outboard hole and connect to inboard hole of lever. Index markings should then be disregarded. DO NOT re-index.



►*1961 CORVAIR CHOKE CABLE SEIZURE CORRECTION:* Make sure cables are not kinked, galled, or rusted in conduit. Make sure rear cable slider block is not binding and that there is no interference at rear cable wire ends. If slider block binds because of dirt, install a snap-on Choke Cable Dust Cover, Part No. 3813044. To prevent interference of control wires at carburetors, make sure that no more than ¼" of wire protrudes from carburetor choke levers.

►*1961 CORVAIR CHOKE ADJUSTMENT CHANGE: See "Choke Adjustment" below.*

ACCELERATOR CONTROL LINKAGE ADJUSTMENT: Remove mudguard over idler lever "A" (see illustration) on transmission, then disconnect swivel "D" from lever "A". Disconnect swivel "B" from left carburetor cross shaft lever "E". Pull rod "C" to wide open throttle (through detent for Powerglide and against stop for standard transmission) and turn lever "E" to wide open throttle position (carburetor throttle lever against the stop). Adjust swivel "B" to align with hole in lever "E", then lengthen rod "C" by backing off swivel **five full turns.** Position accelerator pedal by placing a block of wood 1" thick (Synchro-mesh). 1¼" thick (Automatic Trans.) between pedal and floor mat. Hold lever "A" in wide open throttle position (through detent for Powerglide) and turn swivel "D" to align with hole in lever "A". Install mudguard. *NOTE - This complete procedure provides proper clearance between accelerator pedal and floor mat at wide open throttle.*

CARBURETOR SYNCHRONIZATION, IDLE SPEED & FAST IDLE ADJUSTMENT: With engine off and both throttle rods disconnected at carburetor cross shaft levers, back idle speed and fast idle adjustment screws away from throttle shaft lever at each carburetor. Place a .003" feeler gauge between idle speed screw and throttle shaft lever. Turn screw in until it just contacts gauge, then remove gauge and **turn screw in 1½ turns.** Repeat procedure with opposite carburetor. With choke valve fully open, place .045" feeler gauge between fast idle speed screw and tang on throttle lever, then adjust screw until it just contacts gauge. Repeat with opposite carburetor. *NOTE - This .045" setting supersedes previous setting of .030" (Synchro-mesh), .010" (Powerglide), and will correct excessive fast idle RPM.* On both carburetors, turn idle mixture screws in lightly to its seat and back out 1½ turns. *CAUTION - Do not turn idle mixture screws in tightly against seats.* On right hand carburetor, connect throttle rod to carburetor cross shaft lever, then on left hand carburetor, rotate cross shaft (with accelerator rod) to insure positive closing of right hand carburetor throttle valve. Adjust throttle rod length in swivel until rod freely enters hole in carburetor cross shaft lever and secure rod with clip. *CAUTION - Following idle speed screw and mixture adjustments must be exactly duplicated on both carburetors to maintain proper synchronization.* Start engine and bring to normal operating temperature, then check and adjust ignition timing (see above). Connect vacuum gauge to adapter on vacuum balance tube and connect a tachometer to engine. Adjust idle speed screws equally on both carburetors to obtain an idle speed of 500 RPM (Std. Engine), 600 RPM (Hi Perf. Eng. - Synchro-mesh), 500 RPM (Hi Perf. Eng. - Powerglide), 650 RPM (Air Cond.) with Powerglide in "D". Adjust idle mixture screw on both carburetors equally to obtain peak steady vacuum at given idle speed. Remove vacuum gauge and close the adapter. Remove distributor vacuum advance hose from right hand carburetor and plastic cap from left hand carburetor spark port adapter tube, then connect vacuum gauge to adapter tube at each carburetor (use two equally calibrated gauges). Move accelerator rod to obtain 1200 RPM (transmission in neutral). Check vacuum reading at each carburetor and note differences. If vacuum difference is 1" or less, carburetors are properly synchronized. If difference is more than 1", return engine to proper idle speed and adjust **left hand carburetor** throttle rod one turn (up to increase left carburetor vacuum and down to decrease) and recheck carburetor vacuum difference at 1200 RPM (make adjustments by disconnecting rod at cross shaft end and rotating in swivel). Repeat adjustment as necessary. *NOTE - It is preferable to have higher vacuum reading on right hand carburetor (distributor advanc side).* Remove vacuum gauges and replace hose and cap on adapter tubes. *CAUTION - When making linkage adjustments, accelerate engine by moving accelerator rod only. DO NOT open throttle by grasping oth r portions of linkage as this may upset synchronization.* To make final adjustment, replace air cleaners and connect vacuum gauge to vacuum balance tube adapter, then with engine idling at 500 RPM (Std. Engine), 600 RPM (Hi Perf. Engine - Synchro-mesh), 500 RPM (Hi

CONTINUED ON NEXT PAGE

POWERGLIDE THROTTLE LINKAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Perf Engine - Powerglide), 650 RPM (Air Cond Cars) with Powerglide in "D" (Drive), adjust idle speed and mixture screws equally on both carburetors to obtain highest steady vacuum reading between 14-18"

ROCHESTER MODEL "H"

Single barrel downdraft type similar in design to previous models Two carburetors used, one on each intake manifold Each carburetor is a complete assembly Choke control is manual type on each carburetor, controlled by a single knob on instrument panel Individual air cleaners connected by an air intake tube, are mounted on each carburetor Carburetors are used as follows

Engine & Transmission	Rochester No
Std (All), Synchro-mesh (Early)	7019101
Std (All), Synchro-mesh (Later)	7019111
Std (All), Powerglide (Early)	7019100
Std (All) Powerglide (Later)	7019110
Hi Perf (All) All Trans (Early)	7019107
Hi Perf (All), All Trans (Later)	7019117

Idle Speed & Mixture Setting - *See 'Carburetor Synchronization, Idle Speed & Fast Idle Adjustment' under CARBURETOR above*

►*CHOKE ADJUSTMENT NOTE Following procedure supersedes previous procedures*

Choke Adjustment - Move slider block on choke main cable housing at firewall to full forward position and tighten housing clamp to cable housing Move slide to 1/4" from rear of mounting bracket with instrument panel knob bottomed on bracket at instrument panel and tighten slide screw onto main choke cable wire Assemble cable and housing assemblies loosely at both carburetor mounting brackets Extend cable housing approximately 1/4" beyond mounting bracket clamp and tighten clamp at each carburetor With slide approximately 1/2" from rear of mounting bracket slot, tighten swivel at each choke lever and throttle kick cam when choke is fully open Cut cable wire so about 1/4" extends past swivel *NOTE - Do not bend cable wire Hold swivel with a wrench when tightening cable wire to prevent kinking* Pull choke knob to check for proper operation Choke should just begin to move when knob is 3/8" to 1/2" out *NOTE - During first 3/8' to 1/2' of knob travel, fast idle cam raises idle speed without moving choke valve Pull knob to end of travel and choke valve should be closed*

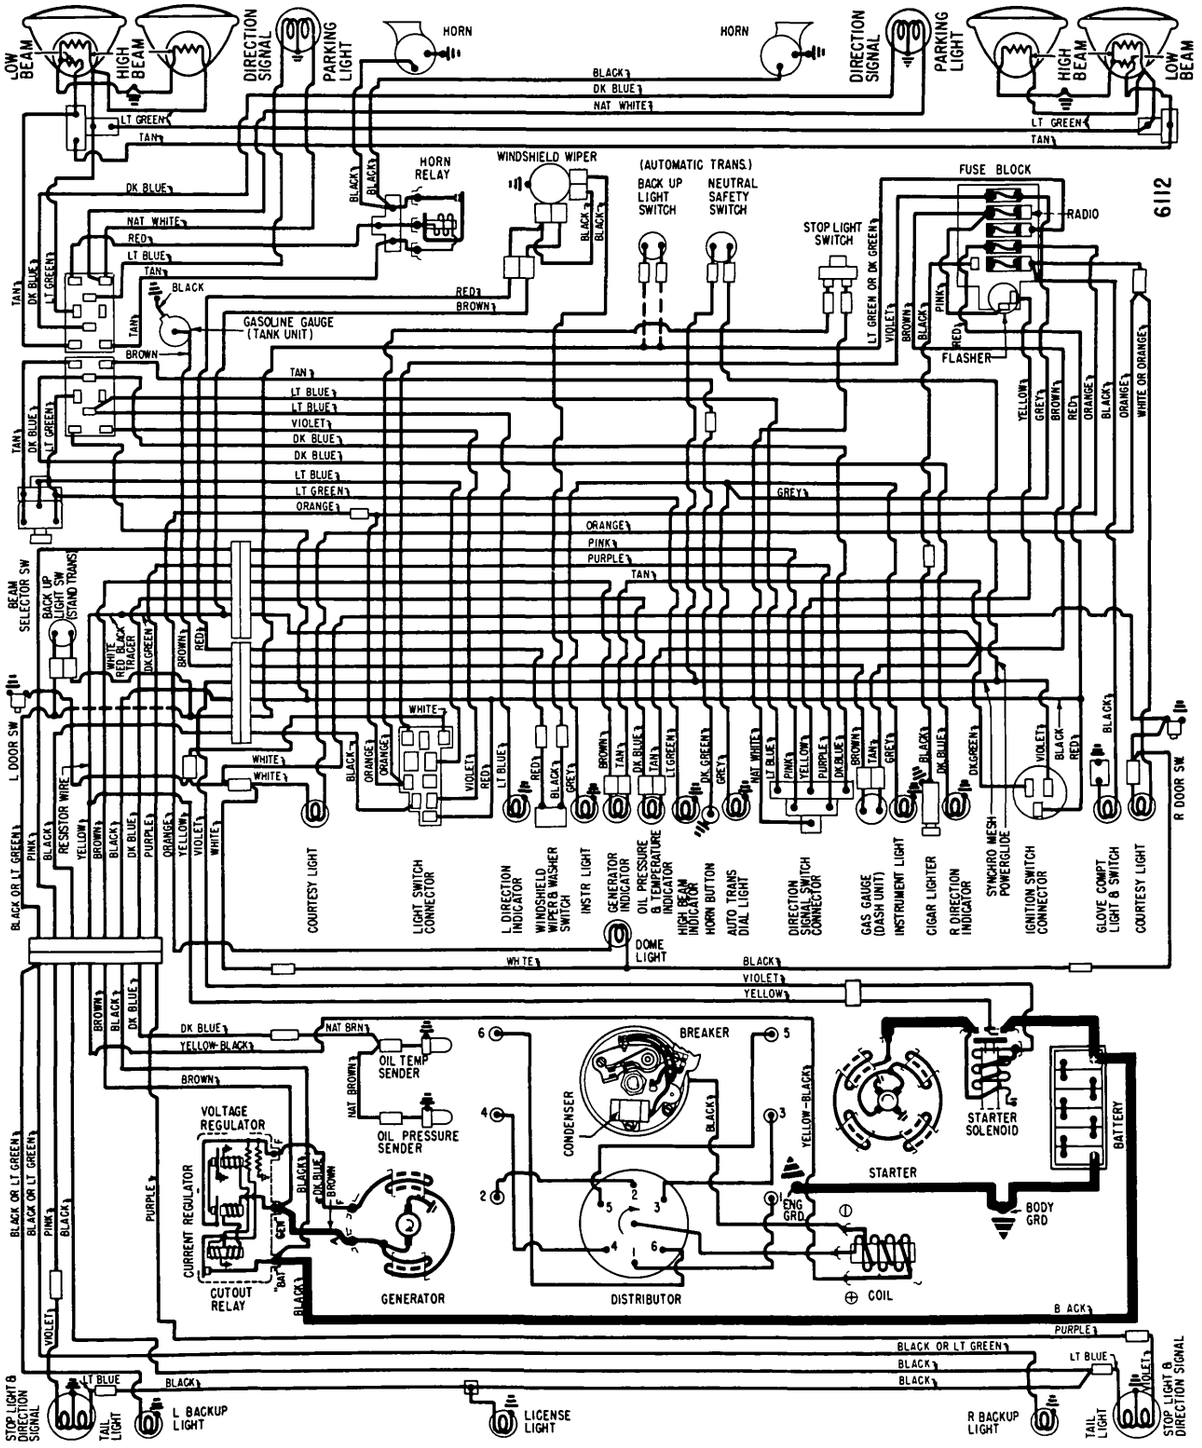
Throttle Linkage Adjustment - *See CARBURETOR above*

►*OTHER DATA See Rochester H Carburetors in Carburetion Section*

CARB. EQUIPMENT

Fuel Pump - AC No 4704 (Early) No 4886 (Later) Fuel only

Fuel Pump Pressure - 4-5 lbs at 500-1000 RPM



Gasoline Gauge AC Electric type

Dash Unit - AC No 5643032 (Pass) No 5643525 (Trucks)

Tank Unit - AC No 5641645 (Pass), No 5641632 (Trucks)

Fuel Filter In fuel inlet line of each carburetor Clean every 15,000 miles or sooner with solvent and compressed air Install with point of cone facing inlet line

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Air Cleaner: Oil wetted type with reusable Polyurethane element. One assembly mounted on each carburetor. Clean element every 2000 miles or sooner if needed.

►*CLEANING CAUTION* Clean element (after removing metal support) in **kerosene or mineral spirits only.** Squeeze out all solvent, then dip in light engine oil and squeeze out excess oil. DO NOT shake, swing or wring element. **Squeeze only.**

BATTERY

Delco No. 457 (Std.). 12 volt, 7 plate, 35 ampere hour capacity. **No. 557 (Optl.).** 12 volt, 9 plate, 42 ampere hour capacity. Identified by green paint on negative terminal. Both batteries at 20 hr rate. *NOTE* - Batteries are dry type for service replacement.

Battery Ground - Negative, to body and generator.

Engine Ground - Left and right sides of engine to body.

STARTER

Delco-Remy No. 1108306 (Synchro-mesh), No. 1108307 (Powerglide).

Armature - Delco-Remy No. 1946226 (All).

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs. minimum.

Performance Data

Torque	RPM	Volts	Ⓒ Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

Ⓒ - Includes Solenoid.

Starting Switch: Delco-Remy Solenoid No. 1119910 mounted on starter and controlled by Ignition & Starter Switch, Delco-Remy No. 1116657.

Neutral Safety Switch: Delco-Remy No. 1998717 Combination neutral safety and back-up light switch. **Adjustment** - *See "Corvair Transaxle" in Transmission Section.*

Starter Removal: *See "Electrical Notes" in Corvair Special Data.*

GENERATOR

Delco-Remy No. 1102227 (Std.), No. 1105135 (Low Cut-In).

Armature - Delco-Remy No. 1952301 (1102227 Gen.), No. 1950521 (1105135 Gen.)

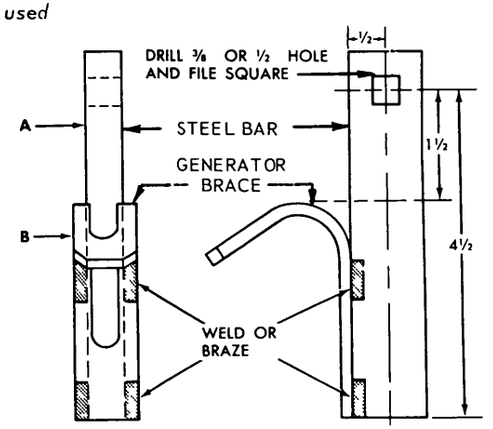
Performance Data

Generator	Amperes	Volts	RPM
1102227	30	14.0	2240
1105135	35	14.0	1730

Rotation - Clockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.69-1.79 amps. (1102227), 2.73-3.00 amps. (1105135) at 12 volts and 80°F.



►*BLOWER BELT ADJUSTMENT NOTE Following procedures and specifications supersede previous recommendations.*

Blower Belt Adjustment: *NOTE - New belt is one installed for less than 1000 miles. Used belt is one installed for more than 1000 miles. Use either of two methods listed below for belt adjustment.*

Strand Tension Gauge Method - Use a variable reading strand tension gauge and adjust idler pulley to obtain 70 lbs. strand tension on **new** belt, or 50 lbs. strand tension on **used** belt.

Special Torque Tool Method - *Refer to "Tool Fabrication Note" and illustration below.* Place slot of hooked end of tool over reinforcing rib of pulley bracket with shank end of tool toward rear of car (relative to idler pulley installed position). Loosen idler pulley attaching bolt. Insert torque wrench into tool shank and pull wrench to rear of car to apply 20 lbs. torque for **new** belt, or 15 lbs. torque for **used** belt. Tighten the pulley attaching bolt and nut while holding tension load. *CAUTION - DO NOT allow torque to exceed specifications even momentarily. Any slight variation in tension will result in an excessively tight belt. If specifications are exceeded, complete readjustment is necessary.*

►*TOOL FABRICATION NOTE* Make tool shown in illustration from a steel bar ¼" thick, ¾" wide, and 5" long, and the slotted end of a generator brace, Part No. 3836330 or 3739845. Hook has a developed length of 5". *CAUTION - Hold dimensions shown in illustration to plus or minus 1/16" to assure correct tension when tool is used.*

BLOWER BELT ADJUSTING TOOL

►*NEW BLOWER BELT INSTALLATION NOTE* When a new belt is installed, adjust tension as for new belt (see above), then operate engine at 1500 RPM for a minute or two to seat belt, then readjust tension (new belt specifications). *NOTE - This procedure supersedes previous recommendations.*

Air Conditioning Compressor Belt Adjustment: ½-¾" deflection midway between compressor and crankshaft pulleys under a 15 lb. load.

►*GENERATOR PULLEY INSTALLATION CAUTION* Pulley nut has **left-hand threads.** DO NOT attempt to turn nut in opposite direction nor install a right-hand thread nut as severe damage to armature will result.

Generator Installation: *See "Electrical Notes" in Corvair Special Data.*

REGULATOR

Delco-Remy No. 1119001 or 1119261 (Std. Gen.). "Post Type" with nylon adjusting nuts above Voltage & Current Regulator units for air gap adjustment.

Delco-Remy No. 1119635 (Low Cut-In Gen.). "Double Contact" type.

Specifications below are "Normal" settings.

Cut-out Relay

Cuts In - 11.8-13.5 volts (1119001, 261), 11.8-13.0 volts (1119635).

Cuts Out (1119261) - 1-4 amperes reverse current at 12.5 volts for relay points to open.

Contact Gap - .020".

Air Gap - .020" (1119001), .023" (1119261 & 1119635).

Voltage Regulator

Setting (1119001, 261) - 13.8-14.7 volts at 125°F.

Setting (1119635) - 13.8-14.6 volts at 125°F ambient temperature when operating on upper contacts. 1-3 volts lower when operating on lower contacts.

Contact Gap (1119635) - .016" (upper contacts) with lower contacts just touching.

Air Gap - .075" (1119001, 261), .067" (1119635) with armature pressed down to point where contacts just touch.

Current Regulator

Setting - 27.0-31.0 amps. (1119001, 261), 27.8-32.4 amps. (1119635) at 125°F ambient temperature.

Air Gap - .070" (1119261), .075" (1119001, 635) with armature pressed down to point where contacts just touch.

►*OTHER DATA - See "Delco-Remy 1119000 Series (Single Contact) Regulators" and "Delco-Remy 1119600 Series (Double Contact) Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlights: 4-Headlight System.

Stop Light Switch Location Under instrument panel.

Adjustment - Adjust switch in mounting bracket so electrical contact is made when brake pedal depressed ½-¾" from fully released position.

Lighting Switch Removal: Disconnect battery ground cable and pull switch to ON position. Depress switch shaft retaining button (top of switch under instrument panel) and remove shaft and knob. Remove switch retaining ferrule and bezel and remove switch.

Ignition Switch Removal: With negative cable disconnected at battery, position ignition switch in "Lock" and insert a wire in small hole in cylinder face. Depress plunger with wire and continue to turn key counterclockwise until cylinder can be removed. Use a spanner wrench (Tool J-7607 or J-5893, with inside of tangs filed off), and remove attaching nut, then remove switch. To remove "theft resistant" connector, use a piece of heavy wire stock and press on lock clip in slot in connector. Hold wire in place and work connector away from switch.

Instrument Cluster Removal (Pass. Cars): Disconnect battery ground cable and disconnect connectors from back of cluster. Pull wiring harness out of retaining clips on cluster. Disconnect speedometer cable. Remove lighting switch (see above). Remove cigar lighter attaching nut from behind panel and remove lighter. Lower mast jacket and steering wheel or remove steering wheel (see Steering Section). Remove instrument panel-to-cluster attaching screws and remove cluster, instrument center panel and seal by pulling straight out and turning slightly to clear transmission range selector. *NOTE - Individual bulb sockets and fuel gauge may be removed without removing cluster.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Instrument Cluster Removal (Gre nbrier & Trucks): Disconnect battery ground cable On Powerglide trucks, remove "C" clip holding transmission cable assembly to transmission control assembly Remove cable assembly attaching nut from control support arm Move selector lever to "Low" On all trucks, remove speedometer cable and cluster attaching screws Remove cluster from instrument panel, disconnect cluster wiring and remove from truck *NOTE* - When installing, Powerglide selector lever must be in full DOWN position

CIRCUIT BREAKER: 15 Ampere - Headlights, Parking Lights, High Beam Indicator, In headlight switch

FUSES: Located in junction block and fuse holder beneath instrument panel

10 Ampere - Heater Blower, Glove Box Light
10 Ampere - Tail, Stop, Dome Lights
20 Ampere - Heater System
4 Ampere - Radio
3 Ampere - All Instrument Panel Lights

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section*

►*CYLINDER HEAD EXCESSIVE TEMPERATURE INDICATOR NOTE:* A red indicator light on instrument panel will light when cylinder head temperature reaches 450°F A disc type sending unit on underside of right hand cylinder head, near No 3 cylinder controls this light This indicator light also serves dual purpose of indicating low oil pressure *See "Oiling System" and "Cooling" below.*

►*ALUMINUM THREAD REPAIR NOTE. A thread repair kit, Part No 3780960, is available for repairing stripped or damaged threads in aluminum parts*

►*ANTI-SEIZE COMPOUND NOTE· Permatex No 404 Anti-Seize Compound (or equivalent) must be used on threads of all bolts, studs or capscrews entering an aluminum part to prevent thread seizure and damage*

DESCRIPTION: Own 6 cylinder, horizontal opposed, overhead valve, air-cooled aluminum type of same design used previously except for the following changes

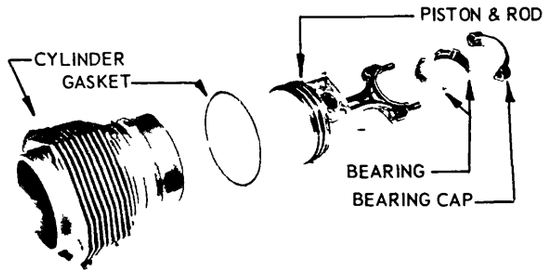
Compression Ratio - Some later production engines have different compression ratio *See "Monza & High P rformance Engines Production Change" and "Engine Suffix Table" under MODEL IDENTIFICATION above, and also "Engine Specifications" below.*

Engine Shrouding - Engine lower shrouds and exhaust ducts are now one piece

Crankshaft - Front and rear oil slinger and retainer eliminated

Exhaust Manifold Sleeves - Press fit into exhaust manifold instead of sliding fit.

Co ling System - *See "Cooling" below for various changes*



Engine Specifications

Engine	Bore	Stroke	Displacement
All	3 4375"	2 60"	145 cu ins
Engine	Compr. Ratio	Rated HP	Developed HP
Std ①	8 0-1	28 4	80 at 4400 RPM
Std ②	9 0-1	28 4	80 at 4400 RPM
Hi Perf ③	8 0-1	28 4	98 at 4600 RPM
Hi Perf ④	9 0-1	28 4	98 at 4600 RPM

① - All 500 & 700 Series, and Early 900 2-Door Series
② - Later 900 2-Door Series, and All 900 4-Door Series
③ - All Series, Up to Engine No T-0109 (Synchromesh), T-0207 (Powerglide)
④ - All Series, Beginning Engine No T-0109 (Synchromesh), T-0207 (Powerglide)

Compression & Vacuum Reading - *See TUNE-UP.*

►*STD. (9 0-1) & HI PERF. (ALL) ENGINES CYLINDER HEAD NOTE·* Cylinder heads used on these engines use different valve springs and valve spring shims than Std (8 0-1) engine *See below*

CORVAIR CYLINDER ASSEMBLY

ENGINE REMOVAL: *See "Power Train" in Corvair Special Data*

TIGHTENING TORQUES: *See "Tightening Specifications" in Corvair Special Data*

ENGINE MOUNTS: *See "Engine Service" in Corvair Special Data*

CRANKCASE COVER, BLOWER & BLOWER BEARING: *See "Engine Service" in Corvair Special Data*

OIL COOLER: *See "Engine Service" in Corvair Special Data*

CYLINDER HEAD: *See "Engine Service" in Corvair Special Data*

EXHAUST MANIFOLD: *See "Engine Service" in Corvair Special Data*

CRANKCASE & CYLINDER HEAD STUDS: *See "Engine Service" in Corvair Special Data.*

OIL PAN REMOVAL: Drain crankcase and remove oil pan retaining bolts Remove pan

CYLINDER

Individual cast iron type with integral cooling fins Replacement cylinders are furnished only as an assembly with piston and pin

Bore - 3 4370-3 4400" Maximum wear limit 005"

Removal - *See "Engine Service" in Corvair Special Data.*

PISTONS

Aluminum alloy, tin plated, slipper type skirt with steel strut Piston pin is offset toward major thrust side

Removal - Piston and rod removed as an assembly with cylinder *See "Engine Service" in Corvair Special Data*

Clearance - 0011- 0015" measured 2 20" from top of cylinder bores

Installing Pistons: Install piston with notch on top of piston toward front (flywheel end) of engine on both banks

Replac ment Pistons: Standard size only Piston, pin, and cylinder are furnished as a complete assembly

PISTON PIN

Pin is press fit in connecting rod

Diamet r - 7999- 8002" **L ngth** - 2 630-2 650"

Pin Fit in Piston - 00015- 00025" With piston and pin at 70°F and light film of oil on pin, pin should support own weight in either piston pin boss

Pin Fit in Connecting Rod - Press fit. *See "Engine Service" in Corvair Special Data.*

Replacement Pins: Standard size only furnished in assembly with piston and cylinder

PISTON RINGS

Compression rings are cast alloy iron with wear resistant coating Oil ring is a single piece, uncoated, with a slotted expander

Ring	Width	End Gap	Sid Clearance
Compr (1 & 2)	.0770- 0780"	010- 020"	0012- 0032"
Oil (3)	1860- 1865"	010- 020"	002- 0035"

Installing Rings - Install rings with identification marks and inside bevel **away fr m** top of piston *NOTE - Ring position is reversed from 1960 models*

Replacement Rings: Furnished Standard size only

CONNECTING ROD

Length - 4 719-4 721" center-to-center
Journal Diameter - 1 799-1 800"
Lower Bearing - Replaceable precision type
Clearance - 0007-.0027".
Sideplay - 005- 010"

Bearing Replacement: Furnished Std , 001", 002", 010", & 020" Undersize, To replace bearings, *see "Engine Service" in Corvair Special Data*

Installing Rods: No squirt hole Install in either direction

CRANKCASE

Cast aluminum alloy, vertically divided into two halves held together at parting line by bolts Studs for mounting cylinders, cylinder heads, rocker arms, and rear housing are mounted in each half and are replaceable Crankcase must be separated for service on either crankshaft or camshaft

Crankcase Separation: Crankcase can be separated after removal of cylinder heads, cylinders, rear housing, and clutch housing *See "Engine Service" in Corvair Special Data.*

Stud Replacement: *See "Engine Service' in Corvair Special Data*

CRANKSHAFT

Journal Diameter - 2 0978-2 0998" (No 1 & 2), 2 0983-2 0993" (No 3 & 4)

Bearings - Steel backed babbitt precision type No adjustment

Clearance - 0012- 0027" (No 1 & 2), 0007- 0022" (No 3 & 4)

Replacement Bearings: Furnished Std , 001", 002", 010", & 020" Undersize Also No 1 bearing furnished 003" Undersize To replace bearings, crankcase must be separated *See "Engine Service" in Corvair Special Data*

►*NO 4 MAIN BEARING NON-INTERCHANGEABILITY CAUTION* No 4 bearing upper half is 0015" thicker and lower half 0015" thinner than corresponding bearing halves of No 2 & 3 bearings to lower centerline of No 4 bearing No 4 bearing halves have brown dye on

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

edges for identification DO NOT install a No 4 bearing in No 2 or 3 positions, nor a No. 2 or 3 bearing in No 4 position.

End Thrust - Taken by flanged type No 1 (rear) main bearing (at accessory drive end of engine).
Endplay - 002- 006"

Crankshaft Front & Rear Oil Seals: *See "Engine Service" in Corvair Special Data.*

Vibration Damper: None used

Crankshaft Drive Flange : Integral with steel timing gear. Pressed on crankshaft. *See "Engine Service" in Corvair Special Data*

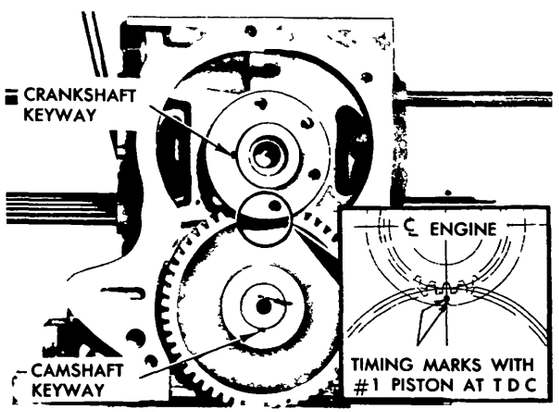
Crankshaft Pulley Removal: Unnecessary to remove power train. *See "Engine Service" in Corvair Special Data.*

CAMSHAFT

Alloy cast iron camshaft located below crankshaft on split line of engine. Camshaft journals ride directly on machined base metal of crankcase and bearing inserts are not used. Exhaust valve lobes are twice the width of intake lobes and actuate a pair of exhaust valve lifters

►*HIGH PERF. ENGINE NOTE:* Special camshaft, Part No 3777255, used in this engine **Do not** interchange with Std Engine Camshaft, Part No. 3779332.

Journal Diameter - 1 4395-1 4405" (front), 1.1995-1 2005" (all others)



Clearance - 0015- 0035" (new), .002-.004" (used). *NOTE - If beyond the above limits, replace either crankcase or camshaft.*

End Thrust: Controlled by thrust washer located between camshaft gear and front bearing
Endplay - 002- 007"

Camshaft Removal: Crankcase must be separated. *See "Engine Service" in Corvair Special Data*

Timing Gear: Aluminum, with steel crankshaft gear, pressed on camshaft Replace gears in matched sets only To remove gear, remove camshaft and see *"Engine Service" in Corvair Special Data.*
Backlash - 002- 004"

Camshaft Setting: Align notch in crankshaft gear flange with mark in camshaft gear adjacent to each other across shaft centers Notches can be aligned only when crankcase reassembled. *See "Engine Service" in Corvair Special Data*

CORVAIR VALVE TIMING MARKS

VALVES

Valve	Head Diam.	℄ Stem Diam.	Length
Intake	1 335-1 345"	3415-.3422"	4.489-4.509"
Exhaust	1 235-1.245"	② .3410-.3417"	4 494-4.514"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°③	④ .314"	⑤ 0010-.0027"
Exhaust	45°③	④ 344"	⑥ .0014-.0030"

℄ - Standard Also furnished 003" & .010" Oversize (Intake), .003", .010", .020" Oversize (Exhaust).
② - Top of stem .3400-.3407" at bottom of stem. *NOTE - Valve stems are tapered .001".*
③ - Valve Face Angle 44°.
④ - 380" Intake & Exhaust on Hi Perf. Engines.
⑤ - Wear limit 004"
⑥ - *Supersedes previous 0015-.0032".* Wear limit .006".

Valve Seat Width - 1/32-3/32" Intake, 1/16-1/8" Exhaust.

Valve Seat Inserts: Steel, not replaceable.

Valve Guides: Pressed into cylinder head Not replaceable. Guides may be reamed for oversize valve stems if valve clearance excessive Intake valves furnished with .003" & 010" oversize stems, exhaust valves furnished with 003", 010" & 020" oversize stems. Use Reamer Set J-5830.

Valve Springs: Spring must be installed with a hardened shim (minimum 020" - furnished 030") under it to protect aluminum head.
Free Length - 1 74" (Std 8.0-1), 2.08" (Std. 9 0-1 & Hi Perf All)

Spring Specifications - Std. (8.0-1)

Valve	Lbs. Pressure	Length
Closed	58-64	1.508"
Open	141-149	1.148"

Spring Specifications - Std. (9.0-1) & Hi Perf. (All)

Valve	Lbs. Pressure	Length
Closed	69-79	1.696"
Open	159-169	1.306"

►*VALVE SPRING INSTALLED HEIGHT CAUTION:* Check installed height of valve spring after grinding valves by measuring distance from spring seat on cylinder head to top of valve spring If this dimension exceeds "Preferred Height" listed in table below, install additional 1/32" shim, Part No 6255818 (Std. 8 0-1), No 3781876 (Std 9.0-1 & Hi Perf All), under valve spring to bring height within limits. *CAUTION - Do not add shims to bring height to less than "Minimum Height" below.*

Valve Spring Height Specifications

Engine	Valve	Preferred Height	Min. Height
Std (8 0-1)	Intake	1 15/32"	1 7/16"
	Exhaust	1 1/2"	1 15/16"
Std (9 0-1)	Intake	1 11/16"	1 21/32"
	Exhaust	1 11/16"	1 21/32"
Hi Perf (All)	Intake	1 11/16"	1 21/32"
	Exhaust	1 11/16"	1 21/32"

Pushrods: Externally mounted type between cylinder head and crankcase and enclosed in drain tubes. For servicing, see *"Engine Service" in Corvair Special Data.*

Valve Lifters: Hydraulic Both "long travel" and "short travel" type used in production. DO NOT intermix both type lifters on the same engine. *See "Engine Service" in Corvair Special Data.*
Hydraulic Lifter Adjustment - *See "Engine Service" in Corvair Special Data.*

Rocker Arms: Mounted individually on cylinder-cylinder head studs.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications (Std. 8.0-1 & 9.0-1 Ratio Engines)

Intake Valves - Open 43° BTDC. Close 93° ALDC.
Exhaust Valves - Open 87° BLDC. Close 69° ATDC.

(Hi Perf. 8.0-1 & 9.0-1 Ratio Engines)

Intake Valves - Open 54° BTDC. Close 118° ALDC.
Exhaust Valves - Open 95° BLDC. Close 78° ATDC

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Corvair Special Data.*

Crankcase Capacity: 4 qts refill, 5½ qts dry engine Add 1 pint with filter change.

Normal Oil Pressure: 35 lbs. at 2000 RPM
Pressure Relief Valve - In engine rear housing Not adjustable.

Oil Pressure Indicator: Light on instrument panel controlled by Oil Pressure Switch, No. 3751700 (Std.), No. 534598 (Air Cond.) Light comes on when ignition switch turned on but goes off during normal engine operation This light also serves dual purpose of indicating excessive cylinder head temperature *See "Cooling" below*

►*OIL PRESSURE SWITCH INSTALLATION CAUTION:* Switch is grounded through threads of body. **Do not** coat threads with sealer or anti-seize compound. Torque switch to 45-65 **inch-lbs.**

Oil Filter: Full-flow type Replace element every 4000 miles Use a new seal and tighten center bolt to 9-15 ft. lbs.
Replacement Filter Element - AC No. PF-4.

►*AIR CONDITIONED CAR OIL FILTER REPLACEMENT NOTE:* To prevent oil spilling into engine compartment when changing filter, remove both filter and adapter as a unit and separate filter from adapter at the bench.

Oil Pump: Gear type pump located in engine rear housing and driven by distributor shaft
Pump Overhaul - *See "Oiling System" in Corvair Special Data.*

Oil Cooler: Located at rear of engine left side shield. Clean every 5000 miles by removing access cover and removing dirt, twigs, etc.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Crankcas V ntilation: Standard - Air intake through oil filler cap and outlet pipe from top of crankcase cover and down on right side of engine

Positive - Outlet pipe replaced by a metal tube and flexible tubing from top of engine shroud to right carburetor air cleaner case No ventilation valve used Clean pipe and hose at 10,000 mile intervals or sooner if needed

ENGINE COOLING SYSTEM

Air cooled by blower mounted on top of engine Engine temperature regulated by a bellows type thermostat filled with butyl alcohol in each lower shroud exhaust duct Each thermostat operates a damper door at rear of each lower exhaust duct Exhaust damper doors restrict blower air exhaust until engine reaches operating temperature *NOTE - If thermostat fails, damper doors will remain open*

Th rmostat: Chevrolet No 3152003, bellows type filled with butyl alcohol under vacuum Two used, one in each engine lower shroud exhaust duct Thermostats control exhaust damper doors which restrict blower air exhaust until engine reaches operating temperature Thermostats start to open damper doors at 200-210°F and doors are fully open at 225-230°F If thermostats fail, atmospheric pressure causes damper doors to remain in open position

Exhaust Damper Door Adjustment - *Make this adjustment whenever a new thermostat is installed* With exhaust damper door fully open, pull thermostat actuating rod out to maximum travel (thermostat against bracket stop) With 2 11/32" opening from upper flat of damper door edge to exhaust duct top edge, adjust swivel on actuating rod until it enters damper door Install retaining clip

Temperature Indicator; Disc type switch, Part No 1993533 (Std), No 1993574 (Air Cond), on underside of right cylinder head near No 3 cylinder controls indicator light on instrument panel Light will come on if cylinder head temperature reaches 450°F This light serves dual purpose of indicating engine oil pressure *See "Oiling System" above*

►*TEMPERATURE INDICATOR SENDING UNIT INSTALLATION CAUTION.* Switch is grounded through threads of body **Do not** coat threads with sealer or anti-seize compound Torque switch to 10-15 ft lbs

LUBRICATION

LUBRICATION: Synchro-mesh Transmission (Checking Lubricant Level) - *NOTE - Synchro-mesh transmission and rear axle differential carrier assembly are connected by internal passages* Check lubricant level every 1000 miles, drain and refill every 10,000 miles Use only SAE 80 "Multi-Purpose" gear lubricant *CAUTION - Do not use "Straight Mineral Oil" gear lubricants or any "active sulphur soap" lubricants* With unit at normal operating temperature, check fluid level in differential carrier first (plug is adjacent to rear axle universal joint on left side of transmission case) If level is low in differential case, also check level in transmission *NOTE - With unit at operating temperature, fluid should be level with bottom of filler plug hole If unit is cold, fluid should be ½" below filler plug hole*

Draining & Refilling - Remove drain plug in transmission housing and in differential carrier housing *NOTE - Transmission drain plug is on left side adjacent to idler arm on side of transmission cas* Refill by adding lubricant to both units (5 pints total) Check level at both units after refilling

Automatic Transmission (Ch cking Lubricant L vel): Check fluid level in transmission every 1000 miles With transmission selector lever in "N" position and transmission at normal operating temperature, engine idling, check fluid level on dipstick in filler tube Add fluid as necessary to bring level to "Full" mark on dipstick using Automatic Transmission Fluid Type "A" (Suffix "A") *NOTE - Automatic Transmission Fluid Type "A' may be substituted if necessary*

Draining & Refilling - *NOTE - Not required except at time of transmission overhaul* Drain oil by loosening filler tube attaching nut in oil pan Tighten filler tube nut and add 4 pints of recommended fluid using filler tube and funnel J-4264 Start engine and allow to idle 3-5 minutes, then add sufficient fluid to bring level to "Full" mark

Capacity - 6 pts (converter not drained), 13-14 pts (converter drained)

Differential Carrier With Pow rglid (Ch cking Lubricant Level): With unit at normal operating temperature, check fluid level in differential carrier (plug is adjacent to rear axle universal joint on left side of transmission case) *NOTE - With unit at operating temperature, fluid level should be even with bottom of filler plug hole If unit is cold, l vel should be ½" below filler plug hole*

Draining & Refilling - Drain carrier housing and replace drain plug Refill housing with 3 1 pts of recommended gear lubricant

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

ALUMINUM ENGINES SERVICE CAUTIONS

SERVICE PRECAUTIONS: *NOTE* - Extreme caution must be observed when working on aluminum engines to prevent damage by scratching, nicking, or scoring Note the following

1) Do not drop or slide machined surfaces on bench or floor

2) Do not use gasket cement (Except as indicated under Cylinder Head Installation)

3) Lubricate all bolts or screws entering an aluminum part See "Bolt Thread Lubrication Note" below

4) Tighten bolts and nuts to the specified torque DO NOT overtighten Torque valves are for clean lubricated threads

►*BOLT THREAD LUBRICATION NOTE* Use engine oil or special thread lubricant on all threads entering an aluminum part

DAMAGED OR WORN THREAD REPAIR (ALUMINUM BLOCK): "Heli-Coils" are available locally for repairing damaged or worn threads in aluminum The repair consists of drilling out worn or damaged threads, tapping hole with special "Heli-Coil" tap, and installing a "Heli-Coil" insert in tapped hole This brings hole back to original thread size See following table.

"Heli-Coil" Thread Inserts

Thread Size	Insert Part No.	Drill Size	Special Tap Part No.	Inserting Tool No.
1/4"-20	1185-4	266"	4 CPB	528-4N

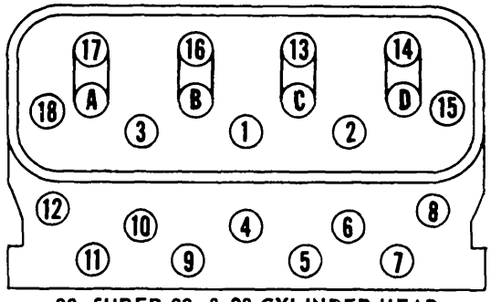
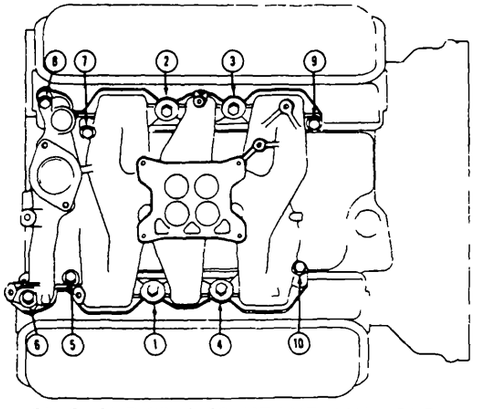
CYLINDER HEAD & MANIFOLD

88, SUPER 88, & 98



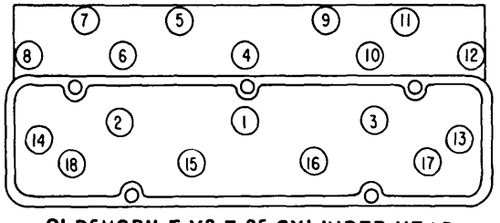
CYLINDER HEAD: Removal - Drain radiator and cylinder block Remove intake manifold and generator, disconnect exhaust pipes Remove valve covers On air conditioned cars, remove compressor bracket attaching bolts and tip compressor to rear to remove right valve cover On power steering cars, remove pump mounting bracket bolts and move assembly to one side to remove left valve cover Remove rocker arm shaft assembly Disconnect ground strap from rear of head Rock pushrods to break oil seal between rod and lifter seat (to avoid pulling lifter from bore), then remove pushrods and remaining cylinder head bolts Remove cylinder head with exhaust manifold attached

On Air Conditioned Cars - To remove right cylinder head, proceed as follows Loosen and remove all cylinder head bolts *NOTE - No 17 & 18 bolts cannot be removed because of blower duct assembly* Position rocker arm shaft away from head and remove pushrods Tip No 15 & 16 rocker arms to vertical position, tip their pushrods to within ½" of blower duct and tape in position Remove oil dipstick tube Lift head, rocker shaft assembly and exhaust manifold off dowel pins then move down and forward to clear blower duct



Installation - *NOTE* When new cylinder head is installed on left hand bank engine unit number must be transferred to new head Use Guide Studs J 3455 and apply P O B No 3 sealer to both sides of gasket Place gasket and head over studs and tighten all bolts snug Tighten **Numbered** bolts in sequence indicated in diagram to 50-60 ft lbs Tighten **Lettered** bolts in sequence shown in diagram to 14-22 ft lbs Retighten **Numbered** bolts in correct sequence to 60 80 ft lbs Retighten **Lettered** bolts in correct sequence to 14-22 ft lbs

INTAKE MANIFOLD Removal - Drain radiator disconnect upper radiator hose from water outlet Remove air cleaner and disconnect spark plug wires and throttle linkage Remove fuel and vacuum lines that interfere with manifold removal and disconnect primary coil wire and remove ignition wires from resistor On power steering cars disconnect power steering pump and bracket as an assembly On air conditioned cars remove external fuel filter Disconnect generator then remove attaching bolts and tip compressor and bracket rearward to obtain clearance for manifold removal Remove intake manifold with coil and carburetor attached Clean cylinder head and manifold machined surfaces



Installation - Reverse removal operations using new graphite coated metal gaskets Apply Permatex No 3 sealer or equivalent around gasket water holes Dip manifold bolts in C P No 9 sealer Install bolts and nuts and torque to specifications Adjust power steering belt tension adjust throttle linkage

88, SUPER 88, & 98 CYLINDER HEAD

88, SUPER 88, & 98 INTAKE MANIFOLD

OLDSMOBILE V8 F-85 CYLINDER HEAD

F-85 MODELS

►*ALUMINUM ENGINE CAUTION Use car in handling all aluminum parts*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CYLINDER HEAD: R moval - Drain radiator and cylinder block. Remove intake manifold (see below), then disconnect exhaust pipe. Disconnect spark plug wires and remove valve cover.

To remove right cylinder head, remove generator rear mounting bracket bolt. Remove ground straps at front and rear of cylinder head. If equipped with heater, remove all head bolts except rear rocker arm shaft bracket bolt. Then **loosen** rear rocker arm shaft bracket bolt and raise shaft assembly from head and remove all pushrods except No. 16. Lift No. 16 to within 1" of blower case and tape to rocker shaft. Lift head, rocker shaft assembly, and exhaust manifold off dowel pins and remove as a unit by angling it forward to clear blower case.

To remove left cylinder head, remove power steering belt (if so equipped), then remove power steering pump bracket-to-cylinder head bolts. Remove rocker arm shaft assembly and push rods. Remove cylinder head bolts and cylinder head with exhaust manifold attached.

Installation - Head gaskets should be coated on both sides with POB No. 4 Sealer or equivalent. Likewise coat the cylinder head bolts and torque to specifications (*see diagram*). **F-85 MODELS**

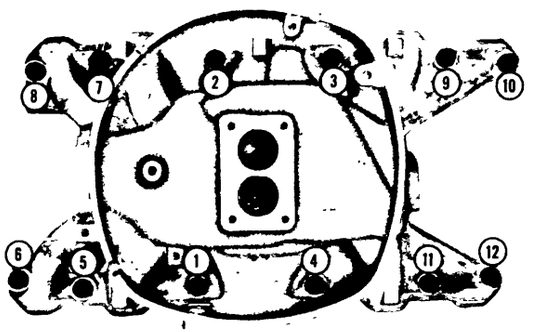
INTAKE MANIFOLD: Removal - Drain radiator and disconnect upper hose from outlet. Disconnect heater hose at rear of manifold. Disconnect spark plug wires and remove carburetor cover. Disconnect throttle linkage from accelerator bellcrank and then disconnect choke heat tube and lower throttle rod. Remove fuel and vacuum lines from carburetor. Disconnect primary wiring from coil and secondary lead. Disconnect temperature gauge wire. Slide thermostat bypass hose clamp back on hose at water pump. Remove intake manifold bolts, then remove manifold with coil and carburetor attached. Remove intake manifold gasket clamp bolts, clamps, seals, and gasket.

Installation - Reverse removal procedure and note the following. Coat either side of gasket with POB No. 3 and install. Install end seals and clamps then lubricate clamp bolts with engine oil and torque to 10-15 ft. lbs. *NOTE - When tightening clamp bolts, intake gasket must be positioned so manifold-to-head bolt holes will be open.* After positioning intake manifold on engine and connecting thermostatic bypass hose to water pump, coat intake manifold bolts with engine oil and install. Torque bolts alternately to specifications.

PISTON PINS

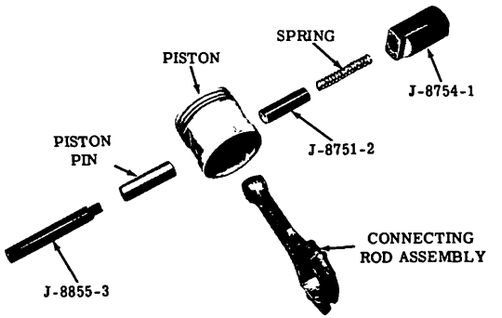
F-85 MODELS

Piston Pin Removal: Place piston on Tool No. J-8754-1 with letter "F" on piston facing up. Press pin out with Tool No. J-8855-3.



Installation - Place spring and guide stop Tool No. J-8751-2 in main body of Tool No. J-8754-1. Place piston on this tool and press pin in with Tool No. J-8855-3 until pin makes contact with guide stop tool in main body of Tool No. J-8754-1. This automatically centers pin in piston. Pin to connecting rod fit is .0007-.0013" tight.

CRANKSHAFT & MAIN BEARINGS



►*F-85 CRANKSHAFT ASSEMBLY REPLACEMENT PARTS CAUTION & BALANCING NOTE:* Crankshaft, balancer, and flywheel are balanced individually in production and complete assembly is then balanced by installation of unstaked pins in holes provided around rim of flywheel and balancer. *NOTE* - Flywheel is balanced individually in production by installation of **staked** pins in above holes. When replacing balancer or flywheel, maintain crankshaft assembly balance by transfering balance pins (unstaked) to new unit as follows:

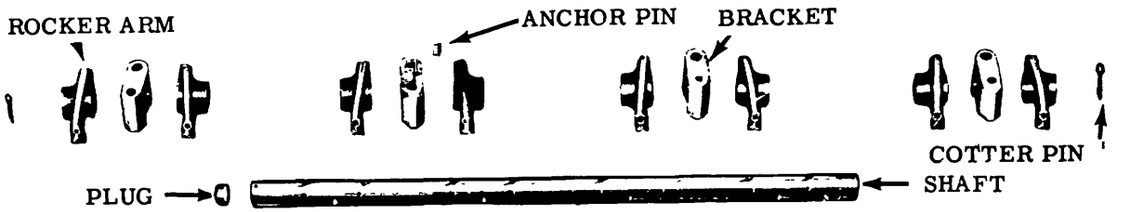
Balancer - If no pins used on old balancer, install new balancer as is. If balance pins are found on old balancer, transfer these pins (unstaked) to corresponding position on new balancer.

Flywheel - If no balance pins (unstaked) found on old flywheel, install new flywheel as is. If balance pins (unstaked) found on old flywheel, transfer pins to corresponding position on new flywheel. *NOTE - If* the presence of a staked pin on new flywheel prevents transfer of balance pin, place unstaked pin in nearest corresponding hole.

F-85 INTAKE MANIFOLD

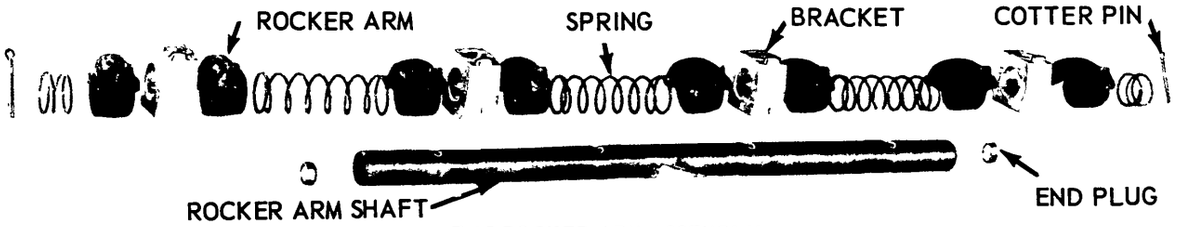
F-85 PISTON PIN ASSEMBLY

88, SUPER 88 & 98



REAR MAIN BEARING OIL SEAL: Asbestos covered wiper seal installed in rear groove in bearing cap and block (oil slinger operates in front groove).

Oil Seal Installation - Crankshaft must be removed to replace upper half of seal. Place seal in groove in cap or block by hand, then drive tightly into groove by tapping Tool 23-18 with hammer. Seal is bottomed in cap or block when Tool 23-18 is seated in cap only and the undercut area of tool will pass over seal, when tool moved across cap or block. Hold Tool 23-18 tightly against seated seal and cut seal flush with parting line between upper and lower bearing. *NOTE* - Ends of seal must be cut clean (no frayed ends) and seal must entirely fill groove. After bearing cap installed, wipe DuPont Cement No. 5402 in grooves in block on both sides of bearing cap and press two cork seals into place in grooves.



F-85 MODELS

REAR MAIN BEARING OIL SEAL: Replacement - Oil pan and rear main bearing cap, insert and seals must be removed. Install seal into bearing cap, packing by hand. Using Installer Tool No. J-8807, hammer seal into place. To check if seal is fully seated, slide tool away from seal. With tool seated fully in bearing cap, slide tool against seal. If undercut area of tool slides over seal, seal is fully seated. Rotate tool before cutting off excess seal packing. Cut seal 1/16" from bearing surface. Taper end of seal into a point.

CONTINUED ON NEXT PAGE

88, SUPER 88, & 98 ROCKER ARM ASSEMBLY

F-85 ROCKER ARM ASSEMBLY

CONTINUED FROM PRECEDING PAGE

With screwdriver, pack fibers toward center, away from edges. Rotate tool to cut seal between notch and handle. Install two side bearing cap seals, leaving seal extended on each side. Coat back of insert with light film of oil and install in bearing cap. Clean crankshaft bearing journal and seal contact. Install bearing cap guide pins. Install bearing cap into place by tapping with wood block. Remove guide pins. Apply lubricant Part No. 980131 to cap bolts then torque to specifications. Do not trim ends of side seals.

►*NOTE: Seal in block installed with crankshaft removed.*

ENGINE FRONT COVER

88, SUPER 88, & 98

ENGINE FRONT COVER: Removal - Drain cooling system and disconnect lower radiator hose and heater hose from front cover. Disconnect generator link at generator and remove front engine mount to crossmember nuts. Use Tool J-8568 to raise engine to clear bolts of crossmember, then insert wood block 8" x 2" x 4" between each exhaust manifold and upper control arm and allow engine to rest on 2 x 4's. Remove oil pan, radiator assembly, fan blades and pulley, then remove crankshaft pulley. Remove distributor cap and rotate engine until rotor points toward cowl, then remove fuel pump assembly. Remove front cover attaching bolts and front cover assembly.

Installation - Reverse removal procedures and tighten belts to gauge line on Tool 33-70. *NOTE* - Use a new front oil seal and coat fuel pump rocker arm pad with Special Seal Lubricant Part No. 567196. Front cover bolts should be dipped in P.O.B. No. 3 Sealer and torqued to specifications. Coat on side of fuel and vacuum pump gasket with gasket cement such as P.O.B. No. 4.

Engine Front Cover Oil Seal (Crankshaft Front Oil Seal) Replacement: *NOTE - Front cover oil seal can be replaced without removing radiator or crankshaft pulley key as follows:* Remove crankshaft pulley and thread Pilot Bolt J-7583-3 into crankshaft. Thread Tool J-7583-1 into oil seal and then tighten Forcing Screw J-7583-2 until seal is free from front cover. Remove seal from tool and pilot bolt from crankshaft.

Installation - *NOTE - Two types seal (½" & ¾" thick) used in production. Both seals can be installed with Seal Installer J-7584-1 and Adapter Ring J-7584-2 must be used with ¾" seal.* Coat outer diameter of seal with P.O.B. No. 3 sealer and lips of seal with Special Lubricant, Part No. 567196. Position seal in front cover. If ¾" seal used, place Adapter Ring J-7584-2 between Installer J-7584-1 and seal. Place Installer over seal and thread Forcing Screw J-7584-3 into crankshaft until Installer contacts front cover. Remove tools and install pulley and belts.

F-85 MODELS

ENGINE FRONT COVER: Removal - Drain cooling system disconnect heater hose, bypass hose and radiator hoses and oil pressure switch wire. Remove crankshaft balancer, fan and fan pulley, generator and mounting bracket. Remove fuel pump and fuel pump hoses. Remove front oil pan bolts and cover-to-block attaching bolts and remove cover.

Installation - *NOTE - When front cover is removed, the oil pump cover must also be removed, and Petrolatum packed around pump gears. This will prevent loss of oil pump prime.* To install front cover, apply Permatex No. 2 to new gasket and place on block. Install front cover. Apply engine oil to bolts and torque evenly to specifications. Install balancer (see above). Connect oil pressure switch. Install generator, mounting bracket, and adjusting link. Install new fuel pump gasket using Permatex No. 2. Apply special seal lubricant on fuel pump arm. Torque to specifications. Connect other parts in reverse order of removal procedure.

Engine Front Cover Oil Seal (Crankshaft Front Oil Seal) Replacement: Remove front cover *(see above)*. Lay front cover flat on bench. Remove seal retainer with drift.

Installation - Assemble seal in retainer. Support front cover on wood block. Apply POB No. 4 sealer to outside of seal retainer. Place seal and retainer in cover with seal joint towards top of cover and install with Tool No. J-8753 until seated. Stake retainer securely. Place Tool No. J-8753-2 in seal and push tool, a little at a time, from both sides until tool goes through seal.

CAMSHAFT & BEARINGS

ALL MODELS

CAMSHAFT: Removal - Remove grille and radiator. Remove valve lifters as outlined in *HYDRAULIC LIFTERS* below. Remove distributor. Remove engine front cover as outlined in *ENGINE FRONT COVER* above. Remove camshaft assembly, fuel pump eccentric, camshaft sprocket and timing chain. Slide camshaft carefully out front of engine.

Installation - Coat camshaft liberally with engine oil mixed with GM Concentrate No. 582099. Reverse removal procedure being careful not to damage parts.

Camshaft Bearings Removal & Installation (88, SUPER 88, & 98): *NOTE - DO NOT replace bearings individually.* Use Tool Set No. J-4476 to replace bearings. DO NOT remove or disturb camshaft plug at rear of block.

Camshaft Bearings Removal & Installation (F-85): *NOTE - Bearings must be replaced in complete sets.* Remove bearings in numerical order. Drive them rearward out of their bores (exc. No. 5). To remove No. 5 bearing, drill a 3/16" hole in block (do not drill through the bearing) and with a small drift, dent the bearing enough to allow removal out front of bore. Install No. 5 bearing first (align all oil passages) then install other bearings opposite of removal sequence. Position bearings in block as follows: No. 5 bearing - 18 7/32", No. 4 - 13 13/32", No. 3 - 9 11/64", No. 2 - 4 15/16", No. 1 - 1/8", from front face of block.

VALVE SYSTEM

ROCKER ARMS

ROCKER ARM SHAFT ASSEMBLY: 88, Super 88, & 98 - Removal - Remove rocker arm cover. *NOTE* - On Air Cond. Cars it will be necessary to remove compressor and generator bracket bolts and tip compressor rearward to remove R.H. cover. On Power Steering Cars, it will be necessary to remove pump mounting bracket bolts and move assembly to one side to remove L.H. cover. Remove rocker arm bracket bolts. If equipped with Air Cond. (right side only), loosen all bracket bolts. Remove cotter key from rear of rocker shaft and remove rocker arms, springs or shaft as required. Remove rocker arm shaft assembly.

Disassembly - Remove cotter pins from ends of rocker shaft. Remove the brackets and the rocker arms from shaft. *NOTE* - One bracket is attached to shaft by anchor pin. When necessary to remove this bracket, insert drift through oil passage in bracket to drive out pin. If necessary to remove plug, punch hole in plug and pry plug from end of shaft.

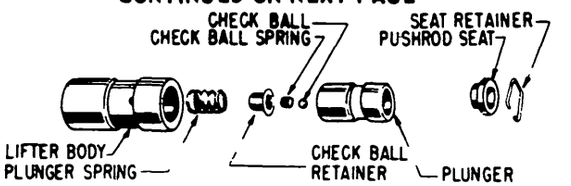
Reassembly - Reverse disassembly procedure and note the following: Pinned bracket must have pin driven in flush with bracket. Rocker shaft plug must be driven in until outer shoulder is 9/32" into end of shaft.

ROCKER ARM SHAFT ASSEMBLY: F-85 Models - Removal - Remove carburetor cover. Disconnect heat tube from carburetor and manifold on right side. Disconnect spark plug wires and valve cover-to-cylinder head screws and rotate cover off breather pipe and remove cover. Remove rocker arm shaft bracket-to-head bolts. Remove heater blower assembly to remove right rocker arm assembly.

Disassembly - Remove cotter pins from ends of shaft. *NOTE* - Disassemble one shaft assembly at a time and mark for correct reinstallation. Remove springs, arms, and brackets from shaft. If necessary to remove shaft end plug, punch hole in plug, then pry plug from shaft.

Reassembly - If shaft plug was removed, drive new plug in shaft to clear cotter pin hole. Lubricate frictional surfaces of rocker arms and shaft with engine oil and reverse removal procedure.

Installation - Reverse removal procedure and note the following: Coat bolt threads with POB No. 4 Sealer or equivalent and torque to 45-55 ft. lbs. Engage shaft with dowel.



HYDRAULIC LIFTERS

VALVE LIFTERS: Hydraulic, Barrel Type. Consists of plunger and valve assembly operating in a cylinder formed by valve lifter body (see illustration). Oil is forced into lifter from main oil gallery through hole in side of body and plunger.

Removal - *NOTE - Keep lifters in order for reinstallation in original bores in block.* Remove intake manifold, *see "Intake Manifold"*, engine top cover, valve rocker arm covers and rocker arm shaft assemblies. To remove No. 8 intake or exhaust lifter on air conditioned cars proceed as follows: Loosen R.H. rocker shaft bracket bolts. Lift rocker shaft and pry rocker arms against springs and slide pushrod up between between rocker arm and bracket away from lifter then remove lifter. On all units remove pushrods and use "D-Carb." if necessary to assist in removing lifters.

Disassembly: Use Tool BT-31 or small screwdriver to remove retainer spring. Remove pushrod seat, plunger, and plunger spring. Remove ball check retainer from plunger, then remove ball and spring.

CONTINUED ON NEXT PAGE

HYDRAULIC VALVE LIFTER (TYPICAL)

CONTINUED FROM PRECEDING PAGE

Cleaning & Inspecti n: Use cleaning brush J-5099 and clean solvent to remove all foreign material from all parts Check all parts for nicks, burrs, or scoring *NCTE* - Ball ball check retainer, springs, pushrod seat and snap ring are interchangeable or can be replaced individually Body and plunger are selective fit and are not interchangeable Replace lifter when body or plunger are worn or damaged *CAUTION - DO NOT replace lifter when a slight gap appears or lifter shows leakage where foot is welded to body unless leak-down is not within specifications* Place straightedge across lifter foot If light appears under straightedge placed across foot of lifter, it indicates a flat or concave surface and lifter should be replaced and camshaft lobe checked for wear Wear at camshaft cam center is normal, but wear across entire width of cam base circle requires replacing of camshaft

R assembly & Testing: Lifter must be assembled while submerged in test fluid to obtain accurate leak-down rate

1) Install Adapter 105-2 in reservoir of Tester BT-60, then fill reservoir with Hydraulic Lifter Test Fluid BT-59 to ½" of top of reservoir.

2) Assemble ball check, spring, and retainer into plunger with flange pressed tight against bottom of recess in plunger

3) Install spring over ball check retainer. Hold plunger with spring up and insert into lifter body (to prevent cocking spring) Place assembly in tester cup, then position pushrod seat into plunger Position ¼" steel test ball on pushrod seat and lower tester ram until it contacts steel ball *NOTE* - Allow ram to move downward by its own weight until air bubbles disappear

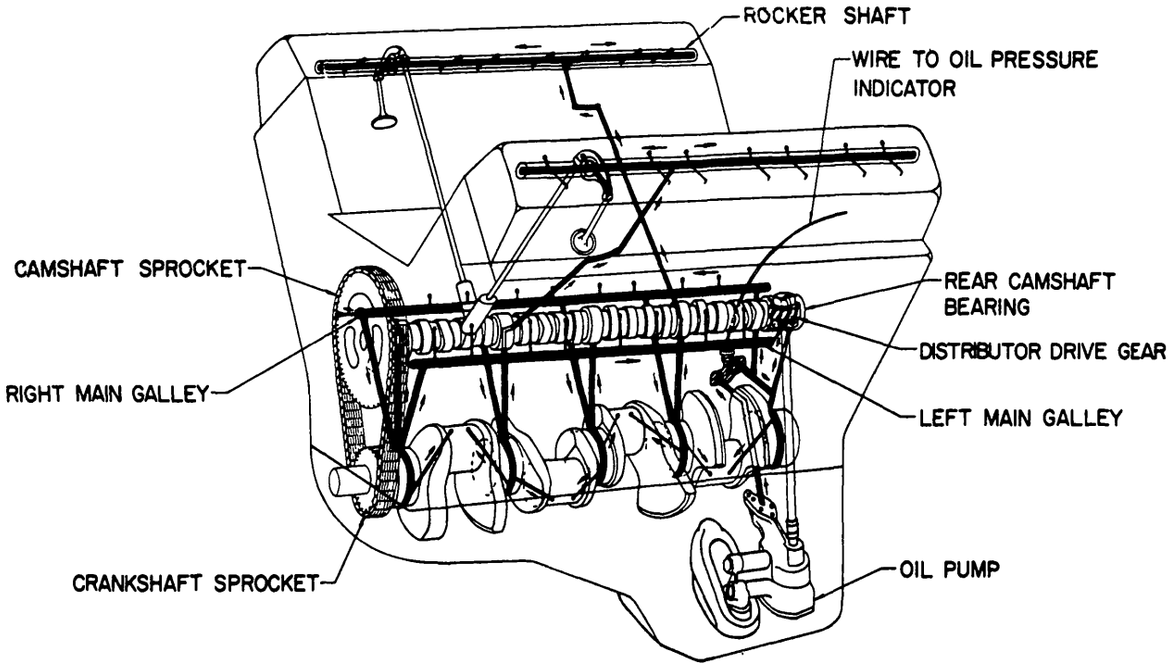
4) Raise ram, then allow it to lower Repeat several times or until all air is expelled from lifter *CAUTION - DO NOT ATTEMPT TO EXPEL AIR FROM LIFTER BY PUMPING RAM.*

5) When all air is removed, allow ram to bleed down lifter to expose ring groove and install retaining ring

6) Adjust ram screw so it contacts steel ball in pushrod seat when pointer is at start line Raise ram and start test by resting arm on steel ball

7) Rotate reservoir one revolution every two seconds, and time indicator from start to stop line. Allowable leak-down time is shown in table below *NOTE* - If lifter is within specifications, it can be placed in service without removing test fluid.

Lifter Leak-down Rate



Model	Used Lifters	New Lifters
F-85	8-40 seconds	12-40 seconds
88, Super 88, 98	12-90 seconds	20-90 seconds

Lifter Identification (Exc. F-85)

Identification Note - Production engines used Standard, 001", or 010" oversize lifters Use correct size when replacing lifters All lifters have identification numeral (Except Standard) on lifter body Cylinder block marked "1" or "10" for lifter size on rail under rocker arm cover When no mark appears lifters are standard

Lifter Identification (F-85)

Standard size only (Heavy Duty lifters are mechanical type).

88, SUPER 88 & 98 ENGINE OILING SYSTEM

OILING SYSTEM
ENGINE LUBRICATION
88, SUPER 88 , & 98

ENGINE LUBRICATION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, camshaft bearings, and to hydraulic valve lifters, fuel pump eccentric and lever, and distributor drive gear. Oil metered by camshaft bearings lubricates other valve parts (rocker arms, pushrods, and valve stems). Other parts are lubricated by oil spray.

OPERATION: Gear type oil pump mounted on rear main bearing cap in crankcase draws oil through fixed oil strainer and intake pipe mounted on pump cover and delivers oil through a passage in the pump body, rear main bearing cap, and crankcase to the oil filter intake port (filter mounted on pad at right rear corner of crankcase). From the filter outlet port on the pad, a horizontal cross passage and vertical passage connect with the right main oil gallery extending the full length of the engine just below the right bank valve lifters. At the forward end of this gallery, a "V" passage connects to front main bearing and to the forward end of the left main oil gallery extending back along the engine just below the left bank valve lifters. Oil is distributed from these main oil galleries as follows:

Crankshaft & Camshaft Bearings - Rear crankshaft and camshaft bearings are lubricated by a vertical passage intersecting the horizontal cross passage from the oil filter (see above). **Other** crankshaft and camshaft bearings are lubricated by a "V" shaped oil passage in each crankcase web leading down from the right main oil gallery to the crankshaft bearing and then up to the camshaft bearing (additional passage at front crankshaft bearing supplies oil to left main oil gallery).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod is lubricated through passage from adjacent main bearing (separate oil lead to each rod on each crankshaft throw).

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from slot in side of bearing cap of rod for opposite bank of cylinders (slot in rod cap must be upward or toward center of engine to provide this cross-lubrication).

Valve Lifters - Each lifter supplied with oil through short passage leading upward from main gallery at point directly below lifter.

Rocker Arms, Pushrods & Valves - Hollow rocker arm shafts are supplied with oil through passage in block leading from No. 2 camshaft bearing (left bank), No. 4 camshaft bearing (right bank), and connecting passage in head which registers with drilled oil passage in rocker shaft bracket (see Note below). Rocker arm is drilled to provide lubrication for pushrod socket and valve tip. Oil return holes are provided on lower side of heads.

ROCKER SHAFT BRACKET NOTE - Rocker shaft bracket with drilled oil lead has anchor pin which locates shaft properly so that oil hole in bracket and shaft line up (pin is driven in flush with top of bracket). This bracket is No. 2 or 3 (left bank), No. 4 or 3 (right bank) depending on whether end brackets are used (discontinued during 1960 production).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Distributor Drive Gear - Lubricated from drilled hole in plug at rear end of left main oil gallery.

Timing Chain & Sprockets, Fuel Pump Lever & Eccentric - Lubricated from drilled hole in hexagonal headed plug which closes front end of right main oil gallery.

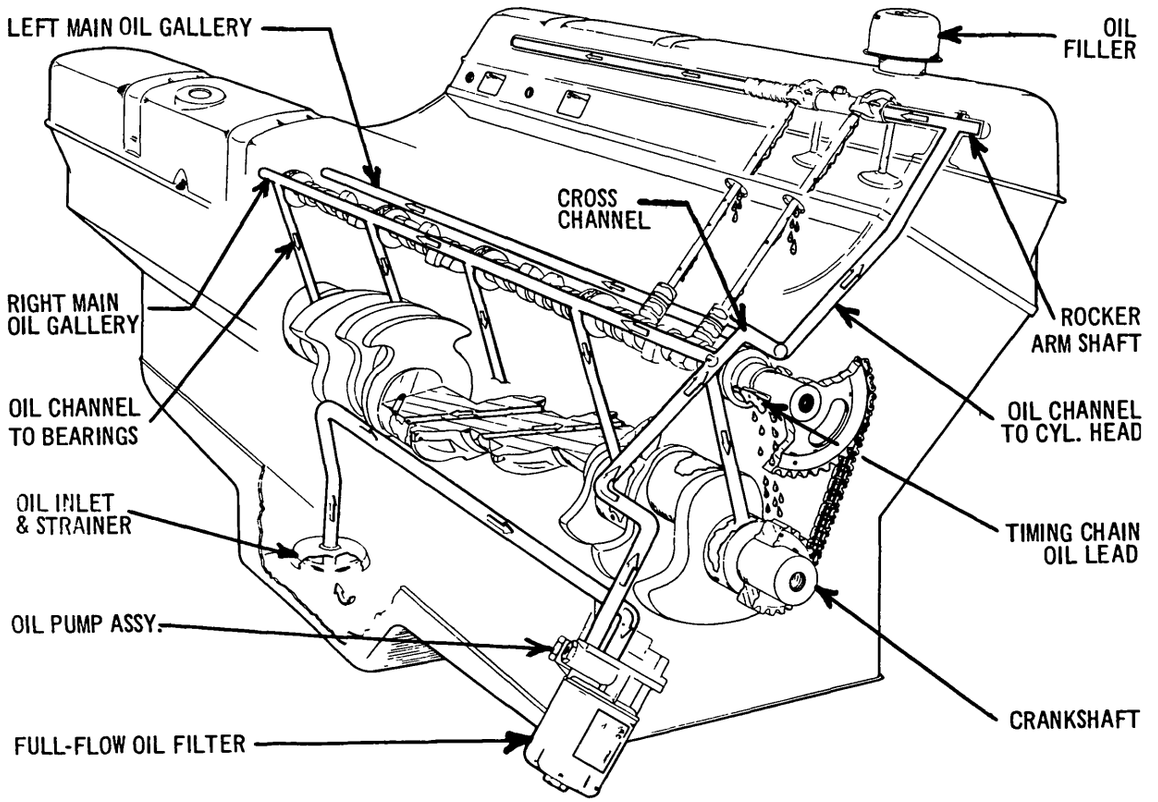
OIL FILTER: Full flow type mounted on pad on right rear of crankcase. Filter has bypass valve to ensure engine lubrication if filter element clogged.

►*CAUTION:* On cars where filter not used, a cover with a channel oil passage connecting the inlet and outlet ports is installed on filter pad to provide oil circulation. If cover removed, install with new gasket (coat both sides of gasket with POB No. 5 sealer), and torque cover bolts to 35-40 ft. lbs.

F-85 MODELS

ENGINE LUBRICATION: Force feed type with oil supplied under pressure to crankshaft, connecting rod and camshaft bearings and to valve lifters. Oil is supplied under controlled pressure to rocker arm bearings and pushrods. All other moving parts are lubricated by gravity flow or splash. *See Engine Oil Flow Diagram.*

OPERATION: Gear type oil pump located in timing chain cover, draws oil through screen and pipe assembly (or over top of screen if clogged) and a drilled passage in crankcase connecting, to drilled passage in timing chain cover. All oil is discharged from pump to cover assembly. Spring loaded relief valve (in cover) limits oil pressure to a maximum of 33 lbs. per square inch. A bypass valve (in cover) opens when filter becomes clogged (4½-5 lbs. pressure difference between filter inlet and outlet) to bypass unfiltered oil directly to oil galleries in engine. Oil from filter (mounted on oil pump cover) supplies oil through oil pump cover and drilled passages in crankcase to two main oil galleries that run full length of the crankcase.



Crankshaft & Camshaft - Both crankshaft and camshaft are supplied oil through drilled passages in crankcase, from right main oil gallery.

Connecting Rod & Pistons - Main bearings supply oil through drilled passages in crankshaft to connecting rod bearings. Pistons and cylinder walls are lubricated by oil forced through small notch in connecting rod bearing parting surface that registers with hole in crankshaft every revolution. Piston pins are lubricated by splash.

Timing Chain & Sprockets - Drilled holes in camshaft connect front camshaft bearing to key slot in front of camshaft. Oil flows from camshaft journal into keyslot over woodruff key in space between key and camshaft sprocket and fuel pump eccentric. A relief in forward end of fuel pump eccentric allows oil to escape between eccentric and camshaft distributor gear. Oil strikes distributor gear once each camshaft revolution, supplying lubrication to timing chain and sprockets.

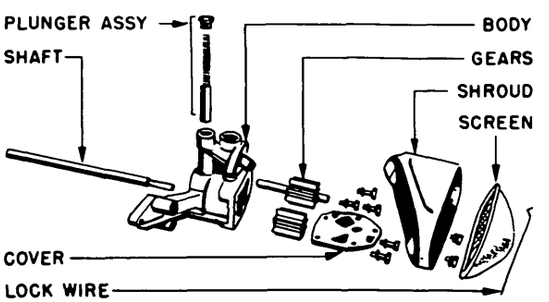
Hydraulic Lifters - Full pressure lubrication is supplied hydraulic lifters from cutouts in lifter bores in main oil galleries.

Rocker Arms, Valves and Pushrods - These items receive oil from main oil galleries through drilled holes in front of cylinder block and head, leading up from forward end of corresponding main oil gallery. Hole in head ends beneath front rocker arm shaft bracket. A notch cast in base of bracket allows oil to flow up inside bracket (between bracket and bolt) to hollow rocker arm shaft (plugged at both ends). Each rocker arm receives oil through hole in underside of shaft. Grooves in arm provide lubrication to bearing surfaces. Oil is metered to pushrod seat and valve stem through holes drilled in rocker arm. Excess oil returns to oil pan through passages in cylinder head and block.

F-85 ENGINE OILING SYSTEM

OIL PUMP
88, SUPER 88 & 98

OIL PUMP: Removal & Disassembly - Remove oil pan, see car page, and remove three capscrews and lockwashers, then remove pump. Pull extension drive shaft from pump. *NOTE - Do not remove special washers from extension shaft (serviced as an assembly).* Remove oil screen lockwire and screen. Remove screen shroud attaching screws and remove shroud. Remove oil pump cover screws and cover, then remove oil pump gears. Remove pressure regulator nut, spring and valve.



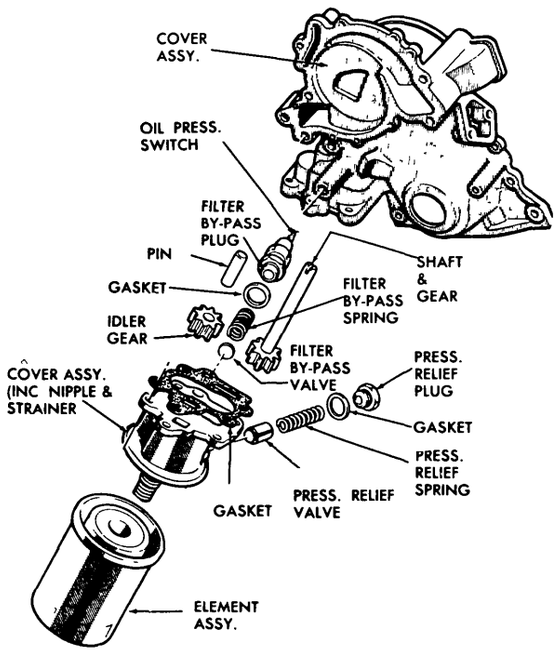
Cleaning & Inspection: Wash all parts in solvent and blow out passages with compressed air. Inspect all parts for scoring, clean up small imperfections with crocus cloth. Relief valve clearance should be .0025-.005". Gear end clearance should be .0025-.008".

Reassembly - Reverse disassembly procedure and tighten cover screws to 5-8 ft. lbs., shroud screws to 4-7 ft. lbs. *CAUTION* - The end of extension shaft nearest to special washers must be inserted into drive shaft.

F-85 MODELS

OIL PUMP: Removal & Disassembly - Disconnect pressure switch wire. Remove all dirt from connections and joints. Remove oil filter and pump cover-to-front cover attaching screws. Remove cover carefully, then slide idler and oil pump drive gears out. Remove oil filter

CONTINUED ON NEXT PAGE



88, SUPER 88, & 98 OIL PUMP

CONTINUED FROM PRECEDING PAGE

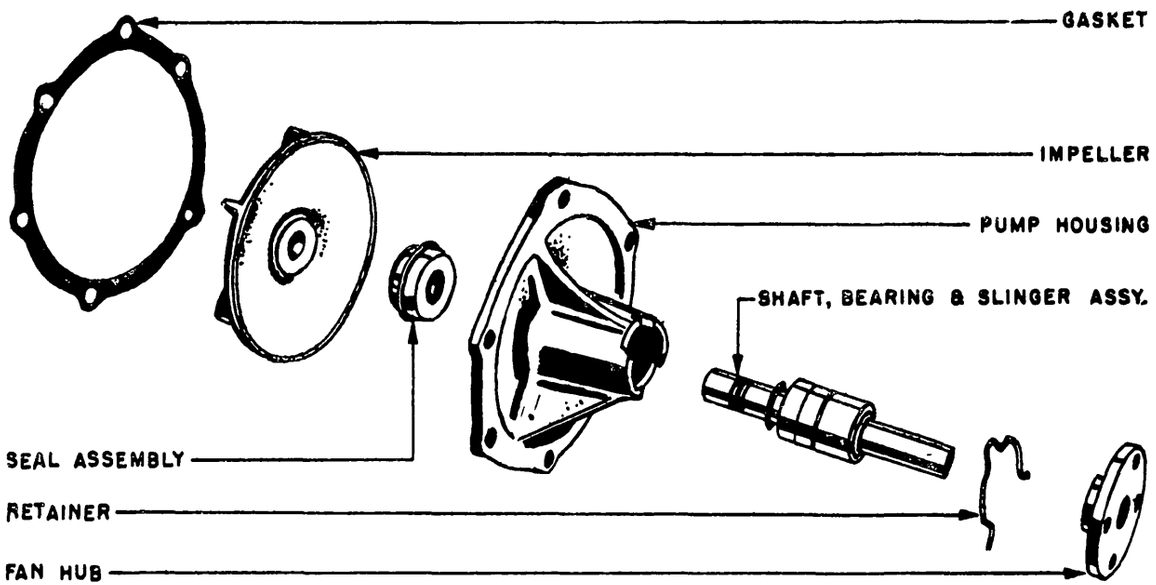
bypass valve cap, spring and valve. Remove oil pressure valve cap and spring. Remove pressure regulator valve by tapping housing in palm of hand.

Cleaning & Inspection: Wash all parts in solvent and blow dry with air. Inspect all parts for scoring, cracks, nicks, or warping. Check pressure relief valve clearance in bore. Clearance should be .0015-.0035". Gear end clearance should be .0015-.0075".

Reassembly - Install filter bypass valve into output passage bore (inside diameter ribs) seating valve squarely in bottom of passage. Install spring (light weight), gasket and cap. Replace gasket if damaged. Install pressure regulator valve (flat end first), pressure regulator spring, gasket and cap. Torque caps to 30-35 ft. lbs. Install pump drive gear and idler gear. Install new pump gasket. Fill gear pocket with petrolatum and force into every cavity and between gear teeth. *NOTE - Packed petrolatum helps in priming pump.*

F-85 OIL PUMP

COOLING SYSTEM



WATER PUMP

88, SUPER 88, & 98

WATER PUMP: Disassembly - Remove bearing retainer wire from front of housing. Support outside surface of pump housing in press and press shaft through impeller and housing pressing impeller end of shaft toward front of housing. Remove seal assembly from rear of housing by driving against face of seal with drift. Support hub and press shaft through hub to remove hub.

Reassembly - Place Gauge 33-68 in impeller side of housing, use driver, Tool 5175, to press shaft and bearing assembly into housing from opposite side until shaft bottoms on gauge. Install retainer wire. Support inner end of shaft on press and use Tool BT-16 to press hub on shaft. Coat outer diameter of new seal with C.P. No. 9 Sealer and use Tool 23-17 to press it into place. Clean mating surface of impeller of any foreign particles and use Tool BT-15 to support impeller while pressing shaft through impeller until bottom edges of vanes are 13/16" from machined face at edge of housing.

Installation - Use gasket cement on pump housing to retain gasket on housing, then install pump assembly in front cover and tighten 5/16" bolt to 14-22 ft. lbs., 7/16" bolts to 24-40 ft. lbs. Install fan pulley, spacer and fan. Tighten fan to hub bolts to 10-15 ft. lbs. Install pulley belts and adjust belt tension.

88, SUPER 88, & 98 WATER PUMP

►*JACKING & HOISTING CAUTION* Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section

►*STARTING CAR BY PUSHING CAUTION:* Hydra-Matic cars cannot be started by pushing because of transmission design

MODEL IDENTIFICATION

Series	①Designation	Engine
Dynamic 88	32	394"
Super 88	35	394"
98	38	394"

① - First two digits of series and body type designation following year number (61) under STYLE on body identification plate

SERIAL NUMBER: Stamped on plate on left front door pillar Number (example below) includes identification data

① ② ③ ④
61 2 M 01001

① - Year (1961)
② - Series - 2 - 88, 5 - Super 88, 8 - 98
③ - Assembly Plant M Lansing, A Atlanta K Kansas City, L Linden, C South Gate, W Wilmington, T Arlington
④ - Beginning Vehicle Number

Engine Unit Number: Stamped on pad located on top of center exhaust port of left cylinder bank

Starting Unit Number - 1001 with prefix and suffix letters as follows

Model	Prefix	Suffix	Carb.	Compr. Ratio
88	F	None	2-Bbl	8 5-1
88	F	H	2-Bbl	10 0-1
88	G	None	4-Bbl	10 0-1
S88, 98	G	None	4-Bbl	10 0-1
Exp 88	F	E	2-Bbl	8 3-1
Exp S88, 98	G	E	4-Bbl	8 3-1

TUNE-UP

COMPRESSION PRESSURE: 100 lbs minimum at cranking speed with throttle and choke open and spark plugs removed Reading on low cylinder must not be less than 80% of high cylinder

VALVE TAPPET CLEARANCE: Zero lash (hydraulic)

MANIFOLD HEAT CONTROL: Thermostatic coil type located on left side between exhaust manifold and exhaust pipe

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition or carburetion troubles *See "Closed Crankcase Ventilation Systems" in Carburetion Section*

IGNITION

FIRING ORDER: 1-8-7-3-6-5-4-2
Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7

SPARK PLUG GAP: 030"
Spark Plugs - AC No 45 (Low compr engine), 44 (High compr engine), 46 (Export) 14 mm Torque to 18-34 ft lbs

COIL: Delco-Remy No. 1115087 (Std.), 1115091 (H.D.).
Ignition Current - 2 0 amps idling, 4 5 amps stopped
Resistor - Delco-Remy No 1948127 1 75-1 85 ohms at 80°F

►*COIL RESISTOR NOTE* Resistor is connected in lead from ignition switch to coil Bypassed during cranking by second lead from ignition switch

DISTRIBUTOR: Delco-Remy No. 1110968 (Std.), 1110978 (H.D.). Window type with external adjustments *NOTE* - Heavy Duty Distributor Double Breaker Type
Condenser - Delco-Remy No 1932004 (Std Distr)
Capacity - 18- 23 mfd
Contact Point Set - Delco-Remy No 1931988 (Std Distr)
Breaker Gap - 016" (Std), 014- 018" (Heavy Duty-Both sets)
Cam Angle - 28-32° (set to 30°) (Std) 29°±1° (Heavy Duty)
►*HEAVY DUTY DISTRIBUTOR NOTE:* After adjusting each breaker individually, cam angle with both breakers operating must be 34°±1°
Breaker Arm Spring Tension - 19-23 ozs
Rotation - Counterclockwise viewed from above

Automatic Advance

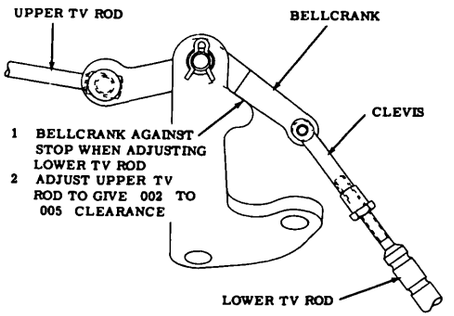
Degrees	Distr.	RPM	Degrees	Eng.	RPM
0-2		400	0-4		800
6 5-8 5		975	13-17		1950
8-10		1200	16-20		2400
11-13		2200	22-26		4400

Vacuum Spark Control: Delco-Remy No 1116168 (Std 1110968 Distr)

Vacuum Advance

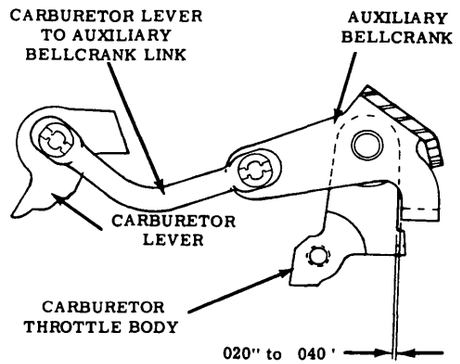
Distr Degrees	Eng Degrees	Vacuum (" of Hg)
Start	0	8-10
11	22	19-21

►*VACUUM ADVANCE OPERATIONAL CHECK:* Vacuum advance operation should be checked whenever Ignition Timing is set After setting ignition timing (with vacuum advance cut off by disconnecting vacuum line), reconnect vacuum line and check ignition timing If vacuum advance operating correctly, engine RPM should increase and timing should advance, if not, vacuum unit is defective



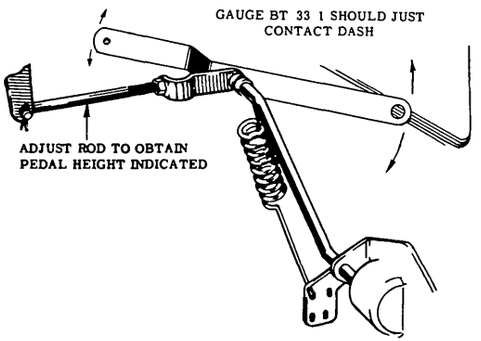
IGNITION TIMING

Setting - 5° BTDC (Low compr eng), 7½° BTDC (High compr eng), with engine idling at 850 RPM and vacuum line to distributor disconnected and vacuum line fitting taped closed After setting ignition timing, reconnect vacuum line and check vacuum unit operation *See above*
►*DETONATION NOTE:* If engine detonates due to low octane fuel or carbon build-up, retard timing 2½° from specified setting
►*HIGH OCTANE FUEL NOTE* When using extra high octane fuel, timing may be advanced providing spark knock is not encountered
Timing Mark - Three slots in rim of crankshaft balancer and pointer on upper left side of front cover Slots indicate 0°, 5° BTDC and 10° BTDC



CARBURETOR

►*CARBURETOR APPLICATION:* Rochester carburetors are used Series 88 has one 2-barrel carburetor, Series S88 & 98 have one 4-barrel carburetor 4-barrel carburetor is optional on Series 88



►*THROTTLE LINKAGE DISCONNECTION CAUTION:* Whenever linkage disconnected from transmission,

UPPER & LOWER THROTTLE VALVE ROD

CARBURETOR LEVER-BELLCRANK LINK

ACCELERATOR PEDAL ADJUSTMENT

clearance between end of manual shift rod and lower throttle valve rod must be 1/8" minimum (throttle valve rod pushed forward) To adjust, bend outer leg of shift relay bellcrank outward so 1/8-5/16" clearance obtained between manual shift rod cotter pin and throttle valve rod

Throttle Return Check Adjustment: With transmission in "N" (Neutral) and engine at normal operating temperature, set carburetor on fast idle and adjust to 1600

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

RPM (4-Bbl.), 1900 RPM (2-Bbl.). Turn off engine. Rotate fast idle cam so fast idle screw rests on highest step of fast idle cam. Clearance between contact screw and contact on throttle lever should be .020" (4-Bbl.), .050" (2-Bbl.). To adjust, turn contact screw using two wrenches so that diaphragm is not permitted to turn.

THROTTLE LINKAGE ADJUSTMENT: Transmission Throttle Lever Adjustment - Raise car and remove lower throttle valve relay rod from lever at side of transmission. Place short end of Gauge BT-33-1 into manual lever shaft. Hold throttle lever to end of its rearward travel and adjust lever (by bending as required) so that hole in throttle valve lever is visible within hole in gauge (not necessarily centered). Lower car and make the next three adjustments with carburetor throttle valves in closed position. To completely close throttle valves, start engine, remove air cleaner and block intermediate choke lever (at climatic control housing) to release fast idle cam. Use Tool J-6342-01 to hold plunger away from throttle lever. Stop engine, BACK OUT SLOW IDLE ADJUSTING SCREW UNTIL CARBURETOR THROTTLE VALVES ARE COMPLETELY CLOSED. There should now be clearance at end of fast idle screw, slow idle screw, and throttle return check plunger.

Lower Throttle Valve Rod Adjustment: Loosen jam nut on lower throttle valve rod and remove both rods from bellcrank. Hold throttle valve bellcrank and lower throttle valve rod against their rearward stops, adjust lower throttle valve rod clevis so that pin will enter freely into holes in clevis and throttle valve bellcrank. Install cotter pin and tighten jam nut.

Carburetor Lever to Auxiliary Bellcrank Link Adjustment: Bend link as necessary to obtain .020-.040" clearance as shown in diagram.

Upper Throttle Valve Rod Adjustment: Adjust length by rotating rod until bellcrank is .002-.005" off its stop with throttle valves closed. *NOTE - Do not apply pressure when making this adjustment.* Tighten jam nut.

Idle Speed Adjustment: Make this adjustment as shown below, then make Throttle Downshift Stop Screw Adjustment and Accelerator Pedal Alignment & Height Adjustment with choke completely off, fast idle off, and carburetor throttle valves in slow idle position.

Throttle Downshift Stopscrew Adjustment: Loosen jam nut and back out stopscrew (located in auxiliary bellcrank adjacent to carburetor throttle lever) several turns Hold throttle lever so that throttle valves are in wide open position, and rotate throttle valve bellcrank counterclockwise to point of maximum transmission lever travel. *NOTE - Do not bend or stretch linkage.* Hold linkage in this position and adjust stopscrew to just touch tang on downshift lever. Allow throttle valves to close, then turn screw in 1½-2 turns and tighten jam nut.

Accelerator Pedal Alignment & Height Adjustment: Bend left ball stud (located behind lower end of accelerator pedal) up or down as required to correct pedal alignment. Adjust accelerator rod to position rod to bellcrank bushing so that Gauge BT-33-1 just touches dash (see diagram). Lubricate linkage pivot points

ROCHESTER 2GC 2-BARREL

Rochester 2GC No. 7019052 (Std.), 7019058 (Air Cond.). 2-Barrel downdraft types with automatic choke.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel Cyls. 1-4-6-7*

►*IDLE COMPENSATOR CAUTION:* When making idle Setting and Idle Speed adjustments, Idle Compensator must be in closed position (remove air cleaner and insert pencil or suitable tool in throttle bore). If engine speed increases when air cleaner installed, do not decrease speed. Readjust if engine speed decreases.

Idle Setting - After idle speed set to correct specifications (see Idle Speed below), turn both idle mixture mixture screws for smoothest idle with highest vacuum reading and RPM, then turn each screw out ¼ turn.

Idle Speed - 550 RPM Synchro-mesh, 500 RPM Auto. Trans. in Drive. *NOTE - On cars with Idle Compensator, air conditioning must be turned OFF. On cars without Idle Compensator, air conditioning must be ON.*

Float Level - 11/16" (Carbs. with "A" or no letter on Ident. Tag - use Tool No. BT-179), 1/2" (Carbs. with "B" or higher on Ident. Tag - use Tool No. BT-197). With air horn inverted and gasket in place, place edge of gauge across air horn gasket at outer end of float with lower edge of float seam touching gauge. Bend float arm to adjust.

Float Drop - Bend float tang to obtain a distance of 1 29/32" (Carbs. with "A" or no marking on Ident. Tag), 1 13/16" (Carbs. with "B" or higher on Ident. Tag). This distance measured from surface of gasket to bottom of float with air horn upright and float hanging free.

Fast Idle - Rotate fast idle cam so fast idle screw is on high step of cam. With engine running at normal operating temperature and transmission in "N" (Neutral) adjust fast idle screw to obtain an engine speed of 1900 RPM (2200 RPM for sub-zero temperatures). Readjust throttle return check.

Automatic Choke Setting: Centered on index.

Throttle Linkage & Return Check Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 2G & 2GC Carburetors" in Carburetion Section.*

ROCHESTER 4GC 4-BARREL

Rochester 4GC No. 7019050 (Std.), 7019054 (Air Cond.). 4-Barrel downdraft type. Idle compensator (thermostatically controlled idle air bypass) used on air conditioned (factory installed) cars.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT Cyls. 1-4-6-7.*

►*IDLE COMPENSATOR CAUTION:* When making Idle Setting & Idle Speed Adjustments, Idle Compensator must be in closed position (remove air cleaner and insert pencil or suitable tool in throttle bore). If engine speed increases when air cleaner installed, do not decrease speed. Readjust if engine speed decreases.

Idle Setting - After idle speed set to correct specifications (See Idle Speed below), turn both idle mixture screws for smoothest idle with highest vacuum reading and RPM, then turn each screw out ⅛ turn.

Idle Speed - 550 RPM Synchro-mesh Trans., 500 RPM Auto. Trans. in Drive. *NOTE - On cars with Idle Compensator, air conditioning must be OFF, on cars without Idle Compensator, air conditioning must be ON.*

Automatic Choke Setting: Centered at index.

Throttle Return Check Adjustment (Hydra-Matic Cars): *See CARBURETOR above.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 4G & 4GC Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: AC. Two types used.

AC No.	Replacement Pumps	Type
3415 (Less Heater or A.C.)		Fuel Only
3416 (With Heater or A.C.)		ℂ Fuel & Vacuum

ℂ - Pulsator type pump with external fuel filter and return line to tank.

Pressure - 5-6 lbs. at 1800 RPM measured at upper end of pump-to-carburetor line.

Gasoline Gauge: AC electric type.

Dash Unit - AC No. 5643375.

Tank Unit - AC No. 5641245 (exc. Sta. Wgn.), 5641586 (Sta. Wgn.), 5641587 (Sta. Wgn. with Air Cond.). *NOTE* - Tank units on Station Wagon are "2-Wire" type.

Air Cleaner: Oil wetted type (Std. Series 88), Heavy Duty replaceable paper element type (Std. Super 88 & 98, Optl. Series 88).

►*HEAVY DUTY AIR CLEANER CAUTION:* Replace element at 10,000 mile intervals or oftener in dusty driving conditions. Remove air cleaner, remove element, clean body and install new element.

BATTERY

Series 88 - **Delco-Remy No. 463.** 12 volt, 9 plate, 62 ampere hour capacity (20 hr. rate).

Super 88 & 98 - **Delco-Remy No. 563.** 12 volt, 11 plate, 70 ampere hour capacity (20 hr. rate).

Battery Ground - Negative.

Engine Ground - Rear of right cylinder head to firewall.

STARTER

Delco-Remy No. 1107665 (Series 88), No. 1107776 (Super 88 & 98). *NOTE - 1107776 is a "Two-Shunt" type.*

Armature - Delco-Remy No. 1932185 (1107665), No. 1941888 (1107776).

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 40 ozs. minimum (1107665), 35 ozs. minimum (1107776).

Performance Data - 1107665

Torque	RPM	Volts	ℂ Amperes
0 ft. lbs.	3600-5100	10.6	65-100
	Lock	3.5	300-360

Performance Data - 1107776

Torque	RPM	Volts	ℂ Amperes
0 ft. lbs.	3900-5400	10.6	80-120
	Lock	2.0	290-370

ℂ - Includes Solenoid.

Starter Switch: Solenoid Switch, Delco-Remy No. 1119798 (1107665), No. 1114257 (1107776) mounted on starter and controlled by combination Starter & Ignition Switch, Delco-Remy No. 1116591 and Neutral Safety & Back-up Switch (see below.).

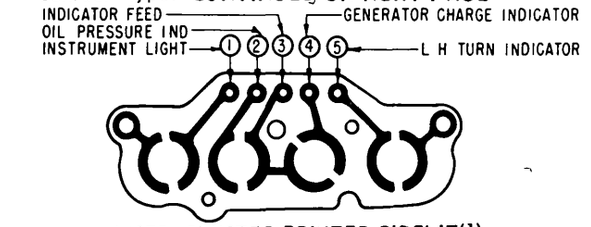
CONTINUED FROM PRECEDING PAGE

Hydra-Matic Neutral Saf ty & Back-Up Light Switch: Oldsmobile No. 579408
Adjustm nt - *See "Dual-Coupling Hydra matic' in Transmission Section.*

GENERATOR

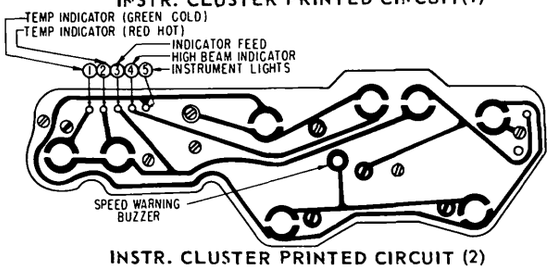
D lco-R my N . 1102217 (Std.), 1102187 (A.C. Cars).
Armatur - Delco-Remy No 1939837 (1102187), 1946719 (1102217).

►*CHARGING CIRCUIT FUSE CAUTION:* Battery charging circuit is protected by a 50 ampere fuse clipped to "BAT" terminal of generator regulator Check for blown fuse when diagnosing generator, regulator, or battery failure.



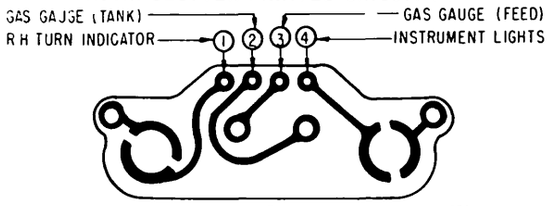
P rformance Data (Cold)

Generator	Amperes	Volts	RPM
1102217	35	14.0	2510
1102187	45	14.0	2520

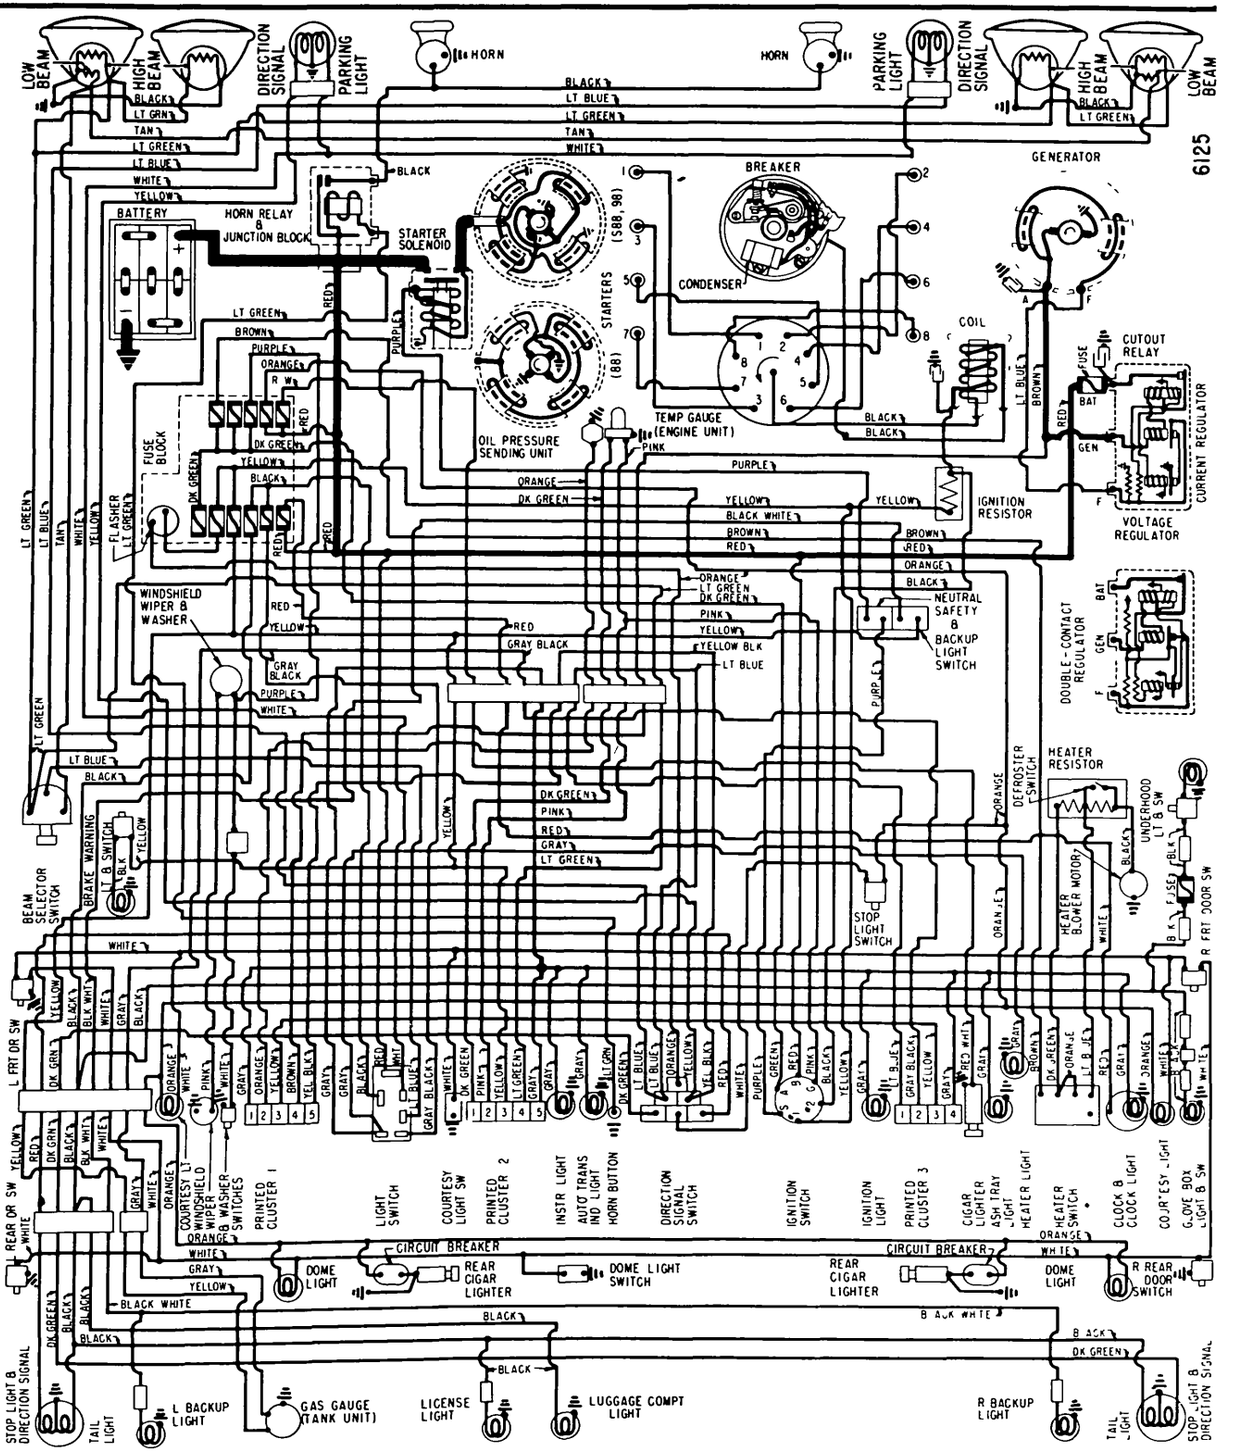


Brush Spring Tension - 28 ozs.
Fi ld Current - 1 62-1.82 amps. (1102217), 2 66-2 86 amps (1102187) at 12 volts and 80°F.
Rotati n - Counterclockwise at commutator end
Belt Adjustment: Place Tension Tool 33-70 on generator belt. Loosen generator adjusting link bolt Tighten belt until line on Tool 33-70 is even with pointer Tighten adjusting link bolt

GENERATOR REGULATOR



Delc-R my N . 1119253 (1102217 Gen.), 1119600 (1102187 Gen.). *NOTE - Regulator 1119600 is "Double Contact" type.* **CONTINUED ON NEXT PAGE**



INSTR. CLUSTER PRINTED CIRCUIT(1)

INSTR. CLUSTER PRINTED CIRCUIT (2)

INSTR. CLUSTER PRINTED CIRCUIT (3)

CONTINUED FROM PRECEDING PAGE

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE*
►*REGULATOR CAUTION Regulators must be used with generators as indicated above DO NOT interchange regulators*
NOTE – Specifications below are Normal settings

Cutout Relay

Cuts In – 11 8–13 5 volts (1119253) 11 3–13 0 volts (1119600) hot
Contact Gap – 020"
Air Gap – 020" with contacts just closed

Voltage Regulator

Setting - (1119253) - 13 8-14 7 volts at ambient temperature 125°F
Setting (1119600) – 13 8–14 6 volts operating on upper contacts 1– 3 volts lower operating on lower contacts At an ambient temperature of 125°F
Contact Gap (1119600) – 016" (upper contacts) with lower contacts just touching
Air Gap – 075" (1119253) 067" (1119600) with armature pressed down to point where contacts just touch
Checking & Adjusting – *See "Delco-Remy 1119000 Series Regulators" and "Delco-Remy (Double Contact) Regulators' in Electrical Section*

Current Regulator

Setting (1119253) - 32-37 amps (adjust to 35 amps) hot
Setting (1119600) - 38-45 amps (adjust to 40 amps) hot
Air Gap - 075" with armature pressed down to point where contacts just touch
Checking & Adjusting - *See "Delco-Remy 1119000 Series Regulators" and "Delco-Remy (Double Contact) Regulators' in Electrical Section*

MISC. ELECTRICAL

►*INSTRUMENT PANEL PRINTED CIRCUIT NOTE* Instrument "cluster" served by three printed circuits Service of printed circuits is by replacement only

Speedometer Head Assembly Removal: Disconnect parking brake assembly, then loosen it at cowl Disconnect L H instrument panel brace, headlight switch, and ventilation or A C controls Remove sockets, wiring harness and safety sentinel buzzer (if so equipped) from speedometer head assembly Remove mounting nuts and rotate top of assembly downward DO NOT DAMAGE PRINTED CIRCUIT Disconnect speedometer cable and withdraw assembly from under left side of steering column To install, reverse removal procedure

Speedometer Head Removal: Remove speedometer head assembly (see above) Remove safety sentinel control knob (if so equipped) Remove case-to-bezel attaching screws Remove speedometer head-to-case attaching screws Remove safety sentinel actuating wire from printed circuit (if so equipped) then remove speedometer head from housing

Speedometer Head Printed Circuit Removal - Remove speedometer head assembly (see above) Remove printed circuit attaching screws Remove safety sentinel actuating wire from printed circuit (if so equipped) To install, reverse removal procedure

Fuel Gauge or Warning Lights Assembly Removal: To remove an assembly disconnect wiring connector, remove nuts and washers, and withdraw assembly from front of instrument panel To install, reverse removal procedure

Fuel Gauge or Warning Lights Printed Circuit Removal - Remove affected assembly (see above) Remove light sockets Remove caps, nuts and washers from fuel gauge Remove attaching screws and remove printed circuit To install, reverse removal procedure

Fuel Gauge Removal - Remove case-to-gauge bezel screws and remove bezel, glass and retainer Remove face plate-to-case screws and remove face plate Remove caps, nuts and washers, then remove gauge from case To install, reverse removal procedure

Light Switch Removal: Disconnect battery Disconnect wires from light switch (push-in-type) Pull switch out to last position, then depress button on top of switch assembly and remove rod and knob Remove Guide-Matic switch knob setscrew (if so equipped) and remove knob Use screwdriver to remove sleeve, then remove escutcheon with Allen wrench Remove headlight switch from rear of instrument panel

Stop Light Switch Location: Mechanical type Mounted on pedal stop bracket above brake pedal arm

Adjusting - With brake pedal released, and adjusting screw backed out to point where lights are on, turn adjusting screw in until lights just go off, then back screw out exactly three turns

CIRCUIT BREAKERS: 20 Ampere Protects headlights, beam indicator and parking lights

FUSES: All fuses located in fuse panel on firewall behind instrument panel Color coded to simplify servicing
SFE 20 Ampere. Protects Tail, License Plate, Glove Comp , Hood and Trunk lights
SFE 20 Ampere (88,S88), AGC 25 (98). Protects Stop, Dome and Courtesy lights Also Rear Seat Cigar lighters (98)
AGA3. Protects Instr ,Ign ,Clock and Heat Control lights
SFE 9. Protects Back-Up, Indicator, Fuel Gauge and Parking Brake light
AGA 2. Protects Clock
AGN 4. (Std), 7 5 (Super Deluxe) Radio
SFE 20 Ampere. Wiper, Cigar Lighter and Heater/Air Cond

HORN RELAY: Delco-Remy No 1116946

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section*

ENGINE SPECIFICATIONS: Own 90° V8 Valve-in-head All Models use 394" engine

Engine	Bore	Stroke	Displacement
All 394"	4 1/8"	3 11/16"	394 cu ins

Engine	Compr.Ratio	Rated HP	Developed HP
394"(88)	8 5-1 ①	54	250 at 4200 RPM
394"(Optl 88)	10 0-1 ①	54	275 at 4200 RPM
394"(Optl 88)	10 0-1 ②	54	325 at 4400 RPM
394"(S88,98)	10 0-1 ②	54	325 at 4600 RPM
394"(Exp 88)	8 3-1 ①	54	
394"(Exp S88,98)	8 3-1 ②	54	

① - 2-Bbl Carb ② - 4-Bbl Carb

Compression & Vacuum Reading - *See TUNE-UP*

►*ENGINE OPERATION IN LOW OCTANE AREAS (FOREIGN TRAVEL):* The following modifications should be made to the standard engine before attempting travel in low octane areas (Foreign Travel) to prevent excessive detonation and resultant engine damage Lower the compression ratio by making changes listed for fuel of octane rating indicated *TIMING NOTE* - Set ignition timing in range of 5° BTDC to 0° (TDC)

Octane Rating	Head Gasket	Piston Type	Compr. Ratio	Spark Plugs
98-95	Std ①	Std	9 75-1	Std.
87-84	②	Std	8 4-1	AC No 46
84-81	②	Export	7 8-1	AC No 46
80-77	③	Export	7 4-1	AC No 46

① - 025" thick
② - Use Parts Kit No 577044 consisting of 100" thick Head Gaskets, 060" thick Intake Manifold Gaskets, and set of longer Pushrods
③ - Use Parts Kit No 577046 consisting of 125" thick Head Gaskets, 060" thick Intake Manifold Gaskets, and set of longer Pushrods
CAUTION - When head gasket used is thicker than 060", longer pushrods, Part No 577049, must be installed

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Oldsmobile Special Data*

INTAKE MANIFOLD: *See "Cylind r Head & Manifold" in Oldsmobile Special Data*

TIGHTENING TORQUES: *S "Tightening Specifications" in Oldsmobile Special Data*

OIL PAN REMOVAL: Turn crankshaft to bring No 1 piston at bottom of stroke (so oil pan will clear counterweights on No 1 & 2 cyl) Disconnect battery cable and remove exhaust crossover pipe Disconnect idler arm support from frame Remove both front engine mount attaching nuts and use Tool J-8568 to raise engine so bolts will just clear crossmember Drain oil and remove pan *NOTE - Holes provided in front crossmember for access to front oil pan bolts*

PISTONS

Aluminum alloy, three-ring, autothermic, steel strut, slipper skirt, cam ground, tin plated

►*NOTE* Two types used Dished type (8 75-1 compr ratio), and flat type (10 0-1 compr ratio)
Length - 4 05" **Weight -** 27 76 ozs
Removal - Pistons & Rods removed from above

►*CAUTION* Mark pistons rods and bearing caps with number of cylinder before removing to insure correct reinstallation

Clearance - 0075- 00125" at thrust surface (selective fit) *NOTE* - Some engines may have 005" or 010" Oversize pistons
Fitting Pistons - Use a 0015" x ½" x 12" ribbon feeler between inverted piston (pin and rings removed) and cylinder wall at right angles to piston pin position Pull to withdraw feeler should be 3-12 lbs
Replacement Pistons. Furnished with fitted pins in Std , 010" 020" 030" Oversize

Standard Piston Sizes

Piston Code	Cyl Code	Piston Cod	Cyl. Cod
A	AA & A	W	WW & W
B	BB & B	X	XX & X
C	CC & C	Y	YY & Y
D	DD & D	Z	ZZ & Z
E	EE & E		

CONTINUED ON NEXT PAGE

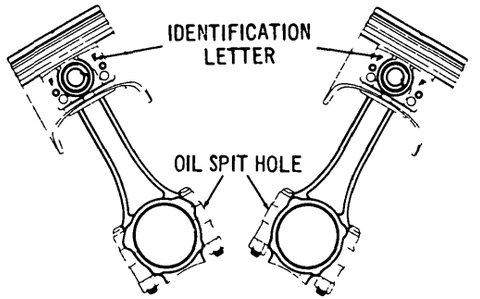
See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Installing Pistons: Install piston on same numbered connecting rod with "F" on pin boss and notch or notches toward front of engine. See *Rod Installation.*

PISTON PIN

Floating type with lock ring at each end. Pins are offset in piston .090" toward right side of engine.



►*CAUTION:* Discard old lock rings and install new service type lock rings when installing pins.

Diameter - .9803" -.9807". **Length** - 3.126".

Pin Fit in Piston - .0003-.0005" loose. Pin should not fall through piston of own weight when using the low limit (.0003"). Can be pushed into place with hand.

Pin Fit in Rod Bushing - .0003-.0005" loose.

Replacement Pins: Std., .001" & .003" Oversize.

OLDSMOBILE PISTON & ROD ASSY.

PISTON RINGS

Two compression rings and one oil ring used.

Ring	Width	End Gap	Side Clearance
Compr. (1)	.0775-.078"	.013-.023"	.001-.004"
Compr. (2)	.0925-.0935"	.013-.023"	.001-.004"
Oil	①	.015-.055"	-0005-.007"

① - .1831-.1889" (Perfect Circle), .1840-.1890" (Sealed Power).

Replacement Rings: Std. and .010" Oversize.

Installing Rings: Install upper "Chrome" and lower "Parco Lubrite" compression rings with side up that is marked with a dimple (Sealed Power) or word "TOP" (Perfect Circle).

CONNECTING ROD

Length - 6.996-7.000" center-to-center. **Weight** - 34.55 ozs.

Crankpin Journal Diameter - 2.4992-2.5002".

Lower Bearing - Moraine 400 steel backed aluminum with babbitt overlay.

Clearance - .0005-.0026" (vertical), .0013-.0034" (horizontal).

Sideplay - .002-.011" (total both rods).

Replacement Bearings: Std. and .002", .010", .020" Undersize.

Installing Rods: Install connecting rod in engine with oil spit hole toward center of engine. Install connecting rod caps with bearing index notches in rod and cap on same side.

►*CAUTION: Use Guide Tool BT-22 over rod bolts to prevent damaging crankpin journals when removing and installing piston and rod assemblies.*

CRANKSHAFT

Journal Diameter - 2.9990-3.000". Five bearings.

Bearings - Moraine 400 steel-backed aluminum with babbitt overlay (Nos. 1 through 4), Durex 100A steel-backed babbitt overlay (No. 5).

Clearance - .0005-.0021" (Nos. 1 & 2), .0008-.0024" (Nos. 3 & 4), .0020-.0034" (No. 5). **Wear Limit** - .0035" (Nos. 1 through 4), .0045" (No. 5).

►*MAIN BEARING CAUTION:* If main bearing clearance not within specifications (above), correct by use of selective bearing shells (see table below for sizes and specifications). **Replace both bearing halves (upper and lower shells) as a pair and do not attempt to shim behind shells.**

Main Bearing Identification

Thickness	Identification (on Tang)
Standard	None
.0005" Undersize	B
.0010" Undersize	C
.0015" Undersize	E

Replacement Bearings: Furnished Std. and .0005", .001", .0015", .002", .010" .020" Undersize. See table above for identification. **Install bearings in pairs (upper and lower shells).**

End Thrust: Taken by No. 5 (flanged) bearing.

Endplay - .004-.008".

Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Oldsmobile Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Oldsmobile Special Data.*

CAMSHAFT

►*IDENTIFICATION NOTE: Camshaft used in Series 88 (with 2-Bbl. Carb.) is identified by step on thrust flange.*

Journal Diameter - 1.9977-1.9985".

Bearings - Steel-backed babbitt.

Clearance - .001-.0033".

End Thrust: Taken by flange at front of camshaft against front camshaft bearing. Camshaft held to rear by plunger and spring at front end of camshaft.

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Oldsmobile Special Data.*

Timing Chain: Single flanged side guide type. **Width** - 27/32". **Pitch** - .50". **Length** - 24" or 48 links.

Camshaft Setting: Mesh chain with sprocket marks adjacent and in line with a straightedge across shaft centers (or use Tool BT-11).

►*FUEL PUMP ECCENTRIC NOTE:* Fuel pump eccentric bolted to front of camshaft ahead of sprocket with cupped side out.

►*CAMSHAFT REPLACEMENT CAUTION:* Coat camshaft liberally with engine oil mixed with G.M. Concentrate Part No. 567725 to insure proper installation and provide initial lubrication.

Engine Front Cover Removal & Installation: *See "Engine Front Cover" in Oldsmobile Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: Two types used and either type can be removed and installed without removing Engine Front Cover. *See "Engine Front Cover" in Oldsmobile Special Data.*

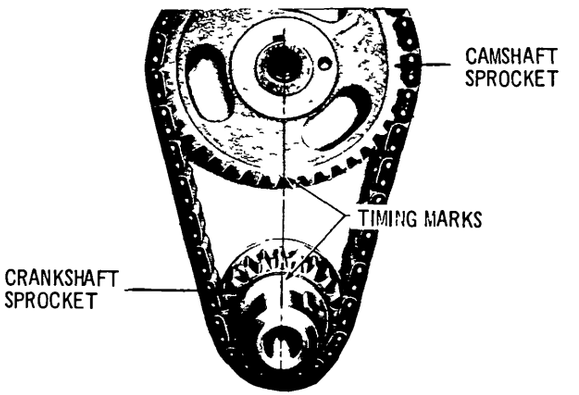
VALVES

Tappet Clearance: None in service (hydraulic).

Valve	Head Diam.	Stem Diam.	Length
Intake	1.870-1.880"	.3427-.3432"	4.999"
Exhaust	1.557-1.567"	.3940-.3945"	4.999"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.437"	.0011-.0025"
Exhaust	45°	.435"	.0015-.0030"

Valve Seat Width - .037-.075", all valves.



Valve Stem Seals - Cup type oil seal (deflector) installed cup side down on valve stem below valve spring retainer on all valves.

Valve Springs: Outside diameter at bottom is larger than at top. No damper springs used.

Valve Spring Specifications

Valve	Pressure	Length
Open	175-189 lbs.	1.437"
Closed	85-95 lbs.	1.837"

Free Length - 2.25".

OLDSMOBILE VALVE TIMING MARKS

Valve Guides: To remove old guides, support head and drive guides out through top of head using Remover Tool J-3062. Install new guides as follows: Place Gauge Washer J-5158-3 on valve spring seat. Use Valve Guide Installer Tool J-5158-2 to drive new guide in head (grooved end of guide up) until tool seats against gauge washer. This will correctly position guides in head (guide should extend 25/32" above face of valve spring seat).

►*OVERSIZE VALVE GUIDE NOTE:* Valve guides with .010" oversize outside diameter may be identified by a groove on guide.

Valve Lifters: Hydraulic lifters standard on all models.

►*HYDRAULIC LIFTER INSTALLATION CAUTION:* Production engines use Standard, .001" or .010" oversize lifters. Use correct size when replacing lifters. All lifters have identification numeral (Except Standard) on lifter body. Cylinder block marked "1" or "10" for lifter size on rail under rocker arm cover. When no mark appears, lifters are standard.

Diameter - .9210-.9215" (Std.). **Length** - 2.125".

Clearance in Block - .0005-.0020" (Selective)

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Replacement Lifters: Std., .001", 002", 003", 005" & 010" Oversize

Hydraulic Lifter Removal, Overhaul & Testing - See *"Valve System" in Oldsmobile Special Data.*

Rocker Arm Assembly: See *"Valve System" in Oldsmobile Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing (8.75-1 Eng.)

Intake Valves - Open 14°BTDC, Close 50°ALDC.
Exhaust Valves - Open 54°BLDC, Close 16° ATDC.

Valve Timing (10.0-1 Eng.)

Intake Valves - Open 11°BTDC, Close 59° ALDC.
Exhaust Valves - Open 59°BLDC, Close 20°ATDC.

Valve Timing Check: Remove left hand cylinder head rocker arm assembly and rotate engine so that No. 1 piston is on top dead center (firing stroke). Install Tool No. J-5374-01 in place of rear rocker shaft bracket with step plunger over No. 7 cylinder exhaust pushrod. The pilot at bottom of tool will fit into cylinder head bolt hole. Screw main body of gauge down so step plunger contacts pushrod and small diameter of plunger is flush with top of main body. Tighten clamp bolt. Rotate engine one complete revolution so that No. 1 piston is again at TDC (intake stroke). If timing chain is installed properly, third step of plunger will rise 1/32" above (8.75-1 Eng.), be nearly flush to (10.0-1 Eng.), top of main body. If plunger rises more, camshaft is advanced, and if less, camshaft is retarded.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Oldsmobile Special Data.*

Crankcase Capacity: 4 qts. refill. 5 qts. with filter change.

Normal Oil Pressure: 35-45 lbs. at 50 MPH

Pressure Regulator - In pump body. Not adjustable. Valve starts to open at 45 lbs. Maximum pump pressure is 45-55 lbs.

Oil Pressure Indicator - Oil pressure warning light on instrument panel and oil pressure switch in engine block or oil filter. Lights when pressure below 3 lbs.

Engine Unit: AC No. 1508319

Oil Pump: Gear type. In crankcase at rear end.

Oil Pump Removal, Overhaul & Installation - See *"Oiling System" in Oldsmobile Special Data.*

Oil Filter: Full flow type. Replace element every 6,000 miles or sooner if needed. Located on lower right side of crankcase.

Replacement Filter Element - AC No. PF-7

Crankcase Ventilation: Standard Cars - Air intake in oil filler cap with oil-wetted cleaner, AC No. 1552233 (Std.), No. 1551509 (Heavy Duty). Outlet is connected to ventilating baffle at rear of block above right bank. Outlet pipe is push fit at ventilator and extends down below right rear corner of engine.

Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to manifold with valve in line. See *"Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 20 qts. (Less AC & Heater), 21¾ qts. (AC less Heater). Add 1 qt. for Heater.

Pressure Valve: Radiator filler cap. AC No. RC-6, 13 lbs. (Std.), AC No. RC-15, 15 lbs. (Air Cond.).

Thermostat: Choke type, 170°F.

Water Pump: Packless, sealed ball bearing type. See *"Cooling System" in Oldsmobile Special Data.*

Removal - Drain cooling system, and loosen belts. Remove fan, spacer and pulley from pump hub. Remove four pump housing to engine front cover bolts and two pump housing to block bolts, and remove pump.

Temperature Indicator: Two light system (Red & Green) with temperature switch in engine block. GREEN light is lighted when engine running cold and goes out when engine temperature reaches 113°F±2°F. RED light remains off during normal engine operation but comes on when engine temperature reaches 234°F. (Std.), 238°F. (Air Cond. Cars) plus or minus 2°F. *NOTE* - Red light will come on when ignition key turned to "Start" position (to test bulb and circuit) but should go out when key returned to running position.

Engine Unit - Delco-Remy No. 1998741

LUBRICATION

HYDRA-MATIC 3-SPEED TRANSMISSION LUBRICATION: Check fluid level every 2,000 miles, drain and refill every 26,000 miles. Use only Automatic Transmission Fluid Type A, Suffix A.

Checking Fluid Level: Check fluid level with car on level floor, transmission at normal operating temperature, engine idling, and selector lever in "P" (Park) position. Maintain fluid level at "Full" mark on dipstick located at right rear corner of engine. Do not overfill. Use only Automatic Transmission Fluid Type A, Suffix A.

Capacity - Approx. 5½ qts. (transmission only), 6½ qts. (when pan removed), 9 qts. (after overhaul).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING: Before jacking, hoisting, or working under cars, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

►*STARTING CAR BY PUSHING NOTE (AUTOMATIC TRANSMISSION CARS): Because of transmission design, car cannot be started by pushing.*

MODEL IDENTIFICATION

Series	Series Designation
Standard	3000
Deluxe	3100

SERIAL NUMBER: Stamped on plate attached to left front door pillar. Number (example below) includes identification data.

① ② ③ ④
61 0 M 01001

① - Year (1961).
② - Series - 0 - 3000. 1 - 3100.
③ - Assembly Plant. M Lansing. C South Gate.
④ - Beginning vehicle number.

Engine Unit Number: Stamped on front of right hand cylinder head.

Starting Unit Number - S-001001. Suffix letter "E" indicates an Export Low Compression engine option.

TUNE-UP

VALVE TAPPET CLEARANCE: Zero lash, hydraulic.

MANIFOLD HEAT CONTROL: None used. Intake manifold is heated by engine coolant.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

►*ENGINE STARVATION OR CLOGGED FUEL FILTER (EARLY CARS) CORRECTION:* Install later car production fuel filter, Oldsmobile No. 583496, as follows: drain tank to 1 gal., remove tank. Flush thoroughly with gasoline (1 gal. in tank), remove old filter and replace.

►*HARD COLD STARTING CORRECTION (EARLY CARS):* On early cars with AC No. 46FF spark plugs, use new plugs No. 46FFX. *See SPARK PLUGS below.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .040".

Spark Plugs - AC No. 46FF (Early Cars), 46FFX (Later Cars). *NOTE* - Use only 46FFX plugs in replacement. 14mm, tighten to 15 ft. lbs.

COIL: Delco-Remy No. 1115087 (Std.), 1115091 or 1115160 (Heavy Duty - with 1110979 Distr.).

Ignition Current - 2.0 amps. idling, 4.5 amps. stopped.

Resistor (Std.) - Resistance wire (1.75-1.85 ohms) integral part of wiring harness connected in circuit between coil and No. 1 Terminal of ignition switch.

Resistor (Heavy Duty) - Delco-Remy No. 1931385.

DISTRIBUTOR: Delco-Remy No. 1110975 (Std. & Pwr. Pack), 1110979 (Heavy Duty).

►*NOTE: Heavy Duty Distributor Double Breaker Type.*

Point Set - Delco-Remy No 1931988 (Std. Distr.).

Condenser - Delco-Remy No. 1928111 (Std. Distr.).

Capacity - .18-.23 mfd.

Breaker Gap (Std. Distr.) - .016". Gap will be correct when cam angle properly set.

Breaker Point Setting (Heavy Duty Distr.) - .014-.018" (both sets).

Cam Angle - 28-32° (Std.), 29 ±1° (Heavy Duty).

►*NOTE:* Heavy Duty cam angle with both breakers operating must be 34 ±1°.

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Clockwise when viewed from above.

Automatic Advance

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0-2		500	0-4		1000
5-7		1000	10-14		2000
11-13		2100	22-26		4200
11-13		2300	22-26		4600

Vacuum Spark Control: Delco-Remy No. 1116175 (Std. Distr.).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	5-7
12°	24	15.25-17.0

IGNITION TIMING

Setting - 5° BTDC at 850 RPM (Std. Eng.), 7½ BTDC at 850 RPM (Pwr. Pack Eng.). Distributor vacuum line disconnected, with pipe plugged.

►*DETONATION NOTE:* If engine detonates with above setting due to low octane fuel or carbon build-up, timing should be retarded to 2½° BTDC. If extra high-octane fuel is used, timing may be advanced beyond 5° BTDC setting if no detonation occurs.

Timing Mark - Timing indicator on chain case cover marked "0" (TDC), "5" (5° BTDC), "10" (10° BTDC). Align correct mark with groove on harmonic balancer.

CARBURETOR

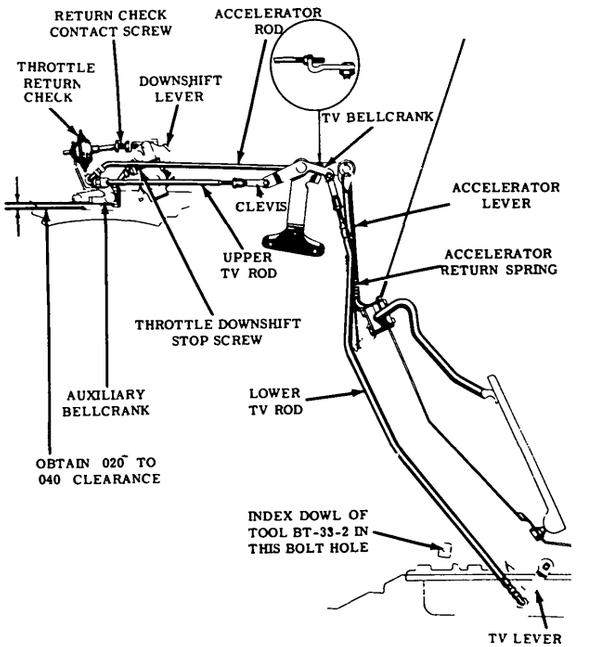
►*CARBURETOR APPLICATION: Rochester 2-Bbl (Std. Engs.), 4-Bbl. (Optional Pwr. Pack & Heavy Duty Engs.).*

THROTTLE LINKAGE ADJUSTMENT: Raise car and disconnect throttle valve rod from lever on transmission and position Gauge, BT-33-2, so index dowel of tool enters hole in boss on transmission case (forward and slightly above transmission throttle valve lever shaft). The hole in throttle valve lever must be within the hole on gauge (opposite end from dowel pin) when holding throttle valve lever in rearward position. If hole in lever does not fall within hole in gauge, bend lever with Bending Tool, BT-33-7. Lower car and disconnect upper throttle valve rod from throttle valve bellcrank, then disconnect lower throttle valve rod from bellcrank. While holding lower throttle valve lever downward and throttle valve bellcrank down at rear, clevis pin must be a free fit. If necessary, adjust clevis, then connect lower throttle valve lever to bellcrank. Remove air cleaner and block choke valve open, then back off idle adjusting screw until it is not touching idle cam when accelerator return spring is holding throttle valves closed. Bend auxiliary bellcrank link to obtain 020-.040" between auxiliary bellcrank and gauge surface of manifold. Adjust upper throttle valve rod clevis so pin is free at throttle valve bellcrank (bellcrank against stop at rear), **then adjust clevis ½ turn long.** Loosen throttle downshift stopscrew locknut and back off screw approximately 6 turns. With accelerator lever, move throttle to wide open and then over-travel the linkage to a point of maximum transmission throttle valve lever travel. *CAUTION - Do not stretch or bend linkage.* Hold accelerator lever in wide open position and adjust stopscrew to just touch downshift lever tang, **then turn stopscrew in an additional 1½ turns.** Hold choke valve in off position and adjust idle speed. Adjust Throttle Return Check (see below), then check and adjust accelerator pedal height as follows:

Accelerator Pedal Height - Use Tool BT-33-2, placing tool over throttle valve bellcrank pin (with hole nearest pin). Swing gauge in an arc and adjust length of accelerator lever rod (loosen locknut and turn rod in swivel) until end of gauge just touches nearest surface of cowl.

►*THROTTLE LINKAGE ADJUSTMENT CAUTION:* If a tang is on the auxiliary throttle bellcrank (some early production cars may have it), remove before making adjustments

THROTTLE RETURN CHECK ADJUSTMENT: Adjust throttle return check stopscrew to obtain .020" clearance at return check plunger with idle speed screw resting on highest step of fast idle cam.



ROCHESTER 2GC 2-BARREL

Rochester 2GC No. 7019092 (Synchro-mesh), No. 7019095 (Auto. Trans.). Downdraft type with automatic choke

►*LOADING DURING WARM-UP CORRECTION:* Change unloader setting (to correct loading at ¾-full throttle) and automatic choke setting. *See below.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8. LEFT barrel feeds 1-4-6-7.*

Idle Setting - Initial setting 1½ turns open. Turn screws out for richer mixture.

OLDSMOBILE F-85 THROTTLE LINKAGE

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Idl Spe d - 550 RPM (Synchro-mesh), 500 RPM (Auto Trans without Air Cond) 550 RPM (Auto Trans with Air Cond) Transmission selector lever should be in "Dr" position on Auto Trans Cars

Float Level - 35/64" (Gauge BT-187) with air horn inverted and gasket installed measured between lower edge (sharp edge) of float seam at outer end of pontoon at toe, and air horn gasket To adjust, bend float arm at rear

Float Drop - 1 29/32" (Gauge BT-187) distance from gasket to bottom of float with air horn upright and gasket in place To adjust bend float tang

Unloader Setting Choke valve opening with throttle valve wide open should be .250" (¼" drill) measured between upper edge of choke valve and air horn wall *This supersedes previous setting of .160 and will correct loading during warm-up*

Fast Idle No adjustment, will be correct when hot or slow idle correctly set

Automatic Choke Setting 1 point lean *Supersedes centered setting and will correct loading during warm-up*

Carb-Airator Adjustment *NOTE - This is an external breather attached to carburetor on air conditioned cars to assist in reducing rich fuel and air mixture during hot idling* In extreme hot temperature (95°F or over) if hot idle is rough or erratic or stalling occurs tighten temperature screw (on side of unit) one turn and road test car *CAUTION - Do not upset normal idle setting and do not overtighten the screw* If engine idles too fast under these extreme hot temperatures tighten the air screw (directly below temperature screw on unit)

►*OTHER DATA See "Rochester 2G & 2GC Carburetors' in Carburetion Section*

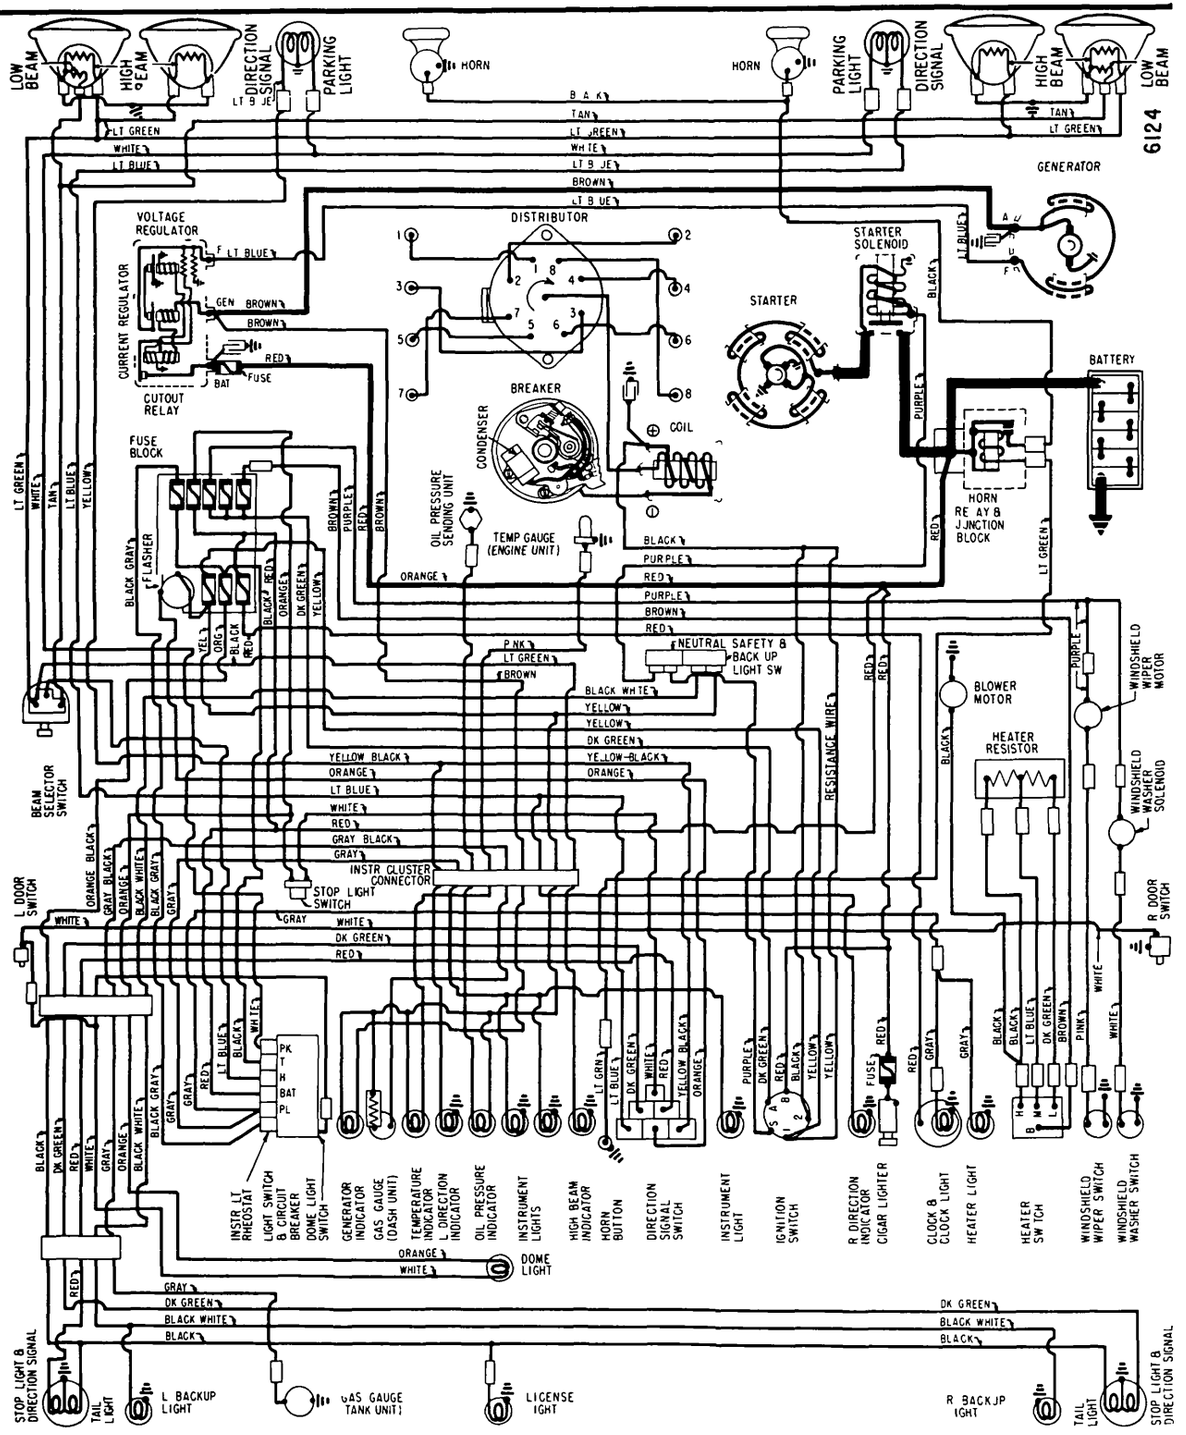
ROCHESTER 4GC 4-BARREL

Rochester No 7019055 (Pwr Pack exc A C), 7019056 (Pwr Pack with A C), 7019057 (Heavy Duty)

►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyls 2-3-5-8 LEFT barrels feed 1 4 6-7*

►*IDLE COMPENSATOR CAUTION* Idle Compensator (thermostatically controlled idle air bypass) used on air conditioned cars and must be in closed position when making idle setting and idle speed adjustments Remove air cleaner and insert pencil or suitable tool in throttle bore

Idle Setting - Turn adjusting screws in or out for desired mixture



Idle Speed - 500 RPM (Automatic Trans in "Dr") 550 RPM (Synchro-mesh Trans in "Neutral") 550 RPM (All A C Cars with idle compensator closed)

Throttle Linkage Adjustment *See CARBURETOR above*

►*OTHER DATA See "Rochester 4GC Carburetors' in Carburetion Section*

CARB. EQUIPMENT

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Air Cleaner: Polyurethane (Std. on 2-Bbl. Cars), Paper-disposable element (Std. on 4-Bbl. and optional on 2-Bbl., Cars). Service the foam element every 6000 miles by washing in kerosene and wringing dry. Oil element with SAE 20 engine oil then wring out excess. Replace disposable element every 16000 miles.

BATTERY

Delco-Remy No. 454. 12 volt, 9 plate, 40 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Rear of right hand cylinder head.

STARTER

Delco-Remy No. 1108302. Armature - No. 1935829.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. minimum.

Performance Data

Torque	RPM	Volts	Ⓒ Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

Ⓒ - Includes solenoid.

Starter Switch: Delco-Remy No. 1114278 (solenoid switch) mounted on starter and controlled by combination Ignition & Starter Switch, Delco-Remy No. 1116587 and Neutral Safety & Back-up Light Switch (see below).

Hydra-Matic Neutral Safety & Back-up Light Switch: Delco-Remy No. 1993523 (Std. Trans. Back-up), Oldsmobile No. 579438 (Hydra-Matic).
Adjustment - *See "Oldsmobile F-85 Hydra-Matic Transmission" in Transmission Section.*

GENERATOR

Delco-Remy No. 1102236 (Std.), 1102230 (Police).
Armature - Delco-Remy No. 1948005.

►*CHARGING CIRCUIT FUSE CAUTION: Battery charging circuit protected by 45 amp. fuse No. 575532 on "BAT" terminal of generator regulator. Check fuse when diagnosing generator, regulator or battery failures.*

Performance Data

Model	Amperes	Volts	RPM
Std.	35	14.0	2630
Police	45	14.0	2520

Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 28 ozs.
Field Current - 1.69-1.79 (Std.), 2.66-2.86 (Police) amps. at 12 volts and 80°F.

Belt Adjustment: Place Tension Tool No. BT-33-70 on generator belt (from under car between generator and crankshaft pulley). Loosen generator adjusting link bolt and tighten belt until line on tool is even with pointer. Tighten adjusting link bolt to 14-17 ft. lbs.

GENERATOR REGULATOR

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*
Delco-Remy No. 1119253 (Std.), 1119600 (Police). "Post Type" with nylon adjusting nuts above voltage and current regulators for air gap adjustment.

►*DOUBLE CONTACT REGULATOR NOTE: Regulator 1119600 has double contact for voltage regulation. NOTE - Specifications below are for "Normal" settings.*

Cut out Relay
Cuts In - 11.8-13.5 volts (1119253), 11.8-13.0 volts (1119600).
Contact Gap - .020" (All).
Air Gap - .020" (All) with contacts just closed.

Voltage Regulator
Setting (1119253) - 13.8-14.7 volts at 125°F ambient temperature.
Setting (1119600) - 13.8-14.6 volts (upper contacts), .1-.3 volt lower (lower contacts) at 125°F ambient temperature.
Contact Gap - .016" (upper contacts) with lower contacts just touching.
Air Gap (1119253) - .075" with contacts just touching.
Air Gap (1119600) - .067" with contacts just touching.

Current Regulator
Setting (1119253) - 31.0-35.5 amps. at 125°F ambient temperature.
Setting (1119600) - 38.0-45.0 amps. at 125°F ambient temperature.
Air Gap - .075" (All) with contacts just touching.

►*OTHER DATA: See "Delco-Remy 1119000 Series Regulators" or "Delco-Remy (Double Contact) Regulators" in Electrical Section.*

MISC. ELECTRICAL

►*INSTRUMENT PANEL PRINTED CIRCUIT NOTE:* Entire instrument cluster served by a printed circuit. All units in cluster are connected by a multiple contact plug which is keyed to prevent improper assembly. Service of printed circuit is by **replacement only.**

Instrument Cluster Removal: Disconnect positive cable from battery. Remove cluster cover attaching screws. Disconnect wiring harness, clock and speedometer cable at cluster. Remove cluster-to-instrument panel attaching nuts and washers from under instrument panel. To install, reverse removal procedure.

Speedometer Head Removal (Cluster Removed): Remove instrument cluster bezel-to-case attaching screws. Remove bezel and face. Remove speedometer head attaching screws from case assembly, then remove speedometer head. To install, reverse removal procedure.

Speedometer Head Printed Circuit Removal (Cluster Removed): Remove all cluster lamp sockets and circuit attaching screws. Remove hex nuts from fuel gauge mounting studs. Remove printed circuit. To install, reverse removal procedure.

Fuel Gauge Assembly Removal: Disconnect positive cable from battery. Remove cluster cover. Disconnect fuel gauge wiring connector and light socket from printed circuit. Remove attaching nuts and withdraw fuel gauge from front of cluster. To install, reverse removal procedure.

Headlight Switch Removal: Disconnect positive cable from battery. Disconnect wiring from light switch. Remove knob and rod by first pulling out to "ON" position, then depressing button on top of switch assembly and pull rod out. Remove escutcheon with Tool No. J-6592-01. Remove headlight switch from rear of instrument panel. To install, reverse removal procedure.

Stop Light Switch Location: Mechanical type mounted on bracket on pedal stop above brake pedal arm.

Adjustment - Adjust switch in its mounting bracket by loosening locknuts.

CIRCUIT BREAKER: 20 Ampere - Headlights, High Beam Indicator, Parking & Tail Lights. In headlight switch. *NOTE - Tail lights also protected by 9 ampere fuse on fuse block.*

FUSES: All fuses located on fuse block attached to inside of cowl panel to left of steering column.
20 Ampere - Dome & Stop Lights.
20 Ampere - Heater & Air Conditioner.
20 Ampere - Windshield Wiper & Washer.
9 Ampere - Instrument & Back-up Lights.
9 Ampere - Tail Lights.
4 Ampere - Radio (Deluxe).
3 Ampere - Instrument Panel Lights & Clock Light.
2 Ampere - Electric Clock.
20 Ampere - Cigar Lighter (on back of lighter).

HORN RELAY: Delco-Remy 1116946.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: Own. 90° valve-in-head aluminum block V8 with non-replaceable cast iron cylinder liners. Cylinder heads are aluminum.

Engine	Bore	Stroke	Displacement
All	3.5"	2.80"	215 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
Std.	8.75-1	39.2	155 at 4800 RPM
Power Pack	10.25-1	39.2	
Heavy Duty	11.0-1	39.2	

►*ENGINE SERVICE NOTE: For Aluminum Engine Service Cautions see "Engine" in Oldsmobile Special Data.*

►*ENGINE OPERATION IN LOW OCTANE AREAS (FOREIGN TRAVEL):* The following modifications should be made before attempting travel in low octane areas to prevent excessive detonation and resultant engine damage. Lower the compression ratio by making changes listed for fuel or octane rating listed below. *NOTE* - "Normal" octane requirements are 90 for standard engine and 99 for Power Pack Engine.

8.75-1 Compr. Ratio Engine

Octane Rating	Head	Gasket Ⓒ	Compr. Ratio	Spark Plugs
86	no change	.045"②	8.25-1	47FF

10.25-1 Compr. Ratio Engine

88	8.75-1 Head	no change	8.5-1	47FF
85	8.75-1 Head	.045"②	8.0-1	47FF

Ⓒ - Std. Head Gasket Thickness .020".
② - Kit No. 583457 (incl. Head and Intake Manifold Gaskets).

►*MODIFIED ENGINE (FOREIGN TRAVEL) TIMING NOTE:* Ignition timing may have to be set in range of 5°BTDC to 0° TDC if detonation still occurs.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Oldsmobile Special Data.*
INTAKE MANIFOLD: *See "Cylinder Head & Manifold" in Oldsmobile Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Oldsmobile Special Data.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

OIL PAN REMOVAL: Raise car and drain oil, then disconnect relay rod from steering idler arm. Remove cover on front of lower flywheel housing and remove pan bolts. *NOTE* - On some types of lifts, it may be necessary to drop oil intake pipe and screen assembly into oil pan before removing pan. Position crankshaft so counterweights do not interfere with pan removal.

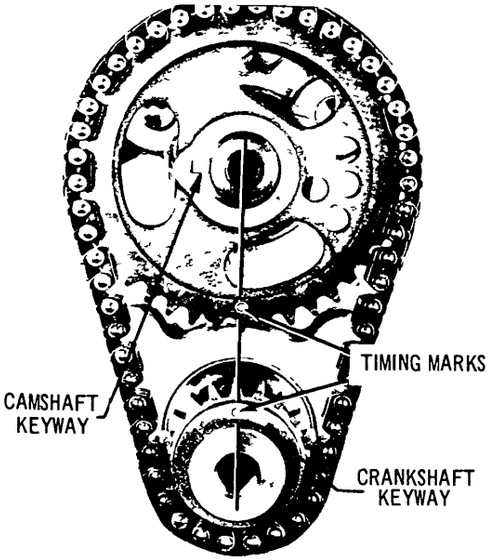
PISTONS

Aluminum alloy, All-Aluminum, cam ground, tin plated.
Weight - 14.78 ozs. (Std. Eng.).
R moval - Pistons & Rods removed from above.
►*CAUTION:* Mark pistons, rods, and bearing caps with number of cylinder before removing to insure correct reinstallation.
Clearance - .0005-.0011" at thrust surface.
Fitting Pistons - Use a .0015" x ½" x 12" feeler(ribbon) between inverted piston (pin and rings removed) and cylinder wall at right angles to piston pin position. Pull to withdraw feeler should be 3-8 lbs.
R placement Pistons: Furnished with fitted pins in Std., and .010" Oversize (Std. Eng.), .030" Oversize (H.D. Eng.).
Installing Pistons - Install piston on connecting rod with "F" on piston pin web and notch in head toward front of engine. *See Rod Installation.*

PISTON RINGS

Pressed in rod. Pins are offset in piston .040" to right of cylinder bore centerline.
Diameter - .8747-.8750". **Length** - 2.860-2.880".
Pin Fit in Piston - .0003-.0005" loose. Pin should not fall through piston of own weight when using the low limit (.0003"). Can be pushed into place with hand.
Pin Fit in Rod Bushing - .0007-.0013" **interference fit.**
Replacement Pins: Standard only.
Piston Pin Installation - *See "Piston Pins" in Oldsmobile Special Data.*

PISTON PIN



Two compression and one oil ring used. Upper ring chrome plated, lower ring Ferrox treated. Oil ring is spring steel.

Ring	Width	End Gap	Side Clearance
Compr.(1&2)	.0780-.0785"	.010-.020"	.003-.005"
Oil (3)℄	.2184-.2319"	.015-.055"	.0005-.0055"

℄ - Three-piece, consisting of two rails and a spacer.
Replacement Rings: Std. & .010" oversize.

CONNECTING ROD

L ngth - 5.660" center-to-center.
Crankpin Journal Diameter - 1.999-2.000".
Bearing - Moraine 100 Durex with GM 4167-M Babbitt Overlay. Steel backed.
Clearance - .0002-.0022".
Endplay - .006-.014" (total for both rods).
Installing Rods - Install piston and rod assembly in engine with identification boss on rod and cap toward **front of engine** (Right Hand Cylinders), toward **rear of engine** (Left Hand Cylinders). Oil spurt hole in rod must be upwards.
Replacement Bearings: Std., .002", .010" & .020" Undersize.

VALVE TIMING MARKS

CRANKSHAFT

Journal Diameter - 2.298-2 299" Five bearings.
Bearings - Steel-backed Durex 100-A with Babbitt Overlay.
Clearance - .0008- 0024". **Wear Limit** - .0035"
►*CAUTION: UPPER AND LOWER MAIN BEARING SHELLS MUST BE INSTALLED IN MATCHED PAIRS.*
Replacement Bearings - Furnished in Std , .001", .002" & .010" Undersize.
End Thrust: Taken by No. 3 (center) main bearing.
Endplay - .004-.008".
Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Oldsmobile Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Oldsmobile Special Data.*
►*BALANCER, CRANKSHAFT, FLYWHEEL REPLACEMENT CAUTION: See "Crankshaft & Bearings" in Oldsmobile Special Data.*

CAMSHAFT

►*HEAVY DUTY ENGINE NOTE:* Special camshaft No 583043 used
Journal Diameter - **(1)** 1.785-1.786", **(2)** 1 755-1 756", **(3)** 1 725-1.726", **(4)** 1 695-1 696", **(5)** 1 665-1 666"
Bearings - Five Steel Backed Babbitt.
Clearance - .0005-.0025" (1), .0005-.0035" (Others).
Endplay - .011-.059".
Camshaft Setting - Mesh chain with sprocket marks adjacent and in line with straightedge across shaft centers.
Timing Chain: Width - 875". **L ngth** - 54 links **Pitch** - 375"
Camshaft Rem val & Installation: *See "Camshaft & Bearings" in Oldsmobil Special Data.*
►*FUEL PUMP ECCENTRIC NOTE:* Fuel pump eccentric bolted to front of camshaft ahead of sprocket with cupped side out.
►*CAMSHAFT REPLACEMENT CAUTION:* Coat camshaft liberally with engine oil mixed with GM Concentrate Part No 567725 to insure proper installation and provide initial lubrication.
Engine Front Cover Removal & Installation: *See "Engine Front Cover" in Oldsmobile Special Data.*
Engine Front Cover Oil Seal (Crankshaft Fr nt S al). Installation: *See "Engine Front Cover" in Oldsmobile Special Data.*

VALVES

Tappet Clearance: None in service (Hydraulic).

Valve	Head Diam.	Stem Diam.	L ngth
Intake	1.517-1.527"	.3427-3432"	4.863"
Exhaust	1.348-1 358"	.3422-.3427"	4.861"

Valve	Seat ngle	Lift	St m Clearance
Intake	45°	384"	.0010-.0025"
Exhaust	45°	384"	.0015-.0030"

Valve Seat Width - .037-.075"
Valve Stem Seals: Inverted cup over upper end of valve, under valve spring retainer.
Valve Springs: Single spring used on all valves.

Spring Specifications

Valve	Lbs. Pressure	Length
Closed	70-80	1.750"
Open	160-175	1 350"

Free Length - 2 150"
Valve Guides: Press fit. To remove, support cylinder head and drive out valve guide with Tool No. BT-68-5A. To install, lubricate guide and bore with engine oil. Place valve guide into cylinder head with outside beveled end up. *NOTE* - Intake guides must be installed with grooved end up. Place guide installer Tool No. BT-68-5B over new guide and drive until tool makes contact with cylinder head This positions guide.
►*OVERSIZE VALVE GUIDE NOTE:* Oversize valve guides identified by 2 grooves (.001"OS), 1 groove (010"OS), 3 grooves (.011"OS). When replacing guides use .001" oversize guides.
Valve Lifters: Hydraulic lifters standard on all models. Mechanical lifters available with special camshaft on heavy duty engines
Diameter - 8422-.8427" **Length** - 1.997-2.007".
Clearance in Block - .0008- 0023" selective
Replacement Lifters: Standard only
Hydraulic Lifter Removal, Overhaul & T sting: *Se "Valve System" in Oldsmobile Special Data.*
Rocker Arm Assembly: *See "Valve System" in Oldsmobile Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above

Valve Timing Sp cificati ns (Standard Engin)

Intake Valves - Open 22° BTDC Close 58° ALDC
Exhaust Valv s - Open 60° BLDC Close 20° ATDC

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Oldsmobile Special Data.*

Crankcase Capacity: 4 qts. refill, 5 qts. with filter change.

Normal Oil Pressure: 30 lbs. at 2400 RPM.

Pressure Regulator - In pump body. Not adjustable.

Oil Pressure Indicator - Oil pressure warning lights on instrument panel and oil pressure switch on oil pump. Lights when pressure below 3 lbs.

Engine Unit - AC No. 1508319.

Oil Pump: Gear Type. Located in front engine cover.

Oil Pump Removal, Overhaul & Installation - *See "Oiling System" in Oldsmobile Special Data.*

Oil Filter: Full-flow type. Replace element every 6000 miles or sooner if needed. Located on oil pump cover.

Replacement Filter Element - AC PF-7.

Crankcase Ventilation: Standard Cars - Air intake in oil filler & breather cap with oil-wetted cleaner, AC No. 1552233. Outlet is connected to ventilating baffle at one rocker arm cover. Oil filler & breather cap at other rocker arm cover.

Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to intake manifold with a valve in the line. *See "Positive Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

Water Capacity: 10.5 qts., add 1.5 qts. for heater, .05 qt. for air conditioning.

Pressure Valve: Radiator filler cap AC No. RC-6 (Std.), with air conditioning AC No. RC-15.

Thermostat: AC No. 1199784 (170°F). Located in water outlet on intake manifold.

Water Pump: Packless, sealed ball bearing type. Service by replacement only.

Removal - Drain cooling system, disconnect heater and lower radiator hose from pump. Loosen pulley belts, then remove fan and pulley from pump. Remove pump-to-front cover attaching bolts. Remove pump.

Temperature Indicator: Controlled by thermal switch in right front of intake manifold. A red light indicates temperature has reached 238°±2°F (cars without A.C.). Engine Unit - Delco-Remy 1993508 (Std.), 1993513 (A.C. Cars).

LUBRICATION

AUTOMATIC TRANSMISSION LUBRICATION: Check fluid level every 2,000 miles, drain and refill every 25,000 miles. Use only Automatic Transmission Fluid Type A, Suffix A.

Checking Fluid Level - Check with car level, transmission at normal operating temperature and selector lever in "P" position. Maintain level to FULL mark on dipstick located at right rear side of engine. *NOTE* - 1 pint fluid required to bring level from ADD mark to FULL mark on dipstick. With transmission cold, oil level should be at ADD mark. DO NOT OVERFILL.

Capacity - Approximately 7 qts.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS

PONTIAC V8 & TEMPEST 4 CYLINDER

	Ft. Lbs.
Cylinder Head	85-100
Intake Manifold	30-45
Exhaust Manifold	20-35
Oil Pan	8-15
Main Bearing Cap (Rear)	110-130
Main Bearing Caps (Others)	90-110
Flywheel	85-100
Vibration Damper	130-190
Crankshaft Pulley	130-190
Con Rod Caps	40-46
Camshaft Sprocket	30-45
Rocker Arm Cover	25-70 in. lbs.
Pushrod Cover	25-70 in. lbs.
Engine Front Cover (To Oil Pan)	10-20
Water Pump	10-25
Oil Pump	20-35
Oil Filter	20-35
Clutch Housing (Pontiac V8)	60-90
Clutch Housing (Tempest 4 Cyl.)	40-60
Transmission to Clutch Housing (Pontiac V8)	45-60
Transmission to Clutch Housing (Tempest 4 Cyl.)	35-40

ENGINE

ENGINE REMOVAL: Pontiac - *NOTE* - Engine removed with or without transmission. Detail following includes transmission with engine.

1) Drain water, engine and transmission oil. Remove hood. Disconnect all wires, pipes and throttle linkage. Remove carburetor, crankcase ventilator pipe, heater hoses, cooler lines, radiator and fan, battery and cables.

2) On Power Steering Cars, remove pump belt and pump from mounting bracket and secure assembly out of way.

3) Disconnect exhaust pipe from crossover pipe, and disconnect gearshift linkage.

4) On synchro-mesh cars, disconnect clutch fork linkage and remove clutch countershaft bracket from flywheel housing.

5) Remove propeller shaft assembly. Raise engine slightly by hooking chain to intake manifold, threading chain through holes behind carburetor.

6) Remove front and rear insulator mounting screws. Disconnect cooler lines at timing cover.

7) On Auto-Trans cars, place transmission jack under transmission and remove frame crossmember. *CAUTION - Without jack for support, transmission will swing down when crossmember removed.*

8) Hoist engine and transmission out of chassis.

ENGINE REMOVAL: Tempest - Remove hood, drain and remove radiator. Disconnect heater hoses at engine. Disconnect all accessible wires. Disconnect fuel line at fuel pump, then disconnect vacuum modulator line (Auto Trans.). Disconnect battery ground strap. Remove front fender cross brace, fan and pulley, and disconnect accelerator rod at engine. Raise front of car. Disconnect clutch and shifting linkage (Synchro-mesh). Disconnect exhaust pipe at manifold. Place wooden block at rear of engine. Disconnect propeller shaft and torque tube from rear of engine. Disconnect engine support at crossmember. Carefully raise engine with chainfall or overhead hoist. Move engine forward to clear firewall and heater. To install, reverse removal procedure.

CYLINDER HEAD & MANIFOLD

►*CYLINDER HEAD PRODUCTION CHANGE:* New type right and left cylinder heads used on late model Pontiac V8 and Tempest 4 Cyl. cars. New heads are cast with an undercut at lower inboard edge, necessitating a revision of rocker arm and valve stem length checking procedures. *See VALVE SYSTEM below.*

CYLINDER HEAD: Removal - Remove intake manifold, pushrod and rocker arm cover. Loosen rocker arm retaining nuts and move rocker arms off pushrods. *NOTE - Remove pushrods but keep them separated for reinstallation in original position.* Remove crossover pipe to manifold attaching screws. Remove battery ground and engine ground straps on left head or engine ground strap and Hydra-Matic oil level indicator tube bracket on right head. Remove head screws (head held in place by dowels) and remove head with exhaust manifold attaching Hooks J-4266. *CAUTION - Handle head carefully as rocker arm studs are hardened and may crack if struck. NOTE* - Left head must be raised off dowels, moved forward and "jockeyed" to clear power steering and brake equipment.

Installation - Right and left heads are the same. *NOTE - When installing new head, transfer all serviceable parts to new head. Use new seals on all valve stems and new exhaust manifold gasket. Install new intake manifold mounting studs. Check rocker arm position with Gauge J-8928.* Reverse removal procedure and note the following. Head screws are of three different lengths and will project an equal distance from head. DO NOT use sealer of any kind on threads.

PISTON PINS

Removal: *NOTE - Piston Pin Remover & Replacer Set, J-6901 is used. Individual parts are marked with respective numbers.* Place plunger of Tool J-6901 into piston pin bore and position on arbor press. Put J-6901-5 between connecting rod and piston boss. Put J-6901-3 in pin and press until pin bottoms in J-6901. Remove J-6901-5 and plunger and spring from J-6901. Reposition on arbor press and press pin out of rod.

Installation: Place plunger and spring in J-6901 and place plunger in piston pin bore. Position on arbor press. Coat pin and rod lightly with graphite lubricant. Insert pin, put J-6901-3 in pin and press pin in until it bottoms against plunger of J-6901. Piston must turn freely on pin. *Pin must not move under 1500 lb minimum load after assembly.*

Oversize Pin Installation - 001" and 003" oversize pins can be installed. Connecting rod can be honed to fit **but must be 0008-.0016" smaller than the pin used.**

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING OIL SEAL REPLACEMENT:

1) Drain oil and remove oil pan, oil pump, and oil pump drive shaft. Remove oil baffle and cylinder block to oil baffle tube (lower oil level indicator tube). Remove transmission (See Synchro-mesh Transmission Removal on Car Page or Hydra-Matic Drive in Transmission Section). On 4 Cylinder cars, support engine and remove front crossmember assembly.

2) Remove rear center main bearing cap and upper half of rear center main bearing shell to allow crankshaft to be lowered and to prevent damage to thrust surfaces of bearing. Remove rear main bearing cap and loosen remaining bearing caps sufficiently to allow crankshaft to be lowered approximately ½" at rear.

3) With crankshaft lowered to provide clearance, remove upper half of rear main bearing oil seal and bearing shell.

4) Install seal in cap, compress with Tool J-7588, and trim one end flush with cap. *NOTE - On engines with no cast slots in seal groove in block, rotate seal in cap and recompress slightly to eliminate bumps caused by seal retention slots in cap.* Remove seal from cap and turn end-for-end and install in block by slipping up over crankshaft into seal cavity. Install rear center main bearing cap and bearing shell and torque to 95 ft. lbs. Trim both ends of seal flush with block.

5) Install a new seal in cap as above and trim flush with cap. Install cap with shell and tighten to 120 ft. lbs. Remove rear main bearing cap again and inspect split line to be certain that none of seal material has been compressed between cap and block. Make sure mating surfaces are clean.

6) **Next, apply a bead of sealer (Permatex No. 3) approx. 1/16" in diameter to mating surface of cap extending from packing seal groove outward to the groove for oil pan cork rear gasket.** Install rear main bearing cap and tighten to 120 ft. lbs. torque.

7) Remove rear center main bearing cap and reinstall upper half of bearing shell. Install cap and tighten to 95 ft. lbs. Tighten remaining bearing caps to 95 ft. lbs. Replace transmission, oil pump, oil pump drive shaft, oil baffle, oil pan and flywheel lower cover and shield.

►*CAUTION:* Seal must be installed exactly as detailed above to prevent oil leaks at rear bearing. Make certain that seals not cut too short and that mating surfaces of bearing cap and block are free of any packing material, dirt or oiliness (except for Permatex bead on cap) and that they are not scratched or burred.

VIBRATION DAMPENER

VIBRATION DAMPENER: Removal—Loosen generator at adjusting strap and remove fan belt from vibration dampener. On cars equipped with power steering, also remove power steering pump belt. Position fan so wide angles will be at top and bottom allowing access to dampener. Remove dampener attaching screw (15/16" socket) and retaining washer, and slide dampener off shaft.

Installation: Reverse the removal procedure.

ENGINE FRONT COVER

ENGINE FRONT COVER: Removal - Drain cooling system. Remove generator adjusting strap, fan and accessory belt, and fan pulley and fan from water pump. Disconnect radiator hoses and remove fuel pump and vibration damper. On 4 cylinder cars, loosen timing cover attaching bolts and loosen timing cover-to-intake manifold draw bolt, then remove cover. On V8, remove oil pan-to-cover screws, cover-to-oil cooler line screws, and cover-to-block screws and nuts, then pull cover forward to clear studs and remove.

CRANKSHAFT FRONT OIL SEAL REPLACEMENT: After front cover removed (above), slide old seal off end of crankshaft. Coat face of new seal with graphite

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

lubricant and install on crankshaft before installing front cover.

CAMSHAFT & BEARINGS

►*NOTE:* Camshafts on 4 cylinder cars can be removed by first removing radiator grille lower panel, grille, and hood latch as an assembly. Then remove front bumper assembly, drain radiator and remove. Engine will then be accessible for camshaft removal.

CAMSHAFT REMOVAL & INSTALLATION: Drain radiator. Remove intake manifold, crankcase ventilator outlet pipe, pushrod cover and rocker arm covers. Disconnect and move spark plug wires out of way. Loosen rocker arm ball nuts so rocker arms can be disengaged from pushrods and turned sideways. Remove pushrods and hydraulic lifters. Mark or store pushrods and lifters so they can be installed in original positions Remove radiator and timing chain cover. Remove timing chain cover seal and fuel pump eccentric. Slide timing chain and sprockets off ends of crankshaft and camshaft. Remove distributor. Remove camshaft thrust plate attaching screws and remove thrust plate. Slide camshaft out of engine carefully, making sure not to damage bearings in block. Front of engine should be raised as necessary to permit shaft to slide between grille and hood catch support plate. To install, reverse removal procedure.

TIMING CHAIN TENSIONER (4 CYLINDER CARS): Removal - Right hand bumper must be removed first, because of hook in each end of spring. DO NOT attempt to remove spring by twisting or stretching spring. *To install, reverse removal procedure, and note the following:* Bumper bolts should not bottom in threads. If they do, tap deeper with bottoming tap. Check to see that two-bolt bumper bracket is wider than gap between each bolt head and block. The single bolt shoulder should bottom on block face, allowing bracket to rotate freely.

VALVE SYSTEM

CHECKING VALVE STEM LENGTH: Position rocker arm on stud and hold in place using Rocker Arm Stud Installer J-8927. Slip valve into place and hold it against valve seat. While holding rocker arm and valve in position securely, insert Valve Train Gauge J-8928 through pushrod hole and seat snugly in pushrod seat of rocker arm. With all parts seated, step end of gauge should be flush with gasket face of head *(See NOTE below)*, but should not project past step on gauge. If gauge projects too far (valve stem too long), grind off tip of valve stem as necessary. *CAUTION* - When grinding end of valve stem be careful not to overheat it (may soften hardened stem).

►*NOTE:* Late production cylinder head requires a straight edge at this point because of the undercut. Clamp straight edge on lower inboard side of head (flush with bottom of head). Use this point as the reference point.

ROCKER ARMS

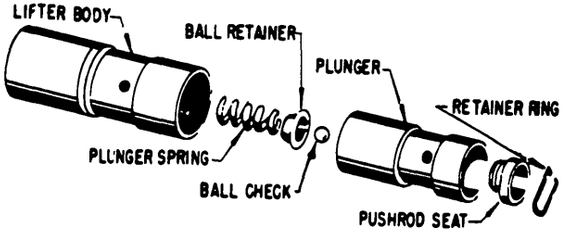
ROCKER ARM STUD REPLACEMENT: *NOTE–Use oversize stud (.003") only when original stud is found to be loose in cylinder head. Use Std. size stud for replacement when original stud threads are damaged.*

Removal: 1) Remove cylinder head. With rocker arm removed, file two slots, 3/32"-1/8" deep, on opposite sides of rocker arm stud. Top of slots should be 1/4-3/8" below thread travel. Place washer J-8934-3 at bottom of rocker arm stud. Position rocker arm stud Remover J-8934-1 on rocker arm stud and tighten screws securely with 5/32" Allen wrench. Place spacer J-8934-2 over stud remover. Thread 7/8" standard nut on stud remover and turn nut until rocker arm stud is out of cylinder head. If oversize stud being installed, ream out stud hole with Reamer J-5715.

2) Remove plugs from ends of cylinder head oil gallery and thoroughly clean out metal deposits and foreign matter from cylinder head (head must be right side up so metal or foreign material will not lodge around studs).

Installation: 1) Position rocker arm on new rocker arm stud and place Rocker Arm Stud Installer on stud in place of rocker arm ball. Carefully press stud into head using a 2-ton press, until it is installed about half-way (7/16").

2) Position Valve Train Gauge in pushrod hole so that it seats properly in the rocker arm. With valve seated, slowly press rocker arm stud into cylinder head until gauge projects about midway between end of gauge and step with respect to gasket surface of cylinder head. *NOTE* - On late production cylinder heads, clamp straight edge on lower inboard side of head (flush) and use for reference point.



3) Remove Rocker Arm Stud Installer, rocker arm and ball. Blow air through hole in new stud to insure that passage is not restricted, and blow air through oil gallery. Replace plugs in ends of oil gallery. Check oil passages from oil gallery to all studs. Install rocker arm and ball and install nut loosely. Replace cylinder head.

HYDRAULIC LIFTERS

HYDRAULIC VALVE LIFTER OVERHAUL: Removal– Remove intake manifold, pushrod cover and rocker arm cover. Loosen rocker arm ball nut and move rocker arm off pushrod. Remove pushrods and lifters.

Disassembly: Remove pushrod seat retaining ring by holding down seat with pushrod while dislodging spring from lifter body with pointed tool (*NOTE*–it may be necessary to unseat lifter ball, using plunger unloader J-5097, before plunger can be pushed down). Invert lifter and allow plunger to slide out of body. If plunger sticks, place lifter in large end of Hydraulic Valve Lifter Plunger Remover J-4160-A, with pushrod end of lifter downward. Hold tool firmly in hand with thumb over lifter body and strike sharply against a block of wood until plunger falls out (it may be necessary to soak a lifter with a stuck plunger in cleaning solvent to loosen plunger in body). *CAUTION–If more than one lifter is being disassembled at a time make very sure that parts for each individual lifter be kept together so that parts are not intermixed.*

Inspection: Wash individual lifters separately, keeping parts for each lifter together. If necessary, soak lifter in suitable carbon solvent to dissolve varnish and carbon. Using a lint free cloth, clean each part with a hard wiping action. Use a bristle brush if required. Do not use a wire brush or sandpaper. Inspect lifter body for scoring, and check cam surface at end of lifter for wear. Check plunger, and using a

HYDRAULIC VALVE LIFTER

magnifying glass, inspect check ball seat for defects, and outer surface of plunger for scratches or scores. Inspect pushrod seat for roughness and make sure hole in seat is open. Inspect lifter ball for nicks or scoring. If any part of lifter is found defective, replace entire unit.

Assembly: Rinse all parts in clean kerosene before assembly and assemble without drying. Rinse plunger spring and ball retainer and position retainer in spring. Install ball in retainer. Rinse plunger and place on retainer so seat on plunger mates with ball. Invert plunger with parts assembled thus far and, after rinsing body, install body over spring and plunger. Place lifter body on clean paper; rinse and install pushrod seat and retainer ring.

Checking Leakdown Rate: Fill tester cup in Valve Lifter Leakdown Tester J-5790, to approximately 1 inch from top with special testing fluid. Swing weight arm up out of way, raise ram, and position lifter into boss in center of tester cup. Place 7.32" steel ball in pushrod seat of lifter and lower ram onto ball. Adjust ram (with weight arm clear of ram) so that pointer is positioned on set line (marked "S"). Tighten jam nut to maintain setting. Operate lifter through full travel of plunger by pumping weight arm to fill lifter with test fluid and force out air, (Lifter must be completely submerged at all times). Continue pumping for several strokes after definite resistance is felt (*NOTE–If noticeably weak resistance is felt during any one of last few strokes (of hard pumping), replace ball in lifter and repeat test to this point.* Raise weight arm to allow plunger spring to expand fully; lower arm onto ram and commence turning crank slowly (1 revolution every 2 seconds). Time indicator travel from lower line (first line above set line) to line marked .125" or 1/8", while still rotating cup with crank. Lifter is satisfactory if rate is between 12 and 40 seconds. Check a questionable lifter 3-4 times before discarding.

Installation: *(CAUTION–If new lifter is to be installed, remove sealer coating from new lifter, making sure that hole in pushrod seat is not plugged with seal coating. Check leakdown rate).* Place new lifter in lifter boss and replace pushrod exactly as removed (same end against rocker arm). Tighten rocker arm ball retaining nuts to 15 ft. lbs. Replace rocker arm cover, pushrod cover and intake manifold.

OILING SYSTEM

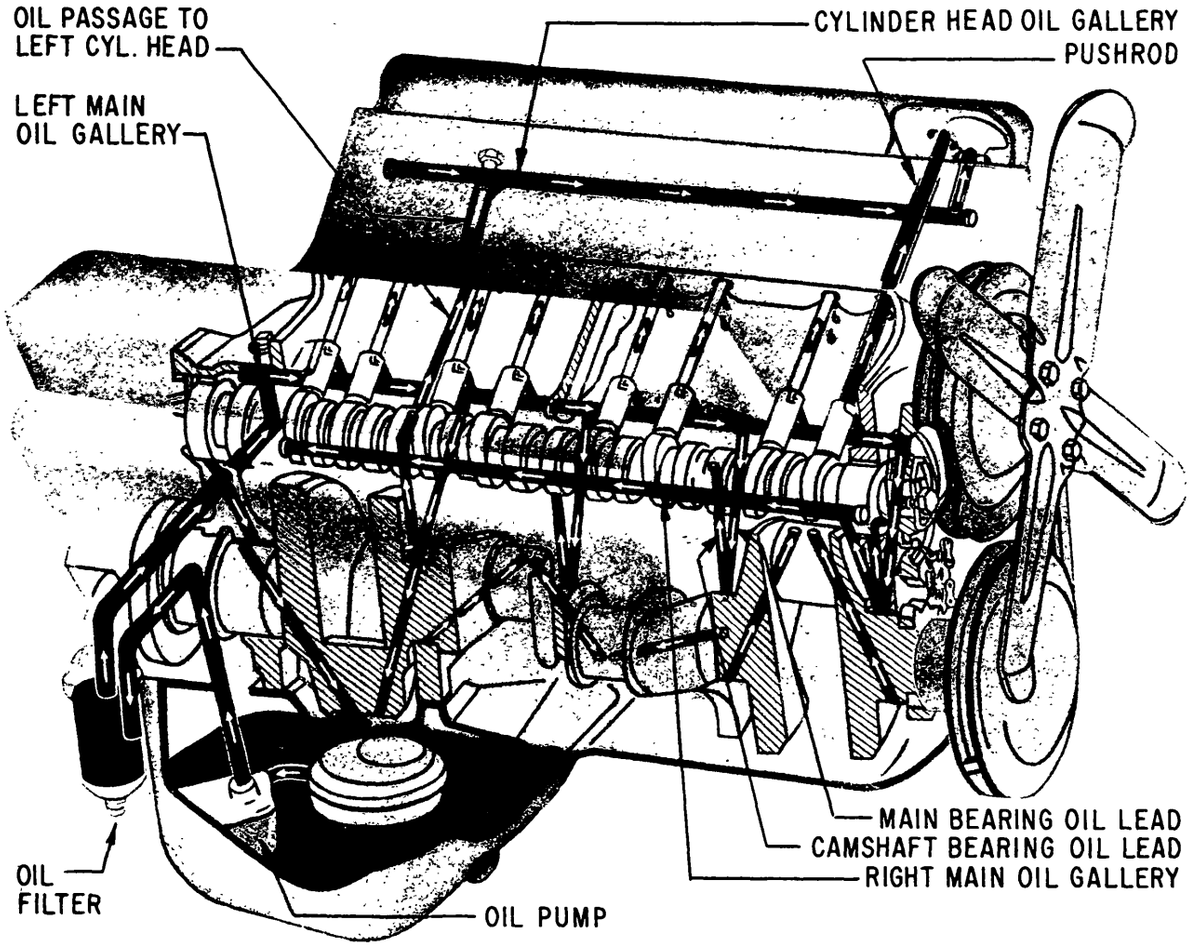
ENGINE LUBRICATION

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and to hydraulic valve lifters.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Metered oil is supplied to pushrod seats, rocker arms, timing chain and sprockets, and distributor drive gear. All other parts are lubricated by oil spray.



OPERATION: Gear type oil pump mounted on lower face of block in rear of crankcase draws oil up through floating oil strainer and intake pipe mounted on pump body and delivers oil through passages in pump body and crankcase to inlet port on oil filter mounting pad on right side of crankcase. From filter outlet, oil flows through transverse passage in rear end of block to rear end of left main oil gallery which extends along entire length of engine block. At forward end of left main oil gallery a "V" passage extends down to crankshaft bearing and up to forward end of right main oil gallery which also extends along entire length of engine block. Oil is distributed through these oil galleries as follows: **Crankshaft & Camshaft Bearings** - **Rear** bearings are lubricated through short vertical passage extending between crankshaft bearing bore and camshaft bearing bore and intersecting the oil filter outlet passage (above) from which oil is supplied to these bearings. **Other** bearings are lubricated by "V" passage in each crankcase web which extends down from left main oil gallery to crankshaft bearing bore and then up to camshaft bearing bore (additional passage at front crankshaft bearing supplies oil to right main oil gallery).

Connecting Rods - Crankshaft is drilled and each connecting rod bearing is lubricated through drilled hole from adjacent main bearing.

Pistons & Pins - Lubricated by oil jet thrown on cylinder walls through groove between rod and bearing cap of connecting rod for opposite cylinder when this groove lines up with oil hole in crankpin journal. *NOTE* - Rods must be installed with this groove upward or toward camshaft for this cross-lubrication.

Pushrods, Rocker Arms, & Valves - Pushrods are filled with oil directly through small hole in top of lifter for lubrication of upper and lower pushrod seats. Vertical passages in block at No. 2 camshaft bearing (for right bank), and No. 4 camshaft bearing (left bank) extend up through engine block and matching passages in head (passage in head is around one cylinder head bolt with grooved channel in lower face of head to connect with hole in block) to connect with cylinder head oil gallery which extends along entire length of each cylinder head. Oil in this system is metered by camshaft bearing and is fed intermittenly when oil holes line up. Rocker arm studs (pressed in head) extend down into this cylinder head oil gallery and have drilled oil passage with side hole at rocker arm ball seat through which oil flows to lubricate ball seat and up through grooves in ball to fill channel section of arm. This oil overflows end of rocker arm to lubricate valve tip. Excess oil in rocker chamber drains down pushrod openings into lifter chamber and oil drain holes in floor of lifter chamber (at each side of center crankcase web) return oil to the oil pan.

Valv Lifters - Hydraulic valve lifters are supplied with oil through short vertical passage extending from main oil gallery directly to lefter bore.

PONTIAC V8 ENGINE OILING SYSTEM (4 CYL. ENGINE SIMILAR)

Timing Chain, Sprockets, & Fuel Pump Eccentric - Drilled holes in camshaft front journal provide a jet of oil when hole in journal lines up with oil hole in bearing. This jet strikes camshaft thrust plate and part of the oil is diverted downward through grooves in front face of engine block and thrust plate for sprocket and chain lubrication. An additional hole in the thrust plate permits an oil jet to pass through opening in camshaft sprocket and lubricate fuel pump eccentric and rocker arm.

Distributor Shaft & Bushings - Lubricated through passage in block from main oil gallery.

OIL FILTER: Full flow type mounted on base adapter bolted on right side of crankcase. Bypass valve located in filter base assures engine lubrication if filter element clogged.

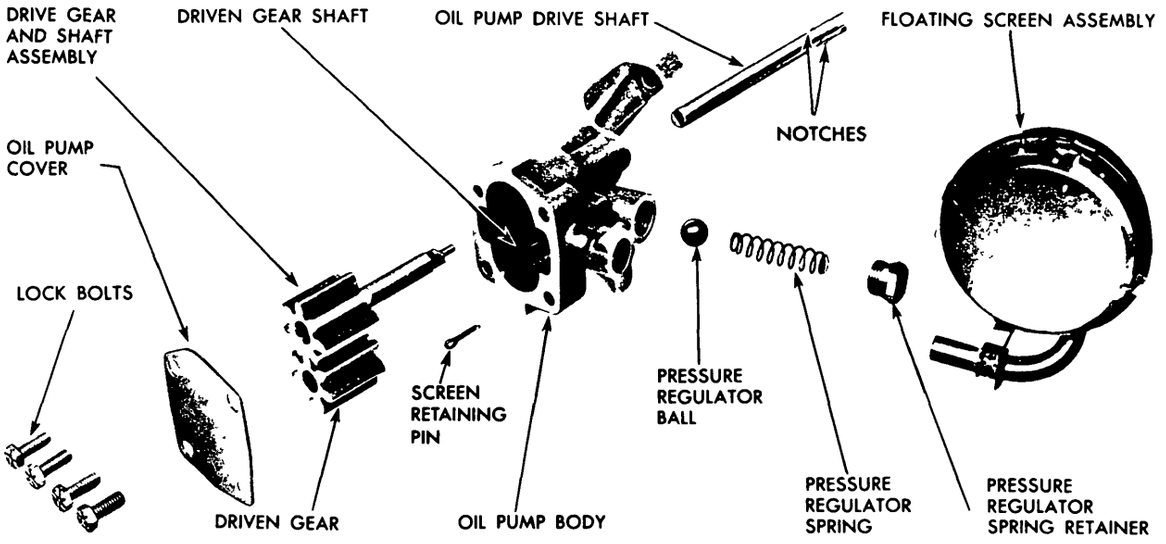
4 CYLINDER ENGINE

Engine design and oiling system similar to Pontiac V8 except for absence of left bank. See above.

OIL PUMP

OIL PUMP OVERHAUL: Removal—Remove oil pan and remove oil pump attaching screws while holding pump in place. Carefully lower oil pump away from block with one hand while removing oil pump drive shaft with the other hand.

Disassembly: Remove cotter pin which retains floating screen to pump inlet and remove screen. Remove pressure regulator and spring retainer, spring and pressure regulator ball. Remove screws retaining cover to oil pump body and remove cover. Remove driven gear and drive gear with shaft.



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Cleaning & Inspection: Clean all parts thoroughly (clean screen with Bendix Cleaner). Inspect pressure regulator spring for distortion, cracks, and wear on sides. Inspect pressure regulator ball for nicks or other damage. Inspect oil pump drive shaft (distributor to pump shaft) for wear or cracks. Inspect all other pump parts for wear. Replace parts as necessary.

Ass mbly: Install drive and driven gears. Install cover and turn drive shaft by hand to insure that it turns freely and has a slight amount of endplay. Install pressure regulator ball, spring and retainer using a new gasket on retainer. *(CAUTION–Do not attempt to change il pr ssur by varying length of pressure regulator spring).* Install screen assembly on oil pump and install new cotter pin retainer.

Installati n: To install pump, position drive shaft into position in distributor and oil pump drive gear, then position oil pump in place on block, indexing drive shaft with pump drive gear shaft. Install two attaching screws with lockwashers and tighten securely. *(NOTE–* Removal and installation of pump does not disturb distributor timing). Install oil pan.

PONTIAC OIL PUMP (ALL MODELS)

►*JACKING & HOISTING CAUTION: B fore jacking, hoisting, or working und r car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

►*STARTING CAR BY PUSHING CAUTION: Hydra-Matic cars CANNOT be started by pushing because of transmission design.*

►*HYDRA-MATIC TRANSMISSION USAGE NOTE:* **3-Speed type** used in Catalina & Ventura (23 & 25) Series; **4-Speed type** used in Star Chief & Bonneville (26,27 & 28) Series.

MODEL IDENTIFICATION

Series	①Series Designation
Catalina	23
Ventura	25
Star Chief	26
Bonneville Safari (Station Wagon)	27
Bonneville	28

① - First two digits of series and body style designation following "61" year number under STYLE on body identification plate.

SERIAL & ENGINE NUMBER: Stamped on plate on left front door hinge pillar post and on front of right bank of engine on lower outer edge near water pump outlet hose. (See also engine production Code Number below). Number (example below) includes identification data.

① ② ③ ④
3 61 P 1001

① - Series. **3** - 23, **5** - 25, **6** - 26, **7** - 27, **8**-28.

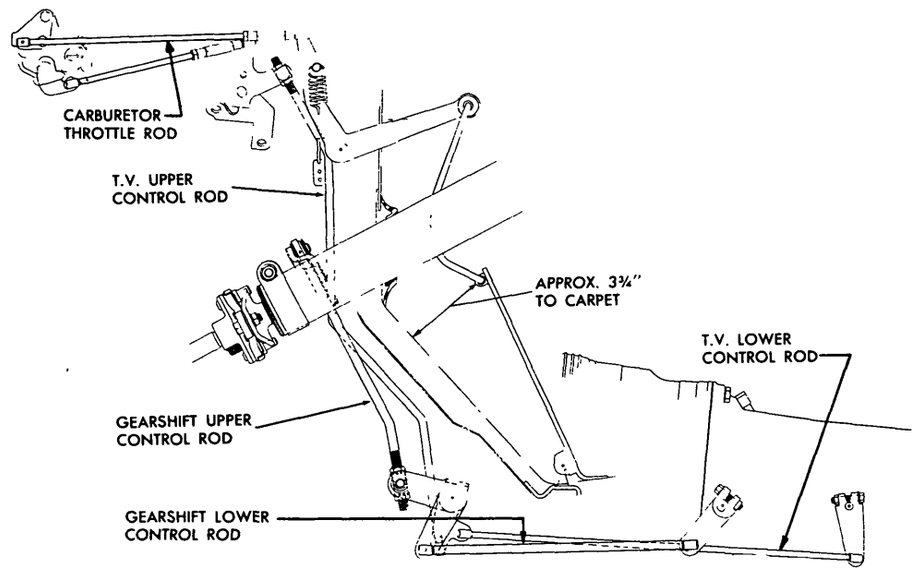
② - Model Year. **61** 1961.

③ - Assembly Plant. **P** Pontiac, **S** South Gate, **W** Wilmington, **K** Kansas City, **L** Linden, **D** Doraville, **A** Arlington.

④ - Beginning vehicle number for each prefix combination.

Engine Production Code Number: Stamped on front face of right cylinder bank on upper edge near water pump outlet. *Do not confuse this number with Serial and Engine Number.*

►*ENGINE IDENTIFICATION LETTER CODE:* Forty-three different engine combinations used. Letter code (A2, F4, etc.) stamped on small pad directly below Engine Production Code Number. Letter code indicates various items of equipment used in a particular engine and will be listed in following data.



TUNE-UP

►*COLD START & TRANSMISSION FORCED DOWN-SHIFT IMPROVEMENT CHANGE (Cars with single 2-Bbl. or Triple 2-Bbl. Carburetors):* Throttle rod should be positioned in MIDDLE hole of carburetor throttle lever (was in top hole). Later cars have this change.

►*LEANNESS DURING WARM-UP CORRECTION (Early Cars with 2-Bbl. Carburetors): See "Rochester 2GC Carburetors" below.*

►*FLOODING CORRECTION (Early Cars with 2-Bbl. Carburetors): See "Rochester 2GC Carburetors" below.*

►*STALLING AFTER STARTING, LEANNESS DURING WARM-UP, OR "BUMP" ON ACCELERATION (Early Cars with 4-Bbl. Carburetors): S e "Cart r AFB Carbur t rs" below.*

HYDRA-MATIC THROTTLE LINKAGE

COMPRESSION PRESSURE: 140-150 lbs. (8.6-1 ratio), 155-165 lbs. (10.25-1 & 10.75-1 ratios) at 155-165 RPM. Lowest cylinder must not be less than 80% of highest cylinder.

VALVE TAPPET CLEARANCE: Zero lash, hydraulic lifters.

MANIFOLD HEAT CONTROL: Thermostatic coil type in right exhaust manifold outlet. Valve must operate freely and anti-rattle spring must be installed in a downward position. Bend anti-rattle bracket so counterweight strikes stop before heat valve strikes inside of manifold in closed position.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".
Spark Plugs - AC No. 45S (No. 43S for high speed driving). 14 mm. Torque to 25 ft. lbs.

COIL: Delco-Remy No. 1115134.
Ignition Current - 2.1 amps. idling, 3.4 amps. stopped.
Resistor - Resistance wire (1.28-1.36 ohms) connected in circuit between coil and IGN.1 terminal of ignition switch. Bypassed during cranking by second lead from ignition switch.

DISTRIBUTOR: Delco-Remy No. 1110971 (8.6-1 ratio), No. 1110970 (10.25-1 & 10.75-1 ratios), No. 1110976 (Racing). *NOTE* - Distributor 1110976 is Double Breaker type.

Condenser - Delco-Remy No. 1932004 (Distr. No. 1110971, 70).
Capacity - .18-.23 mfd.
Contact Point Set - Delco-Remy No. 1931988 (Distr. No. 1110971, 70).
Breaker Gap (1110970 & 71) - Gap (.016") will be correct when cam angle correctly set.
Breaker Gap (1110976) - .014-.018" (new points).
Cam Angle (1110970 & 71) - 28-32°. Set at 30°. Will give .016" breaker gap.
Cam Angle (1110976) - Adjust each set of points to 29°±1°, which should give cam angle of 34°±1° (both sets of points operating together).
Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Counterclockwise viewed from above.

Automatic Advanc - 1110971

Degrees	Distr.	RPM	Degrees	Eng.	RPM
0-2		450	0-4		900
6-8		1050	12-16		2100

Start		0	8-10
10		20	14 75-16 75

IGNITION TIMING

Setting - 6° BTDC with engine at correct idle speed, at operating temperature, and with distributor vacuum line disconnected

►*IGNITION TIMING NOTE* The above timing setting (6° BTDC) is for operation on regular fuels (8 6-1 ratio engine), and for premium fuels (10 25-1 & 10 75-1 ratio engines) Do not retard later than 0° for any reason

Timing Marks - Two marks on harmonic balancer, TDC and 6° BTDC Pointer on timing sprocket cover aligned with correct mark on balancer

CARBURETOR

►*CARBURETOR APPLICATION Carter and Rochester carburetors used as follows·*

Model	Carburetor
All Models (Except Bonneville)	Rochester 2-Bbl
Bonneville	Carter AFB 4-Bbl
All Models (Optional)	Rochester Triple 2-Bbl

THROTTLE LINKAGE ADJUSTMENT: With engine and transmission at normal operating temperature, idle speed correctly set, proceed as follows Loosen both nuts on transmission throttle control rod trunnion Stop engine and install Linkage Adjusting Pin J-7687 through holes in throttle control lever and bracket *NOTE - On cars with throttle return check, remove throttle return check or install Holding Tool J-6342-01 over return check* Close throttle valves fully and loosen locknut on transmission throttle control rod Adjust length of rod so gauge pin is a free fit in holes Tighten locknut, but leave pin in place Push transmission throttle control rod down until transmission throttle control outer lever reaches end of its travel *CAUTION - Upper locknut must not touch trunnion* Hold rod and tighten upper and lower trunnion locknuts finger tight **Then shorten rod** by backing off lower nut 2½ turns Tighten upper nut securely Remove gauge pin Loosen locknut on carburetor throttle rod and adjust rod so there is 4 35/64" clearance from underside of attaching boss on accelerator pedal to body toe pan (3¾" to carpet) Tighten locknut Remove Tool J-6342-01

►*IMPROVED "FORCED DOWN-SHIFT" PERFORMANCE (Cars with singl 2-Bbl or Triple 2-Bbl Carburetors)* Make certain throttle rod is positioned in MIDDLE hole of carburetor throttle lever

►*THROTTLE LINKAGE ADJUSTMENT CAUTION (Cars with 4-Bbl Carburetor)* Throttle control rod assembly connecting throttle valve lever to idler lever at rear of engine may be too short for proper security (after adjustment) Lengthen rod by using hex connector assembly from throttle rod, Part No 537182, in place of connector used in production

THROTTLE RETURN CHECK ADJUSTMENT: Make carburetor fast idle adjustment (4-Bbl), then stop engine On 2-Bbl , rotate fast idle cam so idle speed screw rests on next to highest step of fast idle cam On 4-Bbl , rotate fast idle cam so fast idle screw rests on highest step of cam Clearance between contact screw and contact on throttle lever should be 062- 067" (2-Bbl with choke on throttle body), 090- 095" (2-Bbl with choke on air horn and all 4-Bbl) Adjust by turning contact screw (hold sleeve next to diaphragm bracket from turning)

ROCHESTER 2GC 2-BARREL

Car Model	Carburetor No.
Std Engine Synchro-mesh	Ⓒ 7019060
Std Eng H-M 4-Speed No Air Cond	② 7019070
Std Eng H-M 3-Speed No Air Cond	② 7019071
Std Eng H-M 4-Speed With Air Cond	② 7019072
Std Eng H-M 3-Speed With Air Cond	② 7019073
425E Eng H-M 4-Speed No Air Cond	Ⓒ 7019074
425E Eng H-M 3-Speed No Air Cond	Ⓒ 7019075
425E Eng H-M 4-Speed With Air Cond	Ⓒ 7019076
425E Eng H-M 3-Speed With Air Cond	Ⓒ 7019077

Ⓒ - 1 7/16" throttle bore with choke on air horn
② - 1 11/16" throttle bore with choke on throttle body

►*LEANNESS DURING WARM-UP CORRECTION (Cars with Automatic Transmission)* On carburetors prior to change "A" as indicated on carburetor identification tag modification kits can be installed Carburetors marked "A" or later have these changes made in production *See 'Rochester 2G & 2GC Carburetors in Carburetion Section*

►*FLOODING CORRECTION (Early Cars)* On carburetors with "flat" type bowl cover gasket, install later type "domed" gasket, Part No 7021007 to provide increased float clearance Later carburetors have this type gasket and modified float

►*PUMP DURATION SPRING CHANGE FOR IMPROVED ACCELERATION PERFORMANCE (Auto Trans Cars).* Carburetors marked "C" or later on identification tag have new Pump Duration Spring, Part No 7011385

►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrel feeds Cyls 2-3-5-8, LEFT barrel feeds 1-4-6-7*

►*IDLE COMPENSATOR CAUTION* Idle Compensator (thermostatically controlled idle air bypass) used on all cars with Air Conditioning Compensator valve must be closed when making idle setting and idle speed adjustments Press on spring-loaded button on rear of carburetor throttle body

Idle Setting - Initial setting 1½ turns open Turn screw out for richer mixture

Idle Speed - 480-500 RPM with Hydra-Matic in "DR" 540-560 RPM with Air Cond "Off" and Hydra-Matic in "DR"

Float Level - 5/8"±1/16" (Std Eng Hydra-Matic), 11/16"±1/16" (Std Eng Synchro-mesh & 425E Eng) between bottom of float seam at toe end and air horn gasket with air horn inverted, gasket in place and needle seated Use Gauge J-8556(5/8"), J-8557 (11/16") To adjust, bend float arm

Float Drop - 1¾" (Gauge J-8556 or J-8557) from gasket surface to lowest point of float with air horn upright, gasket in place and float hanging free To adjust, bend float tang

Fast Idl : No adjustment Fast idle will be correct when hot or slow idle correctly set

Automatic Choke Setting: Centered at index

Throttle Linkage Adjustment: *See CARBURETOR abov*

►*OTHER DATA See "Rochester 2G & 2GC Carburetors" in Carburetion Section*

CARTER AFB 4-BARREL

Carter AFB 4-Barrel. Standard on Bonneville, Optional on all other models as follows

Transmission	Carburetor N .
Synchro-mesh	3123S, SA
Hydra-Matic 4-Speed	3124S, SA, SB
Hydra-Matic 3-Speed	3125S, SA, SB

►*"BUMP" ON ACCELERATION CORRECTION (Cars with 3123S, 3124S, 3125S Carburetors)* This condition noted when throttle fully opened above 30 MPH 1-5 miles after Cold Start Correct by installing new Secondary Clusters *See 'Carter AFB 4-Bbl Carburetors" in Carburetion Section*

►*STALLING AFTER START & LEANNESS DURING WARM-UP CORRECTION (Early Automatic Trans Cars) On 'S" and "SA" carburetors, see 'Carter AFB 4-Bbl Carburetors' in Carburetion Section for recommended Automatic Choke and Pump Connector Link settings NOTE - 'SB' carburetors have above settings and other production changes*

►*MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyls 2-3-5-8, LEFT barrels feed 1-4-6-7*

►*IDLE SPEED ADJUSTMENT NOTE Idle Air Bypass screw on throttle body is used to adjust idle speed.*

Idle Mixture & Speed Setting - Special procedure required to insure correct mixture and speed (idle air) screw settings *See 'Carter AFB 4-Barrel Carburetors' in Carburetion Section*

Throttle Linkage Adjustment: *See CARBURETOR above*

►*OTHER DATA See "Carter AFB 4-Barrel Carburetors" in Carburetion Section*

TRIPLE CARBURETORS (Rochester 2G & 2GC)

	Rochester Carburetor N .		
Transmission	Front	Center	R ar
Synchro-mesh	7013063	7019064	7013065
Hydra-Matic 4-Speed	7013063	7019067	7013065
Hydra-Matic 3-Speed	7013063	7019069	7013065

Idle Speed - Same as other models (see 2GC data above)

For complete adjustment data on these carburetors (including linkage adjustment to insure correct synchronization), see "Rochester Triple Carburetors" in Carburetion Section

CARB. EQUIPMENT

Fuel Pump· AC No 4512 Fuel only
Pressure - 5¼-6½ lbs at 500-1000 RPM

Fuel Filter AC No GF-61P (exc Air Conditioning), No GF-73 (Air Conditioning) Located near fuel pump in line between pump and carburetor Replace at 15,000 miles or every 12 months

Gasoline Gauge: AC electric type
Dash Unit - AC No 5643436 (Std), 5643520 (Optl)

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Tank Unit - AC. Used as follows:

Model	Std. Cars	Air Cond. Cars
All exc. Sta. Wgn.	5641736	5641737
Station Wagon	5641570	5641571

Air Cleaner: Standard - Oil wetted type. Service Spring and Fall or every 10,000 miles. *NOTE - In dusty areas, service every 2,000 miles or oftener.* Clean by immersing element in gasoline or kerosene and reoiling with engine oil.

Heavy Duty - Paper element type, replace or clean every 15,000 miles or yearly. *CAUTION* - Clean by blowing air on inner circumference of filter element.

►*POLYURETHANE ELEMENT NOTE & CLEANING CAUTION:* Plastic type. May be used to replace other elements and may be found on cars in service. Clean element by removing it from screen and washing in solvent (such as kerosene at room temperature) and squeezing dry (*CAUTION - DO NOT wring dry*). Dip element in SAE 10W-30 oil, squeeze to remove excess oil, reinstall element on screen with sealing edges evenly overlapping the screen.

BATTERY

Delco. Used as follows:

Synchro-mesh Cars - 2SMR53, No. 458. 12 volt, 9 plate, 53 ampere hour capacity (20 hr. rate).

Hydra-Matic Cars - No. 558. 12 volt, 11 plate, 63 ampere hour capacity (20 hr. rate).

Extra Duty Battery - 3SMR72, No. 670. 12 volt, 11 plate, 72 ampere hour capacity (20 hr. rate).

Battery Ground - Negative.

Engine Ground - Left front corner of left cylinder head.

STARTER

Delco-Remy No. 1107791 (8.6-1 ratio except 425E Eng. with Air Cond.), No. 1107781 (All others). *NOTE - Starter No. 1107781 is "Two Shunt" type.*

Armature - Delco-Remy No. 1950563 (1107791 Str.), No. 1949770 (1107781 Str.).

Drive - Overrunning clutch (solenoid pinion shift).

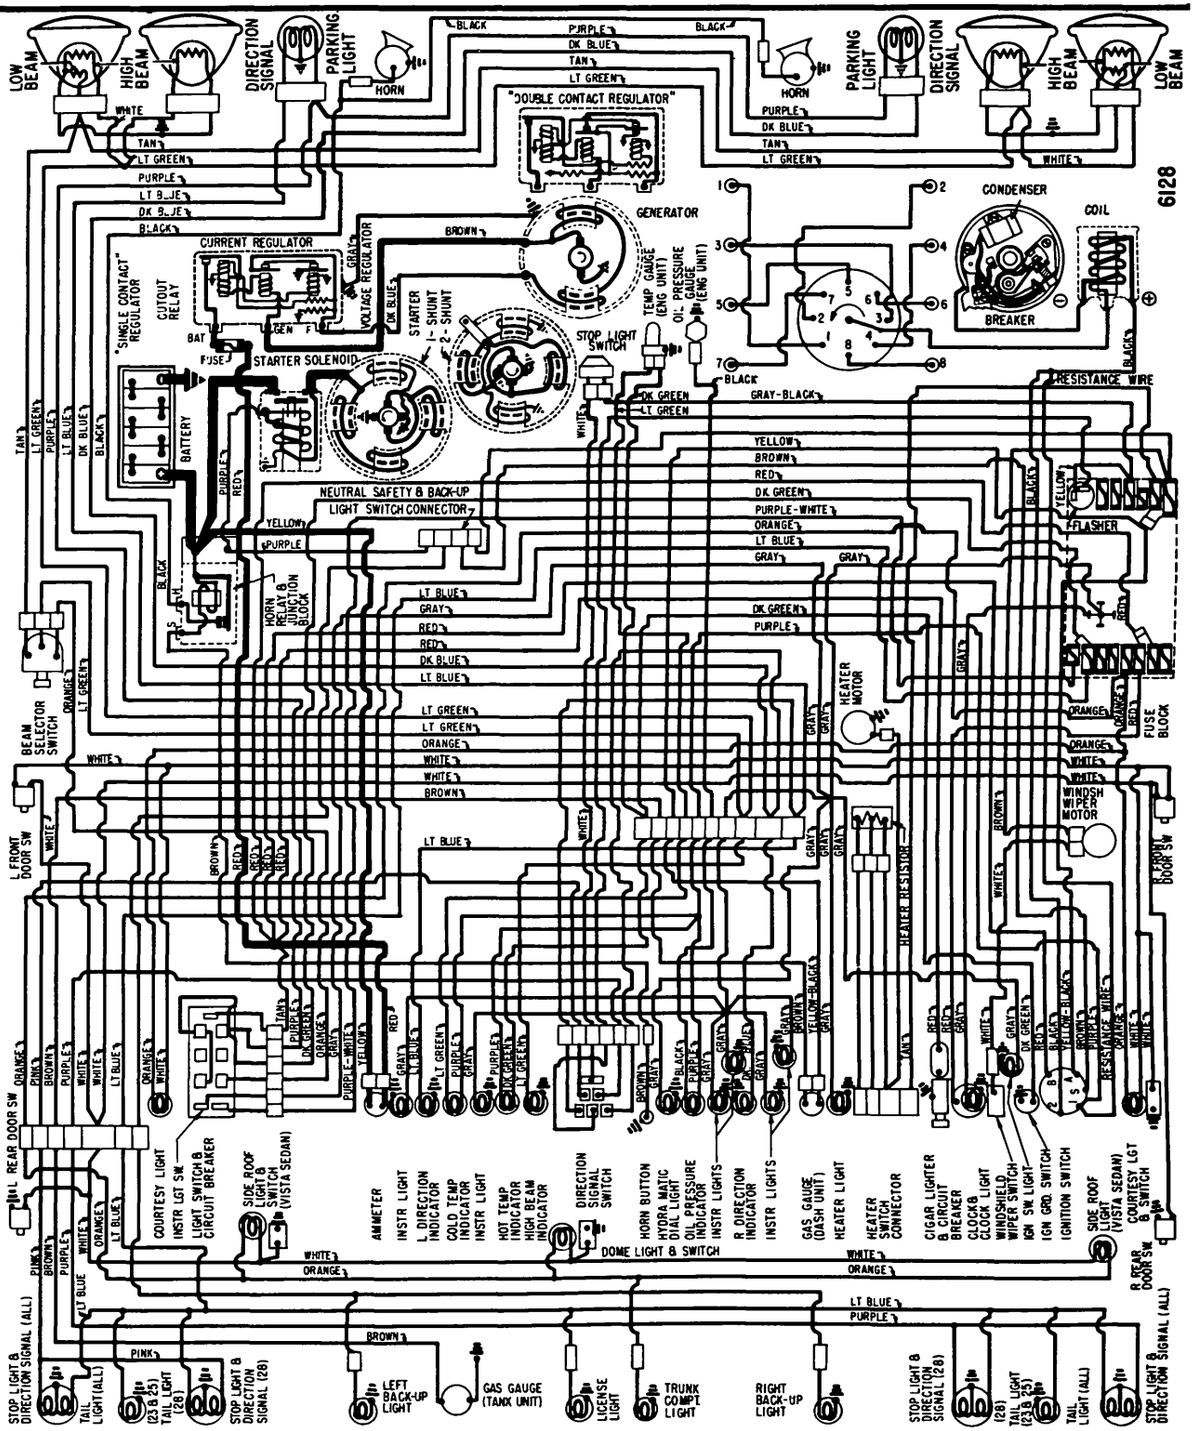
Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs. minimum.

Performance Data - 1107791

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10.5 ft. lbs.	Lock	5.8	435

Performance Data - 1107781



Torque	RPM	Volts	Amperes
0 ft. lbs.	3900-5400	10.6	80-120
	Lock	2.0	290-370

Starting Switch: Delco-Remy Solenoid No. 1119798 (Synchro-mesh), No. 1114257 (Auto. Trans.) mounted on starter and controlled by Ignition & Starter Switch.

Neutral Safety & Back-up Light Switch: Delco-Remy No. 1998705 located on steering column behind instrument panel.

Adjustment - *See "Dual-Coupling Hydra-Matic Drive" in Transmission Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

GENERATOR

►*CHARGING CIRCUIT FUSE CAUTION Battery charging circuit protected by a 45 amp fuse, No 1945172 (Std Reg), 60 amp fuse, No 1945171 (Double Contact Reg) clipped to 'BAT" terminal of generator regulator Check for blown fuse when diagnosing gen rator, regulator, or battery failure*

Ic -Remy Used as follows

Model	Early - Generator - Late	
Std Heater	1102203	1102263
Deluxe Heater	1102199	1102264
Hvy Duty & Air Cond	1102220	
Hvy Duty Low Cut-In	1105143	
3 2-Bbl Carbs ①	1102240	1102265

① - Also use with 425A Engine

►*GENERATOR VIBRATION CORRECTION (EARLY CARS)* To correct vibration or resonance at 30-50 MPH install Brace No 540599 from generator mounting bracket to cylinder head, and Brace No 540601 from bracket to exhaust manifold

Performance Data

Generator	Amperes	Volts	RPM
1102203	30	14 0	2240
1102263	30	14 0	2310
1102199 & 240	35	14 0	2630
1102264 & 265	35	14 0	2730
1102220 & 1105143	45	14 0	2520

Rotation - Counterclockwise at commutator end
Brush Spring Tension - 28 ozs
Field Current - 1 69-1 79 amps (1102203, 199 & 240) 2 66-2 86 amps (1102220 & 1105143), 1 48-1 62 amps (1102263, 264 & 265) at 12 volts and 80°F
Belt Adjustment - ¼" deflection with 5-6 lbs pressure midway between pulleys (Std), 1/8" deflection with 6-7 lbs pressure midway between pulleys (Air Cond)

GENERATOR REGULATOR

Delco-Remy. Used as follows

Regulator	Generator
1119001①	1102203 & 1102263
1119002②	1102199 240 264 & 265
1119600③	1102220 & 1105143
1119604④	1102199 240, 264 & 265
1119663⑤	1102203 & 1102263

① - Regulator Assembly No 1119263 (with fuse)
② - Regulator Assembly No 1119264 (with fuse)
③ - Regulator Assembly No 1119623 (with fuse)
④ - Used for Headlight Flicker Correction *See HEADLIGHT FLICKER CORRECTION under MISC ELECTRICAL below*

►*REGULATOR NOTE* Regulators 1119600, 1119604 & 1119663 are "Double Contact" type

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE*

NOTE - Specifications below are 'Normal ' settings

Cutout Relay

Cuts In - 11 8-13 5 volts (1119001 002) 11 8-13 0 volts (1119600, 604 663) hot
Contact Gap - 020"
Air Gap - 020" with contacts just closed

Voltage Regulator

Setting (1119001, 002) - 13 8-14 7 volts at 125°F ambient temperature
Setting (1119600, 604, 663) - 13 8-14 6 volts operating on upper contacts 1- 3 volt lower operating on lower contacts at 125°F ambient temperature
Contact Gap (1119600, 604, 663) - 016" (upper contacts) with lower contacts just touching
Air Gap - 075" (1119001, 002), 067" (1119600, 604, 663) with armature pressed down to point where contacts just touch

Current Regulator

Setting - 27 0-31 0 amps (1119001), 27 0-33 0 amps (1119663), 31 0-35 5 amps (1119002, 604), 38 0-45 0 amps (1119600) at 125°F ambient temperature
Air Gap - 075" with armature pressed down to point where contacts just touch

►*OTHER DATA See 'Delco-Remy 6 & 12-Volt Single Contact Regulators or 'Delco-Remy 12-Volt Double Contact Regulators ' in Electrical Section*

ALTERNATOR & REGULATOR

Delco-Remy Alternator No 1117070 with Regulator No 9000562.
Rotation - Clockwise at drive end
Brush Spring Tension - 13 ozs
Field Current - 5 6-6 3 amps at 12 volts and 80°F
Rated Output - 60 amps at 14 volts at 2500 RPM hot (58 amps Cold)

►*OTHER DATA See 'Delco-Remy (Internal Rectifier) Alternator & Transistorized Regulator in Electrical Section*

MISC. ELECTRICAL

►*HEADLIGHT DIMMING OR FLICKER CORRECTION* If this trouble not corrected by usual corrective procedure, replace single contact regulators, Nos 1119001 and 1119002 with Double Contact Regulator Nos 1119663 and 1119604 *See Regulator data above for application and specifications*

Headlights 4-Headlight System

Direction Signals Switch located on steering column behind instrument panel To remove, remove attaching screws and washers remove assembly and horn wire retainer from steering column housing To install, reverse removal procedure

►*FLASHER IDENTIFICATION NOTE* Use flasher unit marked AP 2 (on 23 & 25 Series), AP 3 (on 26 & 28 Series) Flasher mounted on fuse block located on dash shroud above front edge of left floor mat

Instrument Cluster Removal Disconnect battery Disconnect cluster wire at chassis wiring harness connection below plenum chamber On cars with Circ-L-Aire Conditioning remove instrument cluster pad and trim plate (retained with clutch head screws) Remove radio knob and retaining nut Push cluster toward front seat and using a sprin wrench or deep socket, remove lockwashers and nuts Disconnect speedometer cable and remove wire connector from ammeter terminals and other electrical connections On all cars without Circ-L-Aire Conditioning push cluster toward front of car, turn cluster upside down and remove To install, reverse removal procedure

Speedometer Removal (Cluster Removed) Disconnect Safeguard control cable (if so equipped) by pulling straight out Remove cluster face plate and lens by unsnapping face plate from housing Remove screws on back of cluster at speedometer cable fitting area Remove speedometer and instruments carefully If car is equipped with Safeguard speedometer, disconnect ground wire at clip terminal and also the wire retainer clip Carefully note routing of wires before removing ground wire Remove screws retaining numeral plate and remove speedometer head assembly To install, reverse removal procedure

Lighting Switch Removal: Disconnect battery Pull headlight switch knob "ON" Push latch button on side of switch assembly and pull out switch knob assembly Screw bushing from switch assembly, freeing switch from instrument panel

Stop Light Switch Location Mechanical type located on bracket attached to steering column behind instrument panel
Adjustment - Loosen locknut and position switch thread 3/16" to pedal arm with brake fully released *NOTE - Switch must not restrict pedal action*

CIRCUIT BREAKER- 22 Ampere - Headlights High beam indicator Parking & Tail lights In headlight switch *NOTE - Tail lights also protected by 14 ampere fuse in fuse block*

FUSES: *All fuses located in fuse block behind brake & clutch pedals on dash panel inside car Fuses are on RIGHT side of names*
25 Ampere - Back-up lights, windshield wiper & washer
14 Ampere - Tail & License lights
14 Ampere - Stop lights & Direction signals
14 Ampere - Dome & Courtesy lights, trunk light
14 Ampere - Clock & Glove Box lights
7.5 Ampere - Radio
4 Ampere - All Instrument Panel lights (including Rheostat)
Cigar Lighter - Fuse or circuit breaker on forward end of lighter housing

Horn Relay Delco Remy 1116970

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine See 'Air Conditioning Service Cautions in Miscellaneous Section*

►*CYLINDER HEAD PRODUCTION CHANGE* New type left and right cylinder heads used in production on later models New heads are cast with an undercut at lower inboard edge For revised procedures in checking rocker arm stud length and valve stem length, *see "Valves" in Pontiac Special Data*

ENGINE SPECIFICATIONS- Own. V8, valve-in-head All engines are basically the same with modifications and optional equipment as indicated *See Engine Identification Letter Code under MODEL IDENTIFICATION above Reference will be made to Letter Code to indicate on which engines various items will be found*

►*425A ENGINE NOTE* These engines are Letter Codes F4, M4, RM4, FO MO U9 V9 RMO RV9

CONTINUED ON NEXT PAGE

See INDEXES on Pgs 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data

CONTINUED FROM PRECEDING PAGE

►*425E ENGINE NOTE* These engines are Letter Codes E3, E7, W3, W7

Engine	Bore	Stroke	Displacement	Rated HP
All	4 1/16"	3 3/4"	389 cu ins	52 8

Engine©	Compr. Ratio	Developed HP
Std (2-Bbl , S-M)	8 6-1	215 at 3600 RPM
Std (4-Bbl , S-M)	8 6-1	235 at 3600 RPM
425E (2-Bbl , H-M)	8 6-1	230 at 4000 RPM
Optl (2-Bbl , H-M)	10 25-1	267 at 4200 RPM

425A (3 Carbs , All Trans)	10 75-1	348 at 4800 RPM

© - S-M (Synchro-mesh), H-M (Hydra-Matic)

Compression & Vacuum Reading - *See TUNE-UP*

►*ENGINE WHINE AT 800-900 RPM CORRECTION:* Noise may sound like propeller shaft or transmission front bearing noise Caused by interference between engine oil pan and oil pump To correct, tap lightly on rear of oil pan on **left** side of dimple to relieve pan on right side of dimple

OIL PAN REMOVAL: Drain radiator and crankcase Remove hood and air cleaner Disconnect battery ground cable and radiator hoses Move coil away from body Disconnect exhaust manifolds from exhaust pipes Lower idler arm and tie rod by disconnecting idler arm bracket from frame Disconnect engine front mounts Lower starter from clutch housing Remove oil pan retaining bolts Remove clutch housing lower cover Raise engine as high as possible and remove flywheel cover Let oil pan drop from block Remove front main bearing cap and position crankshaft at No 1 firing position Hold crossover pipe and tie rod down and remove oil pan-

Installation - Use new gaskets and cement gasket in rear main bearing cap 1-1¼" from both sides of groove Push pan into place (hold crossover pipe and tie rod down) and install front main bearing cap *NOTE - Place a jack stand under front frame and lower engine to torque cap bolts to 95 ft lbs* Reverse removal procedure to complete installation

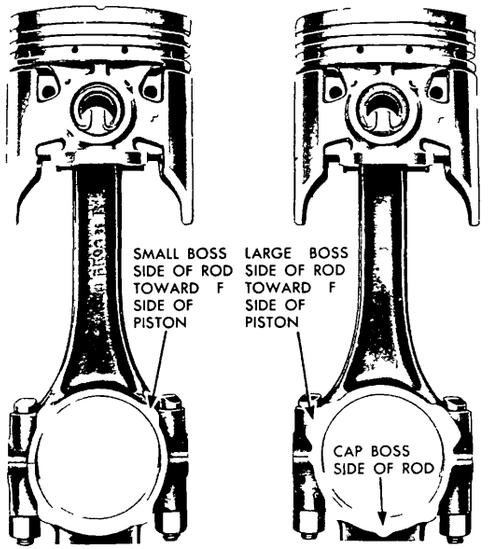
CYLINDER HEAD: *See "Cylinder Head & Manifold' in Pontiac Special Data*

TIGHTENING TORQUES: *See 'Tightening Specifications' in Pontiac Special Data*

PISTONS

Aluminum alloy, tin plated, with piston pin offset 1/16" to right *See "Piston Note" below*

►*PISTON NOTE* Various types used as follows



Low Compression (8.6-1 Ratio) - Pistons have recess or dish in head and are identified by TWO notches at front of piston head and mark "L" on rear piston pin boss *These pistons must not be used in 10 25 & 10 75-1 ratio engines*

High Compression (10.25 & 10.75-1 ratios) - "Flat Top" type Pistons have valve clearance reliefs machined on head and are identified by ONE notch at front of piston head

Removal - Pistons and rods removed from above

Piston Clearance - 0007- 0013" measured 1 18" below top of skirt Fit pistons with 0015" x ½" feeler Pull to withdraw feeler should be 8-15 lbs *NOTE - 0022-0027" clearance on 425A engines, police cars, and 3 carb synchro-mesh engines*

Installing Pistons - Install piston with notches in piston head and "F" mark on piston boss toward front of engine *See Rod Installation*

PONTIAC PISTON & ROD ASSY

Replacement Pistons: Police, T425A & Three 2-Bbl. Carb. - Furnished Std (4 060", 4 061", 4 062" "Flat Top") and 005", 010", 020", 030" Oversize

All Others - Furnished Std (4 061", 4 062", 4 063" "Flat" or "Recessed" Top) and 005", 010", 020", 030" Oversize

PISTON PIN

Pin is press fit in rod

Diameter - 9802" **Length** - 3 25"

Pin Fit in Piston - 0003 0005" loose Piston must turn freely on pin

Pin Fit in Rod - 0008- 0016" press fit

Piston Pin Removal & Installation - *See "Piston Pins' in Pontiac Special Data*

Replacement Pins: Furnished Std and 001", 003" Oversize

PISTON RINGS

Compression rings are cast iron, taper faced No. 1 has thick chrome, No. 2 has Lubrite finish. Oil ring is segmented spring steel with chrome face on rails.

Ring	Width	End Gap	Side Clearance
Compr. (1)	078"	.016-.026"	.0015-.0030"
Compr. (2)	.078"	.013-.025"	.0015-.0035"
Oil	184"	.015-.035"	.0015-.0085"

Installing Rings - Step or chamfer on upper compression ring and letter "T", dot, or word "TOP" on lower compression ring toward the top.

Replacement Rings: Std. and 005", .010", .020", .030" Oversize

CONNECTING ROD

Length - 6 63" (center-to-center)

Crankpin Journal Diameter - 2.2492-2.2502".

Lower Bearing - Durex 100A, steel-backed, replaceable precision type, no shims

Clearance - 0005-.0025"

Sideplay 006 011"

Replacement Bearings: Std 001" and 002" Undersize

Installing Rods: Pistons have "F" marks and one notch (10 0 1 & 10 5-1 ratios) two notches (8 6 1 ratio) on front Install rods so that LARGE machined boss at lower end of rod on same side as "F" mark and notch in piston (Left bank cyls 1 3 5 7) on opposite side of piston from "F" mark and notch (Right bank cyls 2-4 6 8) Install assemblies in engine with "F" marks and notches on piston toward front of engine and oil groove in lower end of rod toward center of engine

CRANKSHAFT

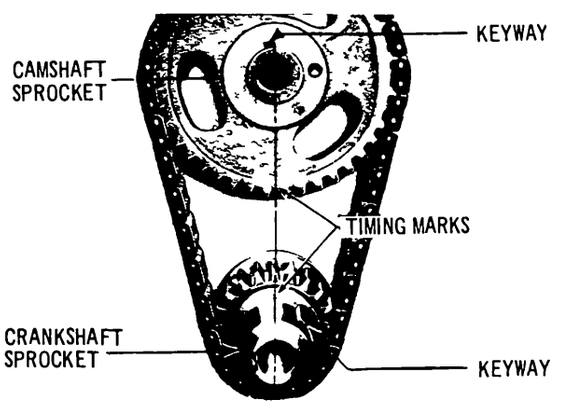
Journal Diameter - 3 000" Five bearings.

Bearings - M-400 (No 4) Durex 100-A (Others) Steel backed inserts, precision type, no shims.

Clearance - 0005- 0025" (Front), 0005- 003" (All Others)

End Thrust: Taken by No 4 (rear center) main bearing

End Play - 0035- 0085"



Replacement Bearings: Furnished Std and 001", .002" Undersize

Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Pontiac Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Pontiac Special Data*

Vibration Dampener Removal & Installation: *See "Vibration Dampener" in Pontiac Special Data*

CONTINUED ON NEXT PAGE

PONTIAC VALVE TIMING MARKS

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CAMSHAFT

►*CAMSHAFT IDENTIFICATION & APPLICATION NOTE:* Different camshafts used on these engines identified by number stamped on end of shaft as follows

Engine	Camshaft No.
Synchro-mesh Engines	1
Hydra-Matic 3-Speed Engines	0
425E Engines (All Trans.)	0
Hydra-Matic 4-Speed Engines ①	4
425A Engines	6

① - Also used on Synchro-mesh Engines C4,P4,R2 R2*, RC4

Journal Diam. - 1.8987-1.8997" Five bearings
Clearance - .0015-.0030"
End Thrust - Taken by thrust plate behind camshaft sprocket
Endplay - .003-.007",
Timing Chain: **Length** 60 links **Width** .88" (Morse), 1" (Link Belt) **Pitch** .375"
►*TIMING CHAIN REMOVAL CAUTION.* **Do not rotate crankshaft with timing chain out of engine.** Damage to valves, pistons or both will result due to piston striking valve. To rotate camshaft with timing chain off, crankshaft must be positioned so pistons are 45° before or after TDC, to avoid damage
Camshaft Setting: Both sprockets marked "O" Mesh chain with sprockets turned so that marks are adjacent and in line across shaft centers
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Pontiac Special Data*
Engine Front Cover Removal: *See "Engine Front Cover" in Pontiac Special Data*
Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Pontiac Special Data*

VALVES

Tappet Clearance: Zero lash, hydraulic lifters

Valves	Head Diam.	Stem Diam.	Length
Intake	1.88"	.3407-.3414"	①4.85"
Exhaust	1.60"	.3402-.3409"	②4.84"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30°③	⑤	.0016-.0033"
Exhaust	45°④	⑤	.0021-.0038"

① - 4.89" on 425A Engines ② - 4.87" on 425A Engines
③ - Valve Face Angle 29° ④ - Valve Face Angle 44°
⑤ - .33" (Synchro-mesh Camshaft), .37" (425E & Hydra-Matic 3-Speed Camshaft), .40" (425A & Hydra-Matic 4-Speed Camshafts)

Valve Seat Width - .045-.071" Intake, .048-.070" Exhaust
Replacement Valves: Furnished Std., .001", .003", .005" Oversize stems
Valve Stem Oil Seals: Used on all valves as follows
Oil Shield - Inverted cup over upper end of outer valve spring (under spring retainer cup)
Oil Seal - Neoprene seal installed in second groove on valve stem (under valve locks)
Valve Stem Length Checking: *See "Valve System" in Pontiac Special Data*
Valve Springs: Single or double (Inner and outer) springs used as follows

Spring Specifications

①**Synchro-mesh Engine Camshaft**

Valve	Pressure	Length
Closed	80 lbs.	1.53"
Open	171 lbs.	1.20"

②**425E & Hydra-Matic 3-Speed Camshaft**

Inner Spring		Outer Spring	
Pressure	Length	Pressure	Length
Closed 26 lbs.	1.48"	Closed 58 lbs.	1.53"
Open 61 lbs.	1.11"	Open 107 lbs.	1.16"

③**Hydra-Matic 4-Speed Camshaft**

Inner Spring		Outer Spring	
Pressure	Length	Pressure	Length
Closed 26 lbs.	1.48"	Closed 60 lbs.	1.52"
Open 64 lbs.	1.08"	Open 114 lbs.	1.12"

④**425A Engine Camshaft**

Inner Spring		Outer Spring	
Pressure	Length	Pressure	Length
Closed 32 lbs.	1.48"	Closed 62 lbs.	1.52"
Open 96 lbs.	1.08"	Open 131 lbs.	1.12"

① - *See "Camshaft Identification & Application Note"*
Valve Guides: Cast integral with cylinder head
Valve Stem Clearance in Guide: .0021-.0038" (Intake), .0026-.0043" (Exhaust). Oversize reamers ream guides to next oversize
Hydraulic Lifters: Standard on all models
Diameter - .8424-.8427" **Length** - 2"
Clearance in Lifter Boss - .0013-.0028"
Hydraulic Lifter Overhaul - *See "Valve System" in Pontiac Special Data*
Rocker Arms: Mounted individually on studs pressed into cylinder head.
Installation of Rocker Arm to Stud - Tighten rocker arm stud nut to 15-25 ft. lbs. torque
Rocker Arm Stud Replacement - *See "Valve System" in Pontiac Special Data.*

VALVE TIMING

See 'Camshaft Setting" and 'Camshaft Identification & Application Note' under CAMSHAFT above

①**Synchro-mesh Camshaft**
Intake Valves - Open 14° BTDC. Close 58° ALDC.
Exhaust Valves - Open 48° BLDC. Close 24° ATDC.

②**425E & Hydra-Matic 3-Speed Camshaft**
Intake Valves - Open 22° BTDC. Close 67° ALDC.
Exhaust Valves - Open 63° BLDC. Close 27° ATDC.

③**Hydra-Matic 4-Speed Camshaft**
Intake Valves - Open 30° BTDC. Close 63° ALDC.
Exhaust Valves - Open 77° BLDC. Close 25° ATDC

④**425A Engine Camshaft**
Intake Valves - Open 29° BTDC. Close 74° ALDC.
Exhaust Valves - Open 82° BLDC. Close 31° ATDC.
① - Marked "1". ② - Marked "O"
③ - Marked "4". ④ - Marked "6".

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM* *See "Engine Lubrication" under OILING SYSTEM in Pontiac Special Data*
Crankcase Capacity: 4 qts. refill, add 1 qt. when changing filter element
Normal Oil Pressure: 30-40 lbs. at 2600 RPM
Pressure Regulator - In oil pump body. Not adjustable
Oil Pump Gear type, located on right rear bottom of cylinder crankcase and driven by distributor drive gear. Distributor timing is not affected by removal and installation of pump
Pump Overhaul - *See "Oiling System" in Pontiac Special Data*
Oil Filter: Full-flow type. Replace element every 15,000 miles or once a year. Use only AC No. PF-7 filter element
Crankcase Ventilation: Standard Cars - Filter elements in oil filler caps in each rocker arm cover, and ventilator pipe at engine rear. Clean filter elements every 2,000 miles by plunging in gasoline or kerosene. Re-oil with engine oil
Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to manifold with valve in line. *See "Closed Crankcase Ventilation Systems" in Carburetion Section*
Oil Pressure Indicator: Warning light on instrument panel controlled by pressure switch on oil filter pad. Light goes on when ignition turned on, goes out when oil pressure reaches 5 lbs. ±1.5 lbs.
►*LOW OIL PRESSURE CORRECTION* If oil pressure indicator remains on, clean oil pump thoroughly. Dirt or chips may be lodged in oil pressure regulator ball seat.

ENGINE COOLING SYSTEM

Water Capacity: 18½ qts., add 1 qt. for heater
Pressure Valve: Radiator filler cap 12-15 lbs. (Std.), 14-17 lbs. (Air Cond.)
Thermostat: Pellet type, in water outlet passage in intake manifold. 170°F (Pontiac No. 3148225) Std., 180°F (No. 3149016) Optl. for use with permanent anti-freeze
Water Pump: Packless, sealed double row ball bearing shaft. Serviced as an assembly
Temperature Gauge: Two-light system (Red & Green) with temperature switch in engine block. GREEN light is lighted when engine running cold and goes off when engine temperature reaches 113°±2°F, RED light remains off during normal engine operation but will come on when engine temperature reaches 238°±2°F. *NOTE* - Red light will light up when ignition switch turned to "Start" position but should go out when key returned to running position (this tests bulb and circuit each time engine is started)
Engine Unit - Delco-Remy No. 1993521 (Std.), No. 1993522 (Air Conditioning)

LUBRICATION

HYDRA-MATIC 3-SPEED & 4-SPEED TRANSMISSION LUBRICATION: Check fluid level every 2,000 miles, drain and refill every 25,000 miles (remove and clean oil pan and replace oil intake strainer). Use only Automatic Transmission Fluid, Type A, Suffix A
Checking Fluid Level: With car on level floor and transmission at normal operating temperature, run engine at idle speed with selector lever in "P" (Park) position. Check fluid level on dipstick at right rear of engine. Add fluid as necessary to bring level to "Full" mark on dipstick. DO NOT OVERFILL. *NOTE* - When transmission cold, fluid level should be at "Add" mark on dipstick. 1 pint required to raise level from Add to Full mark. Use only Automatic Transmission Fluid Type A, Suffix A
Capacity (3-Speed) - Approx. 4½ qts. (after draining) 8½ qts. (after overhaul)
Capacity (4-Speed) - Approx. 10 qts. (after oil pan & torus drained), 10½ qts. (after overhaul).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►*JACKING & HOISTING CAUTION: Before jacking, hoisting, or working under car, see "Jacking & Hoisting Precautions" in Suspension & Wheel Alignment Section.*

MODEL IDENTIFICATION

Series	Series No.	Body Style No.
2-Door Coupe (Std.)	21	27
2-Door Coupe (Custom)	21	17
4-Door Sedan	21	19
4-Door Station Wagon	21	35

SERIAL & ENGINE NUMBER: Stamped on plate on left front door hinge pillar post and on pad on front face of cylinder block (4 Cyl.), on front face of right cylinder bank (V8). *See also Engine Production Code Number below.* Number (example below) includes identification data.

① ② ③ ④
1 61 P 1001

① - Series. 1 21 (Tempest).
② - Year. 61 1961.
③ - Assembly Plant. P Pontiac, S South Gate.
④ - Beginning vehicle number

Engine Production Code Number: Stamped on pad on front face of cylinder block (4 Cyl.), on front face of right cylinder bank (V8). *Do not confuse this number with Serial and Engine Number.*

►*ENGINE IDENTIFICATION LETTER CODE:* Twelve different engine combinations used. Letter Code (DA, DS etc.) stamped on small pad directly below Engine Production Code Number. Letter code indicates various items of equipment used in a particular engine

TUNE-UP

►*ACCELERATION STUMBLE, LEANNESS, OR STALLING DURING WARM-UP: See MANIFOLD HEAT CONTROL below for recommended correction.*

COMPRESSION PRESSURE (4 Cyl.): 140-160 lbs. (8.6-1 ratio), 155-165 lbs. (10.25-1 ratio) at 155-165 RPM. Lowest cylinder must be within 80% of highest cylinder.

VALVE TAPPET CLEARANCE: Zero lash (hydraulic).

MANIFOLD HEAT CONTROL: 4 Cyl. - Thermostatic coil spring type in exhaust manifold outlet. Make sure valve operates freely. **V8** - None used.

►*THERMOSTATIC SPRING CHANGE TO CORRECT ACCELERATION STUMBLE DURING COLD WEATHER:* On cars before Engine No. 71188, install new slower-opening spring, No. 531972, to replace No. 539233. This spring used on later cars.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-up" for ignition or carburetion troubles. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

►*POOR IDLING CORRECTION (POSITIVE CRANKCASE VENTILATION CARS):* Replace old crankcase ventilator outlet valve with new valve, Pontiac Part No. 5647362.

IGNITION

FIRING ORDER: 4 Cyl. - 1-3-4-2. **V8** - 1-8-4-3-6-5-7-2.

Cylinders (V8) - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs (4 Cyl.) - AC 45S. 14mm. Torque to 25 ft. lbs.

Spark Plugs (V8) - AC 45FFS. 14mm. Torque to 15-20 ft. lbs. *CAUTION - Use thread lubricant.*

COIL: Delco-Remy 1115138 (4 Cyl.), 1115136 (V8).

Ignition Current - 3.4 amps. idling, 3.5 amps. stopped (1115138); 2.1 amps. idling, 3.7 amps. stopped (1115136).

Resistor - Resistance wire (1.80 ohms) integral part of wiring harness connected in circuit between coil and spliced to IGN. 1 terminal of ignition switch at temperature and oil indicator feed. Bypassed during cranking by second lead from ignition switch.

DISTRIBUTOR: Delco-Remy 1110254 (4 Cyl. 8.6-1 ratio); 1110261 (4 Cyl. 10.25-1 ratio), 1110977 or 1110983 (V8). Window type with external adjustment.

Condenser - Delco-Remy No. 1928111. **Capacity** - .18-.23 mfd.

Contact Point Set - Delco-Remy.

Breaker Gap - Gap (.016") will be correct when cam angle correctly set.

Cam Angle (4 Cyl.) - 74-76°. Set at 75°. Will give .016" breaker gap.

Cam Angle (V8) - 28-32°. Set at 30°. Will give .016" breaker gap.

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Counterclockwise (4 Cyl.), clockwise (V8) viewed from above.

Automatic Advance - 1110254

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	400	0-4	800
7.5-9.5	1000	15-19	2000
12-14	2125	24-28	4250

Automatic Advance - 1110261

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	400	0-4	800
7-9	1000	14-18	2000
9-11	1875	18-22	3750

Automatic Advance - 1110977, 983

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	500	0-4	1000
6.5-8.5	1050	13-17	2100
12-14	1850	24-28	3700

Vacuum Spark Control: Delco-Remy No. 1116173 (1110254 & 1110261 Distr.), 1116182 (1110977 Distr.), 1116190 (1110983 Distr.). Integral type.

Vacuum Advance - 1116173

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg.)
Start	0	6-8
10	20	13-15

Vacuum Advance - 1116182, 190

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg.)
Start	0	6-8
8	16	14.50-15.75

IGNITION TIMING

Setting - 6° BTDC (4 Cyl.), 5° BTDC (V8) at hot idle speed with vacuum line disconnected and manifold opening taped closed.

Timing Marks (4 Cyl.) - Pointer on engine front cover and TDC & 6° BTDC (top mark) on vibration damper.

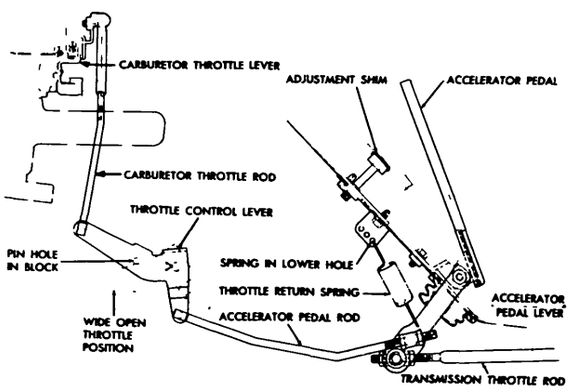
Timing Marks (V8) - Mark on vibration damper to be aligned with 5° mark cast in block.

CARBURETOR

►*CARBURETOR APPLICATION: Rochester B or BC 1-Barrel Standard on 4 Cyl., Rochester 4GC 4-Barrel Optional. Rochester 2GC 2-Barrel used on V8.*

►*ROCHESTER "B" OR "BC" SINGLE BARREL CARBURETOR LEAN DURING WARM-UP (AUTO. TRANS.) OR STUMBLE AT PART THROTTLE (SYNCHRO-MESH TRANS.): See Manifold Heat Control thermostatic spring change (above).*

►*ROCHESTER 4-BBL. CARBURETOR SURGE CORRECTION:* A surge condition when operating under a load at cold temperature may be corrected by replacing jets. *See "Rochester 4GC 4-Bbl. Carburetors" in Carburetion Section.*



►*ROCHESTER 4GC 4-BARREL CARBURETOR STALLING OR LEANNESS DURING WARM-UP OR STUMBLE ON ACCELERATION:* Change Choke Setting to 1 Notch Rich and increase fast idle speed to 2800 RPM (Synchro-mesh Cars), change Choke Setting to 2 Notches Rich (Auto. Trans. Cars). On early carburetors, install new Choke Piston, No. 7020357, to replace piston No. 7019552. On Synchro-mesh Cars, also see Manifold Heat Control Thermostatic Spring Change (above). *NOTE - Carburetors marked "B" or later on identification tag have later type Choke Piston installed.*

THROTTLE LINKAGE ADJUSTMENT: *FOLLOWING PROCEDURE SUPERSEDES PREVIOUSLY PUBLISHED PROCEDURES:*

1) With carburetor throttle wide open, insert ¼" gauge pin, Tool J-7687 (4 Cyl.), J-9257 (V8), in hole in block directly above throttle control lever (see illustration), Adjust carburetor throttle rod (loosen locknut and turn fitting at upper end) so that upper surface of throttle control lever is against pin, then remove gauge pin.

2) Measure height of accelerator pedal stop (under pedal) and adjust as necessary by loosening locknut and turning stop up or down for height of 1 11/16" from toe pan. Tighten locknut securely. Install .060" shim on top of pedal stop, hold or block accelerator pedal down against shim on stop.

CONTINUED ON NEXT PAGE

TEMPEST THROTTLE LINKAGE
4 CYL. (V8 SIMILAR)

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

3) With pedal down against shim on stop, adjust trunnion on transmission throttle rod (loosen one nut and tighten opposite nut) so that transmission throttle valve lever is against wide open throttle stop in transmission *(this is a positive stop - do not confuse this with detent resistance)*. Adjust trunnion on throttle control so that carburetor throttle valve is in wide open position. Check to make certain that carburetor and transmission throttle valve lever reach wide open throttle position at the same time. Remove shim from accelerator pedal stop.

4) Check setting by running engine and slowly moving selector lever to "L" position. If engine speed increases, readjust linkage.

►*THROTTLE CONTROL LINKAGE SPLASH SHIELD:* Splash shield package Pontiac Part No. 541713 available for protection of throttle control linkage (will not protect T.V. linkage under body floor).

THROTTLE RETURN CHECK ADJUSTMENT (4 CYL): Set fast idle adjustment (4 Bbl.), slow idle adjustment (1 Bbl.), then place transmission in neutral. With engine running, disconnect vacuum hose from throttle return check and plug end of vacuum hose. Adjust contact screw of throttle return check to obtain 1175 RPM (1 Bbl.), 1050 RPM (4 Bbl.). *NOTE - Hold sleeve next to diaphragm to prevent turning while adjusting contact screw.*

ANTI-STALL DASHPOT ADJUSTMENT (V8): With throttle linkage and idle speed correctly set, place idle speed adjusting screw on high step of fast idle cam. Adjust dashpot plunger to obtain a clearance of .000-.010" between plunger and throttle lever.

ROCHESTER B & BC

Mod l — **Rochester Carburetor No.**

Synchro-mesh (Manual Choke)..... B 7019061

Automatic Trans. (Automatic Choke).....BC 7019062

►*LEANNESS DURING WARM-UP & PART THROTTLE STUMBLE CORRECTION: See CARBURETOR above.*

Idl S tting - Initial setting 1½ turns open. Turn screw out for richer mixture.

Idl Sp ed - 680-700 RPM (Synchro-mesh with Air Conditioning Off); 580-600 RPM (Auto. Trans. in "D"); 630-650 RPM (Auto. Trans. in "D" and Air Conditioning Off);

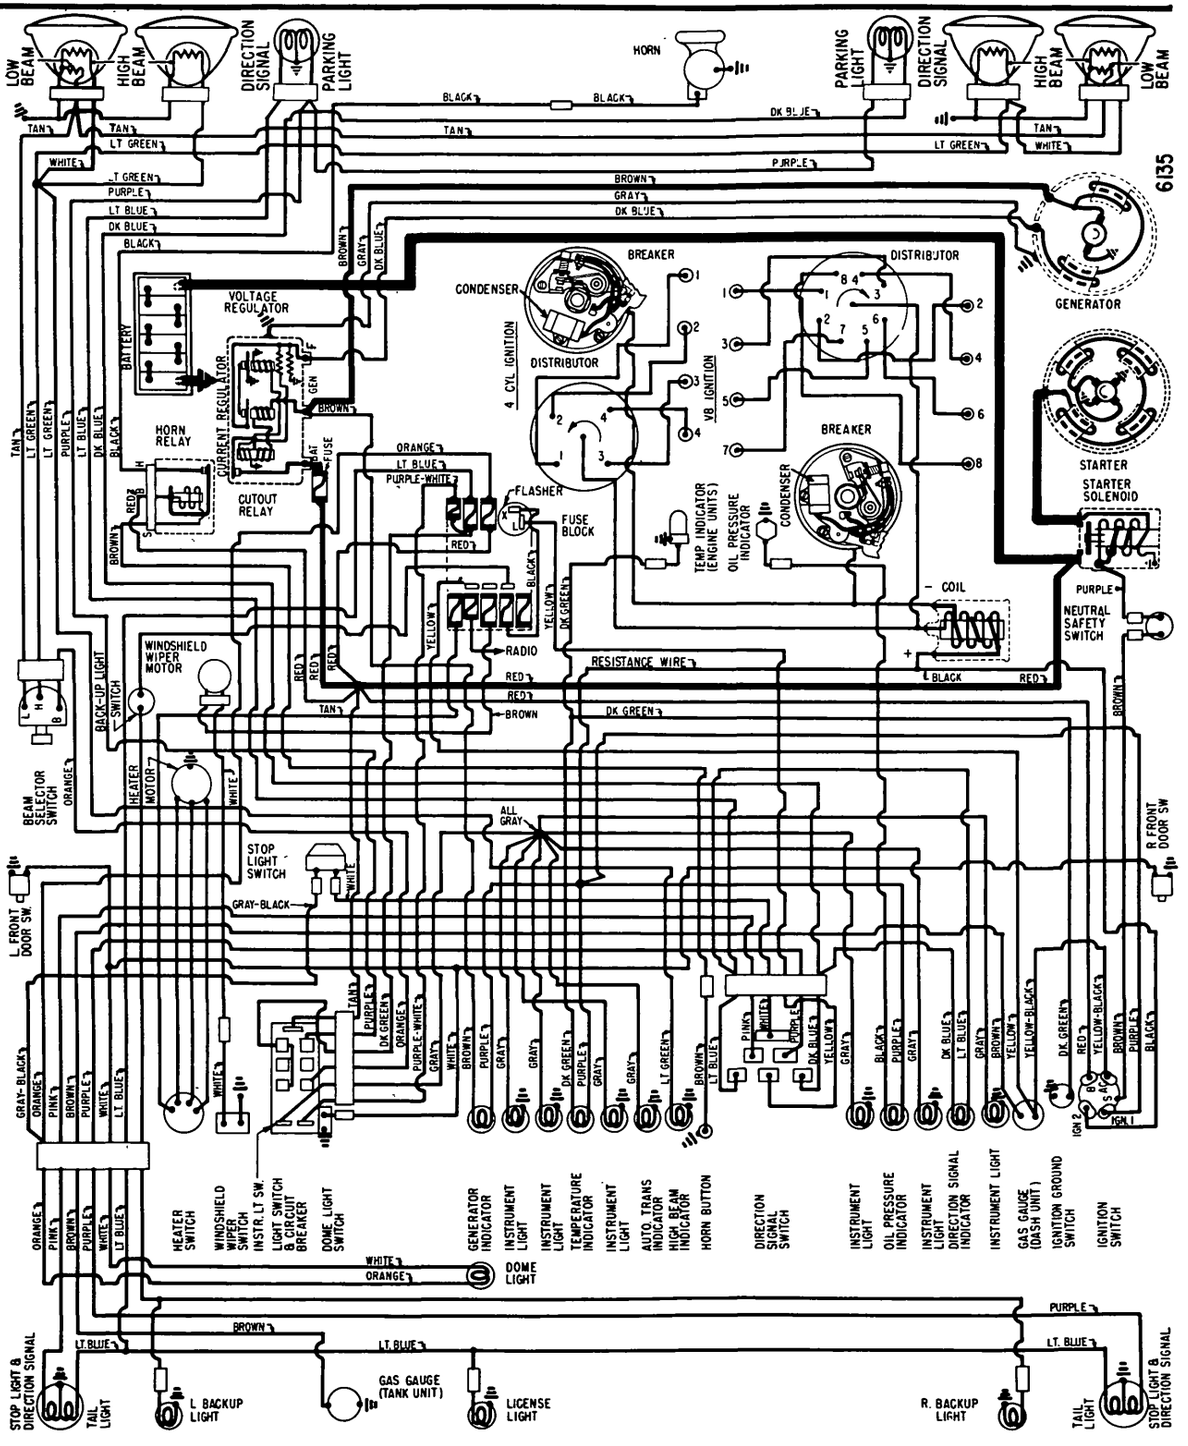
Fl at L v l - 1 9/32" (Gauge J-9190) with air horn inverted and gasket in place. To adjust, bend float arms.

Float Drop - 1¾" (Gauge J-9190) from gasket surface to bottom of float with air horn upright and float hanging free. To adjust, bend float tang.

Fast Idl : No adjustment, will be correct when hot or slow idle correctly set.

Automatic Ch k Setting: 2 Notches Rich (supersedes previous Centered Setting).

Thr ttle Linkag Adjustm nt: *See CARBURETOR above.*



►*OTHER DATA: See "Rochester B & BC Carburetors" in Carbur tion Section.*

ROCHESTER 2GC 2-BARREL

R ch ster 2GC N . 7019863 (Synchro-mesh), No. 7019860 (Automatic). Downdraft type with automatic choke.

►*CHOKE SETTING "TAILORING" FOR CLIMATE AND TEMPERATURE CONDITIONS:* Moving intermediate rod to next OUTER hole (away from choke shaft) will provide richer mixture during warm-up for acceleration

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

or load. Moving intermediate rod to next INNER hole will provide leaner mixture under same operating conditions.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8., LEFT barrel feeds 1-4-6-7.*

Idl Setting - Initial setting 1½ turns open. Turn screw out for richer mixture.

Idl Speed - 580-600 RPM with Auto. Trans. in "D" and Air Conditioning Off.

Fl at Level - 1 17/64" (Gauge J-9191). With air horn inverted and gasket in place, gauge should be over float so it rests against pump side of power piston shaft with outer leg in line with center of float. To adjust, bend float arm.

Fl at Drop - 1 29/32" (Gauge J-9191) distance from gasket to bottom of float with air horn upright and gasket in place. To adjust, bend float tang.

Fast Idle: No adjustment, will be correct when hot or slow idle correctly set.

Aut matic Choke Setting: At index.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 2G & 2GC Carburetors" in Carburetion Section.*

ROCHESTER 4GC 4-BARREL

R chester 4GC No. 7019079 (Synchro-mesh). No. 7019066 (Auto. Trans.). Optional on 4 Cyl. Engine.

►*STALLING OR LEANNESS DURING WARM-UP OR STUMBLE ON ACCELERATION CORRECTION: S e CARBURETOR above.*

►*MANIFOLD FUEL DISTRIBUTION: Carburetor FRONT barrels feed Cyls. 2 & 3, REAR barrels feed 1 & 4.*

►*IDLE SPEED ADJUSTMENT NOTE: Idle Air Bypass screw on throttle body is used to adjust idle speed. Throttle valves are normally closed on slow idle.*

Idle Mixture & Speed Setting - Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Rochester 4GC Carburetors" in Carburetion Section.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Rochester 4GC 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fu l Pump: AC No. 4843 (4 Cyl.), 4827 (V8). Fuel only.
Pressure - 4-5¼ lbs. at 1800 RPM.

Fu l Filter: AC No. GF-61 (4 Cyl.), No. GF-67 (V8 & 4 Cyl. 4-Bbl.). GF-61 filter integral in carburetor fuel inlet. Replace at 15,000 miles intervals. GF-67 (2 & 4-Bbl.) filter disposable type in carburetor inlet line. Replace at 10,000 miles intervals.

Gasoline Gauge: AC Electric.
Dash Unit - AC No. 5643436.
Tank Unit - AC No. 5641735 (Std.), 5641843 (V8 with Air Cond.).

Air Cleaner: Oil-wetted mesh type used on 4 Cyl. with 1-Bbl. Carb. Oil-wetted polyurethane type used on all other options.

►*POLYURETHANE ELEMENT CLEANING CAUTION:* Clean element every 15,000 miles or sooner if needed. Wash in kerosene and oil with SAE 10W-30 oil. *Squeeze element, DO NOT WRING.*

BATTERY

D lc N . 454. 12 volt, 9 plate 42 ampere hour capacity (20 hr. rate).

►*HEAVY DUTY BATTERY CAUTION: Delco-Remy Battery No. 459 must be used with 35 amp. generator and double contact voltage regulator. S e below.*

Battery Ground - Negative.

Engine Ground - To crossmember on each side of engine.

STARTER

Delco-Remy No. 1107796 (4 Cyl.), 1108303 (V8).

Armature - Delco-Remy No. 1932185 (1107796 Str.), 1935829 (1108303 Str.).

Drive - Overrunning clutch (solenoid pinion shift).

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 40 ozs. min. (1107796 Str.), 35 ozs. min. (1108303 Str.).

Performance Data - 1107796

Torque	RPM	Volts	Ⓒ Amperes
0 ft. lbs.	3600-5100	10.6	65-100
	Lock	3.5	300-360

Performance Data - 1108303

Torque	RPM	Volts	Ⓒ Amperes
0 ft. lbs.	6750-10500	10.6	58-80
	Lock	4.0	280-320

Ⓒ - Includes solenoid.

Starting Switch: Delco-Remy No. 1116590 Ignition & Starter Switch Assembly controls Delco-Remy Solenoid No. 1119798 (4 Cyl. exc. AC), No. 1114257 (V8). Solenoid mounted on starter.

Neutral Safety & Back-up Light Switch: Delco-Remy No. 1998717 (Auto. Trans.), 1993530 (Synchro-mesh). Located on steering column behind instrument panel. Back-up light switch located on transmission case (Synchro-mesh).

Adjustment - *See "Pontiac Tempest Transaxle" in Transmission Section.*

GENERATOR

►*CHARGING CIRCUIT FUSE CAUTION: Battery Charging Circuit protected by 45 amp. fuse, No. 1945172, clipped to "BAT" terminal of generator regulator. Check for blown fuse when diagnoising generator, regulator, or battery failure.*

Delco-Remy used as follows:

Model	Generator No.
4 Cyl.	1102224 (Early), 1102266 (Late)
V8	1102237 (Early), 1102267 (Late)
Heavy Duty (35 amp.)	1105145

►*HEAVY DUTY GENERATOR NOTE: Generator No. 1105145 requires double contact Regulator No. 1119641.*

Performance Data

Generator	Amperes	Volts	RPM
1102224, 37	30	14.0	2240
1102266, 67	30	14.0	2310
1105145	35	14.0	1730

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.69-1.79 amps. (1102224, 37). 1.48-1.62 amps. (1102266, 67), 2.73-3.0 amps. (1105145) at 12 volts and 80°F.

Belt Adjustment: ¼" deflection with approximately 5-6 lbs. pressure midway between pulleys; or 70-75 lbs. pressure with Burroughs Gauge.

GENERATOR REGULATOR

►*SEE CHARGING CIRCUIT FUSE CAUTION ABOVE.*

Delco-Remy No. 1119263 (All exc. 1105145 G n.), 1119641 (1105145 Gen.), 1119663 (Sp cial - see N te).

►*REGULATOR 1119663 NOTE: See HEADLIGHTS DIMMING CORRECTION in Miscellaneous Electrical (below) for use of this regulator.*

►*REGULATOR CAUTION: Regulators 1119641 & 1119663 are Double Contact type and must be used with generators listed. DO NOT interchange regulators. NOTE - Specifications below are for "Normal" settings.*

Cutout Relay

Cuts In - 11.8-13.5 volts (1119263), 11.8-13.0 volts (1119641, 63), hot.

Contact Gap - .020".

Air Gap - .020" with contacts just closed.

Voltage R gul t r

Setting (1119263) - 13.8-14.7 volts at 125°F ambient temperature.

Setting (1119641) - 13.5-14.4 volts (upper contacts), .1-.3 volt lower (lower contacts) at 125°F ambient temperature.

Setting (1119663) - 13.8-14.6 volts (upper contacts), .1-.3 volt lower (lower contacts) at 125°F ambient temperature.

Contact Gap (1119641, 63) - .016" (upper contacts) with lower contacts just touching.

Air Gap - .075" (1119263), .067" (1119641,63) with armature pressed down to point where contacts just touch.

Current Regulator

Setting (1119623) - 27.0-31.0 amps. at 125°F ambient temperature.

Setting (1119641) - 31.0-35.5 amps. at 125°F ambient temperature.

Setting (1119663) - 27.0-33.0 amps. at 125°F ambient temperature.

Air Gap - .075" with armature pressed down to point where contacts just touch.

►*OTHER DATA: See "Delco-Remy 1119600 (Double Contact) Regulators" and "D lco-Remy 1119000 Series Regulators" in Electrical Section.*

MISC. ELECTRICAL

►*HEADLIGHTS DIMMING OR FLICKER CORRECTION:* On car equipped with standard 30 ampere generators, if trouble not corrected by usual corrective procedure, replace single contact regulator, No. 1119263, with Double Contact Regulator No. 1119663. *S e specifications above.*

Headlights: 4-Headlight system.

Direction Signals: Switch located on steering column jacket behind instrument panel. To remove switch, loosen clamp screw and remove control cable assembly from switch. To install, reverse removal procedure, making sure switch and lever are in neutral position before tightening switch clamp screws.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Lighting Switch Removal: Unhook one battery cable. Pull headlight switch to "ON" position. Push latch button on bottom of switch assembly and pull out switch knob assembly. Screw bushing from switch assembly allowing switch to be removed from instrument panel.

Instrument Cluster Removal: Disconnect battery. Remove upper and lower retaining screws, and remove screws from lower steering column bezel. Remove speedometer cable. Pull cluster and housing out from instrument panel opening to gain access to wiring. Remove bulbs and wiring. Remove retaining screws (cluster-to-housing). To install, reverse removal procedure.

Speed meter Removal: Remove instrument cluster (see above) then remove all speedometer head retaining screws. Remove speedometer. To install, reverse removal procedure.

Fuel Gauge Removal: Remove instrument cluster (see above) then remove wire connector and bulb. Remove retaining screws, then remove gauge. To install, reverse removal procedure.

Stop Light Switch Location & Adjustment: Mechanical type located on bracket attached to steering column behind instrument panel. To adjust, loosen locknut and position switch thread 3/16" to pedal arm with brake released. *NOTE - Switch must not restrict pedal pedal action.*

CIRCUIT BREAKER: 22 Ampere - Headlights, High Beam Indicator, Parking & Tail Lights. In Headlight Switch. *NOTE - Tail lights also protected by 9 ampere fuse on fuse block.*

FUSES: *All fuses located on fuse block on left side of dash inside car.*

25 Amp re - Windshield wiper & washer, Parking brake warning light.
20 Ampere - Direction signals and back-up lights.
20 Amp re - Cigar lighter.
20 Ampere - Heater & Air Conditioner blowers.
9 Amper - Tail and License lights.
9 Amp re - Dome and Stop lights.
4 Amp r - All instrument panel lights.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extrem care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: Own. Two engines used as follows:

4 Cylinder - Valve-in-head Inclined 45° to right
V8 Engin - Valve-in-head Aluminum block and cylinder head with cast-in (non-replaceable) cylinder liners.

Engine	B r	Stroke	Displacement
4 Cyl.	4 1/16"	3 3/4"	195 cu. ins.
V8	3 50"	2.80"	215 cu. ins.

Engine	Compr.Ratio	Rated HP	Developed HP
4 Cyl. (1-Bbl.)④	8.6-1	26 4	110 at 3800 RPM
4 Cyl.(1-Bbl)①	10.25-1	26 4	120 at 3800 RPM
4 Cyl.(1-Bbl.)②	10 25-1	26 4	140 at 4400 RPM
4 Cyl.(4-Bbl.)③	10.25-1	26.4	155 at 4800 RPM
V8 (2-Bbl.)	8 8-1	39.2	155 at 4400 RPM

① - **OS** Engine. ② - **OA** Engine. ③ - **XS & XA** Engines. ④ - **DA & DS** (Domestic) Engines, **ZS & ZA** (Export-7.6-1 ratio) Engines.

►*ENGINE IDENTIFICATION LETTER CODE NOTE: Located below Engine Production Code No. See Engine Identification above.*

Compression & Vacuum Reading - *See TUNE-UP.*

OIL PAN REMOVAL: Drain crankcase. On 4 Cyl., remove exhaust crossover pipe, flywheel housing front shield, and lower cover. On all cars, remove front crossmember assembly as follows: *NOTE - Crossmember assembly includes entire front suspension system.* Raise car, support crossmember and install an engine support Remove wheels. Disconnect tie rod ends, engine mounts, engine ground straps, and brake lines at crossmember. Remove fuel line from clip on crossmember. Remove retaining bolts and remove crossmember assembly. Remove attaching bolts and remove oil pan.

Installation - Reverse removal procedure. Tighten crossmember retaining bolts to 70-85 ft. lbs., engine front mounts to 30-45 ft. lbs., tie rod end nuts to 55 ft. lbs. (do not back off nut when aligning holes for cotter pin). Tighten V8 oil pan bolts to 6-15 ft. lbs. and use special bolt thread lubricant.

V8 ENGINE

See "Buick Special" car model pages for all data on this engine. NOTE - For engine removal, see "Engine" in Pontiac Special Data.

4 CYLINDER ENGINE

ENGINE REMOVAL: *See "Engine" in Pontiac Special Data.*

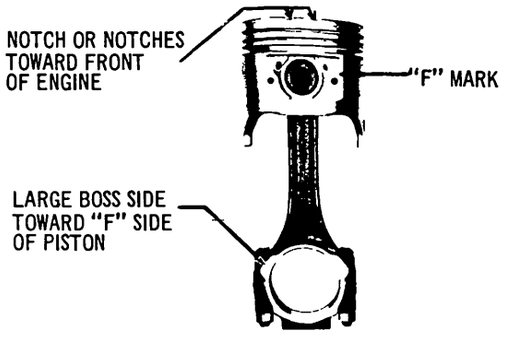
CYLINDER HEAD & MANIFOLD: *See "Cylinder Head & Manifold" in Pontiac Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Pontiac Special Data.*

PISTONS

Aluminum alloy, cam ground, slipper type with steel struts, tin plated. *NOTE* - 8.6-1 ratio pistons have dished head, two notches in front of piston, and "L" on rear of piston near pin boss, and must not be used in 10.25-1 ratio engines. Pistons for these engines have reliefs machined in piston head for valve clearance and have a notch in front of piston

Fitting New Pistons - Measure piston skirt perpendicular to piston pin boss (pin removed) and 1¼" below oil ring groove. Micrometer must be in full contact. Clearance between piston and cylinder bore .0007-.0013" (actually measured).



Installing Pistons: Install pistons with notch or notches in piston head and "F" mark on piston boss toward front of engine. *See Rod Installation.*

Replacement Pistons: Furnished Std. (4.060", 4.061", 4.062", 4.063" "Flat" or "Recessed Top") and .005", .010", .020", and 030" oversizes.

PISTON PIN

Diameter - 9802" **Length** - 3.25".
Clearance in Piston - .0003-.0005" loose.
Clearance in Rod - .0008-.0016" interference fit. Pin is a press fit in rod.
Piston Pin Removal & Installation - *See "Piston Pins" in Pontiac Special Data.*

Replacem nt Pins: Furnished Std. and .001", .003" oversize

PISTON & ROD ASSEMBLY

PISTON RINGS

Compression rings are cast iron, taper faced. No. 1 has thick chrome, No. 2 has Lubrite finish. Oil ring is segmented spring steel with chrome face on rails.

Ring	Width	End Gap	Side Clearanc
Compr. (1)	.078"	.016-.026"	.0015-.0030"
Compr. (2)	.078"	.013-.025"	.0015-.0035"
Oil	.184"	.015-.035"	.0015-.0085"

Installing Rings - Step or chamfer on upper compression ring and letter "T", dot, or word "TOP" on lower compression ring toward the top.

Replacement Rings: Std. and .005", 010", .020", .030" Oversize.

CONNECTING ROD

Length - 6 63" (center-to-center)
Crankpin Journal Diameter - 2.2492-2.2502".
Lower Bearing - Durex 100A, steel-backed, replaceable precision type, no shims.
Clearance - .0005-.0025".
Sideplay - .0045-.0085".

Replacement Bearings: Std. and 001" & .002" undersize.

Rod Installation: Install rods in pistons so that LARGE machined boss at lower end of rod is on same side as "F" mark on piston and toward front of engine.

CRANKSHAFT

Journal Diameter - 3.000". Five bearings.
Bearings - M-400 (No. 4) Durex 100-A (Others) Steel backed inserts, precision type, no shims.
Clearance - .0005-.0025" (Front), 0005-.003" (All Others).

End Thrust: Taken by No. 4 (rear center) main bearing.
End Play - .0035-.0085".

Replacement Bearings: Furnished Std. and 001", .002" Undersize.

Crankshaft Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Main Bearings" in Pontiac Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Pontiac Special Data*

Vibrati n Damp n r R m val & Installati n: *See "Vibration Dampener" in Pontiac Special Data.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CAMSHAFT

►*CAMSHAFT APPLICATION NOTE: Special camshaft No. 539099 used on engines marked OA, XS & XA. No. 537995 used on all other models.*

Journal Diameter - 1.8987-1.8997". Five bearings.

Clearance - .0015-.0030".

End Thrust - Taken by thrust plate behind camshaft sprocket.

Endplay - .003-.007".

Timing Chain: Length - 60 links.

Timing Chain Tensioner - Consists of a fixed bumper on drive side of front face and a spring loaded bumper on slack side of timing chain. *See "Timing Chain" in Pontiac Special Data.*

►*TIMING CHAIN REMOVAL CAUTION:* **Do not rotate crankshaft with timing chain out of engine.** Damage to valves, pistons or both will result due to piston striking valve. To rotate camshaft with timing chain off, crankshaft must be positioned so pistons are 45° before or after TDC, to avoid damage.

Camshaft Setting: Both sprockets marked "O". Mesh chain with sprockets turned so that marks are adjacent and in line across shaft centers.

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Pontiac Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Pontiac Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Pontiac Special Data.*

VALVES

Tappet Clearance: Zero lash, hydraulic lifters.

Valves	Head Diam.	Stem Diam.	Length
Intake	1.88"	3407-.3414"	4.85"
Exhaust	1.60"	3402-.3409"	4.84"

Valve	Seat Angle	Lift	Stem Clearance
Intake	30° ①	③	.0021-.0038"
Exhaust	45° ②	③	.0026-.0043"

① - Valve face angle 29°. ② - Valve face angle 44°.
③ - .33" Synchro-mesh; .40" Auto. Trans.

Valve Seat Width - .048-.070".

Replacement Valves: Furnished Std., .001", .003", .005" Oversize stems.

Valve Stem Oil Seals: Used on all valves as follows:

Oil Shield - Inverted cup over upper end of outer valve spring (under spring retainer cup).

Oil Seal - Neoprene seal installed in second groove on valve stem (under valve locks).

Valve Stem Length Checking: *See "Valve System" in Pontiac Special Data.*

Valve Springs: Single or double (inner and outer) springs used as follows:

Spring Specifications
(DS,DA,ZS,ZA,OS - Std. Camshaft Engs.)

Valve	Pressure	Length
Closed	80 lbs.	1.53"
Open	171 lbs.	1.20"

(OA,XA,XS - Spec. Camshaft Engs.)

Inner Spring		Outer Spring	
Pressure	Length	Pressure	Length
Closed 26 lbs.	1.48"	Closed 60 lbs.	1.52"
Open 64 lbs.	1.08"	Open 114 lbs.	1.12"

Valve Guides: Cast integral with cylinder head. *NOTE* - Ream guides for next oversize using tools No. J-5830-1 (.003" OS), and J-6621 (.005" OS).

Hydraulic Lifters: Standard on all models.

Diameter - .8424-.8427". **Length** - 2".

Clearance in Lifter Boss - .0013-.0028".

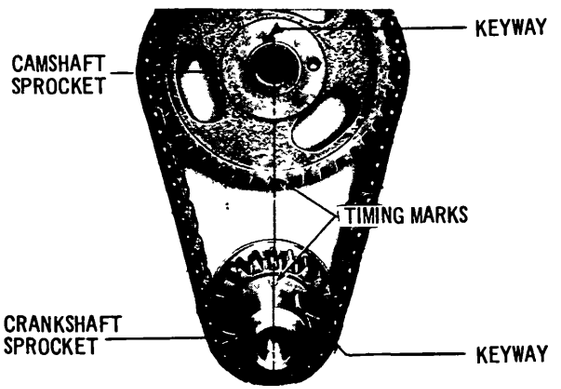
Hydraulic Lifter Overhaul - *See "Valve System" in Pontiac Special Data.*

Rocker Arms: Mounted individually on studs pressed into cylinder head.

Installation of Rocker Arm to Stud - Tighten rocker arm stud nut to 15-25 ft. lbs. torque.

Rocker Arm Stud Replacement - *See "Valve System" in Pontiac Special Data.*

VALVE TIMING



See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications
(DS,DA,ZS,ZA,OS - Std. Camshaft Engs.)

Intake Valves - Open 14° BTDC. Close 58° ALDC.
Exhaust Valves - Open 48° BLDC. Close 24° ATDC.

(OA,XA,XS - Spec. Camshaft Engs.)

Intake Valves - Open 30° BTDC. Close 63° ALDC.
Exhaust Valves - Open 77° BLDC. Close 25° ATDC.

VALVE TIMING MARKS

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Pontiac Special Data.*

Crankcase Capacity: 4 qts. refill, 5 qts. with filter change.

Normal Oil Pressure: 30-40 lbs. at 2600 RPM.

Pressure Regulator - In oil pump body, not adjustable.

►*LOW OIL PRESSURE CORRECTION:* If oil pressure indicator flickers or remains ON, dirt or chips may be lodged in oil pressure regulator ball seat. To correct, clean oil pump thoroughly.

Oil Pump: Spur gear type. 4 Cyl. pump located on right rear lower face of cylinder block and driven by distributor drive gear. V8 oil pump located in timing chain cover.

Pump Overhaul - *See "Oiling System" in Pontiac Special Data.*

Oil Filter: AC PF-7. Full Flow Type. Replace element every 15,000 miles or sooner if needed.

Crankcase Ventilation (Standard Cars): Filter elements located in oil filler cap on left rocker arm cover (V8), front of rocker arm cover (4 Cyl.). Oil baffles in rocker arm cover prevent oil from being exhausted with air through vent pipe. Clean filter element every 12,000 miles or sooner if needed by washing in solvent, blowing dry and re-oiling.

Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to manifold with valve in line. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

Oil Pressure Indicator: Warning light on instrument panel controlled by switch in oil filter pad (4 Cyl.), in oil pump cover (V8). Light goes on when ignition turned on, goes out when oil pressure reaches 5±1½ lbs. *NOTE - If light remains on or flickers, clean oil pump thoroughly. See-LOW OIL PRESSURE CORRECTION above.*

ENGINE COOLING SYSTEM

Water Capacity: 11½ qts., with heater 12½ qts., add ½ qt. with Air Conditioning.

Pressure Valve: Radiator filler cap 14-17 lbs.

Thermostat: Pellet type in water outlet passage in intake manifold. Std. 170°F (Pontiac No. 3148225), Optl. 180°F (Pontiac No. 3149016) for permanent anti-freeze.

Water Pump: Packless, sealed double row ball bearing shaft. Service as an assembly.

Temperature Gauge: Warning light on instrument panel goes on when ignition turned on. When engine temperature reaches 248°F the light goes off. Service thermal switch by replacement.

Engine Unit - Delco-Remy No. 1993508 (4 Cyl. exc. A.C.), 1993513 (4 Cyl. with A.C.), No. 1993518 (V8).

LUBRICATION

TEMPEST TRANSAXLE LUBRICATION: Check each unit as follows:

Synchro-mesh Transmission: Check fluid level at 2,000 mile intervals. Use only SAE 80 or 90 "Multi-Purpose" gear lubricant. DO NOT use straight mineral oil or "active sulphur soap" type lubricants.

Checking Lubricant Level - Maintain lubricant level even with filler plug opening on left side of transmission case. **Capacity** - 2.8 pints.

Automatic Transmission: Check fluid level every 2,000 miles or each time chassis lubricated. No periodic drain or refill is recommended. To drain transmission for removal or overhaul, loosen filler tube attaching nut and allow case to drain.

Checking Fluid Level - *NOTE - On Sedans, dipstick located under access plate in trunk behind and slightly above spare tire; on Station Wagons, dipstick is in spare tire compartment.* Check with engine and transmission at normal operating temperature with selector lever in "N" (Neutral) position. Maintain fluid level at "Full" mark on dipstick (1 pint will raise level from "Add" to "Full" mark). DO NOT OVERFILL. Use Automatic Transmission Fluid Type A, Suffix A (Type A fluid may be used). **Capacity** - 6 pints (refill).

Differential Assembly: Check fluid level at 2,000 mile intervals. Use only SAE 80 or 90 "Multi-Purpose" gear lubricant. DO NOT use straight mineral oil or "active sulphur soap" type lubricants.

Checking Lubricant Level - Maintain lubricant level even with filler plug opening on left side of differential case below universal joint.

Capacity - 3 pints (refill).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

ENGINE

►*AIR CONDITIONED CAR CAUTION:* When removing engine, air conditioning compressor must first be removed from its mounting bracket. *See "Studebaker Air Conditioning" in Miscellaneous Section.*

6 CYLINDER ENGINE

ENGINE REMOVAL: Remove hood, radiator, battery and carburetor air cleaner. Disconnect heater hoses from water pump and cylinder head. Drain crankcase. Disconnect all lines, wires, cables, and hoses from engine. Remove clevis pin connecting accelerator cross shaft and bellcrank rod. Disconnect engine front mounts and engine ground strap from right front mount. Disconnect exhaust pipe from manifold (remove "U" clamp at clutch or converter housing bracket to lower pipe). Remove starter motor. Disconnect one end of right tie-rod, remove shaft from steering bellcrank, and move bellcrank to clear oil pan. Install engine lifting eyebolts in place of Nos. 15 & 20 cylinder head bolts and raise engine so weight is off the front mounts.

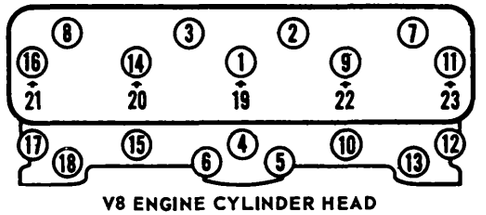
On automatic transmission cars, disconnect accelerator bellcrank-to-transmission rod. Remove converter housing lower plate and disconnect torque converter from drive plate. On all cars, remove clutch or converter housing attaching bolts and drive out dowel pins. Remove engine.

V8 ENGINE

ENGINE REMOVAL: Remove hood, upper air deflector, and fan shroud. Remove battery. On Hawk, remove fan blade assembly. On other cars, remove radiator and water pump manifold. On all cars, remove generator, starter, and exhaust crossover pipe. Turn wheels to extreme right (Hawk), remove steering bellcrank shaft (Others). Remove carburetor air cleaner, fuel pump-to-carburetor pipe, spark modifier pipe, and spark plug cable support brackets from rocker arm covers. Disconnect all hoses, lines, wires, and cables from engine. On automatic transmission cars, disconnect accelerator bellcrank rod at bellcrank. On all cars, disconnect both engine front mounts and engine ground strap. With a sling under intake manifold, raise engine to take weight off front mounts. Remove clutch or converter housing cover plate. Disconnect torque converter from drive plate. Disconnect clutch or converter housing from engine. Push engine forward to disengage clutch housing dowels and until transmission splines are clear. Remove engine.

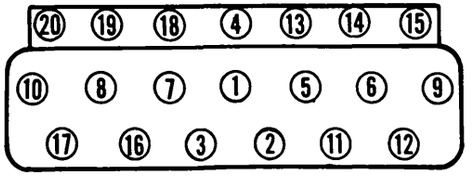
OIL PAN

ALL ENGINES



OIL PAN INSTALLATION: To install oil pan gaskets, filler block must be removed. Remove filler block attaching screws and carefully separate gasket and filler block. If gasket damaged, replace with correct portion of a new front cover gasket. Clean oil pan and mounting flanges of block and apply a sealer such as Perfect Seal to block flanges. Install oil pan gaskets. Install filler block on front cover and install one upper screw. Pry upward on filler block with a stick and install opposite upper screw. *This procedure will compress gasket ends and align filler block.* Install lower screws and tighten all screws until screw heads just engage lockwashers. Install oil pan, tighten mounting screws to specifications and then tighten filler block attaching screws securely.

CYLINDER HEAD & MANIFOLD



►*AIR CONDITIONED CAR CAUTION:* When removing cylinder head, air conditioning compressor must first be removed from its mounting bracket. *See "Studebaker Air Conditioning" in Miscellaneous Section.*

6 CYLINDER ENGINE

CYLINDER HEAD INSTALLATION: Insert dowel studs in capscrew holes Nos. 1, 15 & 17. Coat both sides of gasket with a thin coat of Perfect Seal, install gasket and place cylinder head over dowel studs. Coat capscrews with oil or graphite paste and install. Partially tighten all screws in sequence (see diagram), then again to specifications.

V8 ENGINE CYLINDER HEAD

6 CYL. ENGINE CYLINDER HEAD

V8 ENGINE

CYLINDER HEAD INSTALLATION: *CAUTION - Right and left cylinder heads are interchangeable. Block off rear water pump port on both heads with a dummy plat and gasket. Heat indicator unit is mounted in left head dummy plate.* Coat gasket with Perfect Seal and install. Coat cylinder head capscrews with oil or graphite paste and install nine short screws in outer two rows of holes in head, five medium length screws in center row and tighten finger tight. Install pushrods. Install rocker arm assembly with the four long screws and tighten finger tight. Install rocker arm support bracket screws and tighten alternately to specifications. Tighten cylinder head screws to specifications in sequence shown in diagram. Complete reassembly.

ORIGINAL BORE & PISTONS

ALL ENGINES

ORIGINAL BORE & PISTON SIZES: Standard cylinder bores may vary from 3.0000" to 3.0025" (6 Cyl.), 3.5625" to 3.5645" (V8) oversize in .0005" increments (not more than .001" variation in any one block). Bore size is stamped on top face of cylinder next to bore. *Example: "25" on cylinder indicates bore size 3.0025" (6 Cyl.), 3.5625" (V8).* Replacement pistons furnished for these oversizes under the standard size part number and size is marked on top of piston.

PISTON PINS

ALL ENGINES

PISTON PIN: Removal - Place Removing & Installing Tool J-1293-C in a vise and place piston and rod assembly through tool. *CAUTION - Do not overtight n tool retaining nut as piston pin may be expanded.* Remove locknut and washer from piston pin clamp-screw and install on opposite end of screw. Tighten locknut to remove screw and then separate piston, pin, and rod.

Installation: Use Tool J-1293-C in same manner as for removal. Oil squirt hole in rod must be on solid side of piston. Clampscrew should be installed from slotted side of piston (all V8 pistons and 6 Cyl. pistons Nos. 1, 3, 5); from solid side of piston (6 Cyl. piston Nos. 2, 4, 6). Align flat surface of piston pin with flat surface of clampscrew. Tighten clampscrew locknut to specifications.

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

REAR MAIN BEARING OIL SEAL INSTALLATION: Loosen intermediate bearing cap screws 2 turns nly to aid installation. Install seals as follows:

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Brumm r S al - With seal grooves in block and cap clean and dry, blunt sharp edge of flange at rear of block and carefully insert seal in block so wiping lip of seal contacting crankshaft points away from flywheel. Trim ends flush with block. Install seal in bearing cap and align with block seal. Apply oil to wiping edge of seal and install bearing cap making sure exposed part of seal smoothly straddles rear flange of bearing cap.

Cork Seals - Drive into grooves between sides of cap and block. Do not damage or split seals. Tighten intermediate bearing caps.

►*LEAK TEST NOTE:* After new seals installed, run engine for 45 minutes before checking for leaks.

ENGINE FRONT COVER

6 CYLINDER ENGINE

ENGINE FRONT COVER: Removal - Remove radiator, vibration damper, fan pulley (Puller J-8111) and protect threaded end of crankshaft. Remove attaching bolts and remove cover.

Installation: Install cover on engine leaving attaching bolts loose so cover will center itself when fan pulley installed. Install fan pulley (Pusher Set J-4704-A). Reverse removal procedure.

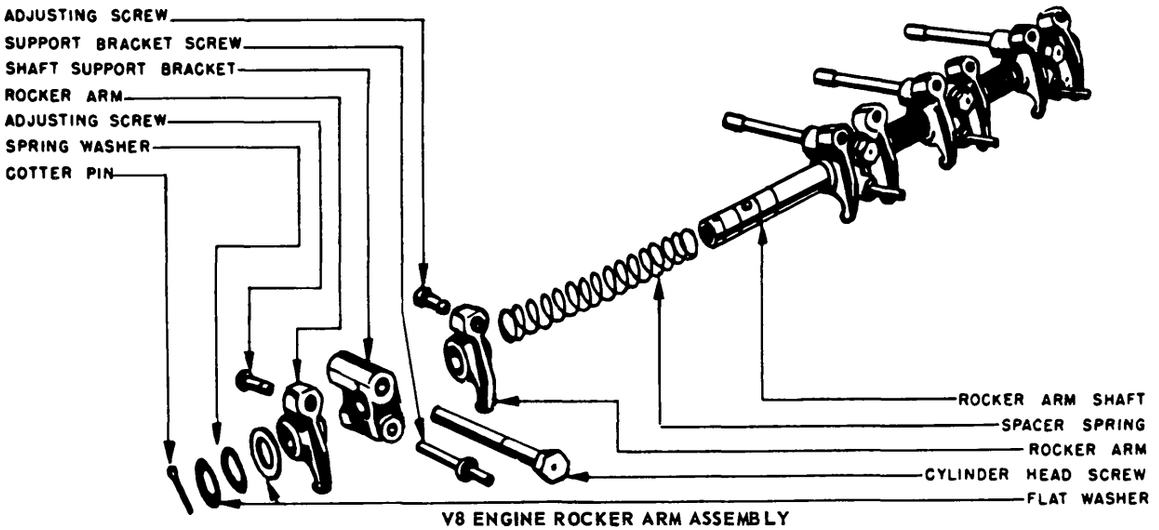
FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Install new felt seal in cover using fan pulley hub to seat it properly.

V8 ENGINE

ENGINE FRONT COVER: Removal - Remove fan shroud (Hawk), radiator, all belts, fan blade assembly, water manifold fuel pump, pump-to-carburetor pipe, vibration damper, and fan pulley hub (Puller J-8111). Remove attaching screws and remove front cover.

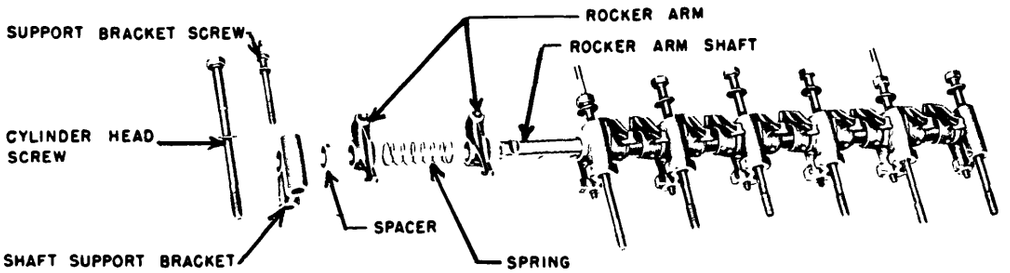
Installation: Install front cover and leave attaching screws loose until fan pulley hub installed so seal and cover will be properly centered. Install fan pulley hub (Pusher Set J-7404). Reverse removal procedure.

FRONT COVER OIL SEAL (CRANKSHAFT FRONT SEAL) INSTALLATION: Install new felt seal in cover and wet with engine oil. Use fan pulley hub to seat seal properly.



CAMSHAFT & BEARINGS

6 CYLINDER ENGINE



CAMSHAFT REMOVAL: *NOTE - If necessary to remove camshaft without removing engine, remove fenders, grille and radiator as an assembly. Then proceed as follows:* Remove cylinder head, manifold assembly, and valve cover plates. Remove valve assemblies and either turn engine over so lifters will fall free or block lifters up away from camshaft lobes. Remove oil pan, oil pump, and pump drive shaft. Remove timing gear cover (see above). Turn crankshaft until camshaft thrust plate screws can be seen through spokes of camshaft gear. Remove capscrews and remove camshaft and gear.

V8 ENGINE

CAMSHAFT REMOVAL: Position IGN mark on vibration damper directly under timing pointer and distributor in No. 6 firing position. Remove fan shroud (Hawk), radiator, fan blade and water manifold assemblies. Remove rocker arm assemblies and pushrods, carburetor and intake manifold assemblies, lifter cover, valve lifters, fuel pump and timing gear cover. Turn camshaft just enough so thrust plate retaining screws can be exposed and removed, then return camshaft to original position. Carefully remove camshaft and gear.

V8 ENGINE ROCKER ARM ASSEMBLY

170" OHV 6 CYLINDER ROCKER ARM

ALL ENGINES

TIMING GEAR REMOVAL: Remove front cover (see above), camshaft gear retaining screw, lock and flat washer, and fuel pump eccentric and lock plate. Use Puller No. J-8111 to remove camshaft gear. Remove crankshaft pulley key and oil slinger and pull crankshaft gear with Tool No. J-8111.

VALVE SYSTEM

VALVE GUIDES

ALL ENGINES

VALVE GUIDE REMOVAL & INSTALLATION: Use Tool J-4673 (V8), J-9265 (6 Cyl.) to drive guides out combustion chamber side of cylinder head. *NOTE - Intake valve guides are longer than exhaust valve guides. Do not interchange.* To install valve guides with Tool J-4673, coat outside of guide lightly with white lead and insert chamfered end of guide from combustion chamber side. Place installing plate on head with "Intake" or "Exhaust" mark up depending on guide being installed, so long side of plate is parallel to end of head and plate bore aligns with guide bore. Insert driver through plate and drive guide into head until shoulder of driver contacts bottom of counterbore in plate.

ROCKER ARMS

ALL ENGINES

►*ROCKER ARMS & ADJUSTING SCREWS PRODUCTION CHANGE:* Beginning Eng. No. V-511761 (259" Eng.), P-7484 1 (289" Eng.), rocker arms and adjusting screws were standardized with the Six Cylinder OHV Engine. All rocker arms and adjusting screws are now identical. *NOTE - Both V8 Engines with new rocker arms require slightly longer pushrods and different rocker arm shafts. Take care correct related parts are used. See following table.*

Part	Part Numb rs Early V8	Late V8	6 Cyl.
Rocker Arm w/screw	536222	1550621	1550621
Adjusting Screw	1541806	1550360	1550360
Pushrod Ⓒ	527890	1550303	1549588
Rocker Arm Shaft	527182	1550946	1550361

Ⓒ - Pushrod length: 11 11/64-11 7/32" (Early V8), 11 21/64-11 3/8"(Late V8), 11 19/32-11 41/64"(6 Cyl.).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

6 CYLINDER ENGINES

ROCKER ARM ASSEMBLY: R m val - Remove air cleaner, rocker arm retaining nuts and washers. Unscrew rocker arm bracket screws from head, then unscrew cylinder head capscrews-to-rocker arm assembly. Remove rocker arm assembly with capscrews remaining in rocker arm shaft brackets.

Disassembly: Mark rocker arm, brackets, and rocker arm shaft for easy reassembly. Press in on one end shaft bracket, then remove cylinder head capscrew. Gradually release spring and carefully remove bracket, spacer, first rocker arm, compression spring, and next rocker arm from the rocker arm shaft. Proceed to next set.

R ass mbly: Clearance between rocker arm shaft and rocker arms must be .0005-.0025". Install rear rocker arm shaft support bracket and insert cylinder head capscrew through bracket to hold in place. Install spacer next to end support, then install a rocker arm on the shaft next to spacer. Bottom of rocker arm must be on oil groove side of shaft and the valve stem end of rocker arm must be on same side of shaft as cylinder head capscrew groove in shaft. Install spacer spring next to rocker arm then install second rocker arm and one center support bracket and secure with cylinder head capscrew. Install remainder in same manner. *NOTE* - Install spacer between end rocker arm and end bracket.

Installation: Reverse removal procedure. Tighten cylinder head capscrews finger tight and tighten bracket screws alternately to avoid distortion. Then torque cylinder head capscrews 46-50 lbs. (refer to torque tightening sequence diagram in this section). Tighten rocker arm shaft bracket screws to a torque of 13-17 ft. lbs. Before installing rocker arm cover, check and adjust valve clearances. Install a new rocker arm cover gasket in cover flange. Torque rocker arm screws three times to 20 in. lbs., tightening rear nut last. Install air cleaner.

V8 ENGINE

►*V8 ROCKER ARM COVER PRODUCTION CHANGE:* New Rocker Arm Cover No. 1554092 is in production and provides for more space between rocker arms and cover. When interference between cover and rocker arms encountered, replace old cover No. 1549230 with new No. 1554092. *NOTE - Do Not use two gaskets under old cover to provide clearance.*

ROCKER ARM ASSEMB LY: Removal - Remove air cleaner, disconnect spark plug wires, drain cooling system and remove rocker arm covers. Remove rocker arm bracket screws and the four rocker arm-cylinder head capscrews. Remove rocker arm assembly.

Disassembly: Mark rocker arms, brackets and rocker shaft for reassembly. Remove cotter pin from end of shaft and slide all parts off shaft, removing cylinder head screws when necessary.

Reassembly: Rocker arm springs should require 9½-10½ lbs. pressure to be compressed to length of 2 1/32". Replace spring if not within specifications. Clearance between rocker arm shaft and rocker arms must be .0005-.0025". Lubricate all parts with oil. Reverse removal procedure. Install parts in order shown in illustration and make sure bottom of rocker arm is on oil groove side of shaft and adjusting screw end of rocker arm is on same side of shaft as cylinder head capscrew groove in shaft. When correctly assembled, flat on end of rocker shaft will be to rear on right bank, to front on left bank.

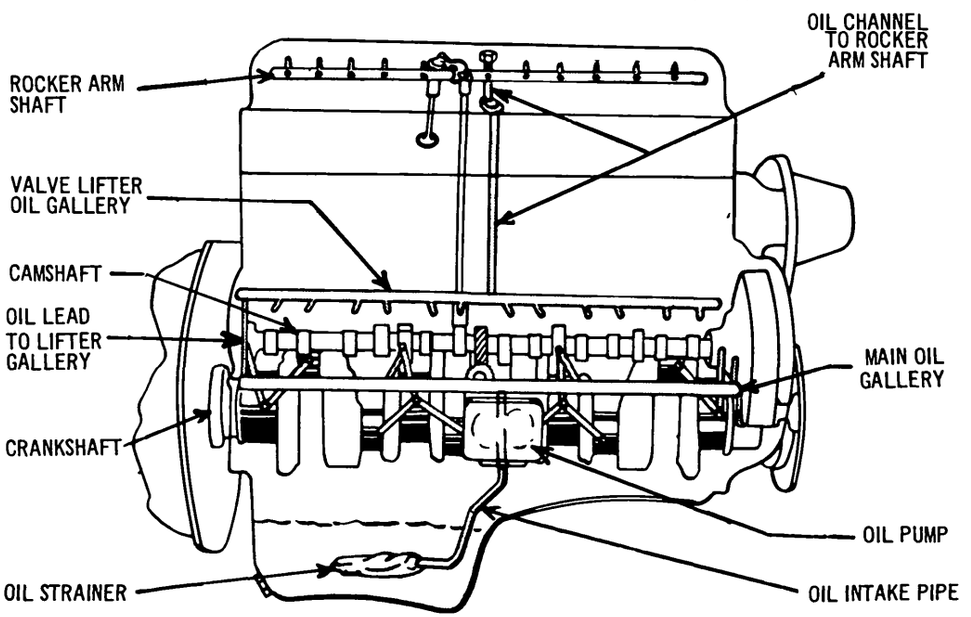
Installati n: Reverse removal procedure, tightening rocker arm bracket screws alternately to avoid distortion.

VALVE LIFTERS
ALL ENGINES

VALVE LIFTER INSTALLATION: Thoroughly clean lifter bores in cylinder block and inspect for smoothness. With lifter and bore clean and dry, check lifter fit and select correct lifter size. Lifters furnished Std., .001" and .005" oversize. *See .005" Oversize Lifter Installation below.*

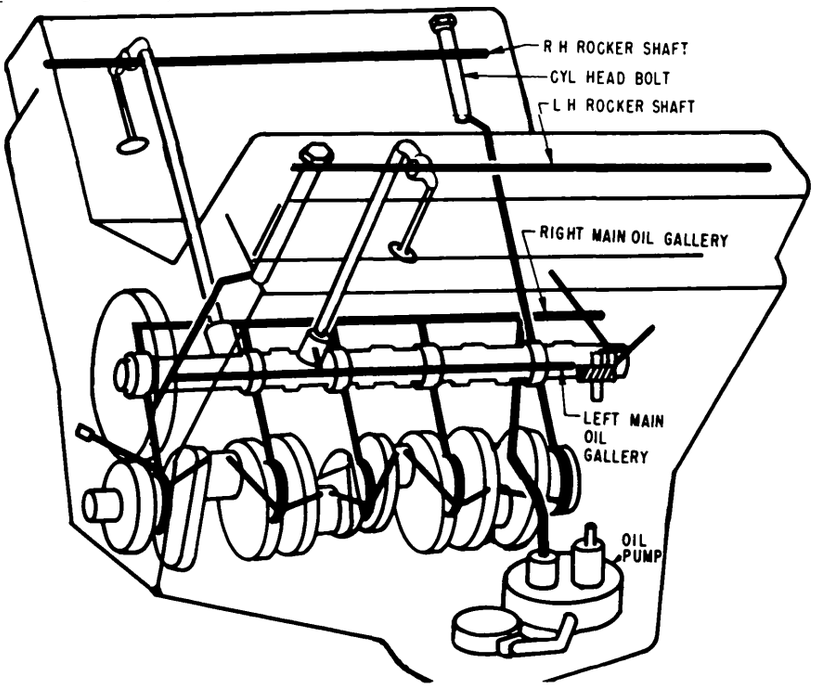
Checking Lifter Fit in Bore: With proper fit, lifter should just slide into place from its own weight. If .001" oversize lifter does not restore proper clearance, bore must be reamed to .005" oversize and .005" oversize lifters installed.

►*.005" OVERSIZE LIFTER INSTALLATION:* Special reamers are required for reaming lifter bores as follows: 32L-STD (6 Cyl.), 1352-STD (V8). These reamers will provide correct lifter clearance.



OILING SYSTEM

ENGINE LUBRICATION
6 CYLINDER ENGINES



DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and valve lifters. All other parts are lubricated by oil spray.

OPERATION: Gear type oil pump mounted externally on right side of crankcase draws oil through floating oil strainer and intake pipe in crankcase which terminates at inlet port in pump mounting base. Oil from pump

CONTINUED ON NEXT PAGE

STUDEBAKER 6 CYLINDER ENGINE OILING SYSTEM

STUDEBAKER V8 ENGINE OILING SYSTEM

CONTINUED FROM PRECEDING PAGE

flows through outlet passage in pump body and mounting pad directly to main oil gallery which extends longitudinally along right side of crankcase (oil pressure regulator is located in crankcase at forward end of this oil gallery). At rear of engine, a transverse passage connects main oil gallery with lifter oil gallery which also extends entire length of engine block on inner side of lifter chamber. Oil is distributed through these oil galleries as follows:

Crankshaft & Camshaft Bearings - Lubricated through drilled passages in each crankcase web extending from main oil gallery to camshaft bearing bore and then down to corresponding main bearing bore (rear camshaft bearing is lubricated from passage connecting main oil gallery to lifter oil gallery).

Connecting Rod Bearings - Crankshaft is drilled and each connecting rod bearing is lubricated through passage from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder walls from drilled hole in connecting rod when this hole lines up with crankpin oil hole.

Valve Lifters - Each lifter lubricated through short oil passage extending from lifter oil gallery to lifter bore.

Rocker Arms, Pushrods & Valves - A vertical oil passage in center of cylinder block connects valve lifter oil gallery with passage in cylinder head. This passage leads the oil up and around the relieved cylinder head capscrew shank to the rocker arm shaft center bracket. The bracket is drilled to connect the capscrew hole with the rocker arm shaft hole. The oil enters the shaft and flows to the rocker arms through small holes drilled in the rocker arm shaft. The rocker arms are drilled from the pushrod ends to the bore and allow the oil to flow to the pushrods. Oil from rocker arm assembly returns to the oil pan through the pushrod passages in the cylinder head and block.

Timing Gears - Lubricated by oil return from pressure regulator valve. Valve bypass port discharges into channel formed by groove in front of block behind engine front plate through which oil is directed onto timing gears. *NOTE* - Small bleed hole in valve plunger provides lubrication for gears at low speeds when pressure regulator valve is closed.

V8 ENGINES

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, valve lifters, and valve mechanism on cylinder head. All other parts are lubricated by oil spray or oil return flow.

OPERATION: Gear type oil pump mounted on rear main bearing cap in crankcase draws oil through floating oil strainer and intake pipe mounted on pump body and delivers oil through passages in rear bearing cap and engine block to rear end of right main oil gallery which extends along entire length of engine. At forward end of the engine, two intersecting cross-passages connect the right main oil gallery with the left main oil gallery which also extends along entire length of the engine. Oil is distributed from these oil galleries as follows:

Crankshaft & Camshaft Bearings - Lubricated through drilled passage in each crankcase web extending from **right hand** main oil gallery to corresponding camshaft and crankshaft bearings. *NOTE* - Rear camshaft bearing is lubricated by separate cross-passage from right main oil gallery.

Connecting Rods - Crankshaft is drilled and each connecting rod bearing is lubricated through drilled hole in shaft from adjacent main bearing.

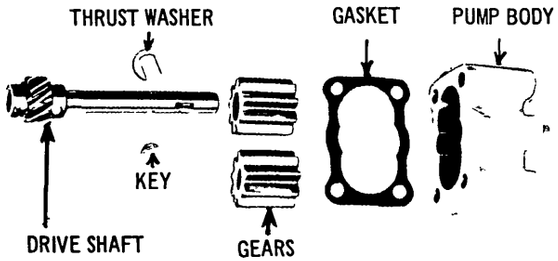
Pistons & Pins - Lubricated by oil spray thrown on cylinder wall from spray hole in lower end of connecting rod when this hole registers with oil hole in crankpin.

Valve Lifters - Lifters are lubricated through short vertical passage leading from adjacent main oil gallery.

Rocker Arms, Pushrods, & Valves - Drilled passages in block at forward end of left main oil gallery (for left bank), and at rear end of right main oil gallery (for right bank) extend up to matching passages in cylinder head and rocker shaft support brackets (front bracket on left head, rear bracket on right head). Passage in head and support bracket is around relieved shank of cylinder head bolt which passes through bracket. Oil flowing through this passage enters hollow rocker arm shaft through angle passage in bracket. Drilled holes in shaft and in rocker arm and tappet adjusting screw provide lubrication for rocker arm, pushrod socket, and valve tip. Drain hole at rear end of each cylinder head and matching passage in block drain excess oil back into lifter chamber (drain hole in head is through hollow dowel). An oil return hole in the lifter chamber permits oil to drain back into oil pan. *NOTE* -Early engines had drain hole at each end of each cylinder head.

Timing Gears - Lubricated by oil bypassed by pressure regulator valve (pressure regulator mounted on right front corner of engine block and oil return passage directs oil on timing gears). Valve plunger has small bleed hole to provide lubrication for gears at low speeds when regulator valve is closed.

Camshaft Gear Thrust Face - Groove in front camshaft bearing permits oil to flow out and through hole in camshaft thrust plate. Two grooves in front face of plate distribute oil over face of thrust plate on which camshaft gear hub rides.



Distributor Drive Shaft & Gear - Lubricated through passage from rear of rear camshaft bearing.

OIL FILTER: Partial flow type mounted on bracket on cylinder head. Oil inlet line is connected to drilled hole at front of left cylinder head and filter outlet pipe returns oil to crankcase filler pipe.

OIL PUMP

6 CYLINDER ENGINE

OIL PUMP: Removal & Disassembly - Disconnect oil pressure pipe and remove pump cover, gasket, and idler gear. Remove drive gear with Tool J-2959. Remove woodruff key and U-shaped thrust washer and remove pump body. To remove pump drive shaft and gear, remove oil pan and distributor. Push drive shaft inward and remove from inside crankcase.

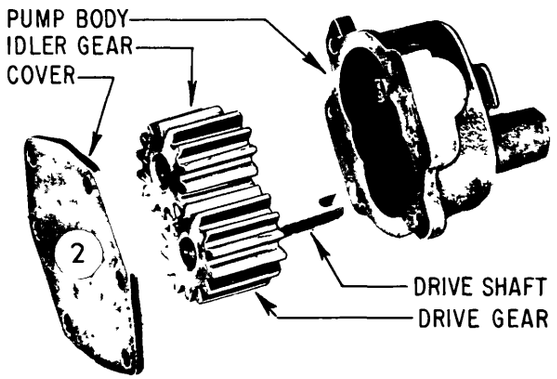
6 CYLINDER ENGINE OIL PUMP

Inspection: Clearance between cover plate and ends of gears should be no more than .007". Lower ends of gears should be flush with cover surface of pump body with gears resting on lower part of body. Total clearance between pump gears should be no more than .010". To check, place a .005" feeler gauge between teeth of gear and body on each side of pump. If gears rotate, replace pump body.

Installation & Reassembly: Reverse removal procedure, dipping each part in oil and using new gaskets. *CAUTION - Install oil pump drive shaft exactly as follows to obtain correct ignition timing.* Install drive shaft and engage camshaft gear and pump drive gear in any position. Position No. 1 Piston at TDC of compression stroke and UDC 1-6 mark on vibration damper directly under pointer on front cover. Disengage pump gear from camshaft gear and turn shaft so keyway points directly to bottom of engine when gears start to engage. Mesh gears (keyway will point to rear of engine). Install distributor. When slot in distributor shaft engages tang on pump drive shaft, distributor rotor should line up with No. 1 terminal in distributor cap.

V8 ENGINE

OIL PUMP: Removal - Remove oil pan. Remove retaining nuts and remove pump.



Disassembly: Remove oil strainer and pipe. Remove cover, idler gear, and drive gear and shaft (do not separate shaft from gear).

Inspection: Inspect cover for scratches or deep scores. Maximum clearance between ends of gears and cover plate is .007" measured with weight of gears on upper part of pump body and a straightedge across body. Total gear-to-body clearance should be not more than .010" measured with a .005" feeler between each gear and body. If gears rotate, replace pump body.

Reassembly: Reverse disassembly procedure and tighten strainer pipe to 30 ft. lbs.

Installation: Reverse removal procedure.

V8 ENGINE OIL PUMP

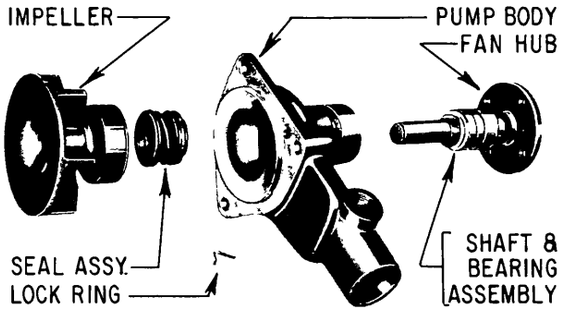
CONTINUED FROM PRECEDING PAGE

COOLING SYSTEM

WATER PUMP

6 CYLINDER ENGINE

WATER PUMP: R moval - Drain cooling system, remove fan belt, fan blades and pulley. Disconnect heater hose and generator adjusting arm. Disconnect radiator-to-pump hose. Remove water pump.



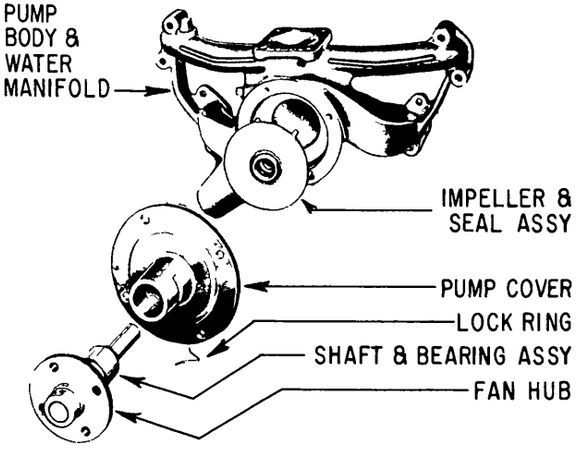
Disass mbly: Remove bearing lock ring, place pump in an arbor press and press shaft, bearing and hub assembly through impeller and front of housing. Press hub from shaft.

R ass mbly: Press n w hub on shaft until flush with end of shaft. Install shaft and lock ring in housing. Use new seal and impeller and press impeller on shaft tc obtain .015-.031" clearance between impeller and housing (rotate shaft when checking clearance).

Installation: Reverse removal procedure.

V8 ENGINE

WATER PUMP: R moval - Drain cooling system, remove belt and fan and pulley. On Hawk, remove fan shroud



6 CYL. ENGINE WATER PUMP

(see below). Remove pump-to-manifold screws and remove water pump.

Disassembly: Remove bearing lock ring and press hub, shaft and bearing assembly out through front of housing. Press hub from shaft.

Reassembly: Use a new hub and press on shaft until flush with end of shaft. Install shaft in housing, install new seal in impeller. Press impeller on shaft until flush with end of shaft. Impeller-to-housing clearance should not exceed .090".

Installation: Reverse removal procedure.

V8 ENGINE WATER PUMP

HAWK MODELS

FAN SHROUD REMOVAL: Drain radiator and remove radiator inlet hose. Remove wiring from shroud and move wiring harness out of way. Remove fan blades. Remove fan shroud attaching screws and remove shroud.

MODEL IDENTIFICATION

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar post

Assembly Plant	Starting Numbers
South Bend	61S-1001
Canada	61SC-1001

ENGINE NUMBER: Stamped on pad at upper left front of cylinder block

Assembly Plant	Starting Numbers
South Bend	S-172601
Canada	SC-20101

►*ENGINE IDENTIFICATION* The following chart helps to identify engine types

Engine Type	③Identifying Mark
Heavy Duty	Clover leaf ①
7 0-1 (Special Export)	X ②
7 0-1 & Heavy Duty (Special Export)	X & Clover Leaf ②

① - On head just below heater water outlet tapped hole & on block just suffixing engine serial number
② - On block just suffixing engine serial number
③ - Standard engines have no special markings

TUNE-UP

►*HARD COLD STARTING CORRECTION:* On cars built before Feb 13, 1961 install new ignition coil and resistor *See Ignition Coil below for data*

COMPRESSION PRESSURE: 140-160 lbs at 150 RPM Maximum variation between cylinders 10 lbs

VALVE TAPPET CLEARANCE: 025- 027" (Cold), 023-025" (Hot), All Valves

►*TAPPET CLEARANCE ADJUSTING SCREW CAUTION:* Screws are located on underside of rocker arm and are self-locking type Torque required to turn screw must be 30 In lbs minimum

MANIFOLD HEAT CONTROL: Automatic thermostatic type

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles *See "Closed Crankcase Ventilation Systems" in Carburetion Section*

►*Y1 TAXICAB POOR GAS MILEAGE COMPLAINT* When investigating such a complaint, check the "hiss-pad" on the underside of the top cover of the Carburetor Air Cleaner Replace the top cover with Studebaker Part No 1545297 if "drooping" exists

►*SPARK KNOCK CORPECTION & Y1 TAXI PRODUCTION CHANGE·* If objectionable spark knock is encountered and higher octane gasoline not available or desirable, install a slightly thicker Cylinder Head gasket, Studebaker Part No 1693440 (reduces compression ratio from 8 5 to 8 0-1) This Cylinder Head Gasket is standard on all Y1 Taxicabs after engine Serial No S-189501

►*ENGINE WARM-UP PERIOD PERFORMANCE IMPROVEMENTS* The following changes in production, as of Jan 16, 1961, can be made on engines built prior to that date **1)** Plain washer, Studebaker No 41X243 has been installed between each manifold retaining clamp and retaining nut These washers (6 per car) minimize possibility of leaks at manifold port flanges **2)** Plain washer Studebaker Part No 41X106 is installed on heat riser valve shaft between the manifold heater valve pad and the thermostatic spring Washer acts as a baffle to deflect heat **away from** thermostatic spring **3)** An external tooth lock washer, Studebaker Part No G-125774, is installed under exhaust manifold heat riser valve set screw to prevent possibility of set screw loosening

IGNITION

FIRING ORDER: 1-5-3-6-2-4

SPARK PLUG GAP: 033- 038"

Spark Plugs - Champion H-14Y 14mm Torque to 25-30 ft lbs Permanent type steel gasket

►*GASKET REPLACEMENT NOTE* If necessary to remove gasket, remove with a cutter Replace with conventional steel gasket Studebaker Part No 536599

COIL: Autolite. Used as follows

Model	Coil No.	Resistor No.
Lark (Early)	200636	None used
Lark (Late)	①200657	1550556
Y1 Taxi	200639	1550556

① - Used to correct hard cold starting on early models

Ignition Current - 4 0 amps idling

DISTRIBUTOR: Autolite IAT-4403B.

Condenser - Autolite No 2-32 **Capacity** 18- 23 mfd
Contact Point Set - Autolite No 1-47
Breaker Gap - 017- 022"
Cam Angle - 37-41°
Breaker Arm Spring Tension - 17-22 ozs
Rotation - Counterclockwise viewed from above

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	300	0	600
2	400	4	800
4	500	8	1000
8	700	16	1400
12	900	24	1800

Vacuum Spark Control: Autolite integral type

Vacuum Advance

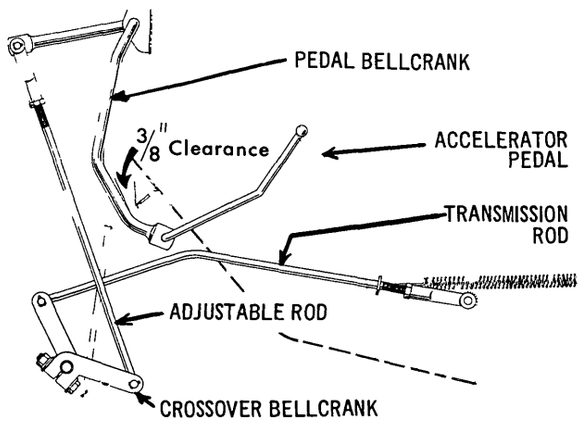
Distr Degrees	Eng Degrees	Vacuum (" of HG)
Start	0	8
4¼	8½	11
8	16	13

IGNITION TIMING

Setting - 2° BTDC
Timing Mark - On vibration damper "IGN" mark in line with pointer on left side of timing cover
Timing - Disconnect vacuum advance pipe at carburetor Install plug in carburetor With engine at idling speed, timing light should show index mark nearest IGN mark directly under pointer

CARBURETOR

►*CARBURETOR APPLICATION: Cart r AS, singl barr l used as follows.*



Model	Carb. Mdl
Pass Cars Exc Taxi(Less Pos Crankcase Vent)	AS 3159S & 3160S
Pass Cars (With Pos Crankcase Vent)	AS 3161S
Taxicab	AS 3186S

►*FLAT SPOT OR ENGINE SURGE CORRECTION & CAUTION·* Use new metering rod Part No 1553351 (AS 3159S & 3160S), 1553350 (AS 3161S) to correct condition (will result in a slight reduction in fuel economy)

►*FUEL LINE STOPPAGE CORRECTION:* Kinked fuel line at either tank or pump can be corrected by installation of new flexible hose, Part No 1543933x2

FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With engine at normal operating temperature and carburetor off fast idle, proceed as follows

1) On right hand side of engine, disconnect adjustable rod from manifold bellcrank and adjust engine idle to 550 RPM with selector lever in "P" or "N" position Hold bellcrank against stop plate (with engine idling at 550 RPM), adjust length of crossover bellcrank-to-manifold bellcrank rod so end of rod will slide into manifold bellcrank freely *NOTE - Engine idle should not change and bellcrank should not leave its stop when rod is connected*

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

2) On left side of engine, adjust length of rod between accelerator pedal bellcrank and crossover bellcrank to provide 3/8" clearance between rib on floor pan and accelerator bellcrank arm *CAUTION - This adjustment must be accurate to prevent engine race on hard brake application or improper kickdown operation*

3) Install pressure gauge on transmission at left front corner of case in front of selector lever Operate engine at 1000 RPM in "D" range (block wheels), adjust rod connecting crossover bellcrank to transmission throttle valve control lever for pressure of 70-75 lbs Remove gauge

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*ADJUSTABLE CONTROL ROD (FROM MANIFOLD BELLCRANK) OVERTRAVEL CAPSULE STICKING CORRECTION:* If sticking condition found on models built prior to Engine No. S-203551, remove adjustable rod from manifold bellcrank, discard old stype adjustable end and replace with new end Studebaker No. 1554371 and new pullback spring clip No. 167320. Install with capsule end **upward.** Adjust throttle control and transmission control linkage.

CARTER AS 3159S, 3160S, 3161S, 3186S

Idl Setting - Initial setting approximately 1 turn open from a lightly seated position. Turn screw out for richer mixture.

Idl Speed - 550 RPM (All Trans.) Flightomatic in "P" or "N" position.

Fl at L v l - ¼" (Gauge T109-282) from top of each float at free end to top of casting. To adjust, bend float arm lever.

Acc l rating Pump - Pump arm on lifter link should be parallel to top of casting. To adjust, bend pump arm.

Fast Idl : .065" clearance between throttle valve and side of body measured opposite idle ports, with fast idle link on high step of cam. To adjust, bend choke connector rod.

Automatic Ch ke Setting: 1 pt. lean.

Thr ttl Linkage Adjustment: See *CARBURETOR* above.

►*OTHER DATA: S "Carter AS Carburetors" in Carbur tion Secti n.*

CARB. EQUIPMENT

Fu l Pump: AC. Fuel only. Replacement Pump 4703.
Fu l Pump Pr ssur - 3½-5½ lbs.

Gas lin Gauge: Electric type.
Dash Unit - Studebaker No. 1552983.
Tank Unit - Studebaker No. 1549575.

Air Cl an r: DRY FILTER ELEMENT TYPE Std., Oil Bath type optional. Clean element every 1,000 miles, replace dry type every 10,000 miles.

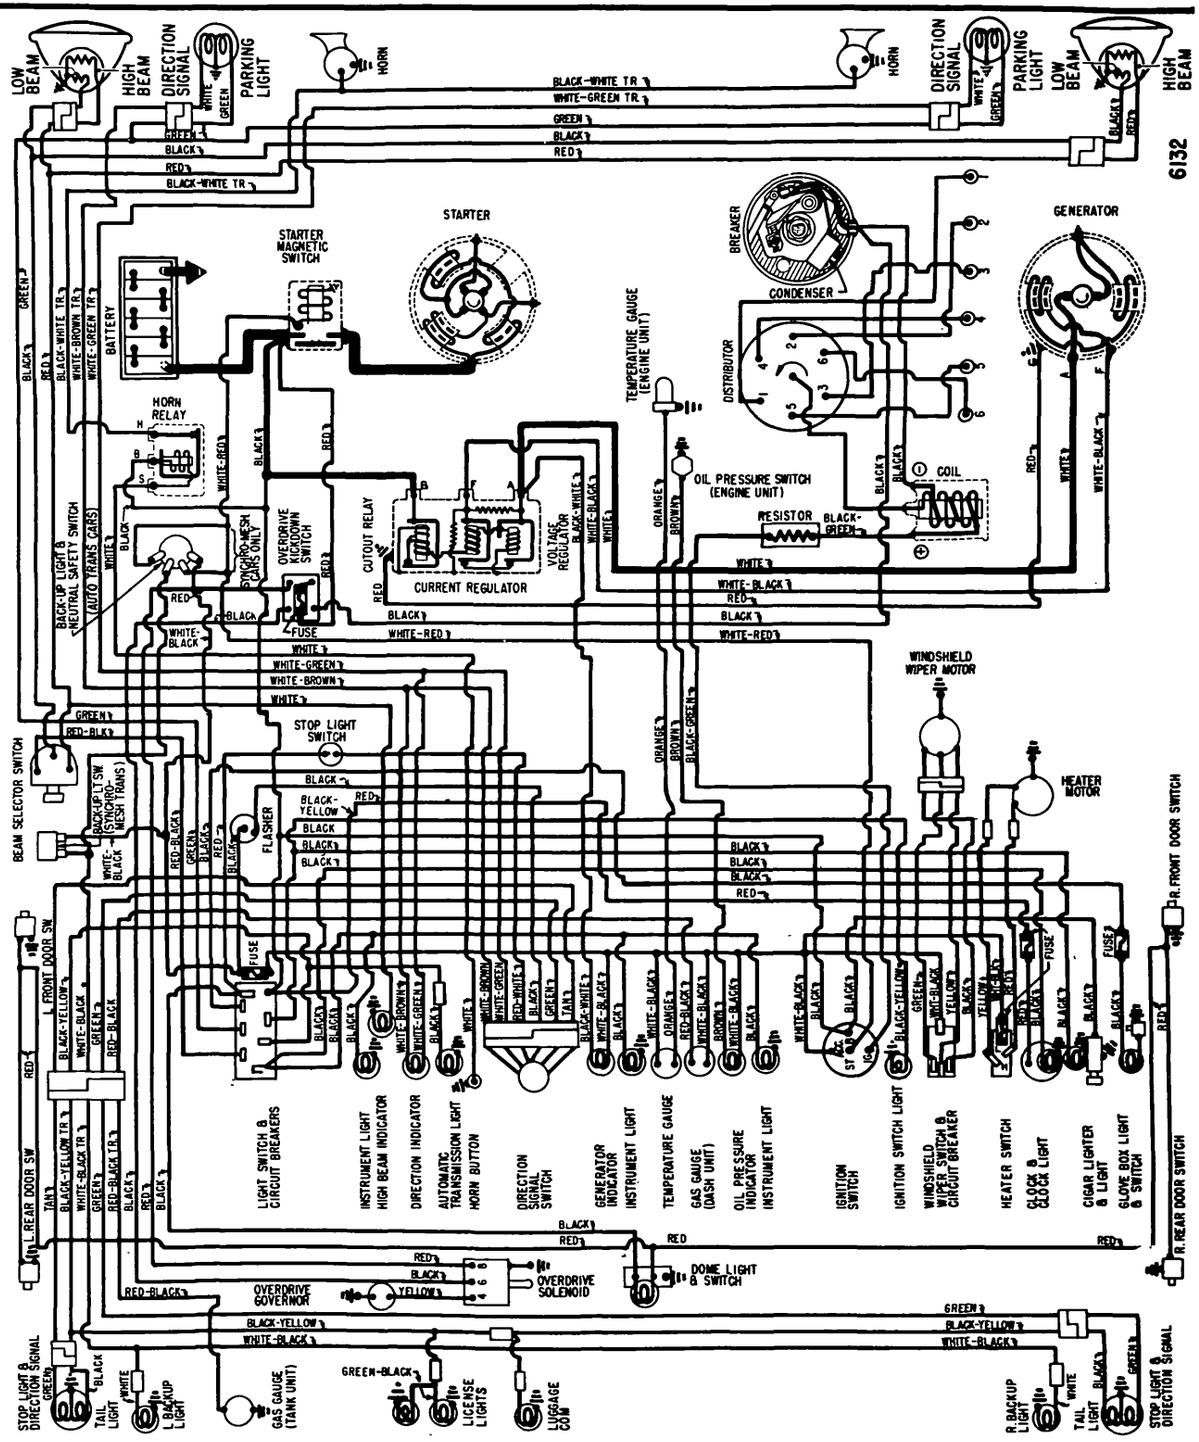
►*DRY TYPE CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT wash element in solvent or other liquids and DO NOT oil, lubricate, or blow out with compressed air.*

BATTERY

Willard HO-11-50. 12 Volt, 9 plate, 50 ampere hour capacity (20 hr. rate).
Batt ry Gr und - Negative.
Engin Gr und - Right front engine support bracket to frame.

STARTER

Autolit MDU-7005. Armature - Autolite No. 16-75.



►*TAXICAB STARTER NOTE: When Delco-Remy starters used, see Lark V8 for service data.*

Driv - Bendix "Folo-Thru" type.
Shunt Field Draw - 4.4-5.1 amps. at 10 volts.
R tation - Counterclockwise at commutator end.
Brush Spring Tensi n - 31-47 ozs.

Performanc Data - MDU-7005

Torque	RPM	Volts	Amperes
0 ft. lbs.	5300	10.0	50 Max.
6.2 ft. lbs.	Lock	4.0	280 Max.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Starter Switch: Magnetic switch, Studebaker No 1550558 mounted on starter and controlled by combination ignition and starter switch.

Automatic Transmission Neutral Safety Switch: Studebaker No. 1552780. Combination Neutral Safety and Back-Up Light Switch mounted on lower end of steering column. Adjust switch so that starter operative only with selector lever in "N" or "P" position.

GENERATOR

Autolite used as follows

Model	Generator No.
Standard	GJP-7102C ① ②
Low Cut-In	GGA-6001-SN ③

① - "B" circuit type. Use only "B" circuit regulator.
② - Serv. No. GJP-7102S.
③ - "A" circuit type. Use only "A" circuit regulator.

►*OPTIONAL DELCO-REMY GENERATOR NOTE: For data on these generators, see Lark V8 pages following.*

Armature - Autolite No. 10-53 (GJP-7102C), 10-24 (GGA-6001SN).

Brush Spring Tension - 18-36 ozs. (GJP-7102C), 34-41 ozs. (GGA-6001SN).

Field Current - 1 6-1.7 amps. (GJP-7102C), 1.1-1.3 amps. (GGA-6001SN) at 10.0 volts (70°F).

Motoring Current - 3.1-3.5 amps (GJP-7102C), 2.3-2.6 amps. (GGA-6001SN) at 10.0 volts (70°F).

Rotation - Counterclockwise at commutator end.

Performance Data - GJP-7102C

Amperes	Volts	RPM
16 min.	15.0	1750
30	15.0	2300 max.
35	15.0	2600 max.

Performance Data - GGA-6001SN

Amperes	Volts	RPM
4.0	14.6	950
40.0	14.6	1600
40.0	15.0	1600

B lt Adjustment: ¼" deflection with 10 lb. pull midway between generator and water pump pulleys.

REGULATOR

Autolite No. VBO-6201A-1 (GJP Gen.). No. VBO-4202A (GGA Gen.). *NOTE - Regulator VBO-6201A-1 is "B" circuit type (use only with GJP Gen.), and Regulator VBO-4202A is "A" circuit type (use only with GGA Gen).*

►*OPTIONAL DELCO-REMY REGULATOR NOTE: For data see Lark V8 pages following.*

Cutout Relay

Cuts In - 12 5-13 5 volts
Cuts Out - 3-5 amps discharge current after a charge of 7 amps
Contact Gap - 015" minimum
Air Gap - 025- 027"

Voltage Regulator

Setting - 14 2-14 8 volts at 80°F, unit operating normally while charging at 7 amperes or with a 25 ohm resistor between regulator and battery
Air Gap - 048- 052" with contacts just opening (check at brass armature stop pin)
Checking & Adjusting (VBO-4202A) - *See "Aut lit 12-V lt Regulators" in El ctrical Secti n.*
Ch cking & Adjusting (VBO-6201A) - *See "Autolit B Circuit R gulators" in El ctrical S cti n*

Current Regulator

►*SETTING CAUTION· "Temperature Compensated" type Set to following specifications at 70°F*

Regulator	Test A - Operating Amperes - Test B
VBO-6201A	44 35 (33-37)
VBO-4202A	49 40 (38-42)

Test A - After 15 minutes operation charging at 7 amps
Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13 6-13 8 volts)
Air Gap - 048- 052" with contacts just opening (check at brass armature stop pin)
Checking & Adjusting (VBO-4202A) - *See "Autolite 12-Volt Regulators" in Electrical Section.*
Checking & Adjusting (VBO-6201A) - *See "Autolite B Circuit Regulators" in Electrical Section*

MISC. ELECTRICAL

Headlights: Single & Dual (4-Headlight system)

Lighting & Instrument Light Switch Removal· Remove switch retaining nut, push switch back through instrument board, disconnect wires *NOTE* - When installing switch, align flat on switch sleeve with corresponding flat on board

Speedometer & Instrument Removal· Units can be removed separately without disturbing other parts

Stop Light Switch Located on inner side of left frame rail forward of steering gear housing (Std Brakes), mounted in elbow fitting on power brake unit (Power Brakes)

►*BACK-UP LIGHT SWITCH REMOVAL WHEN ADJUSTING TRANSMISSION SHIFTING LEVER RODS· See "Lighting System Notes" in Studebaker Special Data.*

CIRCUIT BREAKERS: 18 Ampere. In headlight switch Protects headlights
12 Ampere . In headlight switch Protects Dome, Stop, Instruments, Park & Tail lights
5 Ampere. In windshield wiper switch

FUSES: SFE 14. Protects overdrive In kickdown switch
AGW 7½ Protects radio In lead behind instrument panel
1AG3. Electric clock In lead behind instrument panel
AGC 15. Climatizer & Defroster In switch
Thermal. Cigar lighter On back of lighter socket
SFE 9. Directional Signals & Backup lights On headlight switch

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION Use extreme caution when disconnecting any part of air conditioning equipment or lines for access to engine See "Air Conditioning Service Cautions in Miscellaneous Section*

►*Y1 TAXICAB COMPRESSION RATIO CHANGE: See "Spark Knock Correction & Y1 Taxi Production Change" under TUNE-UP*

ENGINE SPECIFICATIONS: Own. New 6 Cyl Overhead Valve type *NOTE - Y1-taxicab model (heavy duty engin) has an aluminum camshaft timing gear, top compression ring is chrom , and heavy duty intake and xhaust valves are us d*

Bor	Str k	Displacement
3"	4"	170 cu In

Compression Ratio	Rated HP	D v lop d HP
8 5-1 ①	21 6	112 at 4500 RPM

① - 7 0-1 Optional

Compression & Vacuum Reading - *See TUNE-UP*

OIL PAN REMOVAL: Remove oil dipstick and drain oil On long wheelbase models, move wheels to right to move steering bellcrank out of way On other models, disconnect tie rods and reach rod from steering bellcrank Remove retaining pinch bolt and remove bellcrank from shaft Remove oil pan screws and remove pan

OIL PAN INSTALLATION *Se Oil Pan' in Studebaker Special Data*

ENGINE REMOVAL: *See "Engine" in Stud bak r Special Data*

CYLINDER HEAD: *See "Cylinder H ad & Manif ld" in Studebaker Special Data.*

TIGHTENING TORQUES: *S "Tight ning Sp cifications" in Studebaker Special Data*

PIST NS

T-slotted, cam ground, tin plated aluminum alloy with one oil and two compression rings. Heat dam at top of piston controls heat at top ring *NOTE* **- 7-1 compression ratio has crater-head type piston.**

Fitting Pistons - Use a 002" x 1" x 12" feeler gauge inserted on camshaft side of cylinder Insert piston (inverted) in cylinder bore with slotted side away from camshaft and bottom edge of piston 1" below top edge of bore Pull required to withdraw feeler should be 7-12 lbs

Installing Pistons - Oil squirt hole and number on connecting rod should be on solid side of piston *See Rod Installation*

Replacement Pistons: Std., .001", .0025", .010", .020", 030", and 040" Oversize. Pistons furnished with pins

Installing Pistons: Install piston in cylinder bore with "T" slot away from camshaft side *S Rod Installation,*

PISTON PINS

Pin is locked in rod by tapered pin and locknut.
Diameter– 7491-.7495" **Length** 2 625"
Clearance in Piston– 0001- 0003" (selective fit) Light thumb push fit at 70°F
Piston Pin Removal & Installati n–*S "Pist n Pins" in Studebaker Special Data*
Replacement Pins: Std. & 0025', 005" Oversize

PISTON RINGS

Two compression rings (Cast Iron-Ferrex) and one oil ring (Cast Iron-Blued). *NOTE* - Y1 Taxi has Chrome top (No 1) compression ring.

Ring	Width	End Gap	Sid Clearanc
Compr. #1	3/32"	007- 017'	002- 005"
Compr #2	1/8'	007- 017'	002- 005"
Oil	5/32'	007- 017"	0015- 004"

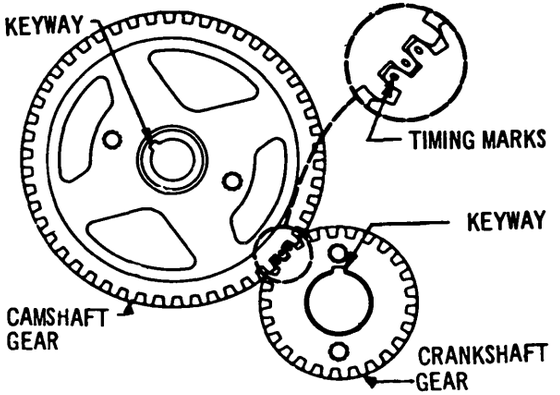
Replacement Rings: Std , 020", 030', & .040" Oversize, in sets

Installing Rings· Top compression ring has step at the inside which must be installed up Second compression ring has step at outside which must be installed down. Inner and outer oil ring end gaps must not come at the same point

S e INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

CONNECTING RODS



L ngth—(Center-to-center) 6 3/8". **Weight**—19.04 ozs.
Crankpin J urnal Diamet r—1.81175-1.81275"
Bearings—Steel backed, Microbabbitt lined, no shims.
►*HEAVY-DUTY ALUMINUM BEARING NOTE:* New type bearings are available for all 170 OVH 6 Cylinder Engines and went into production on 1961 S-Y1 Taxicabs beginning Engine Serial No. 61S-196221. These bearings are steel-backed, lined with aluminum alloy with a flash of babbitt over the aluminum.
Cl aranc—.0005-.002".
Sid Play—.005-.009".
R plac m nt Bearings: Std., .001", .002", .010", .020" Undersize.
Installing Rods: Assemble piston and pin on rod so "T" slot of piston on side opposite oil hole in lower end of rod. Insert tapered end of clamp screw toward heavy boss on rod. With "T" slot of piston away from camshaft side, the narrow part of rod offset will be to right on odd numbered rods, to left on even numbered rods. Rods (#1, 3, 5) cannot be interchanged with rods (#2, 4, 6).
►*REPLACEMENT ROD NOTE:* (Unnumbered Rods)—With spit hole toward you, narrow part of offset will be to the right for odd numbered cylinders, and to the left for even numbered cylinders.

CRANKSHAFT

►*REAR MAIN BEARING OIL LEAK CORRECTION:* If proper installation of new rear oil seal and oil pan gaskets does not stop the leak, make sure that drain core hole in rear main bearing cap connects with groove in cap. Drill and file hole to correct.
J urnal Diameter—3.0623-3.0628". Four bearings.
►*FRONT MAIN BEARING CAP REMOVAL NOTE:* Turn crankshaft until No. 3 and No. 4 pistons are at top of their travel. Remove bearing cap bolts, then remove cap by twisting end away from camshaft toward rear of engine.
Bearings - Steel-backed, micro-babbitt lined. No shims.
►*HEAVY-DUTY ALUMINUM BEARING NOTE (Nos. 2 & 3 Bearings):* Steel-backed, aluminum alloy bearings (with flash of babbitt over the aluminum) used in production on 1961 Y-1 Taxicabs beginning with Engine No. 61S-196221. *Th se bearings available for service.*
Cl aranc - .0005-.002".
Replacement B arings: Standard & .001", .002", .010", .020", .030" Undersize.
End Thrust: Taken by thrust washer assembled between front main bearing and crankshaft gear, controlled by shims between thrust washer and main bearing journal. These shims furnished .003", .005", .007" thick.
Endplay - .003-.006".
Crankshaft R ar Main B aring Oil Seal: *See "Crankshaft & Main Bearings" in Studebaker Special Data.*
Crankshaft Fr nt Oil S al: *See "Engine Front Cover" in Stud bak r Special Data.*

CAMSHAFT

J urnal Diam t rs—(1) 1.7475-1.7480", (2) 1.7162-1.7170", (3) 1.6857-1.6865", (4) 1.6232-1.6240".
B arings—Steel backed babbitt lined bushings.
Clearance—No.1—.0007-.0022", Nos. 2,3,4—.0010-.0027".
End Thrust: Taken by thrust plate assembled on front face of engine block behind camshaft gear (spacer assembled on shaft between gear hub and front bearing journal controls endplay). Adjust endplay by replacing thrust plate or spacer. When installing thrust plate, tighten capscrews evenly and alternately to avoid distorting the plate.
End Play—.003-.006".
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Studebaker Special Data.*
Timing Gears: Crankshaft gear is Cast Iron, Camshaft gear is Celeron with steel hub.
Timing Gear Removal & Installation—*See "Timing Gears" in Studebaker Special Data.*
Backlash—.001-.003".
Camshaft Setting: Mesh marked tooth on camshaft gear between two marked teeth of crankshaft gear.

6 CYL. VALVE TIMING MARKS

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Studebaker Special Data.*

VALVES

Valve	Head Diam.	Stem Diam.	Length
Intake	1.593"	.3415"	5.250"
Exhaust	1.406"	.3415"	5.250"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.359"	.0015-.0035"
Exhaust	45°	.359"	.0015-.0035"

Valve Seat Width - 1/16-3/32".
Valve Springs: Single spring used on all valves.

►*VALVE SPRING LOCK INSTALLATION CAUTION:* When installing lock in recess of lower spring retainer, groove in lock must engage tongue in retainer.

Valve Spring Specifications

Valve	Pressure	Length
Open	105-115 lbs.	1.671"
Closed	45-55 lbs.	2.031"

►*EXCESSIVE VALVE GUIDE WEAR CORRECTION:* Caused by insufficient lubrication at the valve stem and guide. Remove worn valve guide and replace with Tool No. J-9265. Replace related valve and spring, and install new Rocker Arm Shaft, Studebaker No. 1550361. New Rocker Arm Shaft diameter has been reduced .0005" to insure proper lubrication to valve stem and guides.

Valve Guides: Use Tool No. J-9265 to drive guide out of cylinder head from combustion chamber side. Coat outside of guide with white lead, then start chamfered end into head from combustion chamber side. Drive new guide in until driver bottoms on counterbore in plate.

►*OVERSIZE VALVE GUIDE NOTE:* Engines with .010" oversize valve guides have a letter "0" stenciled in pad located at left rear of cylinder head below climatizer outlet elbow connection. All guides will be .010" oversize.
Valve Lifters: Straight Barrel Type. Interchangeable.

►*VALVE TRAIN PARTS CAUTION:* Later rocker arm and adjusting screw assemblies are interchangeable and pushrods and rocker arm shafts are **NOT** interchangeable between 6 Cyl. and V8 engines.
Valve Lifter Installation & Fitting - *See "Valve System" in Studebaker Special Data.*
Replacement Lifters - Std., .001" & .005" Oversize.

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" Oversize Lifters requiring Reaming of Lifter Bore):* *See "Valve System" in Studebaker Special Data.*
Rocker Arm Assembly: *See "Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

Valve Timing Specifications

Intake Valves - Open 15°BTDC. Close 50°30' ALDC
Exhaust Valves - Open 55°36' BLDC. Close 10°ATDC.
Valve Timing Check - Adjust No. 1 intake valve at .030". Rotate engine until No. 6 piston is on the compression stroke (the IN-OP 1-6 marking on damper should be several inches from pointer). Then, while moving pushrod up and down, continue to rotate crankshaft. Valve timing will be correct if pushrod stops moving as above marking is directly below pointer.

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Studebaker Special Data.*

Crankcase Capacity: 5 quarts refill, add 1 quart with filter change.

Normal Oil Pressure: 30 lbs. min. at 2000 RPM.
Pressure Regulator Valve: Opens at 50 lbs. Under plug on lower right front corner of engine. For access, remove engine front cover bolt. Replace weak spring (do not attempt to stretch spring).

CONTINUED ON NEXT PAGE

S e INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Oil Pr ssure Indicator: Indicator light on instrument panel controlled by oil pressure switch, Studebaker No. 1539878, on left side of engine.

Oil Pump: Spur gear type, driven by a gear on camshaft.

Pump Removal, Overhaul, & Installation - *See "Oiling System" in Studebaker Special Data.*

Oil Filter: Partial flow, "disposable" type (replace element and housing as a unit). Replace element at 5000-6000 mile intervals or more often under severe conditions.

►*OIL FILTER INSTALLATION CAUTION:* **Lubricate gasket with engine oil and tighten filter by hand ½-turn after gasket seats on base.** *Do not cross-thread or overtighten.*

Crankcase Ventilation: Standard Cars - Filter element in oil filler cap (air intake) and in breather pipe at left of engine (air outlet). Filter element in breather pipe is replaceable (retained by cotter pin).

P sitive Crankcas Ventilati n Cars - These cars have replaced the road draft tube with a hose to the manifold incorporating a valve in the line.
See "Closed Crankcase Ventilation Systems" in Carburetion Section.

Filter Element Servicing - Remove filter in breather pipe by removing cotter pin and pulling filter out with a hooked wire. Clean filters by washing in kerosene or solvent, drain thoroughly and re-oil by coating with engine oil.

ENGINE COOLING SYSTEM

Water Capacity: 11 qts. refill. Add 1 qt. for heater.
Pressure Valve: 13 lb. radiator filler cap, Studebaker No. 1551190.

Thermostat: Choke type in water outlet on cylinder head. Studebaker No. 1550956 (170°) Std., No. 1551141 (160°) and No. 1551140 (180°) Optional.

Water Pump: Packless, sealed ball bearing type.
Pump Removal & Overhaul - *See "Cooling System" in Studebaker Special Data.*

T mp rature Gauge: Direct Reading, electric type.
Dash Unit - Studebaker No. 1552984.
Engin Unit - Studebaker No. 1549452 (Marked "362-AR" on one face of hex head)

LUBRICATION

AUTOMATIC TRANSMISSION LUBRICATION: Check fluid level every 1,000 miles, drain and refill every 15,000 miles. Use only Automatic Transmission Fluid Type "A", Suffix "A".

Checking Fluid Level - Operate engine with selector lever in "P" position until engine and transmission are at normal operating temperatures. Apply brakes, then move selector lever through all positions slowly. Check fluid level on dipstick and add fluid as necessary to bring level to "F" mark. 1½ pints between "L" and "F" marks.
Capacity - 18 pints (Exc. Taxi & H.D.), 19 pints (Taxi & H.D.).

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

MODEL IDENTIFICATION

Mod l	M d l D signati n
LARK	
Deluxe 2-Door Sedan	61V-F4

Taxicab 4-Door Sedan	61V-Y1
Deluxe 4-Door Sedan (Cruiser)	61V-Y6
HAWK	
Regal Sport Coupe	61V-C6

SERIAL NUMBER: Stamped on plate attached to left front hinge pillar post.

Ass mbly Plant	Starting Numbers
South Bend	61V-1001
Canada	61VC-1001

ENGINE NUMBER: Stamped on machined pad at upper left of cylinder block.

Ass mbly Plant	Starting Numbers 259" Eng.	289" Eng.
South Bend	V-510401	P-74701
Canada	VC-18501	PC-2501

►*ENGINE IDENTIFICATION NOTE:* Heavy Duty Engines have a Clover Leaf on the head just below the water heater outlet tapped hole and on the block just suffixing the engine serial number. Low Compression Engines are identified by cast-in part number on cylinder head.

TUNE-UP

COMPRESSION PRESSURE: 140-160 lbs. at 150 RPM. Maximum variation between cylinders 10 lbs.

VACUUM READING: 18-20" at idling speed.

VALVE TAPPET CLEARANCE: .025-.027" (Cold). .023-.025" (Hot). All valves.

►*TAPPET CLEARANCE ADJUSTING SCREW CAUTION:* Screws are located on underside of rocker arm and are self-locking type. Torque required to turn screw must be 30 In. Lbs. minimum.

MANIFOLD HEAT CONTROL: Automatic thermostatic type. Located in right bank exhaust manifold outlet. **Checking Th rmostatic Coil Spring -** With outer end of coil free from anchor and valve closed (counterweight forward), hooked end of coil should be 90° clockwise from anchor pin at 70°F.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles. See *"Closed Crankcase Ventilation Systems" in Carburetion Section.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylind rs - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .033-.038".

Spark Plugs - Champion H-14Y. 14 mm. Torque to 30 ft. lbs.

►*SPARK PLUG GASKET NOTE:* A permanent type steel gasket is used. If necessary to remove, use a pair of diagonal cutters and replace with conventional steel gasket, Studebaker No. 536599.

COIL: D lc -R my 1115154.

Igniti n Curr nt - 3.8 amps. idling.

R sist r - Resistance wire (Pink, 1.8 ohms) from coil to ignition switch. Bypassed during cranking by lead from starter solenoid to coil.

►*RESISTOR SERVICE REPLACEMENT NOTE:* A new service Ignition Switch-to-Coil Cable, Studebaker Part No. 1554167, is to be used in place of resistance wire. Cable is 81" long, has a resistance of 1.8 ohms, and must not be shortened, but rather folded and taped.

DISTRIBUTOR: Delco-Remy 1110969 or 1110981 (Lark), 1110864 or 1110980 (Hawk).

Condenser - Delco-Remy 1932004 (1110969 Distr.), 1869704 (1110864 Distr.). **Capacity** .18-.23 mfd.

Contact Point Set - Delco-Remy 1931988 (1110969 Distr.), 1918148 (1110864 Distr.).

Breaker Gap - .016" All Models. *See Cam Angle.*

Cam Angle (1110864 & 1110980) - 26-33° with .016"gap.

Cam Angle (1110969 & 1110981) - 28-32°. Set at 30° which will give breaker gap of .016".

Breaker Arm Spring Tension - 19-23 ozs.

Rotation - Counterclockwise viewed from above.

Automatic Advance - (All)

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	350	1-5	700
2-4	400	4-8	800
7-9	800	14-18	1600

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
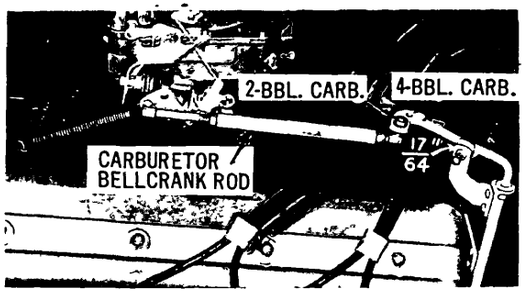
Start	0	8
4	8	10.5
8	16	13

IGNITION TIMING

Setting - 4° BTDC at 600 RPM. Vacuum line to distributor disconnected and opening in carburetor plugged. *After timing set, readjust to 550 RPM.*

Timing Mark - "IGN" line on vibration damper aligned with pointer on timing gear cover.



CARBURETOR

►*CARBURETOR APPLICATION: Stromberg WW 2-Barrel Standard on all models; Carter WCFB 4-Barrel Optional on all models except Taxi.*

►*FUEL LINE STOPPAGE CORRECTI ON:* Kinked fuel line at either tank or pump can be corrected by installation of new flexible hose Part No. 1543933x2.

FLIGHTOMATIC THROTTLE LINKAGE ADJUSTMENT: With engine at normal operating temperature, choke valve wide open and throttle return check operating correctly, proceed as follows:

1) Adjust engine idle speed to 550 RPM with transmission selector lever in "N" (Neutral) position. Set stop on bellcrank (at rear of engine) to provide a 17/64" gap between bellcrank pads (use a 17/64" drill as a gauge). After stop is adjusted, hold in this position.

AUTOMATIC TRANSMISSION THROTTLE LINKAGE

2) *NOTE - Make sure that carburetor-to-bellcrank rod ball joint is in inner hole of bellcrank pad on cars with 2-barrel carburetor, and in outer hole on cars with 4-barrel carburetor. In both cases, ball joint must be on underneath side of bellcrank lever.*

3) Adjust carburetor-bellcrank rod until idle speed screw on carburetor throttle lever just begins to leave its stop.

4) Stop engine and remove 1/8" pipe plug located near throttle lever on side of transmission and install a pressure gauge. Place selector lever in "D" (Drive) position and run engine at 1000 RPM with rear wheels held stationary by foot brake. Adjust length of main bellcrank-to-transmission throttle valve outer lever rod to obtain 80-85 lbs. pressure on gauge (95-100 lbs. on Taxi). Stop engine, remove gauge and install plug.

THROTTLE RETURN CHECK ADJUSTMENT: Loosen throttle return check assembly screw locknut and adjust return check in bracket until plunger just breaks contact with tab on throttle lever. Mark position of check assembly relative to bracket, then turn check assembly **1¼ to 2 turns toward lever.** Tighten locknut.

STROMBERG WW

Stromberg WW 6-123A & B, and 6-125 & A (Positiv Crankcase Ventilation). Throttle return check used with Flightomatic Transmission.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 1-4-6-7, LEFT barrel feeds 2-3-5-8.*

Idle Setting - Initial setting 1¼ turns open, final setting approximately midway between missing and rolling points. Set both screws alike, turn screws out for richer mixture.

Idle Speed - 550-600 RPM, with selector lever in "N" on Flightomatic cars.

Float Level - 3/16" from top edge of main body to top of float. To check, remove bowl cover and place float level gauge of Tool J-7477 across top edge of main body. Float should just touch gauge. To adjust, bend float lip.

Accelerating Pump - Center hole, normal setting. For less fuel install rod in inner hole, for more fuel install rod in outer hole.

Fast Idle Setting: Close the choke so the highest part of high idle cam contacts fast idle screw. Adjust fast idle screw so that a .025" wire can be inserted freely between throttle valve and throttle body on the idle port side.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Automatic Choke Setting: Centered on index
Throttle Linkage Adjustment: See CARBURETOR above.
►*OTHER DATA: See "Stromberg WW (Studebaker) Carburetors" in Carburetion Section.*

CARTER WCFB 4-BARREL

Carter WCFB. Used as follows:

Transmission Type	Carter Carb. No.
Std. & Overdrive	2829S (Std.), 3165S (CCV Ⓒ)
Flightomatic	2830S (Std.), 3166S (CCV Ⓒ)

Ⓒ - Closed Crankcase Ventilation.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 1-4-6-7. LEFT barrels feed 2-3-5-8.*
Idle Setting - Initial setting ½-1½ turns open. Turn screws out for richer mixture.
Idle Speed - 550-600 RPM, with selector lever in "N" on Flightomatic cars.
Throttle Linkage Adjustment: See CARBURETOR above.
►*OTHER DATA: See "Carter WCFB 4-Barrel Carburetors" in Carburetion Section.*

CARB. EQUIPMENT

Fuel Pump: Carter No. 2573S. Fuel only.
Pressure - 3½-5½ lbs.
Gasoline Gauge: Electric type.
Dash Unit – Studebaker No. 1539880 (Hawk), No. 1548689 (others).
Tank Unit – Studebaker No. 1544825.
Air Cleaner: DRY TYPE (Plasticized paper) Standard. Oil Bath type Optional. Clean dry type filter element every 1000 miles, replace element every six months or 10,000 miles.
►*CLEANING CAUTION (DRY TYPE):* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.*

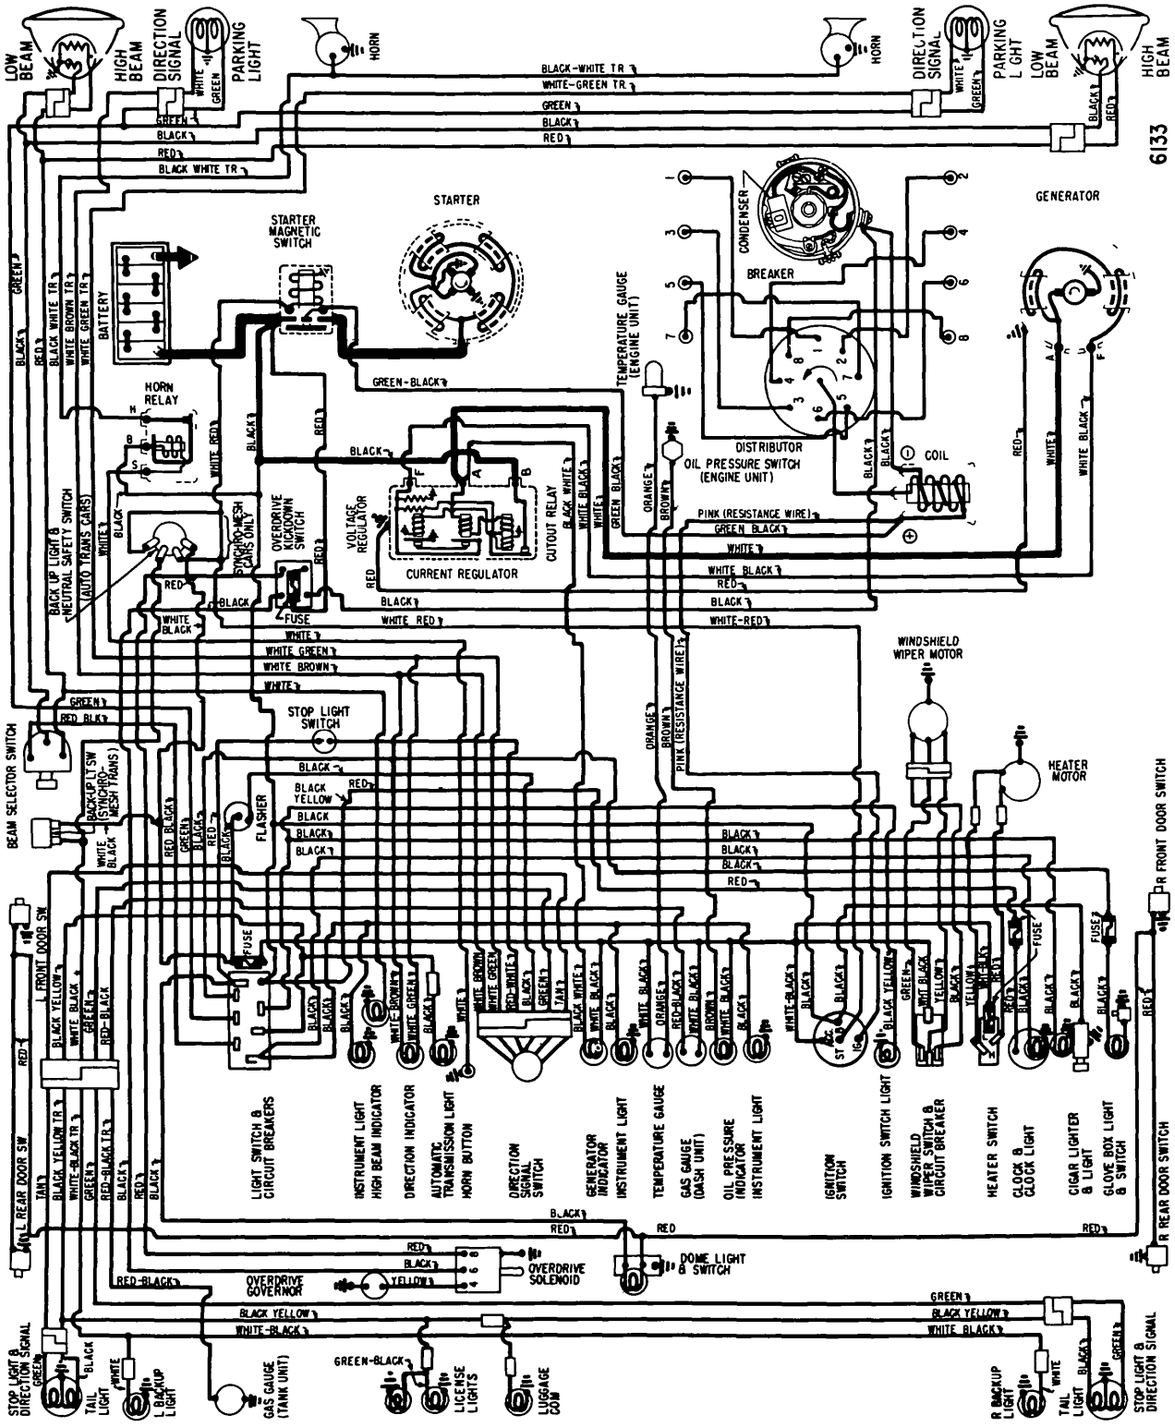
BATTERY

Willard HO-11-50. 12 volt, 9 plate, 50 ampere hour capacity (20 hour rate).
Battery Ground - Negative.
Engine Ground - Front engine support bracket to frame

STARTER

Delco-Remy 1107900 (Synchro-mesh & Overdrive). 1107899 (Flightomatic).
Drive - Bendix "Folo-thru" No. A3474.
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. minimum.

Performance Data



Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10.5 ft. lbs.	Lock	5.8	435

Starting Switch: Magnetic Switch, Studebaker No. 1539716, mounted on dash and controlled by combination Ignition & Starter Switch.
Automatic Transmission Neutral Safety Switch: Studebaker No 1552780 (Exc Hawk), 1549665 (Hawk) on steering column. **Adjustment** - *See "Studebaker Flightomatic Transmission" in Transmission Section.*

GENERATOR

Delco-Remy. Used as follows
►*OPTIONAL AUTOLITE "LOW CUT-IN" GENERATOR NOTE: See Studebaker 6 Cylinder Car Model Pages.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Mod l	Generator N .
Standard	1102248①③
Heavy Duty	1102127②③⑨

① - Serv. No. 1102269. ② - Serv. No. 1102223.
③ - "A" circuit type. Use only "A" circuit regulators.
⑨ - When used on 6 cyl. cars, use of special drive pulley makes it a "low cut-in" type.

Performance Data - Cold

Generator	Amperes	Volts	RPM
1102248	30.0	14.0	2310
1102127	45.0	14.0	2600

Brush Spring Tensi n - 28 ozs.
Field Current - 1.48-1.62 amps. (1102248), 2.66-2.86 amps. (1102127) at 12.0 volts.
Rotati n - Counterclockwise at commutator end.
Belt Adjustment: Hook a spring scale to belt midway between generator and fan pulleys, then adjust belt tension so that pull of 14 lbs. on scale will lift belt ½".
►*FAN BELT REPLACEMENT CAUTION:* Use only Studebaker No. 529374 Fan Belt for replacement on cars with Generator, Studebaker Part No. 1553181 (Delco-Remy Nos. 1102248 or 1102269). The smaller generator pulley diameter requires this slightly shorter belt.

REGULATOR

Delco-Remy N . 1119001 & 03 (1102248 Gen.), 1119610 (1102127 Gen.). All are "A" circuit types.
NOTE - Specificati ns below are "Normal" settings. Delco-R my Regulator No. 1119610 is double contact.

Cutout Relay

Cuts In - 11.8-13.5 volts (1119001 & 03), 11.8-13.0 volts (1119610) Hot.
Contact Gap - .020".
Air Gap - .020" with contacts just closed.

V ltage Regulator

Setting - 13.8-14.7 volts (1119001 & 03), 13.8-14.6 volts (1119610) Hot. .1-.3 volt lower on lower contacts.
Contact Gap - .016".
Air Gap - .075" (1119001 & 03), .067" (1119610) with armature pressed down to point where contacts just touch.

Current Regulator

Setting - 27-31 amps. (1119001 & 03), 36.0-40.5 amps. (1119610) Hot (after 15 minutes continuous operation).
Air Gap - .075" with armature pressed down to point where contacts just touch.
►*OTHER DATA: Se "D lco-Remy 1119000 Series Regulators" or "D lco-R my 1119600 (Double Contact) Seri s Regulators" in El ctrical Section.*

MISC. ELECTRICAL

Headlights: Single & Dual (4-headlight system).
Direction Signals: *F r all data except following note, see Electrical Secti n.*

►*DIRECTION SIGNALS OVER-CANCELLING CORRECTION AND PRODUCTION CHANGE:* On some early model cars the switch might go through the detent position upon recovery from a turn. If this occurs, install a new Switch & Cable Assembly Studebaker No 1551930. New switch & cable assemblies in production and for replacement are pink or red, whereas old style are black or white.

Lighting & Instrument Light Switch Removal: Remove switch retaining nut, push switch back through instrument board, disconnect wires. *NOTE* - When installing switch, align flat on switch sleeve with corresponding flat on board.
Speedometer & Instrument Removal: Units can be removed separately without disturbing other parts.
Stop Light Switch: Located on inner side of left frame rail forward of steering gear housing (Std. Brakes), mounted in elbow fitting on power brake unit (Power Brakes).
►*CIRCUIT BREAKER & FUSE NOTE: For Lark V8 models, see STUDEBAKER LARK 6.*
CIRCUIT BREAKERS (Hawk): 20 Ampere. In headlight switch. Protects Headlights, Beam Indicator, Park, Tail, License Plate, Instruments and Clock lights.
5 Ampere. In Windshield Wiper Switch.
FUSES (Hawk): AGC 15. Protects Stop, Directional Indicator, Dome and Glove Compartment lights.
1AG3. In clock lead.
4 Ampere. In radio lead.
SFE 14. Protects overdrive. In kickdown switch.
AGC 15. Climatizer & Defroster. In switch.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine, See "Air Conditioning Service Cautions" in Miscellaneous Section.*
►*REAR ENGINE INSULATOR PRODUCTION CHANGE & VIBRATION CORRECTION:* New softer insulator Part No. 1553609 used in production starting Eng. Nos. V-522748 and P-77221 (Synchro-mesh & Overdrive Models). New insulator eliminates excessive engine vibration on early cars.
ENGINE SPECIFICATIONS: Own. V8, valve-in-head. Two engines used: 289" Engine used in Hawk Sports Coupe and Optional on Cruiser Model; 259" Engine used on all other models.

Engine	Bore	Stroke	Displacement
259"	3 9/16"	3 1/4"	259.2 cu. ins.
289"	3 9/16"	3 5/8"	289 cu. ins.

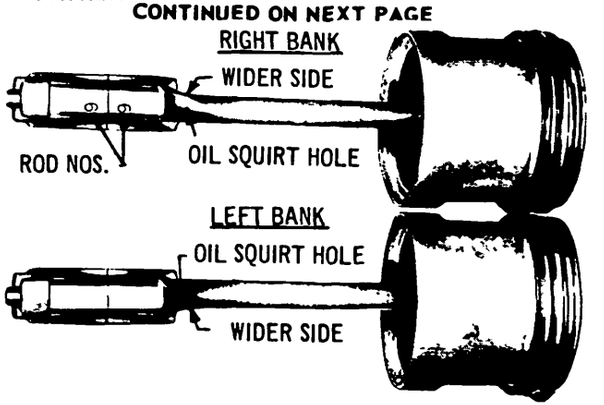
Engine	Compr. Ratio①	Rated HP	Developed HP
259"	8.8-1②	40.6	180 at 4500 RPM
259"	8.8-1③	40.6	195 at 4500 RPM
289"	8.8-1②	40.6	210 at 4500 RPM
289"	8.8-1③	40.6	225 at 4500 RPM

① - 7.5-1 Optional. ② - 2-Bbl. Carb. ③ - 4-Bbl. Carb.
Compression & Vacuum Reading - *See TUNE-UP.*
OIL PAN REMOVAL: Remove dipstick and adapter tube (remove head bolt to remove tube clamp). Disconnect battery. Drain crankcase. Remove starter. On Hawk, swing wheels to right to move steering bellcrank out of way On Other Models, remove steering bellcrank assembly and exhaust crossover pipe. Remove oil pan screws and pan.
OIL PAN INSTALLATION: *S "Oil Pan" in Stud bak r Special Data for sp cial procedure.*
ENGINE REMOVAL: *See "Engine" in Studebak r Special Data.*
CYLINDER HEAD: *See "Cylinder H ad & Manifolds" in Studebaker Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Studebaker Special Data*

PISTONS

Aluminum alloy, cam ground, T-slot, three ring type. *See "Original Bore & Pistons" in Studebaker Special Data.*
►*PISTON INTERCHANGEABILITY CAUTION:* Pistons for 289" engine have a dished head. 259" pistons have flat head. DO NOT interchange between engines.
Weight – 16.21 ozs.
Removal - Pistons & rods remove from above.
Fitting New Pistons: Clearance - Selective feeler fit. Use feeler 1" wide, 002" thick, and 12" long inserted on camshaft side of cylinder bore. Insert inverted piston in bore with slotted side away from camshaft, and bottom edge 1" below top of cylinder bore. Pull required to remove feeler with properly fit piston should be 7-12 lbs.
Replacement Pistons: Std. size & .001", .002", .010", .020", .030", .040" oversize. Pistons furnished with fitted pins.
Installing Pistons: Install piston on rod so that solid side of piston is on same side as oil hole in bearing bore. Install piston in cylinder with the slot toward the left side of engine. *See Rod Installation.*

PISTON PINS



Locked in rod by tapered pin and locknut.
Diameter – .8741-.8745". **Length** – 3 1/16".
Clearance in Piston – .0001-.0003" (selective fit). Light finger push fit at 70° F.
Replacement Pins: Std. size & .0025", .005" oversize.
Removal & Installation: *See "Piston Pins" in Studebak r Special Data.*

PISTON RINGS

Ring	Width	End Gap	Side Clearanc
Compression	.077-.078"	.008-.016"	.002-.005"
Oil	.1855-.1865"	.008-.016"	.0015-.005"

Replacement Rings: Sets of Std., .020", .030" and .040" Oversize.

CONTINUED ON NEXT PAGE

V8 ENGINE PISTON & ROD ASSEMBLY

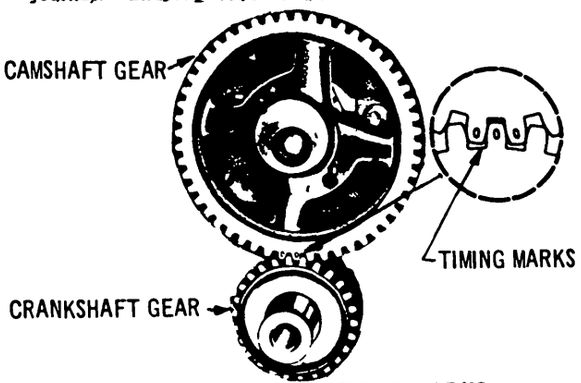
See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Installing Rings: Install compression rings with chamfered side of ring upward Gaps of inner and outer oil rings must not come at same point

CONNECTING RODS

Length - 6 5/8" center-to-center **Weight** - 23 71 ozs
Crankpin Journal Diameter - 1 99925-2 00025"
Lower Bearing - Interchangeable Steel backed micro-babbitt lined type No shims
Clearance - 0005- 002" **Sideplay** - 008- 013"
Replacement Bearings: Std , 001", 002", 010" and 020" Undersize
Installing Rods: Number on rod and bearing cap must be on same side Rod is installed in same numbered cylinder with numbers down toward oil pan (toward right on right bank rods, toward left on left bank rods), and oil squirt hole on all rods toward right of engine Rods are offset with widest half of bearing toward rear on right bank, toward front on left bank



►*CAUTION.* Install piston and pin on rod so that T-slot of piston is on side opposite oil hole in bearing bore Insert tapered end of clamp screw so it will be toward heavy boss Be careful to align flat surface of screw with flat on piston pin Bearing cap must be assembled on rod with groove in cap and rod on same side

►*REPLACEMENT ROD IDENTIFICATION NOTE.* Replacement rods are unnumbered To identify, hold rod upright with oil hole toward you Wide part of offset will be to right on left bank rods to left on right bank rods

CRANKSHAFT

►*REAR MAIN BEARING OIL LEAK CORRECTION* If proper installation of new rear oil seal and oil pan gaskets does not stop the leak, make sure that drain core hole in rear main bearing cap connects with groove in cap Drill and file hole to correct

Journal Diameter–2.4995-2.5000".
Bearings - Steel-backed, micro-babbitt lined. No shims.
Clearance–.0005-.0025".
Replacement Bearings: Std. size, .001", .010", .020", .030" undersize.
End Thrust Taken by thrust plate assembled between front main bearing and crankshaft gear. Controlled by shims between thrust plate and face of main bearing journal. **Endplay**–.003-.006".

V8 ENGINE VALVE TIMING MARKS

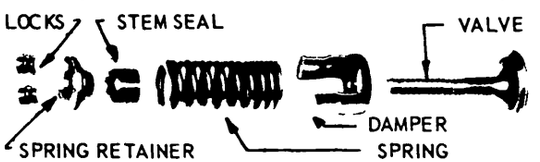
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Stud bak r Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Studebaker Special Data.*

CAMSHAFT

Journal Diameters–(1) 1.86975-1.87075", (2) 1.85375-1.85475", (3) 1.83875-1.83975", (4) 1.82275-1.82375", (5) 1.24475-1.24575".
Bearings–Precision type, steel backed babbitt lined.
Clearance – .00075-.00225" (No. 1), .001-.00275" (Others).
End Thrust: Taken by thrust plate located between front camshaft bearing and camshaft gear.
Endplay–.003-.006".
Camshaft Removal & Installation. *See "Camshaft & Bearings" in Studebaker Special Data.*
Timing Gears: Cast iron crankshaft gear and "Celeron" camshaft gear.
Timing Gear Removal & Installation–*See "Timing Gears" in Studebaker Special Data.*
Backlash–.001-.003".
Camshaft Setting: Mesh marked tooth of camshaft gear between two marked teeth of crankshaft gear.
Engine Front Cover Removal *See "Engine Front Cover" in Studebaker Special Data.*
Engine Front Cover Oil Seal (Crankshaft Front Seal) *See "Engine Front Cover" in Studebaker Special Data.*

VALVES

Tappet Clearance - .023-.025" (Hot), .025-.027" (Cold).



Valve	Head Diameter	Stem Diameter	Length
Intake	1 21/32"	11/32"	5 5/32"
Exhaust	1 17/32"	11/32"	5 5/32"

Valve	Seat Angle	Lift	Stem Clearance
All	45°	23/64"	.0015-.0035"

Valve Seat Width–1/16-3/32".
Valve Stem Oil Seal: "Umbrella" type, rubber seals installed on all exhaust and intake valve stems (with cupped side down toward top of valve guide) within valve spring below spring retainer.
Valve Springs Single spring used. Replace spring if 10% weaker than pressure given in specifications below. *NOTE* - Damper installed on lower (close-coiled) end of all springs.

Valve Spring Specifications

	Pressure	Length
Valve Closed	45-55 lbs.	2 1/32"
Valve Open	105-115 lbs.	1 43/64"

V8 ENGINE VALVE ASSEMBLY

Valve Guides Pressed in head from underside
Guide Removal & Installation–*See "Valve System" in Studebaker Special Data.*
Valve Lifters Straight barrel type. Remove from above. Not necessary to remove camshaft

►*OVERSIZE VALVE LIFTER INSTALLATION (.005" oversize lifters requiring reaming of lifter bore) See "Valve System" in Studebaker Special Data.*
Valve Lifter Installation & Fitting–*See "Valve System" in Studebaker Special Data.*
Replacement Lifters–Std size, 001", 005" oversize
►*CAUTION–When lifters removed, make sure they are installed in original positions.*
Rocker Arms *See "Valve System" in Studebaker Special Data.*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
Intake Valves–Open 11° BTDC Close 54°36' ALDC
Exhaust Valves–Open 51°36' BLDC Close 14° ATDC
Valve Timing Check–Set tappet clearance of No 1 intake valve at 030" Turn crankshaft until No 6 piston is on compression stroke and vibration dampener mark "IN OP 1" is approaching pointer on timing gear cover continue to turn crankshaft slowly while working No 1 intake rocker arm up and down to determine point at which all clearance is taken up Dampener mark "IN OP 1" should be directly under pointer

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM: See "Engine Lubrication" under OILING SYSTEM in Stud bak r Special Data.*
Crankcase Capacity 5 qts. (add one quart when filter changed)
Normal Oil Pressure – 20–40 lbs at 40 MPH
Pressure Regulator Valve – Located on right side at front of engine block slightly above crankcase flange
Oil Pressure Indicator (Lark) Indicator light on instrument panel controlled by oil pressure switch, Studebaker No 1539898
Oil Pressure Indicator (Hawk): Direct reading, non-electric type gauge Studebaker No 1539878

Oil Pump: Spur gear type, on rear main bearing cap in crankcase.
Pump Removal, Overhaul & Installation: *See "Oiling System" in Studebaker Special Data.*

Oil Filter: Partial flow, "disposable" type (replace element and housing as a unit). Replace element at 5000-6000 mile intervals or more often under severe conditions.

►*OIL FILTER INSTALLATION CAUTION:* Lubricate gasket with engine oil and tighten filter **by hand ½-turn after gasket seats on base.** *Do not cross-thread or overtighten*
Replacement Filter Element - Studebaker No 1542739

Crankcase Ventilation: Standard Cars - Filter element is located in oil filler cap (air intake). Breather pipe (air outlet) is connected at rear of valve chamber cover plate.

Positive Crankcase Ventilation Cars - The road draft tube has been replaced by a hose to the manifold utilizing a valve in the line. *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

ENGINE COOLING SYSTEM

Water Capacity: 17 qts. without heater. 18 qts. with heater (Lark), 18½ qts. with heater (Hawk).

Pressur Valve: 14 lb. radiator cap, Studebaker No. 1551190.

Therm stat: Choke type Studebaker No. 1550956 (170° Std.), 1551141 (160°), 1551140 (180°) Optional.

►*REPLACEMENT THERMOSTAT NOTE:* Use only Dole Valve Company Thermostats as replacements. Fulton Sylphon Thermostats can be used on 6 Cylinder Models.

Water Pump: Packless, sealed ball bearing type.

Pump Removal & Overhaul - *See "Cooling System" in Studebaker Special Data.*

Radiator & Fan Shroud Removal - *See "Cooling System" in Studebaker Special Data.*

Temperature Gauge: Direct reading, electric type.

Dash Unit - Studebaker No. 1552984 (Lark), No. 1538879 (Hawk).

Engine Unit - Studebaker No. 1545220 (All).

LUBRICATION

FLIGHTOMATIC TRANSMISSION LUBRICATION: Check fluid level every 1,000 miles, drain and refill every 15,000 miles. Use only Automatic Transmission Fluid Type "A", Suffix "A".

Checking Fluid Level - Operate engine with selector lever in "P" position for 4 mihutes or until engine and transmission reach normal operating temperature. Apply brakes, move selector lever from "P" to "R" and then to "D" position slowly. Check fluid level on dip-stick (Located under hood). Add fluid as necessary to bring level to "F" mark (1½ pints between "L" and "F" marks.

Capacity - 9 qts. (Std.), 9½ qts. (Taxi) drain and refill.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

TIGHTENING SPECIFICATIONS
ALL MODELS

TIGHTENING TORQUES When tightening capscrews or bolt nuts retaining parts listed below use torque indicating wrench and tighten to tensions listed

	Ft. Lbs. 4 Cyl.	6 Cyl.
Cylinder Head	60—70	35—45
Intake & Exhaust Manifolds	29—35	30—35
Oil Pan	9—14	12—15
Main Bearing Caps	65—75	85—95
Crankshaft Counterweight Bolt	60—70	
Flywheel	35—41	35—40
Vibration Damper		100—130
Con Rod Caps (3/8")	40—45	35—45
Piston Pin Clamp Bolt	35—41	
Camshaft Sprocket	30—40	35—40
Rocker Arm Support Bracket	30—36	
Valve Chamber Cover		7—10
Engine Front Cover 5/16"		7-10
Engine Front Cover 7/16"		40-50
Water Pump	12—17	15—20
Oil Pump		30—35

ENGINE
FC-150 & FC-170 MODELS

ENGINE REMOVAL *NOTE* Remove engine transmission and transfer case as a unit as follows

1) Drain cooling system remove driver seats engine hood and panel (FC-170) panels (FC-150) Disconnect battery

2) Remove air cleaner assembly (FC-150) and bracket (FC-170), choke and throttle controls, and on FC-150 remove fuel line at pump

3) Remove carburetor, radiator and heater hoses then remove surge tank

4) On FC-150, remove wires from coil, starter, generator and remove oil filter and bracket

5) On FC-170, remove distributor, oil filler tube, coil oil filter and bracket, temperature and starter to solenoid wires, generator access panel, generator, bracket and pulley.

6) On FC-150, disconnect accelerator control wire at engine bell crank and disconnect oil sender unit

7) On FC-170, disconnect radiator brace at engine and loosen at radiator and move out of way Remove radiator hose at water pump then remove fan belt and blade assembly from fan shaft Disconnect vacuum outlet hose and fuel line from pump and plug line Remove fuel line (pump to carburetor)

8) On FC 170 disconnect exhaust pipe at manifold remote control rod at transfer case oil pressure unit wire and engine ground strap Disconnect two remote control rods at transmission and move out of way

9) On FC 150 disconnect exhaust pipe at manifold raise front of vehicle on jacks and remove front and rear exhaust pipes

10) On FC-170 disconnect clutch control cross shaft and remove hand brake, release spring, cable brackets at bell housing and frame crossmember and cable adjusting rod at lever

11) On FC-150 disconnect brake and clutch cables and springs remote control cable rod at transfer case and remove front propeller shaft

12) On FC-170 disconnect rear propeller shaft at transfer case and secure out of way Disconnect speedometer cable and front propeller shaft at transfer case and remove engine bolts

13) On FC-150 disconnect battery cable at bell housing remove fan belt loosen and raise generator then remove two front motor mount bolts and engine ground strap at frame Disconnect spark plug wires and clamp and remove valve cover and speedometer cable Remove propeller shaft Disconnect shift control rods at transmission levers and secure out of way

14) Attach lifting brackets to engine at head bolt locations so engine will be well balanced, then use crane or "A" frame and chain hoist to support engine Disconnect rear engine support (frame crossmember) at rails Lift front of engine and remove two rubber front mounts

15) Raise vehicle as necessary to lower and remove engine from below *NOTE* - On FC-170 models it may be necessary to raise front of vehicle to loosen front spring clips on front axle so axle may be moved forward to length of brake hose Reverse procedure to reinstall

UTILITY MODELS

ENGINE REMOVAL: Drain cooling system. Remove hood fan, radiator and shroud. Disconnect battery and disconnect wires from overdrive, temperature unit oil pressure unit, starter, generator, coil, and secondary distributor wire. Remove air cleaner Disconnect accelerator linkage at bellcrank, fuel and vacuum lines and ground strap. Disconnect clutch linkage exhaust pipe and front engine supports. Raise engine with sling attached to head bolts and remove bell housing-to-engine bolts Raise engine and move forward to clear bell housing and dash and remove from car

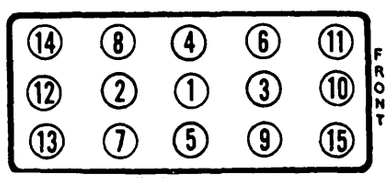
FLEETVAN (U.S. POST OFFICE)

ENGINE REMOVAL: Remove engine, torque converter and transmission as a unit Unit must be lowered with a floor jack and crane or suitable substitute Drain cooling and oiling systems then plug openings Disconnect battery at positive terminal Remove carburetor Remove radiator and heater hoses Disconnect accessible cables and wires Remove cover panels and brake pedal cover plate, then loosen dash lower center panel Disconnect electrical wire from transmission diaphragm solenoid Remove exhaust pipe from muffler and exhaust manifold flange Remove transmission oil cooler tubes and carburetor-to-transmission vacuum line Disconnect all remaining wires Disconnect fuel tank-to-pump line at pump hose Disconnect linkages Disconnect propeller shaft from transmission, slide sleeve back and tie out of way With engine and transmission unit evenly supported, remove transmission-to-frame crossmember bolts then remove bolts attaching front engine supports to frame Move vehicle forward or engine rearward about four inches, then lower engine and transmission unit Raise vehicle away from detached unit Remove torque converter and transmission as a unit from engine

CYLINDER HEAD & MANIFOLD
ALL MODELS

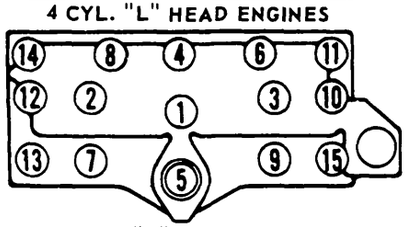
►*CYLINDER HEAD BOLT TIGHTENING CAUTION* On F4-134 engine, one cylinder head nut is under carburetor so that carburetor must be removed to torque this nut On L6-226 engine, one cylinder head bolt is close to distributor adapter so that adapter must be removed to torque this bolt

CYLINDER HEAD INSTALLATION: Tighten stud nuts and capscrews in sequence shown in diagram to correct torque (see above) *NOTE* – On 6 Cyl engine, bolts No. 24 & 26 are of smaller diameter than the others. Use guide pins in these holes when installing head to assure accurate alignment with block and to prevent gasket failure



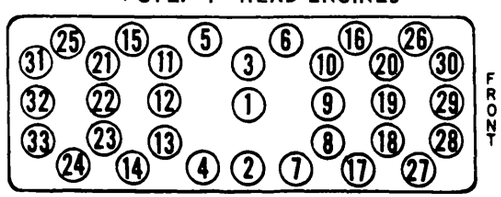
►*HEAD GASKET (4 CYLINDER) INSTALLATION CAUTION:* Install gasket with crimped edges down to prevent gases reaching asbestos *NOTE - Use no sealant*

CRANKSHAFT & MAIN BEARINGS
4 CYL. ENGINES



CRANKSHAFT SERVICING: Bearing Replacement – Engine must be removed from car for bearing replacement (bearings "doweled" in case and crankshaft must be taken out to remove and install bearings). Make certain that oil holes in bearings line up with oil holes in crankcase, and that bearings fit snugly on dowel pins in crankcase and bearing caps.

►*MAIN BEARING CAP IDENTIFICATION CAUTION* Cylinder block center crankshaft bearing web and bearing caps marked with daub of paint to indicate that caps are to be used with that block only *DO NOT USE CAPS WITH ANY OTHER COLOR THAN SHOWN ON WEB*



CONTINUED ON NEXT PAGE

4 CYL. "L" HEAD ENGINES

4 CYL. "F" HEAD ENGINES

6 CYL. 6-226 "L" HEAD ENGINE

CONTINUED FROM PRECEDING PAGE

Rear Bearing Oil Seal (Neoprene Type—*NOTE Upper and lower halves of seal can be replaced without removing crankshaft from engine.* Seal is neoprene with a steel back. Upper half of seal can be removed by using a suitable piece of strap steel (hack saw blade with teeth ground off). Rotate upper half of seal around shaft with steel strap until opposite end protrudes far enough to grasp end and remove. To install, coat both parts of seal with grease and install upper half by rotating it around crankshaft until it is in position with ends even at the engine block. Coat both ends of lower seal with Permatex before installing to insure good seal with upper half.

Rear Bearing Cap Seal—Bearing cap sealed by cylindrical rubber packing strips inserted in holes between cap and case. When installing bearing cap, coat upper face lightly with sealing compound, insert new packing strips after cap is in place. Packing strips should protrude ¼" to provide proper compression when oil pan installed. CAUTION—Do not cut off this protruding portion of the packing.

►*MAIN BEARING CAP LOCATING DOWEL CAUTION:* Raise main bearing cap up evenly to eliminate possibility of bending dowels. Bent dowels will cause misalignment of bearing cap and result in rapid bearing wear and need for early bearing replacement. Install new dowels when old dowels are bent.

6 CYL. ENGINES

►*CRANKSHAFT REAR OIL SEAL LEAK CORRECTION:* **A new kit Part No. 925958 contains all parts necessary to correct rear bearing oil leak.**

►*OVERHAUL NOTE:* **When overhauling an engine using the new oil seal Part No. 925958 (see above), it is necessary to use Engine Overhaul Gasket Set No. 925956 & Oil Pan Gasket Set No. 925957.**

REAR BEARING OIL SEAL INSTALLATION: Crankshaft rear oil seal installed as follows:

OIL PAN TO FILLER BLOCK GASKET INSTALLATION. Install Neoprene Rubber gasket in each filler block (use Gasket Cement in grooves) With each end extending an equal amount (1/16") above faces of filler block ends. Allow cement to dry.

FRONT & REAR FILLER BLOCKS: Lower filler blocks (front & rear) are bolted on lower face of crankcase to close oil pan opening (filler blocks must be removed to replace pan gasket). Rear filler blocks (additional upper filler block guard in crankcase) are grooved for cork oil seals which bear on polished surface of crankshaft directly behind oil slinger. Filler blocks can be removed and replaced without disturbing crankshaft as follows:

Front Filler Block (Lower) Servicing: Remove by taking out mounting screws and timing gear cover screws which enter the filler block. When installing filler block, first install oil pan side gaskets (No. 733542), install filler block (use Permatex) and install new end gasket on block.

Rear Filler Block (Lower) Servicing: Same as for the lower front block (above) except for crankshaft oil seal (square cork gasket or graphite impregnated seal). Remove and discard old gasket or seal. Install new seal (No. 731046) in same manner as described below for Rear Filler Block (Upper) Guard. Install lower filler block after upper filler block guard has been installed.

Rear Filler Block (Upper) Guard Servicing: Guard is seated in groove in crankcase and can be rotated out without disturbing crankshaft after lower filler block removed. Remove and discard old gasket or seal, clean out seal groove. Install new graphite impregnated seal, No. 731046, flatten seal slightly and use mandrel or rod to seat seal in groove by rolling from ends toward center (ends must extend slightly above flat surface of guard). Do not use shellac or sealing compound in groove.

►*CAUTION:* Oil seal in both Upper Filler Block Guard and Rear Filler Block must be centered with crankshaft. If necessary, seal can be built up using 1/32" thick gasket material, 3/16" wide, as shims shellacked to groove in block or guard behind seal.

ENGINE FRONT COVER

4 CYL. ENGINES

FRONT COVER OIL SEAL: Cover has double metal baffle and spring-loaded leather seal which contacts polished surface of crankshaft pulley hub. When installing seal, make certain that seal lip is inward or toward rear of engine.

6 CYL. ENGINES

FRONT COVER OIL SEAL: Drive out old seal using Oil Seal Driver KF-44 Place cover with opening flange on flat surface Coat outer edge of new seal with sealing compound, place seal in opening with seal lip toward rear and drive seal in place.

CAMSHAFT & BEARINGS

4 CYL. ENGINES

CAMSHAFT SERVICING: Removal - Drain radiator and cylinder block, remove radiator and grille, cylinder head, manifold, valves, and valve springs. Remove oil pump, oil pan, crankshaft pulley (use puller), fan drive belts and fan assembly. Remove timing gear cover, camshaft gear and thrust plate and spacer. Block-up all valve lifters (can be tied up with string to manifold studs). Remove camshaft through front of engine.

Camshaft Front Bearing - Consists of steel backed babbitt lined bushing, staked in place to prevent rotation or endwise movement, with oil hole in bushing lined up with oil hole in crankcase.

Camshaft Thrust Plate - Thrust plate assembled behind camshaft gear with a spacer to control endplay. Add shim behind spacer to increase clearance, dress down spacer to reduce clearance. Beveled edge of spacer must be to rear.

6 CYL. ENGINES

CAMSHAFT SERVICING: Removal – Drain cooling system and remove radiator, vibration damper, engine front cover, timing chain and gears. Remove fuel pump, cylinder head, oil pan and oil pump. Remove valve chamber cover, valves and springs. Hold valve lifters in fully up position. Remove camshaft thrust plate and carefully withdraw camshaft from engine.

VALVE SYSTEM

VALVE TAPPET ADJUSTMENT

6 CYL. ENGINES

TAPPET CLEARANCE ADJUSTMENT PROCEDURE: Car manufacturer recommends valves be adjusted in order listed (see table below). Remove right front wheel and access cover in fender splash shield for access to valve compartment. Remove spark plugs so that engine can be turned over by moving fan or fan belt. By setting valves in fully raised position (left hand column), **valves in right hand column** will be on "low" side of cam **in position for tappet adjustment.**

Fully Raise Valve	Then ADJUST Valve:
Nos. 1 and 3	Nos. 10 and 12
Nos. 8 and 9	Nos. 4 and 5
Nos. 2 and 6	Nos. 7 and 11
Nos. 10 and 12	Nos. 1 and 3
Nos. 4 and 5	Nos. 8 and 9
Nos. 7 and 11	Nos. 2 and 6

ROCKER ARMS

4 CYL. "F" HEAD ENGINES

ROCKER ARM ASSEMBLY REMOVAL: Lock rocker arms, shaft, brackets and springs together as a unit by removing cover studs in front and rear rocker arm shaft brackets and installing 5/16"-24 thread set screws in the front and rear brackets in same manner set screws are installed in center brackets. Remove nuts on bracket studs and lift entire assembly off studs as a unit.

Installation: Check push rods, straighten or replace any that are bent. Place push rods in holes in head and block, being sure that they are properly seated in intake valve tappets. Place rocker arm assembly on its studs, seat intake valve adjusting screws in tops of push rods before installing nuts on bracket studs. Torque nuts to 30-36 ft. lbs. Remove extra set screws from front and rear rocker arm shaft brackets, install cover studs in front and rear brackets with short end of stud down.

OILING SYSTEM

ENGINE LUBRICATION

4 CYL. ENGINES

►*"L" HEAD & "F" HEAD ENGINE NOTE:* **These engines have similar oiling systems with exception of cylinder head valve mechanism oiling (Pushrods, Rocker Arms, Valve Tips) used on "F" head engines only.**

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, timing gears, and rocker arm assembly ("F" Head engines only). All other parts are lubricated by oil spray.

OPERATION: Rotor type oil pump mounted externally on left side of crankcase draws oil through floating type oil screen mounted on lower face of crankcase in oil pan (passage from oil intake pipe to pump is through drilled passages in crankcase). Pump delivers oil through passage in pump body directly to main oil gallery which extends along left side of crankcase. Oil is distributed through this oil gallery as follows:

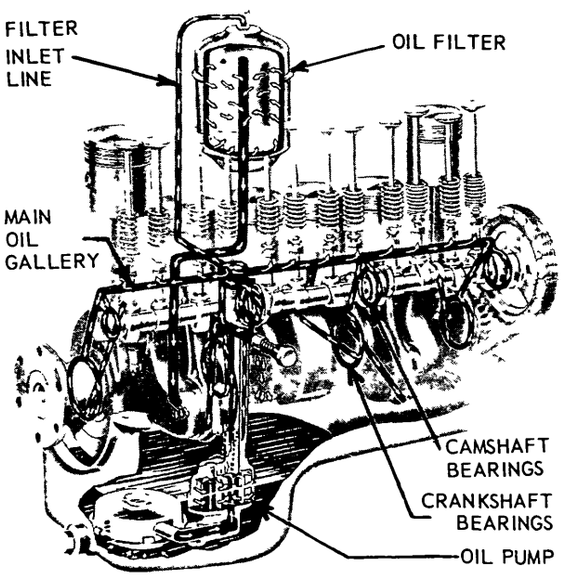
Crankshaft Bearings - Each main bearing supplied with oil from main oil gallery through angle passage in crankcase web extending down from oil gallery to main bearing bore.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

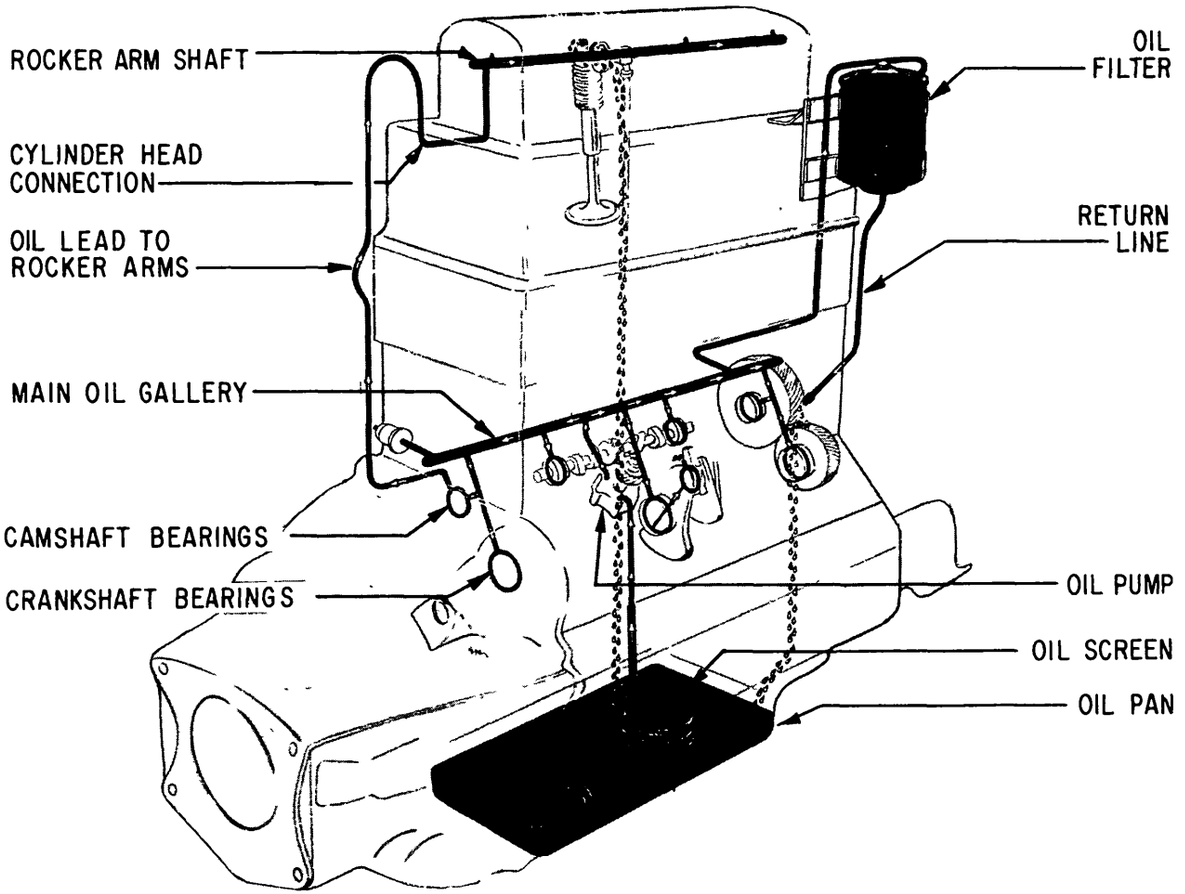
Camshaft B arings - Front & Rear camshaft bearings supplied with oil through short oil passage intersecting corresponding main bearing oil passage. Intermediate camshaft bearings are supplied with oil directly from main oil gallery by passages extending down from the oil gallery to the camshaft bearing bores.

Connecting Rod Bearings - Crankshaft is drilled and each rod bearing is lubricated through passage extending from adjacent main bearing.



Pistons & Pins - Lubricated by oil spray thrown on cylinder wall from spurt hole in connecting rod when this hole lines up with oil hole in crankpin.

Valve Lifters - Lubricated from oil reservoir trough cast in crankcase which is filled by oil spray from connecting rod bearings. Lifter guides are drilled to permit oil flow from trough to lifter bore (lifters have oil groove at center for uniform lubrication of lifter bore).



Timing Gears - Lubricated by oil jet from nozzle threaded in front face of engine block which directs oil on camshaft gear at point where gears mesh. Oil is supplied to nozzle through drilled passage from front main bearing oil passage.

►*TIMING GEAR OIL JET PRODUCTION CHANGE & REPLACEMENT CAUTION:* Beginning with 1960 Engines, Nos. 3J-166871 & 4J-250095, Timing Gear Oil Jet Part No. 924335 (with .040" aperature) was used to prevent oil pressure fluctuations at No. 1 connecting rod bearing. When replacing scored or burned No. 1 rod bearings, check timing gear oil jet and install new type with .040" aperature.

Pushrods, Rocker Arms & Intake Valves ("F" Head Engine) - External oil pipe connects fitting at rear of cylinder block with fitting on top of cylinder head at rear end behind rocker cover. Oil supplied through this line is metered by rear camshaft bearing. Passages in head conduct oil to rear rocker shaft support bracket mounting pad and drilled hole in support bracket and rocker shaft permit oil to flow into hollow rocker shaft. Shaft and rocker arms are drilled for lubrication of rocker arms, pushrod sockets, and valve tips. Excess oil drains back into crankcase through pushrod holes.

WILLYS 6 CYL. 6226 ENGINE OILING SYSTEM

WILLYS 4 CYL. "F" HEAD ENGINE OILING SYSTEM

OIL FILTER: Partial flow type mounted on bracket on engine. Filter inlet pipe is connected at fitting on left side of crankcase and draws oil directly from main oil gallery. Outlet pipe returns oil to crankcase.

6 CYL. 6226 ENGINE

DESCRIPTION: Force feed type with oil supplied under full pressure to all crankshaft, connecting rod, and camshaft bearings, and valve lifters. All other parts are lubricated by oil spray.

OPERATION: Gear type oil pump mounted on lower face of crankcase in oil pan draws oil through floating oil screen and intake pipe mounted on pump cover and delivers oil directly to main oil gallery which extends along right side of crankcase to left of lifter bores (oil flows up around shaft in pump body to outlet hole which registers with oil passage in block when pump installed). *See Caution below.* Pressure regulator valve is located under plug on right side of crankcase at end of pump outlet cross-passage and returns excess oil directly to oil pan. Oil is distributed through the main oil gallery as detailed below.

►*OIL PUMP BUSHING CAUTION:* Pump bushing (installed in block) must be tight and installed flush with bottom of cylinder block. Loose or improperly installed bushing may restrict main oil gallery.

Crankshaft Bearings - Main bearings supplied with oil from main oil gallery through angle passage in crankcase web extending down from oil gallery to main bearing bore. *NOTE* - No. 3 crankshaft bearing is lubricated directly from pump outlet cross-passage (above).

Camshaft Bearings - Each camshaft bearing supplied with oil directly from main oil gallery by passage in crankcase web extending down from oil gallery to camshaft bearing bore.

C nn cting R d B arings - Crankshaft is drilled and

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

each rod bearing is lubricated through passage extending from adjacent main bearing.

Pistons & Pins - Lubricated by oil spray thrown on cylinder wall from spurt hole in connecting rod when this hole lines up with oil hole in crankpin.

Valve Lifters - Lubricated directly from main oil gallery through cross-passage drilled through each lifter boss. *NOTE* - Oil holes extend completely through lifter bosses and first two groups (Cyl. Nos. 1 through 4) are shielded by sheet metal oil shields held in place by spring clips on underside of shield. No shield is used on rear group (Cyl. Nos. 5 & 6).

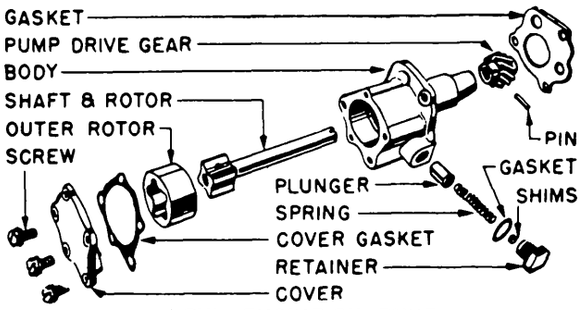
Timing Chain & Sprockets - Lubricated by continuous flow of oil from engine oiling pressure system.

OIL FILTER: Partial flow type mounted on bracket on left side of engine. Filter inlet pipe is connected to fitting on left side of block and draws oil directly from main oil gallery. Outlet pipe returns oil directly to oil pan.

OIL PUMP

4 CYL. ENGINE OIL PUMP

OIL PUMP REMOVAL & OVERHAUL: (Removal)—Rotate engine until distributor rotor points to No. 1 firing position and timing mark on flywheel or vibration dampener is directly under pointer (do not remove distributor, pump must be installed so gears mesh without moving rotor for correct engine timing). *CAUTION*—Crankshaft must not be rotated with oil pump removed). Remove pump mounting bolts and pull pump out as far as possible. Place a short jack between front suspension support and front lower edge of block and push engine to right until pump is free (Note—It may be necessary to loosen engine support bolts for more movement). Check pump shaft for wear before disassembling pump by mounting it in a vise with a dial indicator bearing against shoulder on gear, at right angles to relief valve housing. Move gear toward, then away from indicator and note total reading. If this play exceeds .010", replace complete pump.



Disassembly: Remove cover screws, cover and gasket and shake outer rotor from housing. Remove relief valve retainer, gasket, shims, spring, and plunger. If rotor is to be replaced, file off one end of gear retaining pin, pull gear off shaft and remove shaft and inner rotor from housing. Clean all parts in solvent and check for wear, pits and scoring.

Inspection: Measure clearance between outer rotor and pump body. Replace body if clearance exceeds .012". Check cover to make certain that inner surface is not rough or scored and that inner face is flat within .001". Rotors must be within .001" thickness of each other. With gear installed on pump shaft, clearance between gear and pump body should be .003-.010".

Checking Rotor Clearance: Position inner rotor with one lobe engaged between lobes of outer rotor, then measure clearance of opposite inner rotor lobe and lobe of outer rotor. This clearance should be .010". To check end clearance, install the cover without gasket and tighten screws. If shaft can be turned by hand, end clearance is excessive. Install new cover and repeat test. If rotors still not tight, replace rotors.

Reassembly: Install relief valve, spring, gasket and retainer. If shims were removed, install them between spring and retainer. If new rotors installed, slide gear on shaft after installing shaft and rotor in housing. Position gear so there is not over .010" clearance between gear and pump housing and drill a 5/32" hole through pump shaft for retaining pin. Install pin and peen ends. Install cover and gasket and tighten screws.

Installation (4 Cyl. Models): Check to see that timing marks on flywheel or vibration dampener are directly under pointer and distributor rotor is pointed toward No. 1 firing position. Insert pump in block with pump gear positioned so that it will engage

4 CYL. ENGINE OIL PUMP

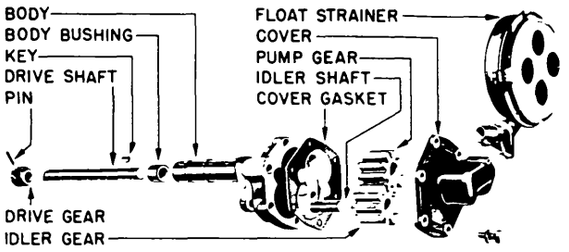
camshaft gear and the distributor shaft drive key without moving distributor rotor. Installation can be made only in one position without moving distributor rotor as slot in drive gear and key on distributor shaft is machined off-center.

6 CYL. ENGINE OIL PUMP

OIL PUMP SERVICING: Pump can be removed from engine (with oil pan off) by taking off retaining nut on stud on #3 main bearing cap and pulling pump straight down to disengage drive gear and distributor drive coupling. Service pump as follows:

Disassembly—Take out cotter pin and remove screen float assembly. Remove cover and gasket. Drive out pin holding upper drive gear on shaft (pin peened in place), drive out shaft from gear. remove idler gear (remove idler shaft if required). Take off lower drive gear (press fit and keyed to shaft).

Oil Pump Clearances—Check as follows:



1)—Pump Body Bushing: if over .005" clearance between pump body and ends of lower drive gear teeth, replace bushing and ream to .500-.501".

2)—Pump Shaft: shaft diameter .4990-.4985".

3)—Lower Drive Gear: end of gear should be .001-.004" beyond gasket seat on pump body.

4)—Upper Drive Gear: .002-.004" clearance between underside of gear and upper end of pump body. Controlled by pressing lower drive gear on shaft until this clearance obtained.

NOTE—Cover plate should be replaced if worn from contact with gears, or if cracked.

6 CYL. ENGINE OIL PUMP

Oil Pump Bushing (in Cylinder Block)—Replace if worn or loose (can restrict oil gallery if loose). Replace by using drift inserted in distributor drive shaft bore from top of block. Install new bushing from below (must be flush with bottom of block).

Reassembly—Press upper drive gear on shaft. Insert new pin and peen ends flush with gear. Install shaft and gear in pump body. Press lower drive gear on shaft (with key in place) until .002-.004" clearance obtained between upper drive gear and upper end of pump body. Press idler gear shaft in body, install idler gear. Install cover using new gasket and pin oil screen float assembly on cover. Check shaft and gears—must rotate freely when turned by hand.

Oil Pump Installation—Set #1 piston at top dead center. Insert distributor main drive shaft from top of block. Install pump with pump drive shaft tongue engaging slot in lower end of distributor main drive shaft and in such a position that when installed, slot in upper end of distributor main drive shaft will be approx. parallel to side of block (slot pointing fore-and-aft), install lock washer, tighten mounting nut. Remove distributor shaft for cyl. head installation.

COOLING SYSTEM

WATER PUMP

4 CYL. ENGINE

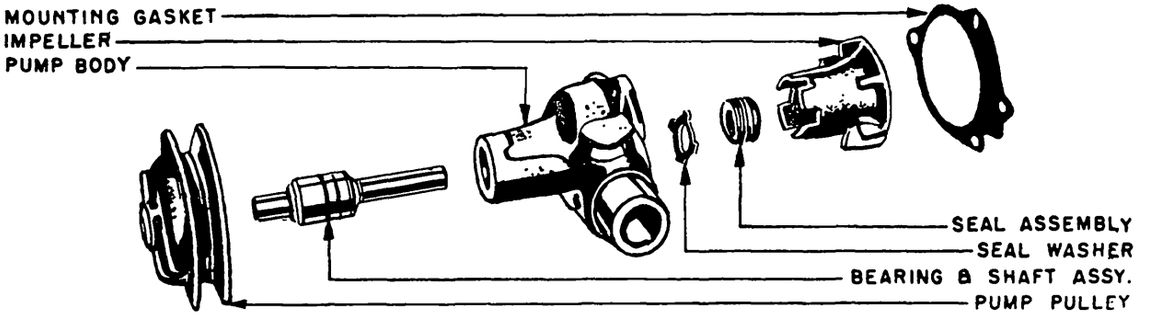
OVERHAUL: Disassembly - Use special W-116 puller and pull impeller off shaft, lift out bakelite seal washer. Remove bearing lock ring from slot in bearing hub on pump housing, support pump housing in arbor press, press shaft and bearing assembly out of pump housing toward forward end. To remove fan pulley from shaft, use any regular puller (special W-115 puller furnished for this purpose) to pull pulley off shaft. Do not attempt to remove bearing from shaft (shaft and bearing serviced as assembly).

Servicing - If rear face of pump housing is not smooth and flat, resurface with special Tool C-551 or install new pump body.

Pump Reassembly: Install shaft and bearing assembly in pump housing (long end of shaft to rear) so that outer

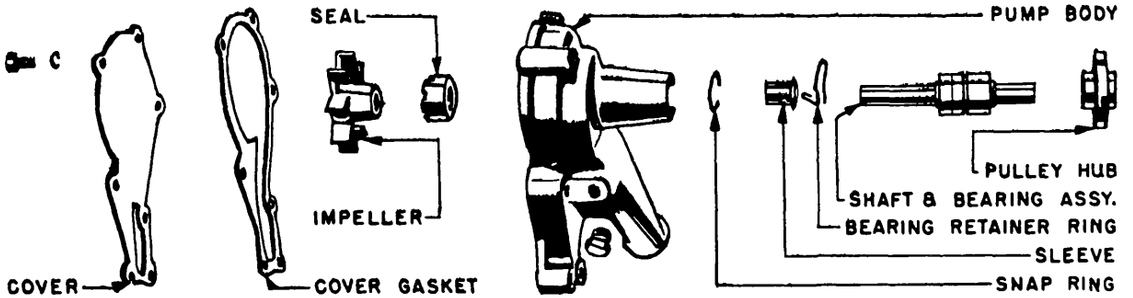
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



end of bearing is flush with front end of housing. Install seal assembly in impeller (dip seal parts in brake fluid before installing), press impeller on shaft until end of shaft is flush with face of impeller hub. Press fan pulley on forward end of shaft until end of shaft is flush with face of pulley. Check location of locking ring groove in bearing with respect to slot in housing, align groove and slot, install bearing locking wire.

6 CYL. ENGINE



OVERHAUL: Disassembly - Remove fan and pulley from pulley hub. Remove pump cover and gasket. With Puller KF-29 and adapter, KF-113, remove impeller from shaft. Remove bearing retainer ring from slot in housing and press shaft assembly out front of housing. Press or drive seal assembly from pump body.

R assembly: Press seal assembly carefully into pump housing. Apply oil or graphite to face of carbon seal washer. Press pump shaft and bearing assembly into pump housing just far enough to insert retaining ring, insert ring. Press impeller on until flush with shaft end. Check impeller position to be sure it clears cover.

Pulley Hub Installation - Press hub on shaft so fan mounting face is 5 7/32" from rear face of rear cover plate. Install cover gasket and cover.

4 CYLINDER ENGINE WATER PUMP

6 CYLINDER ENGINE WATER PUMP

►*ELECTRICAL EQUIPMENT NOTE: Both Auto-Lite and Delco-Remy equipment used and may b intermixed on same vehicle, but g n rator and r gulat r f sam mak must be us d tog ther. 12-VOLT system is standard. 6-VOLT system with either type equipment is optional on all models. Data for all types of equipment is listed below.*

CJ-3B, CJ-5, CJ-6 Universal Jeep	57
FC-150 Forward Control	65
FC-170 Forward Control	61

SERIAL NUMBER: Stamped on metal plate attached in various locations
CJ-3B & DJ-3A to **right** side of dash under hood.
CJ-5 & CJ-6 to l ft side of dash under hood **FJ-3** on **right** side of dash below dimmer switch
FC-150 & FC-170 to cab floor above wheel housing at right door.
All 4WD Trucks on floor riser under **left** side of driver's seat.
All Utility Wag ns on floor riser to **left** and directly behind **back** of driver's seat.
NOTE - Number (example below) includes identification data.

① ② ③ ④ ⑤ ⑥
54 5 4 8 13 10001

① - See "Series Symbol" in Model Table above.
② - See "Body Style" in Body Style Table below.
③ - Engine Type. **3** - 4 Cyl. 134 cu. in. "L" Head. **4** - 4 Cyl 134 cu. in. "F" Head. **6** - 6 Cyl. 226 cu. in "L" Head.
④ - 2 Wheel Drive - 1 or 7 (LHD), 5 (RHD).
4 Wheel Drive - 2 or 8 (LHD), 6 (RHD).
⑤ - Indicates H.D. FC-170 with Dual Rear Wheels Number n t used on other models.
⑥ - Factory Unit Production Number.

B dy Style Table

B dy Styl	Series-54	55-56	57-58	61-65
Wagon	1		①	
Delivery	2			
Flat Faced Cowl	4	4		
Cowl Windshield	5	5		
Stripped Chassis	6	6	③	1 1
Cab Chassis		1		5 5
Pick-Up		2		5 5
Stake		3		5 5
Platform				5 5
Open Body or Canvas Top		②		
Hard Top		④		

① - 1 ("Maverick"), 5 ("El Gaucho").
② - 3 (CJ-3B, DJ-3A), 5 (CJ-5), 7 (CJ-6),
③ - 4 (CJ-3B, DJ-3A), 6 (CJ-5), 8 (CJ-6),
④ - 5 (CJ-5), 3 (DJ-3A).

ENGINE NUMBER: Located as follows·
4 Cyl. Engines - Stamped on top of water pump boss at front of engine.
6 Cyl. Engines - Stamped on boss on left front corner of engine block above generator.
NOTE -- Letters following engine number designate special cylinder bore and bearing oversizes or undersizes. *See "Engine Specifications".*

TUNE-UP

COMPRESSION PRESSURE: 4 Cyl. "L" Head 90-110 lbs.
4 Cyl. "F" Head 115-145 lbs (6.9-1 Ratio), 120-130 lbs. (7 4 or 7 8-1 Ratio).
6 Cyl. "L" Head 120-130 lbs. (6 86-1 ratio), 125-140 lbs (7 3-1 ratio)
NOTE - All cylinders must be equal within 10 lbs

VACUUM READING: Steady 18-21" at idle speed.

TAPPET CLEARANCE:	Intake	Exhaust
4 Cyl. "L" Head	.016"	.016"
4 Cyl. "F" Head	.018"	.016"
6 Cyl.	.014"	.014"

NOTE - Set clearance with engine COLD not running.

►*TAPPET ADJUSTMENT (FORWARD CONTROL MODELS):* Access panel provided in right front wheel housing-

MANIFOLD HEAT CONTROL: Used as follows
4 Cyl. "L" Head - Thermostatic coil on manifold.
4 Cyl. "F" Head - Water jacketed intake manifold.
6 Cyl. – Exhaust heat control valve with spring tension of 180° wind-up on manifold.

CRANKCASE VENTILATION VALVE: Service at regular intervals and check operation before performing a "Tune-Up" for ignition and carburetion troubles *See "Closed Crankcase Ventilation Systems" in Carburetion Section*

IGNITION

FIRING ORDER: 1-3-4-2 (4 Cyl.), 1-5-3-6-2-4 (6 Cyl)
SPARK PLUG GAP: .030".
Spark Plugs - Auto-Lite A7 or Champion J8 14mm. Torque to 28-30 ft. lbs.

COIL: Autolite Coils used on both 6 Cyl & 4 Cyl cars
Replacement Service Coils - Autolite Nos 5-8 (6 volt), 5-10 (12 volt)
Ignition Current - 6 Volt - 2 5 amps idling, 5 amps at 6 3 volts stopped **12 Volt** - 2 8-2 9 amps at 12 5 volts idling or stopped

DISTRIBUTOR: Autolite. *NOTE* - Same distributor used in both 6-volt and 12-volt systems

	Autolite Distr. No.
4 Cyl Jeeps	IAY-4401
4 Cyl Others	IAT-4405
6 Cyl	IAT-4404A

Condenser - Autolite No 2-32 **Capacity** 21-25 mfd
Contact Point Set - Autolite No 1-45 (IAY Distr), No 1-47 (IAT Distr)
Breaker Gap - 020"
Cam Angle - 42°(4 Cyl,), 39° (6 Cyl) plus or minus 3°
Br ak r Arm Spring Tensi n - 17-22 ozs
R tati n - Counterclockwise viewed from above

Aut matic Advanc - IAY-4401, IAT-4405

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	300	0	600
1	425	2	850
6	1050	12	2100
10	1575	20	3150
11	1700	22	3400

Automatic Advance - IAT-4404A

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	300	0	600
1	375	2	750
4	600	8	1200
6	1175	12	2350
7 5	1700	15	3400

Vacuum Spark Control: Autolite (integral type). Not used on IAY-4401 Distributor

Vacuum Advance - IAT-4405

Distr Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	5 1/8
1	2	6 5/8
3	6	9 5/8
5	10	12 1/2
6	12	14

Vacuum Advance - IAT-4404A

Distr Degrees	Eng Degrees	Vacuum (" of Hg)
Start	0	10
1	2	11
3	6	13
4	8	14
5	10	15

DISTRIBUTOR: DELCO-REMY. *NOTE - Same Distributor used in both 6-volt and 12-volt systems.*

Engine	Delco-Remy Distr. N .
4 Cyl Jeeps	1112432
4 Cyl Others	1110255
6 Cyl	1110249

►*DISTRIBUTOR INSTALLATION NOTE:* Oil pump gear must be rotated 1 tooth counterclockwise (viewed from top of engine) from original position This will put No. 1 spark plug lead at front of engine and position vacuum advance so same vacuum line from Auto-Lite distributors can be used
Breaker Gap - 022"
Cam Angle - 25-34° (4 Cyl), 31-37° (6 Cyl).
Breaker Arm Spring Tension - 19-23 ozs
Rotation - Counterclockwise viewed from above.

Automatic Advance - 1110255 & 1112432

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	425	0-4	850
4-6	925	8-12	1850
10-12	1700-1950	20-24	3400-3900

Automatic Advance - 1110249

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	375	0-4	750
2-4	500	4-8	1000
3-5	800	6-10	1600
5-7	1300	10-14	2600

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Vacuum Spark Control: Delco-Remy 1116052 (1110255 Distr.), 1116160 (1110249 Distr.). None used on 1112432 Distr.

Vacuum Advance - 1116052

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	3-5
6	12	9-14

Vacuum Advance - 1116160

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	9-11
5	10	14-18

IGNITION TIMING

Setting - 5° BTDC (All Models).

Timing Mark (4 Cyl. "F" Head) - Notch on rim of fan pulley to align with 5° mark on pointer on timing gear cover. Two marks on pointer - 5° and T (TDC).

Timing Mark (4 Cyl. "L" Head) - 5° mark on flywheel is in center of timing hole in flywheel housing. Flywheel marked T.C. (TDC) and 5° (5° BTDC).

Timing Mark (6 Cyl.) - Align correct graduation with pointer on timing gear cover. Damper marked "O" at TDC with 1° graduations before and after this point.

CARBURETOR

Model	Carter Carb. No.
4 Cyl. "L" Hd. Jeep Dispatcher	YF 2392S
4 Cyl. "F" Hd. Universal Jeep	YF 938SD
4 Cyl. "F" Hd. 4x 2, 4x4, 4WD	YF 951SA
4 Cyl. "F" Hd. Fleetvan	YF 3200S
4 Cyl. "F" Hd. Forward Control	YF 938SD
6 Cyl. "L" Hd. All Models	YF 2467S

Idle Setting - Initial setting ¾ to 1¼ turns open (938SD, 3200S & 951SA), ½ to 2 turns open (2392S), 1 to 2½ turns open (2467S). Turn screw out for richer mixture.

Idle Speed - 600 RPM (4 Cyl.), 550 RPM (6 Cyl.). *NOTE* - Fleetvan (Auto. Trans.) selector lever in "N" (neutral).

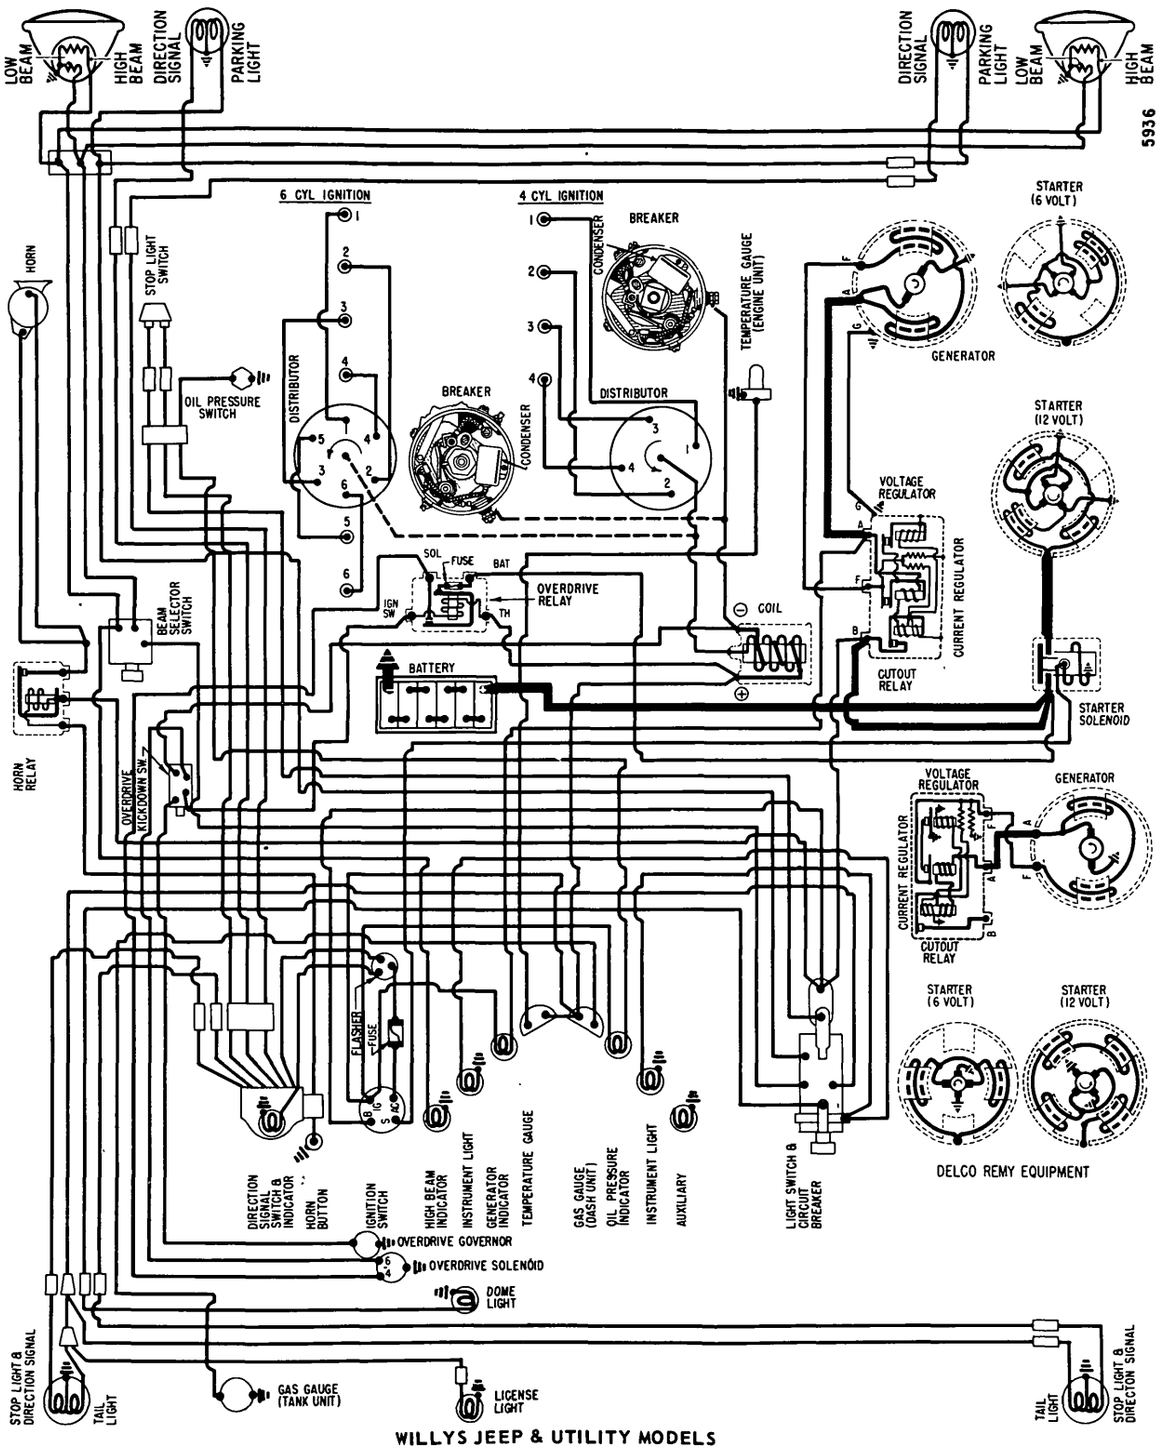
Fl at Level - 5/16" - Gauge T-109-107 (938SD, 951SA, 3200S), 9/32" - Gauge T-109-126 (2392S, 2467S), from top of float at free end to gasket seat on cover with assembly inverted and float resting on intake needle.

Crankcase Ventilation Valve - *See TUNE-UP.*

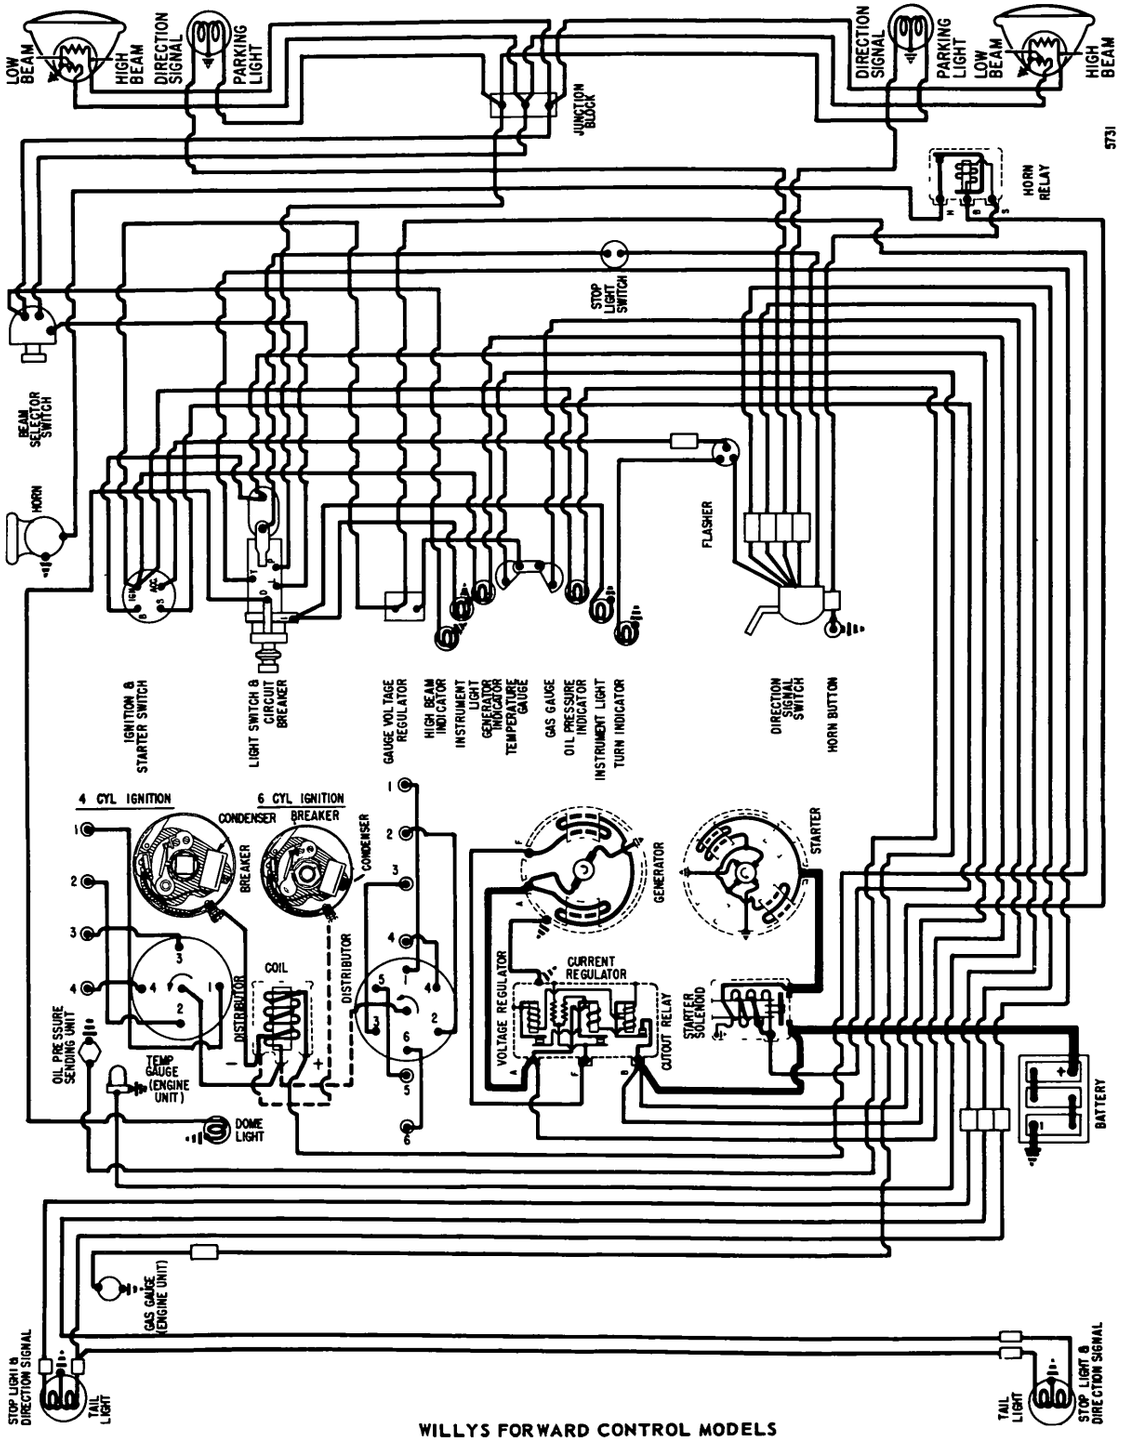
Fast Idle: With choke held in wide open position. lip on fast idle arm should contact boss on body casting.

►*OTHER DATA: See "Carter YF Carburetors" in Carbu r tion Section.*

CARB. EQUIPMENT



Fu l Pump: AC & Carter used as follows:



M del	AC No.	Carter No.
Univ. Jeep ①	4032	
Fleetvan (U.S. Post Office) ②	9716	
Jeep Dispatcher ②	9716	
Fwd. Control (FC-150) ①	4080	
Utility (4 Cyl.) ①	4080	
Fwd. Control (FC-170) ①		M957S
Utility (6 Cyl.) ①		M957S

① - Fuel & Vacuum. ② - Fuel only.

Pr ssur - 2½-3¾ lbs. (AC), 3½-5½ lbs. (Carter), all at 1800 RPM.

CONTINUED ON NEXT PAGE

WILLYS FORWARD CONTROL MODELS

CONTINUED FROM PRECEDING PAGE

►*FUEL FILTER NOTE:* Filter Spool located inside fuel tank on all models exc. Univ. Jeep & Jeep Dispatcher.

Gasoline Gauge: Stewart-Warner Electric Constant Voltage type with gauge voltage regulator on back of instrument panel or fuel gauge.

AIR CLEANER: Oil Bath Type (Exc. DJ-3A). Dry Type (DJ-3A). Service at regular intervals.

6-VOLT ELECTRICAL SYSTEM
AUTO LITE
BATTERY

Autolite 1M-100R (FC-150 & 170), 1M-100 (Others).
6 volt, 15 plate, 100 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Left front engine support (6-226), right front engine support (Others).

STARTER

Autolite MCH-6215 (4 Cyl.), MCH-6210 (6 Cyl.).
Armature - 16-19 (All).
Drive - Bendix "Folo-Thru" type.
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 42-53 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	4300	5.0	65
6.0 ft. lbs.	Lock	2.0	335

Starting Switch: Autolite No. 15-31 (MCH-6215 Starter). Key starting (Magnetic switch controlled by turning key past "Ignition On" position).

GENERATOR

Autolite No. GGW-7404A (4 Cyl.), GGW-7404B (6 Cyl.).
Armature - Autolite No. 10-76 (All).

Performance Data

Amperes	Volts	Cold	RPM	Hot
0	6.4	870-970		950-1050
40.0	8.0	1800-2000		2150-2350
45.0	8.0	1925-2125		2350-2550

Brush Spring Tension - 18-36 ozs.
Field Current - 1.6-1.7 amperes at 5.0 volts.
Motoring Current - 5.0-5.5 amperes at 5.0 volts.
Rotation - Counterclockwise at commutator end.
Belt Adjustment: 1/2-5/8" deflection midway between generator and fan pulleys with normal thumb pressure.

GENERATOR REGULATOR

Autolite No. VBO-4601C.

Cutout Relay

Cuts In - 6.3-6.8 volts.
Cuts Out - 4-6 amps. discharge current after charging at 10 amperes.
Contact Gap - .015" minimum.
Air Gap - 025-.027" with contacts open (check at hinge end of core).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

V ltag Regulator

S tting - 7 2 volts (7 0-7 4) at 80° and charging at 10 amperes or with 25 ohm resistor in charging line

Air Gap – 048– 052" with contacts just opening (check at brass armature stop pin)

Current Regulator

►*SETTING CAUTION· "Temperature Compensated" type Set to following specifications at 70°F*

Test A	Operating Amperes	Test B
54 Amperes max		45 (43-47)

T st A - After 15 minutes operation with current at 10 amperes.

Test B - After additional 15 minutes operation with current regulator operating (load applied to hold to 6 7-6 9 volts).

Air Gap – 048– 052" with contacts just opening (check at brass armature stop pin)

Checking & Adjusting - *See "Auto-Lite 6-Volt Regulators" in Electrical Section*

6-VOLT ELECTRICAL SYSTEM
DELCO-REMY
STARTER

Delco-Remy 1108077 (4 Cyl.), 1108078 (6 Cyl.).
Drive - Bendix "Folo-Thru" type.
Rotation - Counterclockwise at commutator end
Brush Spring Tension - 24 ozs minimum

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs	6000	5 0	60
15 0 ft lbs	Lock	3 0	600

GENERATOR

D lco-Remy 1102832 (4 Cyl.), 1102831 (6 Cyl.).
Replacement Generator Without Pulley - 1102811 (All)

Performance Data

Amperes	Volts	RPM
45	8 0	2350

Brush Spring Tension - 28 ozs
Field Current - 1 87-2 0 amps at 6 0 volts.
Rotation - Counterclockwise at commutator end
B lt Adjustment: 1/2-5/8" deflection midway between generator and fan pulleys with normal thumb pressure

REGULATOR

Delco-Remy 1972063.

Cutout Relay

Cuts In - 5.9-6 7 volts
Contact Gap - .020" **Air Gap** - 020"

Voltage Regulator

Setting - 6.9-7 4 volts
Air Gap - 075" with armature pressed down to point where contacts just touch
Checking & Adjusting - *See "Delco-Remy 6-Volt Regulators" in Electrical Section.*

Current Regulator

Setting - 42-47 amperes.
Air Gap - 075" with armature pressed down to point where contacts just touch
Ch cking & Adjusting - *See "D lco-R my 6-Volt R gulators" in El ctrical S ction*

12-VOLT ELECTRICAL SYSTEM
AUTOLITE
BATTERY

Autolite No. 11-HS used as follows: (All Exc. Fleetvan) - 12 volt, 9 plate, 50 ampere hour capacity (20 hr rate)
(Fleetvan) - Autolite 11-HS. 12 volt, 11 plate, 70 ampere hour capacity (20 hr rate)
Battery Ground - Negative
Engine Ground - Left front engine support (6 Cyl), right front engine support (4 Cyl)

STARTER

Autolite No. MDU-7004 (4 Cyl.), MDU-7003 (6 Cyl.).
Armature - Autolite No 16-82 (All)
Drive - Bendix "Folo-Thru" type
Rotation - Counterclockwise at commutator end
Brush Spring Tension - 31-47 ozs

Performance Data (MDU-7003,4)

Torque	RPM	Volts	Amperes
0 ft lbs	5300	10 0	50
6 2 ft lbs	Lock	4 0	280

Starting Switch· Autolite SAE-4005 (MDM-6005) Key starting (Magnetic switch controlled by turning key past "Ignition On" position)

ALTERNATOR & REGULATOR

Autolite No. ALC-5001 used with Regulator No. 8-106 (VBS-6201A).
Rotation - Clockwise at drive end
Field Current - 2 32-2 43 amps at 10 volts
Rated Output - 42 amps at 14 2 volts at 4200 RPM
►*OTHER DATA See "Autolite Alternator & Regulator" in Electrical Section.*

GENERATOR

Autolite No. GJP-7402A (4 Cyl.), GJP-7402B (6 Cyl.).
Armature - Autolite No 10-53 (All)

Performance Data

Amperes	Volts	RPM
16	15 0	1700
30	15 0	2300
35	15 0	2600

Brush Spring Tension - 18-36 ozs
Field Current - 1 6-1 7 amps at 10 0 volts
Motoring Current - 3 1-3 5 amperes at 10 0 volts
Rotation - Counterclockwise at commutator end

Belt Adjustment: ½–5/8" deflection midway between generator and water pump pulleys with normal thumb pressure

GENERATOR REGULATOR

Autolite No. VBO-4201E-4A.

Cutout Relay

Cuts In - 12 5-13 5 volts
Cuts Out - 3-5 amps discharge after charging at 7 amperes
Contact Gap - 015" Minimum
Air Gap - 025- 027" with contacts open (check at hinge end of core)

V ltag R gulat r

S tting - 14 2-14 8 volts at 80°F and charging at 7 amperes or with 25 ohm resistor in charging line
Air Gap - 048- 052" with contacts just opening

Current Regulat r

►*SETTING CAUTION "Temperature Compensat d type Set to following specifications at 70°F*

Test A	Operating Amperes	Test B
44 Amperes max		35 (33-37) Amps

Test A - After 15 minutes operation charging at 10 amps

Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13 6-13 8 volts)

Air Gap - 048- 052" with contacts just opening

Checking & Adjusting - *See 'Autolite 12-Volt Regulators" in Electrical Section*

12-VOLT ELECTRICAL SYSTEM
DELCO-REMY
STARTER

Delco-Remy 1107746 (4 Cyl), 1107747 (6 Cyl)
Rotation - Counterclockwise at commutator end
Drive - Bendix "Folo-Thru" type
Brush Spring Tension - 35 ozs minimum

Performanc Data

Torque	RPM	Volts	Amperes
0 ft lbs	6900	10 3	75
10 5 ft lbs	Lock	5 8	435

GENERATOR

Delco-Remy 1102172 (4 Cyl.),1102171 (6 Cyl.).
Replacement Generator With ut Pull y - 1102096 (All)

Performanc Data

Amperes	Volts	RPM
30	14 0	2240

Brush Spring Tension - 28 ozs
Field Current - 1 69-1 79 amps at 12 volts (80°F)
Rotation - Counterclockwise at commutator end
Belt Adjustment: 1/2-5/8" deflection midway between generator and fan pulleys with normal thumb pressure

REGULATOR

Delco-Remy 1972029.

Cutout R lay

Cuts In - 11 8-13 5 volts
Contact Gap - 020" **Air Gap** - 020"

Voltage R gulator

Setting - 13 8-14 8 volts
Air Gap - 075" with armature pressed down to point where contacts just touch
Checking & Adjusting - *See "D lco-R my 1119000 Series Regulators" in Electrical S ction*

Current R gulat r

Setting - 27-33 amperes
Air Gap - 075" with armature pressed down to point where contacts just touch
Ch cking & Adjusting - *See "Delco-Remy 1119000 Series Regulators" in Electrical Section*

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

Lighting Switch Removal: Loosen set screw on side of control knob and remove knob. Remove retaining nut and remove switch through panel.

Stop Light Switch Location: On brake master cylinder.

CIRCUIT BREAKER: 25 Ampere - Protects lighting circuits. Integral with headlight switch.

FUSES: Located in lead except overdrive fuse, which is at overdrive relay. See table below.

Fuse Specifications

Item	6 Volt	12 Volt
Overdrive	SFE 20	SFE 14
Dir. Signal	SFE 14	SFE 9
Heater (Exc. Fwd. Contr.)	SFE 14	SFE 9
Heater (Fwd. Contr.)	SFE 10	AGC 10
Radio	SFE 9	①

① - AGA-5 (Fwd. Contr.), AGC-7½ (Utility).

ENGINE

►*THREE DIFFERENT ENGINES USED: See "Model Identification" for application.*

4 CYL. "F" HEAD

Model	Bore	Stroke	Displacement
F4-134 (All)	3.125"	4.375"	134.2 cu. ins.

Model	Compr. Ratio	Rated HP	Developed HP
F4-134 4x2	7.4-1①	15.63	75 at 4000 RPM
F4-134 Others	6.9-1②	15.63	72 at 4000 RPM

① - 7.8-1 Optl. ② - 7.4-1 Optl.

Compression & Vacuum Reading—See *"TUNE-UP"* above.

►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" .010" main & connecting rod journals Undersize.
"B" .010" cylinder bore and pistons Oversize.
"AB" both above conditions exist.

ENGINE REMOVAL (Utility & Forward Control Models): See *"Engine" in Willys Special Data.*

CYLINDER HEAD & GASKET INSTALLATION: See *Willys Special Data.*

TIGHTENING TORQUES: See *Willys Special Data.*

PISTONS

Aluminum alloy, cam ground, T slot, Tin or Brass plated Piston has heat insulating groove above top piston ring groove

►*PISTON OVERSIZE NOTE:* Letter "B" or "AB" following engine number indicates that cylinder bore and pistons are .010" Oversize.

Weight—13.5 ozs.

Removal—Pistons & Rods removed from above.

Fitting New Pistons: Place 003" x 3/4" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove ribbon feeler should be 5 to 10 lbs.

Replacement Pistons: Std. and .010", .020", .030" and .040" Oversize.

Installing Pistons: "T" slot toward valve (left side) of engine (opposite side from oil spray hole in connecting rod lower end).

PISTON PINS

Locked in rod with clamp screw.

Diameter—.8118-.8120". **Length**—2-25/32".

Clearance in Piston - .0001-.0003". Thumb push fit at 70°F.

Replacement Pins - No oversizes available.

PISTON RINGS

Standard Engine

Ring	Width	End Gap	Side Clearance
Compr.(1)	3/32"	.007-.017"	.002-.004"
Compr. (2)	3/32"	.007-.017"	.0015-.0035"
Oil	3/16"	.007-.017"	.001-.0025"

Fleetvan Engine

Ring	Width	End Gap	Side Clearance
Compr. (1)	3/32"	.010-.020"	.002-.004"
Compr. (2)	3/32"	.010-.020"	.0015-.0035"
Oil	3/16"	.015-.055"	①

① - Steel Rail, Chrome-plated.

Replacement Rings: (For rebored cylinders)—Furnished .010", .020", .030" and .040" Oversize.

Service Type Rings—(For Cylinders not Rebored)—Furnished Std. (.000-.009"), .010" (.010-.019"), .020" (.020-.029"), .030" (.030-.039"), .040" (.040-.049") Oversize.

Installing Rings: Install compression rings with mark "Top" (on side) toward top. Rings have tapered face and must be installed correctly. Top ring inner bevel edge must be up.

CONNECTING RODS

Length (Center to Center) - 9.1845-9.1905"

Weight - 32 ozs.

Crankpin Journal Diameter - 1.9375".

►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AB" following the engine number indicates that main and connecting rod journals are .010" Undersize.

Bearings—Steel backed babbitt.

Clearance - .0003-.0025".

Sideplay - .004"-.010".

Replacement Bearings: Std. and .001", 002", .010", .020", .030" Undersize.

Installing Rods: Lower bearing offset. Install rods with short side of bearing toward nearest main bearing or toward front of engine (Nos. 1 & 3), toward rear of engine (Nos. 2 & 4). Oil spray hole in lower end of rod must be toward right of engine (away from camshaft) on all rods.

CRANKSHAFT

Journal Diameter - 2.333-2.334". All main bearings.

►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AB" following engine number indicates that main and connecting rod journals are .010" Undersize.

Bearings—Steel backed babbitt.

Clearance - .0003-.0029".

Replacement Bearings: Std. and .001", .002", .010", .020", .030" Undersize.

Crankshaft Servicing: See *"Crankshaft & Main Bearings" in Willys Special Data*

End Thrust: Taken by thrust washer between crankshaft gear and front bearing Endplay controlled by shims between thrust washer and shoulder on crankshaft. *NOTE* - Thrust washer must be installed with inner beveled edge toward front bearing Endplay—.004-.006".

Crankshaft Rear Main Bearing Oil Seal: Knurls added to rear seal surface on crankshaft. See *"Crankshaft & Main Bearings" in Willys Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): See *"Engine Front Cover" in Willys Special Data.*

CAMSHAFT

Journal Diameters - **(1)** 2.1860-2.1855", **(2)** 2.1225-2.1215", **(3)** 2.0600-2.0590", **(4)** 1.6230-1.6225".

Bearings - No. 1 steel-backed, babbitt (replaceable bushings), Nos. 2, 3, 4 cast iron (precision bored in block).

Clearance - .001-.0025".

End Thrust: Taken by thrust plate behind camshaft gear Endplay controlled by spacer between camshaft gear and shoulder on shaft Endplay can be increased by installing shim between spacer and shaft, or decreased by dressing off spacer *NOTE* - Inner beveled edge of spacer must be toward crankcase

End Play—.004-.007".

Camshaft Servicing: See *"Camshaft & Bearings" in Willys Special Data.*

Timing Gears: Crankshaft gear, steel. Camshaft gear, fibre with steel hub.

Gear Clearance - 000-002"

Camshaft Setting: Mesh marked tooth of camshaft gear with marked space (between teeth) of crankshaft gear

VALVES

Tappet Clearance: Intake 018", Exhaust 016" Cold

Valve	Head Diameter	Stem Diameter	Length
Intake	2"	3733-3738"	4.781"
Exhaust	1-15/32"	371-372"	5.909"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	260"	0007-.0022"
Exhaust	45°	351"	.0025-.0045"

►*EXHAUST VALVE NOTE* Thompson Valve Rotators used

Valve Seat Width—3/64".

Valve Seat Inserts - Used for all exhaust valves

Valve Stem Seals (Intake Valves) - Rubber seal ring installed on upper end of valve stem directly below valve locks When installing valves, install spring and retainer, compress spring, install seal in groove before installing locks

Valve Springs. Install with closed coil upward toward block (Exhaust), down towards head (Intake).

Free Length—1 31/32" (Intake), 2½" (Exhaust).

Valve Spring Specifications

Valve	Intake	Exhaust
Closed	73 lbs. at 1 21/32"	53 lbs. at 2 7/64"
Open	153 lbs. at 1 13/32"	120 lbs. at 1 3/4"

Valve Guides: Use Tool W-238 to remove and install guides. Drive Exhaust guide down into valve compartment to remove. Drive new Exhaust guide to 1" below surface of cylinder block and new Intake guide flush with bottom of valve guide bore in cylinder head.

Rocker Arm Assembly Removal: See *"Valve System" in Willys Special Data.*

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

Valv Lift rs: Mushroom type operating in reamed holes in block. Serviced by installing oversize lifters. Lifters furnished .004"Oversize.
Diameter–.6240-.6245". **Clearance**–.0005-.002".
►*NOTE:* Camshaft must be removed for lifter removal.

VALVE TIMING

See "Camshaft Setting" under "CAMSHAFT" above.
Intake Valves–Open 9° BTDC. Close 50° ALDC.
Exhaust Valves–Open 47° BLDC. Close 12° ATDC.
Valve Timing Check–Set Intake valve clearance at .026". Rotate engine clockwise until No. 1 cylinder is ready for intake stroke. Intake opens 9° BTDC. Note the distance between TDC and the 5° mark and estimate 9° from this distance. With the crankshaft in this position timing is correct if lifter is just tight against valve stem.

ENGINE

4 CYL. "L" HEAD

Model	Bore	Stroke	Displacement
L4-134	3.125"	4.375"	134.2 cu. ins.
Model	**Compr. Ratio**	**Rated HP**	**Developed HP**
L4-134	6.48-1	15.63	60 at 4000 RPM

►*ENGINE NUMBER NOTE: Letters stamped after engine number denote the following:*
"A" - .010" undersize main & connecting rod bearings.
"B" - .010" oversize cylinder bore.
"AB" - Both above conditions exist.
"C" - .002" undersize piston pin.
"D" - .010" undersize main bearing journals only.
"E" - .010" undersize connecting rod bearing journals only.

►*OTHER ENGINE DATA: See "4 Cyl. "F" Head" above and note the following differences:*

VALVES: Tappet Clearance - .016" Cold (Intake & Exhaust).

Valve	Head Diam.	Stem. Diam	Length
Intake	1 17/32"	.373"	5 51/64"
Exhaust	1 15/32"	.371-.372"	5 51/64"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.351"	.0007-.0022"
Exhaust	45°	.351"	.0025-.0045"

Valve Seat Width - 3/64"
Valve Springs: Install all springs with closed coil end up toward cylinder block **Free Length** - 2½"

Spring Specifications (All Valves)

Valve	Pressure & Length
Closed	53 lbs at 2 7/64"
Open	120 lbs at 1 3/4"

Valve Guides: Use W-177 to remove and install guides. Drive guides into valve compartment to remove. Drive new exhaust guide to 1" below surface of cylinder block and new intake guide 1 5/16" below surface of cylinder block.
VALVE TIMING: *Same as on 4 Cyl. "F" Head Engine.* **Valve Timing Ch ck** - Set tappet clearance of No 1 cylinder intake valve at 020" Rotate engine until No 1 cylinder is entering intake stroke (9° BTDC). Note distance between TDC and 5° mark on timing gear cover, estimate position of 9° point With crankshaft in this position, timing is correct if lifter is just tight against valve stem Reset tappet clearance to 016".

ENGINE

6 CYL. "L" HEAD

Model	Bore	Stroke	Displacement
L6-226	3.3125"	4.375"	226.2 cu. ins.
Model	**Compr. Ratio**	**Rated HP**	**Developed HP**
L6-226	6.86-1③	26.33	105 at 3600 RPM

③ - 7.3-1 Optl.

Compression & Vacuum Reading–*See TUNE-UP above.*

►*VALVE CHAMBER COVER STUDS LEAKING CORRECTION AND PRODUCTION CHANGE:* A new oil seal Willys No. 927013 and washer No. G-120395 replace Gasket No. G-137281 in production beginning Eng. Serial Nos. S-16471, T-134501 & F-20951. Oil leakage at valve chamber cover studs can be corrected on earlier models by replacing gasket with new oil seal and washer.

►*ENGINE NUMBER NOTE:* Letters following engine number denote the following:
"A" 010" Undersize main and connecting rod journals
"N" 020" Oversize bore and pistons
"AN" Indicates both "A" and "N" conditions

►*ENGINE SERIAL NUMBER PLATE REPLACEMENT CAUTION:* When installing a new cylinder block, old engine serial number plate must be transferred and installed on new block to prevent oil leakage at drilled holes provided in new block.

ENGINE REMOVAL (Utility & Forward Control Models): *See "Engine" in Willys Special Data.*
CYLINDER HEAD & GASKET INSTALLATION: *See "Cylinder Head & Manifolds" in Willys Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Willys Special Data.*

PISTONS

Aluminum alloy, T-slot, cam ground, tin or brass plated.
►*PISTON OVERSIZE NOTE:* Letters "N" or "AN" following engine number indicates that cylinder bore and pistons are 020" Oversize
Weight - 15 187-15 437 ozs (less rings and pin)
Removal - Pistons and rods removed from above
Fitting New Pistons: Place 0015" x 1/2" ribbon feeler between thrust side of piston and cylinder wall. Pull required to remove feeler should be 5 to 10 lbs.
Piston Replacement–Std., .010", .020", .025, .030", .040", .050", and .060" Oversize.
Installing Pistons: Slot in skirt toward left or away from camshaft.

PISTON PINS

Floating type with lock ring at each end.
Diameter - .8591-.8593". **Length** - 2.779".
Clearance in Piston - .0002". Selective fit. Light thumb push fit.
Clearance in Rod - .0002-.0006". Hand press fit at room temperature.
Pist n Pin Fitting - Palm push fit. Ream connecting rod bushing for proper fit of oversized pins.
Replacem nt Pins: Std., .003" and .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. (Upper)	.0930-.0935"	.008-.016"	.002-.004"
Compr. (Lower)	.0930-.0935"	.008-.016"	.003-.007"
Oil (Top ring)	.1545-.1550"	.008-.016"	.006-.010"
Oil (Bottom ring	.1545-.1550"	.008-.016"	.0025-.004"

Replacement Rings: Ring sets and single rings furnished in following sizes for oversize ranges indicated: Std. (Std.-.009"), .020" (.010-.029"), .030" (.030-.039"), .040" (.040-.049"), .060" (.050-.069").
Installing Rings: Side marked "Top" (compression rings) upward. Chrome plated ring must be installed in top (#1) ring groove.

CONNECTING RODS

Length–6.998"- 7.002" (Center to center)
Crankpin Journal Diameter–2.0619- 2.0627".
►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AN" following engine number indicates that the main and connecting rod journals are .010" Undersize.
Bearings–Steel Backed Babbitt.
Clearance - .0007-.0025" maximum. **Sideplay** - .006-.011".
Replacement Bearings: Std. and .001", .002", .010" and .012", .020" Undersize.
Installing Rods: Mark rods and bearing caps. Install with marks together and toward camshaft in same order as when removed. Oil spray hole in lower end of rod toward camshaft. *NOTE*–Lower bearings offset with narrow side of rod toward nearest main bearing (#1, 3, 5 forward), (#2, 4, 6 toward rear).

CRANKSHAFT

Journal Diameter - 2.374-2.375".
►*JOURNAL DIAMETER UNDERSIZE NOTE:* The letter "A" or "AN" following the engine number indicates that the main and connecting rod journals are .010" Undersize.
Bearings–Steel Backed Babbitt.
Clearance - .0008-.0028".
Replacement Bearings: Std. and .001", .002", .010" and .012", .020" Undersize.
End Thrust: Taken by #4 rear main bearing which is flanged type.
Endplay - .003-.006".
Rear Bearing Oil Seal Installati n: *See "Crankshaft and Main Bearings" in Willys Special Data.*

CAMSHAFT

Journal Diameters–(1) 1.8725-1.8735", (2) 1.8095-1.8105", (3) 1.7472-1.7485", (4) 1.2475-1.2485".
Bearings–Steel Backed Babbitt.
Clearance–.001-.003".
End Thrust: Taken by thrust plate on front of engine (between front bearing journal and hub of sprocket).
End Play–.003-.007".
Camshaft Servicing: *See "Camshaft & Bearings" in Willys Special Data.*
Timing Chain: Non-adjustable type. Width 1" (Early), .875" (Late). Pitch .500".
Length 23" or 46 links.

CONTINUED ON NEXT PAGE

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

CONTINUED FROM PRECEDING PAGE

►*TIMING CHAIN CAUTION. Morse and Link Belt chains used. Chains and sprock t int rchangeabl only in COMPLETE SETS*

Camshaft S tting· Mesh chain with 9 links (or 10 link pins inclusive of pins opposite marks) between marks on sprockets with #6 piston at top dead center on compression stroke.

Engine Fr nt C v r Oil S al (Crankshaft Front Seal): *Se "Engin Front C v r" in Willys Special Data*

VALVES

Tapp t Cl arance: Intake and Exhaust .014" Cold.

►*VALVE TAPPET ADJUSTMENT (FORWARD CONTROL MODELS)* Access panel provided in right front wheel housing for valve tappet adjustment Install jack stand under right frame rail, remove right front wheel, remove wheel housing access panel (both sections of split panel), remove fuel pump and valve covers Tappet clearance can then be adjusted

►*TAPPET CLEARANCE ADJUSTMENT PROCEDURE: S "Valv Syst m" in Willys Special Data*

Valv	H ad Diam.	Stem Diam.	Length
Intake	1 520"	.3402-.3410"	5.187"
Exhaust	1.328"	.3382-.3390"	5.205 '

Valv	S at Angle	Lift	Stem Clearance
Intake	30°	284"	001- 003"
Exhaust	45°	284"	0032- 0050"

Valv S at Ins rts - Used for all exhaust valves

Valv S at Width: 5/64-3/32" (intake), 3/32-7/64" (exhaust).

NOTE–Rotators used on Exhaust valves.

Valve Guid s: Pressed in block. Replace when stem clearance exceeds maximum (above). Ream new guides to inside diameter of .3432-3422".

R placement Guides–Std., .0005" (marked "A"), .0055" (marked "L") to insure .0005-.003" press fit.

Guide Installati n–Place guide (tapered end of guide toward top) in position in bore and drive in to correct position of 1-7/32" below top face of cylinder block.

Valv Springs: Intake & Exhaust valve, spring interchangeable

Fr L ngth–1-31/32".

Valv	Valv Spring Specifications Lbs. Pressure	Length
Closed	51	1 672"
Open	107	1 312"

Valv Lifters: Mushroom type with self locking adjusting screws.

Diamet r–.6855-.6860".

Clearance–Selective fit. Lifter should rotate in bore with slight drag. Service by installing oversize lifter.

Replacement Lifters–Furnished in Std. and the following oversizes marked as indicated "B" is .001", "D" is .002", and "K" is .005" O.S.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above

►*VALVE TIMING NOTE:* Specifications are with tappet clearance as follows. Intake 018", Exhaust 020"

Intake Valves - Open 2° BTDC Close 42° ALDC

Exhaust Valves - Open 42° BLDC Close 8° ATDC

Checking Valve Timing - Check timing marks on vibration damper to be sure they are correct when No 1 Piston is at TDC Adjust No 1 intake and exhaust valve clearance to 0175" Remove spark plugs and turn engine until No 1 intake has zero clearance then continue to turn engine until No 1 intake just starts to open Timing indicator should show 2°±2° BTDC Continue to turn engine Exhaust valve should be closed when indicator shows 8°±2° ATDC

ENGINE OILING SYSTEM

►*ENGINE OILING SYSTEM· See "Engine Lubrication" under OILING SYSTEM in Willys Special Data*

Crankcase Capacity - 4 qts (4 Cyl), 5 qts (6 Cyl , refill

Normal Oil Pressure: 35 lbs at 2000 RPM (4 Cyl), 1700 RPM (6 Cyl)

Pressure Regulator - In pump housing (4 Cyl), right side of cylinder block below valve chamber to rear of engine (6 Cyl)

Oil Pressure Indicator: Red telltale light in Instrument Cluster operated by Oil Pressure Switch Light comes on when Ignition Switch turned on and goes out when oil pressure reaches 6 lbs

Oil Pump: Rotor type on left side of engine (4 Cyl), gear type attached to rear intermediate main bearing in crankcase (6 Cyl)

Oil Pump Overhaul - *See "Oiling System" in Willys Special Data*

Oil Filter: Partial flow type ("Disposable" type used on some cars) *NOTE* - When replacing disposable type filter, tighten filter by hand until gasket contacts mounting flange then tighten one-half turn additional

Crankcase Ventilation: Standard Cars - Filter in oil filler cap and outlet tube from crankcase ventilator baffle on valve side cover

Positive Crankcase Ventilation Cars - Road draft tube replaced by hose to manifold with valve in line *See "Closed Crankcase Ventilation Systems" in Carburetion Section.*

ENGINE COOLING SYSTEM

►*COOLING SYSTEM FILLING CAUTION (FC 150 & FC-170)* These models have separate "surge tank" and cooling system should be checked and filled as follows Fill surge tank to the top replace cap run engine at medium speed for one minute remove cap and recheck coolant level add more coolant as necessary to bring level to top of tank *NOTE* - If system filled with engine cold recheck coolant level after engine run for one minute **after thermostat opens**

►*RADIATOR BYPASS VALVE CAUTION (FC-170)* This valve located on water pump can be closed for cold weather operation for more efficient heater operation but VALVE MUST BE OPEN IN WARM WEATHER FOR PROPER COOLING

►*FC-150 FAN PULLEY NOTE* Install fan pulleys on both water pump and fan shaft assemblies with offset to front of engine to eliminate interference with generator pulley Adjust fan belt to ¼-½" deflection with light thumb pressure by pulling shaft housing to right side of frame

Water Capacity: (FC-150) 10 qts (FC 170) 11 qts (Other 4 Cyl) 11 qts (Other 6 Cyl) 12 qts without heater Add 1 qt for heater (except FC 170 ½ qt)

Pressure Valve: 7 lb. (Jeep & Jeep Dispatcher), 7 lb. (Jeep Utility Exc 6 Cyl 4 x 4) 13 lb. (Jeep Utility 4 x 4) 9 lb. Forward Control (Exc FC-170 with Air Intake Modification Kit) 13 lb (Forward Control with Air Intake Modification Kit)

Thermostat: Harrison In water outlet elbow in cylinder head Opens at 163-168°F

Water Pump: Centrifugal packless ball bearing type *See "Cooling System" in Willys Special Data*

Temperature Gauge: Stewart-Warner Electric Constant Voltage type with gauge voltage regulator on back of instrument panel or fuel gauge

LUBRICATION

FLEETVAN AUTOMATIC TRANSMISSION LUBRICATION: Check fluid level every 1,000 miles, drain and refill every 10,000 miles. Use only Automatic Transmission Fluid Type "A", Suffix "A"

Checking Fluid Level - With engine and transmission at normal operating temperatures, and engine running, move gearshift lever through all positions Return selector lever to "N" (neutral). Remove dipstick and check fluid level, which should be on the "F" FULL mark Add oil, if needed, through dipstick tube.

Capacity - 8½ qts., drain and refill capacity.

See INDEXES on Pgs. 4 to 9 for complete CARBURETION, ELECTRICAL, MECHANICAL data.

►CHANGES, CAUTIONS, CORRECTIONS

►*BUICK CARBURETOR INSTALLATION CAUTION:* Make sure the tin-coated plate located between carburetor and intake manifold is installed with smaller holes toward front. If plate is installed backward, plate will extend ¼" at rear edge of carburetor.

►*1961 PONTIAC (AUTO. TRANS. CARS) STALLING & LEANNESS DURING WARM-UP CORRECTION & CARBURETOR PRODUCTION CHANGES:* As follows: **3124S,SA & 3125S,SA Carbs.** - Set choke 3 notches rich from index. On 3124S, 3125S Carbs., install accelerator pump link in inner hole and adjust pump stroke setting to 5/16". *NOTE - On 3124SA, 3125SA Carbs., vacuum piston has been revised and accelerator pump rod is installed in inner hole in production.* **3124SB & 3125SB Carbs.** - A new choke coil is installed on these carburetors in addition to changes made on 3124SA & 3125SA Carburetors.

►*1961 PONTIAC (3123S, 3124S, 3125S CARBS.) "BUMP" WHEN THROTTLE IS FULLY OPENED ABOVE 30 MPH (1 to 5 MILES AFTER COLD START) CORRECTION:* Install new secondary clusters, Pontiac Part No 535370 (choke side), Pontiac Part No. 535371 (pump side) These new clusters have enlarged auxiliary feed. *NOTE - On later 3123SA, 3124SA, 3125SA Carbs., the new clusters are installed in production. In addition, new secondary metering jets, Pontiac Part No. 7011193 (3123SA), 3742270 (3124SA & 3125SA) have been installed.*

DESCRIPTION: Four barrel downdraft type with automatic choke, similar in design to previous AFB carburetors with the following features

Idle Air System (Cadillac 3177S, 3178S; Chrysler 3084S; Chrysler, Dodge, Plymouth 2903S; Plymouth 2790S, 2791S; Pontiac 3123S, 3124S, 3125S): Throttle valves are completely closed at low idle speed and air is admitted through Idle Air System which consists of an air bypass passage (primary side only) through which air for closed throttle operation is taken from above throttle valves through a metered (non-adjustable) orifice and an adjustable orifice to each primary bore An Idle Speed Screw (single screw for both primary bores) controls adjustable orifice and all idle speed adjustments are made with this screw (throttle stopscrew not used) Throttle valves are completely closed at slow idle speed

Three Stage Step-Up Rod: (Chrysler 3108S, 3134S; Dodge and Plymouth 3103S, 3105S, 3106S, 3131S, 3133S, 3140S): Step-up rods in these carburetors have three step-up stages. Other AFB carburetors have two step-up stages

Idle Compensator Valve (Buick 3088S, 3089S; Cadillac 3177S, 3178S; Pontiac 3124S, 3125S): Assembly is mounted between main venturi on secondary side and consists of a valve, bi-metal strip, holder and mounting bracket Unit is not adjustable and must be replaced if faulty Purpose of compensator is to admit additional air under hot idling conditions and to prevent stalling With high air temperature in carburetor, the valve opens and allows additional air to be drawn into carburetor bores below throttle valves to offset enrichening effect of hot idle. *CAUTION - Idle compensator must be closed while adjusting idle speed.*

Cross-Over Type Automatic Choke (Chrysler, Dodge & Plymouth Carburetors Except 2790S & 2791S): This type automatic choke is a separate unit mounted in a well in intake manifold (at exhaust cross-over passage) and linked to choke valve lever by a connector rod Choke vacuum piston is located in a cylinder in carburetor air horn and linked directly to choke valve. *See "Carter Cross-Over Type Automatic Choke" in 1957 Annual Data or later Manual edition*

ADJUSTMENTS: *Make all adjustments as indicated below.*

►*CHRYSLER, DODGE & PLYMOUTH IDLE SETTING CAUTION:* When making idle speed and mixture adjustments, observe the following **1)** Turn headlights on to high beam to compensate for alternator load (Alternator charges battery at idle speed). **2)** On automatic transmission cars (except models with Ram Manifold), loosen carburetor throttle rod locknut in sliding link so transmission internal stop will not interfere with carburetor throttle lever When adjustments completed, move carburetor throttle rod to rear against its stop and tighten locknut

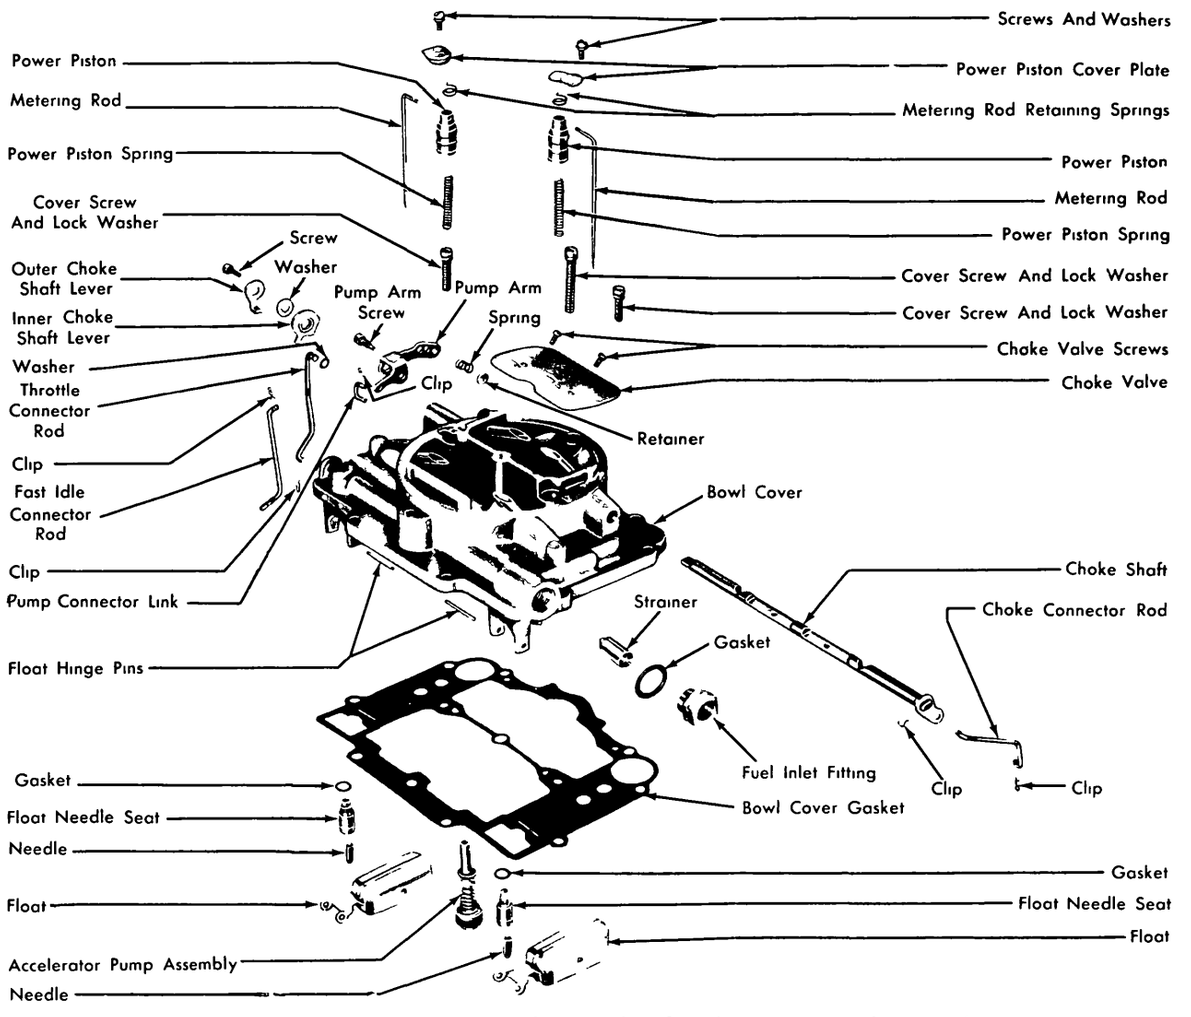
►*IDLE SPEED ADJUSTMENT NOTE (CARS WITH IDLE AIR BY-PASS SYSTEM):* These carburetors have a single Idle Air By-pass Screw which is used for all idle speed adjustments (there is no throttle stopscrew). Turning the idle air adjustment screw outward increases engine speed but also leans out the mixture supplied to engine which must be compensated for by the adjustment of idle mixture screws.

Idle Mixture & Speed Adjustment (Cars with On Carburetor): *CAUTION - On cars with Idl Comp nsator, th the compensator valve must be held clos d whil adjusting idle speed (use pencil or oth r instrum nt to hold compensator down on its seat). On cars with Idle Air System, adjusting the air adjustm nt scr w (t adjust engine speed) will chang the idle mixtur setting and this should always b r ch ck d aft r an engine speed adjustment has b n mad .* If initial adjustment required to allow engine to be warmed up, turn both idle mixture adjusting screws in until lightly seated, then back screws out the correct number of turns shown in table below Run the engine until it reaches normal operating temperature with choke valve wide open and fast idle inoperative (engine idling at hot or slow idle speed). Then proceed as follows: Connect vacuum gauge and tachometer. Adjust engine idle speed to correct figure shown in table below with transmission selector lever in proper rangeas indicated. Make this adjustment by turning throttle stopscrew (or Idle Air Bypass Adjusting Screw on carburetors with this adjustment). Adjust each idle mixture adjusting screw in or out for smooth idling and highest vacuum reading and engine RPM. *(NOTE* - On Buick, set each screw midway between points where engine runs irregularly due to lean and rich mixture). Recheck and if necessary reset idle speed, then recheck idle mixture setting. *CAUTION* - On cars with Idle Air Bypass Adjusting screw, always recheck idle mixture adjustment **after** changing setting of idle air adjusting screw. On cars with automatic transmission, check and adjust Throttle Linkage. *See Throttl Linkage Adjustment under CARBURETOR on each car mod l page.*

Idle Mixture & Speed Adjustm nt (Chrysl r, D Soto, Dodge, Dodge Dart, Plymouth with Tw Carbur t rs): *NOTE - Th s carburetors hav an Idl Air Bypass Screw for idle speed adjustment* Before adjusting carburetors, check and adjust carburetor interconnect-

CONTINUED ON NEXT PAGE

1961 CARTER AFB 4-BARREL CARBURETORS (C nt.)



ing linkage (s *"Throttle Linkage Adjustment" under CARBURETOR on car model pages),* and ignition timing *NOTE - If pr liminary adjustment required to enabl ngine to b started for warm-up, set all idle mixtur scr ws 1-2 turns open from a lightly seated position and s t idl air bypass screws (1 on each carbur t r) 1 turn p n.* Connect a tachometer, then operate engine until it reaches normal operating temperature Turn engine off and disconnect each carburetor throttle rod at bellcrank on manifold. Turn all adjusting screws (mixture and bypass) in finger tight, then open idle air bypass screw (1 on each carburetor) 1 full turn. Open each idle mixture screw (2 on each carburetor) ¾ turn Start the engine and turn idle mixture screws on left carburetor 1/8 turn at a time until smoothest idle is obtained. Repeat this procedure on right hand carburetor, keeping mixture screws with 1/8 turn of each other With transmission in "N" (Neutral), air conditioner compressor ON (if so equipped), adjust idle speed to 750 RPM by adjusting idle air bypass screw on each carburetor equally Repeat the idle mixture adjustment and idle speed adjustment until a smooth idle is obtained at 750 RPM Connect each carburetor throttle rod at bellcrank

Idl Mixture Screw Setting

Car & Carb.	Idle Screw Opening
Buick 3088S, 3089S	¾ turns
Cadillac 3177S, 3178S	1-2½ turns
Chevrolet 3012S, 3221S	½-2 turns

CARTER AFB 4-BARREL CARBURETOR AIR HORN & FLOAT ASSEMBLY (TYPICAL)

① - Throttle Stopscrew or Idle Air Adjusting Screw.
② - Air Conditioner turned OFF.
③ - Air Conditioner turned ON.
④ - Transmission in "N" (Neutral) or "P" (Park).
⑤ - Transmission in "D" (Drive).
⑥ - Transmission in "N" (Neutral).
⑦ - 550 RPM for Air Cond. Cars. Transmission in "D" (Drive) or "R" (Reverse) and Air Conditioning turned on.
⑧ - With Headlights turned ON.
⑨ - 600 RPM on engines with "runner" type intake manifold (carburetor at front and rear)

►*1961 CADILLAC IDLE SPEED ADJUSTMENT CAUTION:* Due to vacuum released parking brake, it is impossible to set the brake with transmission selector lever in "DR" position unless vacuum release is disconnected Disconnect diaphragm at neutral safety switch and tape switch opening to prevent any air leak

►*1961 CHRYSLER, DODGE & PLYMOUTH IDLE SPEED ADJUSTMENT CAUTION See "Idle Setting Caution" above*

Anti-Stall Dashpot (Throttle Return Check): Dashpot is a separate unit mounted on carburetor or elsewhere in throttle linkage *For adjustment, see "Throttle Linkage Adjustment" under CARBURETOR on car model pages*

Idle Speed-Up Control (Cadillac Air Conditioned Cars): This unit increases engine idling speed with air conditioning turned on and transmission selector lever in Neutral. For adjustment, see *CARBURETOR on Cadillac car model page.*

Met ring R ds: No adjustment required. Metering rods not used on secondary side.

CONTINUED ON NEXT PAGE

1961 CARTER AFB 4-BARREL CARBURETORS (C nt.)

Float Setting: *(NOTE - Before adjusting float level and float drop, floats must be aligned as follows).* Align floats by sighting down side of float to determine if side of float is parallel to outer edge of horn casting. To adjust, bend float lever by applying pressure to end of float shell with finger while supporting float lever with thumb (CAUTION - Apply only enough pressure to bend float lever). After aligning float, remove as much clearance as possible between arms of float lever and support lugs on air horn by bending both arms of the lever. Arms should be parallel to inner surfaces of support lugs and float must operate freely without excess clearance on hinge pin.

►*1961 CHRYSLER, DODGE, PLYMOUTH FLOAT SETTING CAUTION: Fuel inlet needles on these carburetors have a "Viton" (resilient synthetic rubber) tip. When bending float lever to adjust height, DO NOT allow float lever to contact inlet needle as tip can be compressed enough to cause a false setting. After being compressed, needle tip is very slow to recover its original shape.*

Fl at Level - Both floats are set to the same height. With air horn inverted, bowl cover gasket in place and needle seated, measure distance from top of float at outer end to air horn gasket with proper gauge (see table below). Adjust by bending float arm.

Float Level Setting

Car & Carb.	℄Height	Gauge No.
Buick 3088S, 3089S	7/32"	T109-106
Cadillac 3177S, 3178S	5/16"	T109-107
Chevrolet 3012S, 3221S, 3270S	7/32"	T109-106
Chrysler 3108S, 3134S	7/32"	T109-106
Chrysler 2903S, 3084S	9/32"	T109-126
Dodge (Exc. 2903S)	7/32"	T109-106
Dodge 2903S	9/32"	T109-126
Plymouth (Exc.2790S, 2903S)	7/32"	T109-106
Plymouth 2790S, 2903S	9/32"	T109-126
Pontiac 3123S, SA	9/32"	T109-126
Pontiac 3124S, SA, SB; 3125S,SA,SB	21/64"	T109-294

℄ - Plus or minus 1/64".

Fl at Drop - With bowl cover held in upright position so that floats hang down at lower end of travel, measure from outer (free) end of float to float bowl gasket. This should be 23/32" plus or minus 1/16" for all models.

Acc lerating Pump Stroke: This is a pump stroke adjustment and not a seasonal setting. On all models with provision for seasonal setting, make certain that connector rod engaged in correct hole in pump arm as listed below. Back out throttle stopscrew so that throttle valves fully seated. Use scale to measure from top surface of bowl cover to top of pump plunger stem. If this distance not correct as shown in table below, adjust by bending connector rod at lower angle using T109-213 bending tool.

Pump Str k S tting

Car & Carb.	Plung r H ight	C nn ct r R d
Buick (All Carbs.)	7/16"	Center
Cadillac (All Carbs.)	15/32"	Inner
Chevrolet (All Carbs.)	33/64"	Non-Adj.

Pontiac 3123S, 24S, 25S	31/64"	℄Center
Pontiac 3123SA, 3124SA, SB	5/16"	Inner
Pontiac 3125SA, SB	5/16"	Inner

℄ - See "Changes, Cautions, Corrections" above.

Automatic Choke (Cross-Over Type): This choke assembly is mounted in well in manifold casting. To adjust with unit off engine, loosen mounting post locknut and turn mounting post with screwdriver until index mark on disc positioned opposite correct mark on scale (see table below for proper setting). When choke is installed on engine, lift cover disc and open and close choke manually to make sure connector rod clears sides of hole in housing cover. If rod does not clear, replace unit (bending the rod will affect choke calibration).

Automatic Choke (Integral Type): *Adjust AFTER Choke Piston Lever Adjustment or Choke Countershaft Adjustment has been completed.* Settings are shown in table below. Adjust by loosening choke cover screws and rotating cover and thermostatic coil assembly.

Automatic Choke Setting

Car & Carb.	Choke Setting
Buick 3088S, 3089S	Centered
Cadillac 3177S, 3178S	1 Point Rich
Chevrolet 3012S, 3221S	Centered

Pontiac 3124SB, 3125SB	1 Point Rich

℄ - "Cross-Over" type Automatic Choke.
② - See "Changes, Cautions, Corrections" above.

Choke Piston Linkage Adjustment: Remove choke cover and coil assembly, gasket, and baffle plate for access to choke piston.

Buick - Bend a .026" wire gauge (Tool T109-189) at a 90° angle approximately 1/8" from end, then open choke valve and insert wire gauge so that bent portion is between top of slot in choke piston cylinder and bottom of slot in piston. Hold wire gauge in position and close choke valve by pressing on piston lever in choke housing until resistance is felt. There should be 3/32" (Gauge T109-125) between top of choke valve and air horn. To adjust, bend choke connector rod.

Cadillac - With choke valve closed choke piston should be flush with top of piston housing. To adjust, bend choke connector rod. *NOTE - Choke valve should be held closed by applying pressure to piston l ver in piston housing.*

Chevrolet (Exc. 3270S) - Close choke valve tightly and hold in this position by pressing on choke piston lever in choke housing. Clearance between choke piston lever and stop in housing should be .010". To adjust, bend choke connector rod.

Chevrolet 3270S - Bend a .026" wire gauge (Tool T-109-189) at a 90° angle approximately 1/8" from end, then open choke valve and insert wire gauge so that bent portion is between top of slot in choke piston cylinder and bottom of slot in piston. Hold wire gauge in position and close choke valve by pressing on piston lever in choke housing until resistance is felt. There should be 7/32" (Gauge T109-106) between top of choke valve and air horn. To adjust, bend choke connector rod.

Chrysler, Dodge & Plymouth 2903S, 3084S - Use a .026" wire gauge (T109-189) with 1/8" section at end bent at 90° angle. Set throttle valve ¼ open, open choke valve wide. Insert wire gauge into choke piston slot so that hooked end enters slot in cylinder wall. Close choke valve by pressing on choke lever until wire is gripped between piston and cylinder with linkage hanging free. Clearance between choke valve and upper edge of air horn should be 1/8". Adjust by bending choke connector rod at angle.

Pontiac - Open throttle so fast idle cam does not contact adjusting screw, then close valve by pressing piston lever in choke housing. Top of choke piston should be flush with top of piston cylinder when choke valve is closed. To adjust, bend choke connector rod.

Fast Idle Linkage: This adjustment must be made before checking and adjusting Fast Idle and Unloader. Adjust each model as follows:

Buick 3088S, 3089S; Chrysl r 3108S, 3134S; D dg & Plymouth 2968S, 3105S, 3106S, 3133S, 3140S, 3152S - With choke valve closed, index mark on fast idle cam should align with adjusting screw. To adjust, bend fast idle connector rod.

Cadillac 3177S, 3178S; Dodg & Plymouth 3103S, 3131S; Plymouth 2791S - With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever, align center of fast idle screw with index mark on cam. To adjust, bend choke fast idle connector rod.

Chevrolet 3012S, 3221S - With slight clearance between lug on fast idle cam and stop on casting, and inner choke shaft lever contacting lug on outer choke shaft lever, align index mark on cam with adjusting screw. To adjust, bend fast idle connector rod.

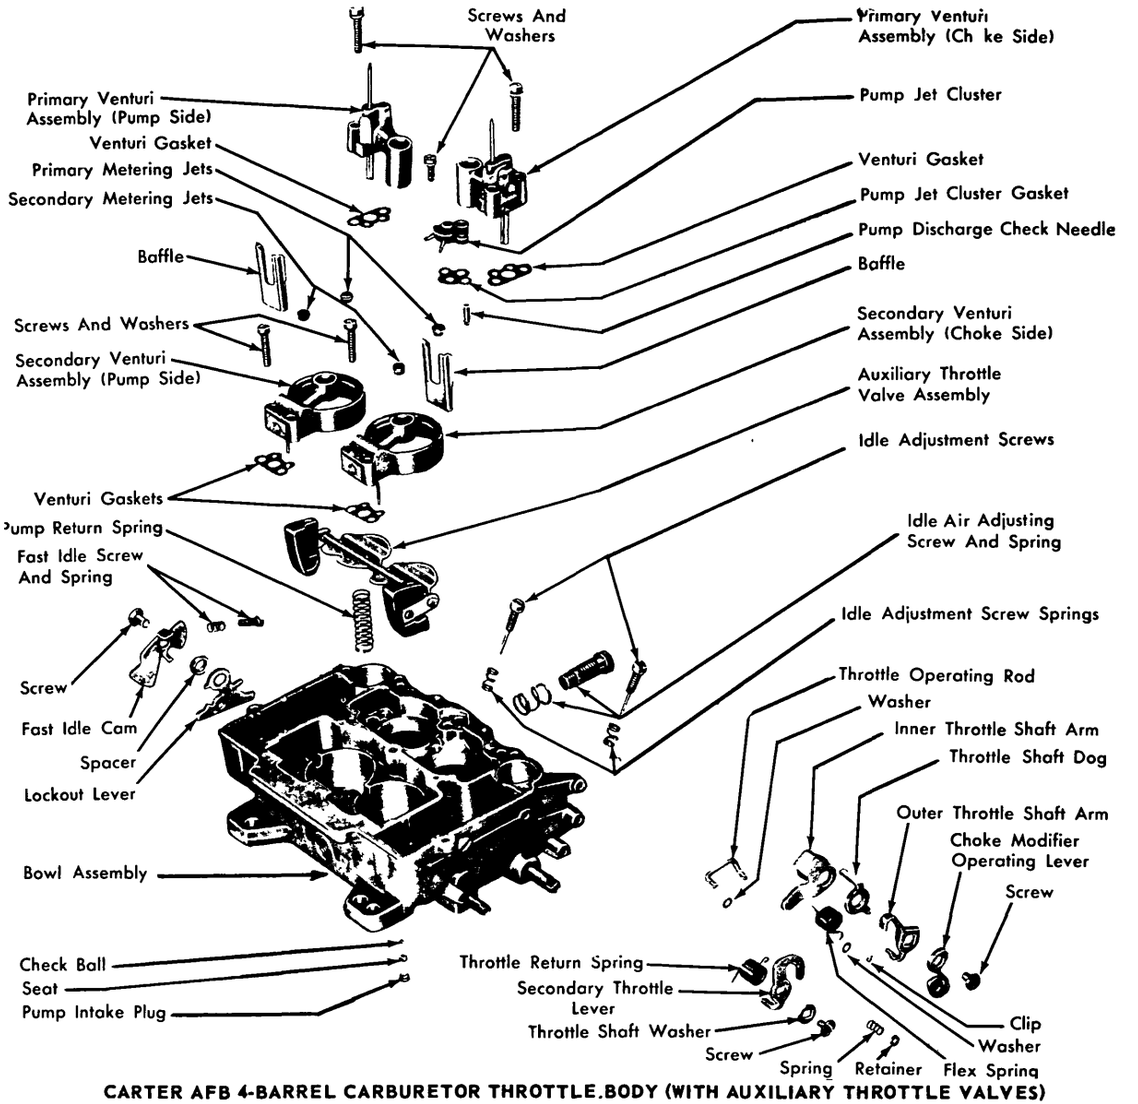
Chevrolet 3270S - With choke valve closed, index mark on fast idle cam should align with adjusting screw. To adjust, bend fast idle connector rod.

Chrysler, Dodge & Plymouth 2903S; Pontiac 3123S, 3124S, 3125S - With choke valve tightly closed, trip lever and cam arm in alignment, align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

CONTINUED ON NEXT PAGE

1961 CARTER AFB 4-BARREL CARBURETORS (C nt.)

Fast Idl Setting: *This adjustment can be made with the carburetor on the bench (Off Engine) but setting should b check d aft r th carburetor installed (On Engine) as f ll ws:*



Fast Idle Adjustm nt (Off Engine) - Open throttle and close choke valve tightly (this will allow fast idle cam to assume fast idle position). With choke valve closed and index mark on fast idle cam in alignment with fast idle adjusting screw, turn screw in or out until throttle valve opening or clearance between lower edge of valve and carburetor wall is correct as shown in table below.

Fast Idle Setting (Off Engine)

Car & Carb.	Valve Opening	Checking Gauge
Buick 3088S, 3089S	.030"	T109-29
Cadillac 3177S, 3178S	.023"	T109-189
Chevrolet (All Carbs.)	.025"	T109-125
Chrysler 3108S, 3134S	.020"	T109-29
Chrysler 2903S, 3084S	.010"	T109-200
Dodge (Exc. 2903S)	.020"	T109-29
Dodge 2903S	.010"	T109-200
Plymouth (Exc. 2903S, 2791S)	.020"	T109-29
Plymouth 2903S	.010"	T109-200
Plymouth 2791S	.012"	T109-200
Pontiac (All Carbs.)	.026"	T109-189

Fast Idl Adjustm nt (On Engine - Except Chrysler, Dodg , Plym uth with Ram Induction) - With engine at normal operating temperature, rotate fast idle cam so that fast idle adjusting screw is on high step of cam and in alignment with index mark (Except Buick). On Buick, place fast idle adjusting screw on lowest (last) step of fast idle cam. On all models, operate engine and adjust fast idle screw for correct engine speed as listed below.

Fast Idl Adjustment (On Engine - Chrysler, Dodge, Plymouth with Ram Induction) - *NOTE - Make fast idle adjustment on each carburetor individually.* With engine at normal operating temperature and idling at 750 RPM, transmission in "N" (Neutral) with air conditioner compressor "ON" (if so equipped). Turn compressor "OFF" (if so equipped) and remove both air cleaners. Disconnect throttle rods at bellcrank and open throttle valves of left hand carburetor far enough to allow positioning of fast idle cam to cam index mark. *NOTE - Right hand carburetor should remain at curb idle position.* Adjust fast idle screw to obtain the correct idle speed indicated in table below. *NOTE - The indicated fast idle speed is for ONE carburetor with the other carburetor on slow idle speed. There is no specification for engine RPM with both carburetors simultaneously set at fast idl position.* Place left hand carburetor in slow idle position (off fast idle), then repeat the above adjusting procedure on right hand carburetor. *NOTE - It is important that both carburetors have identical idle speeds.*

CARTER AFB 4-BARREL CARBURETOR THROTTLE BODY (WITH AUXILIARY THROTTLE VALVES)

Fast Idle Setting (On Engine)

Car Model	Engine RPM
Buick	②650
Cadillac	1700-1750
Chevrolet (Exc. 3270S)	1600-1800
Chevrolet (3270S)	1700
Chrysler (Exc. Ram Induction)	1800
Chrysler (Ram Induction)	①1400
Dodge (Exc. Ram Induction)	③1800
Dodge (Ram Induction)	①1500
Plymouth (Exc. Ram Induction)	③1800
Plymouth (Ram Induction)	①1500
Pontiac	2200

① - Fast idle speed with one carburetor on fast idle and the other on slow idle. There is no specification for engine RPM with both carburetors simultaneously set at fast idle position.

② - With fast idle screw on lowest (last) step of fast idle cam.

③ - For all models except models with 361" engine and synchro-mesh transmission or 3140S carburetor.

Unloader: After fast idle linkage adjusted (above), rotate primary throttle valves to wide open position and check choke valve opening or clearance between upper edge of valve and air horn wall using gauge listed in table below. If clearance not correct, adjust by bending un-

CONTINUED ON NEXT PAGE

1961 CARTER AFB 4-BARREL CARBURETORS (C nt.)

loader lip on primary throttle lever using bending tool T109-214.

►*PONTIAC NOTE:* Manufacturer recommends that throttle valves be opened by depressing accelerator pedal (to simulate actual driving conditions and insure unloader functioning properly in service).

Car Model	Unloader Setting Choke Opening	Checking Gauge
Buick	7/32"	T109-106
Cadillac	5/16"	T109-107
Chevrolet	1/4"	T109-31
Chrysler	1/4"	T109-31
Dodge	1/4"	T109-31
Plymouth	1/4"	T109-31
Pontiac	5/32"	T109-154

Auxiliary Throttle Valves: Velocity type valves (counterweighted free valves without linkage). No adjustment required. Used on all models except as indicated in following note. *NOTE - Auxiliary throttle valves used on Chrysler, Dodge & Plymouth 2903S & 3084S carburetors. Not used on other Chrysler, Dodge & Plymouth carburetors.*

Secondary Throttle Lever Adjustment: This adjustment required to insure correct action of primary and secondary throttle valves. Check and adjust each model as follows:

Chevrolet - Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. *NOTE - Secondary throttle valves will be a few degrees from wide open when primary valves are wide open.* Upper edge of secondary valve should just contact auxiliary valves when both valves are wide open and the wide open stop lug on secondary throttle lever should contact boss on flange to prevent further secondary valve movement. Adjust by bending stop lug. Check and adjust throttle lever closing shoes (see below).

Buick, Cadillac, Chrysler, Dodge, Plymouth & Pontiac - Block choke valves wide open. Open throttle valves until clearance between lower edge of valve and throttle bore on side opposite idle port is correct as shown in table below. Secondary valves should just start to open at this point. Adjust by bending secondary throttle operating rod using Tool T109-213. Open primary valves fully. On Buick, Cadillac & Pontiac, secondary valves should be a few degrees from wide open position with primary throttle valves wide open. On all other carburetors, both primary and secondary valves should be vertical in wide open position. Then check and adjust throttle lever closing shoes (below).

Car & Carb.	Secondary Throttle Lever Setting Primary Throttle Opening
Buick (All)	23/64"
Cadillac (All)	23/64"
Chrysler (Exc. 2903S, 3084S)	3/8"
Chrysler 2903S, 3084S	29/64"
Dodge (Exc. 2903S)	3/8"
Dodge 2903S	29/64"
Plymouth (Exc. 2903S, 2790S, 2791S)	3/8"
Plymouth 2903S	29/64"
Plymouth 2790S, 2791S	23/64"
Pontiac (All)	7/16"

Secondary Throttle Lockout Adjustment: Open throttle valves slightly to clear fast idle cam, open and close choke valve manually. Lockout tang on secondary throttle lever should freely engage in notch of lockout dog. Adjust by bending tang on secondary throttle lever. On some carburetors, additional adjustment required as follows:

Cadillac 3177S, 3178S; Plymouth 2791S - Hold lockout dog tight against stop on flange. With secondary valves partially open, clearance between secondary throttle lever and lockout arm should be .026" (Cadillac); .020" (Plymouth). Use gauge T109-29. To adjust, bend arm at slot on lockout dog. *NOTE - Fast idle cam may be removed to make this adjustment.*

Primary & Secondary Throttle Lever Closing Shoe Adjustment: With primary and secondary throttle valves closed, check clearance between positive closing shoes on throttle levers using Gauge T109-29 (.020"). Clearance at closest point should be .010-.030". Adjust by bending shoe on secondary lever.

OVERHAUL: *See 1957 Annual Data, Page 229, or later Manual editions.*

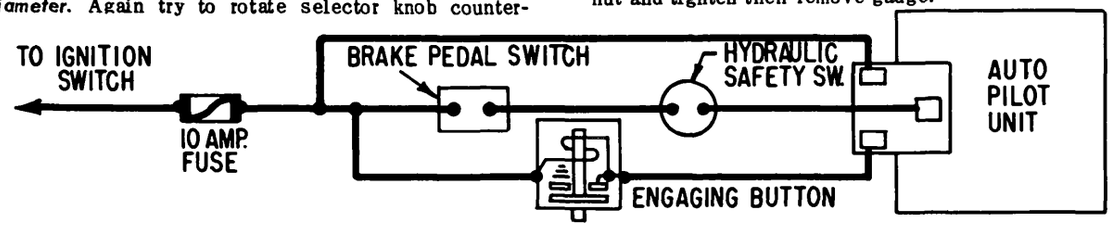
SERVICE PARTS: Gasket Sets - Carter No. 293A (3123S, SA, 3124S,SA,SB, 3125S,SA,SB;) No. 319 (2790S); No. 320 (2791S); No. 323A (3012S, 3221S, 3270S); No. 337 (2903S); No. 342 (3105S, 3106S, 3140S); No. 343 3103S, 3131S); No. 344 (3108S, 3134S, 3152S, 3133S, 2968S); No. 345 (3177S, 3178S); No. 358 (3088S, 3089S).

Re-Carburetion Kit - Carter No. 5040N (3123S, 3124S, 3125S); No. 5041 (3088S); No. 5042 (3089S); No. 5030 (3177S, 3178S).

Zip-Kit - Carter No. 900-62A (3012S); No. 900-101 (2968S); No. 900-120 (3177S, 3178S); No. 900-125 (3088S, 3089S).

1961 CHRYSLER, IMPERIAL, DODGE AUTO-PILOT SPEED CONTROL

Chrysler & Imperial (1961)
Dodge Polara (1961)



DESCRIPTION: Same design as previous units having the automatic lock-in feature. With this feature, the automatic speed control will be maintained until pressure is exerted on brake pedal or by pushing in knob in center of speed selector, however, depressing the brake pedal will not cancel the automatic lock-in feature. To cancel the lock-in feature, it will be necessary to push in knob on speed selector or turn off engine ignition.

OPERATION: *See 1958 Annual Data, Page 300, or later Manual edition.*

TROUBLE SHOOTING & DIAGNOSIS: *See 1958 Annual Data, Page 300, or later Manual edition.*

ADJUSTMENTS: Control Cable Adjustment - Turn selector knob counterclockwise as far as it will go without forcing, then hold dust shield so that it will not rotate when unscrewing clamp nut. Let nut slide down control cable. Remove clamp nut and pull control cable out of dust shield until ferrule on end of cable is free from bottom of dust shield. *NOTE - If ferrule is tight in dust shield, carefully pry the four fingers apart until ferrule slides out freely. If necessary remove dust shield from unit to pry fingers apart. If shield is removed, hold hex fitting at top of shield so it cannot turn while unscrewing shield from unit.* Reinsert ferrule in dust shield and push in lightly on control cable until it stops. *CAUTION - Do not force cable beyond this position. Fingers of dust shield must clamp ferrule on its largest diameter.* Again try to rotate selector knob counterclockwise to make sure it is at low setting, then tighten clamp nut on bottom of dust shield securely.

Linkage Adjustment: With carburetor at slow (hot) idle position, remove nut from link ball joint and pull link ball joint from armature lever. Insert sleeve gauge, Tool C-3844 over gauge bolt and hold armature lever securely against sleeve gauge. Adjust link ball joint until it will freely enter hole in armature lever. Replace nut and tighten then remove gauge.

CHRYSLER, IMPERIAL & DODGE AUTO-PILOT WIRING DIAGRAM

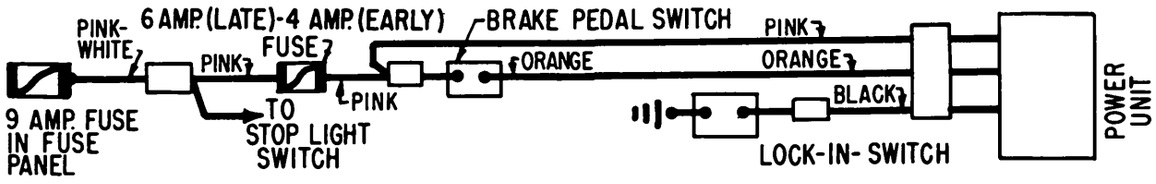
1961 CRUISE CONTROL & AUTOMATIC SPEED CONTROL

Cadillac (1961)
Chevrolet (1961)
Linc ln (1961)
Mercury (1961)

►CHANGES, CAUTIONS, CORRECTIONS

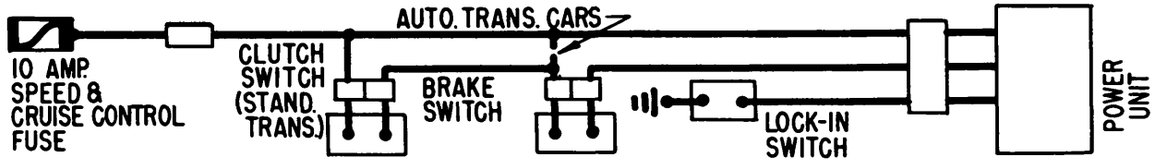
►*1961 CADILLAC CRUISE CONTROL FUSE PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* A 6 amp. fuse is used in production beginning with Engine No. 041719. When replacing the early 4 amp. fuse, it is recommended that the 6 amp. fuse be installed.

DESCRIPTION: Electrically controlled speed warning devise and automatic speed control of same design used on previous models.



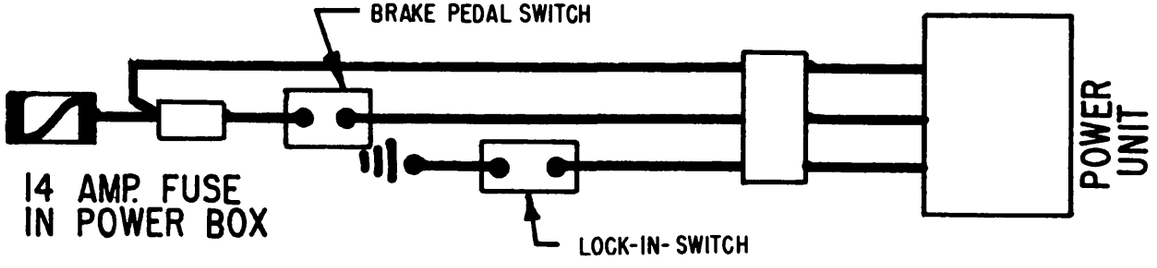
OPERATION: *Same as for 1959 Cadillac Cruise Control. See 1959 Annual Data, Page 259, or later Manual edition and note the following.*

Chevrolet (Synchro-mesh Trans. Cars): A clutch switch is used in addition to brake switch to disengage unit from automatic control.



TROUBLE SHOOTING & DIAGNOSIS: *Same as for 1959 Cadillac Cruise Control. See 1959 Annual Data, Page 259, or later Manual edition.*

ADJUSTMENTS: Accelerator Linkage (Cadillac) - With transmission throttle control rod properly adjusted (see "Carburetor" on Car Model page), start engine and operate at slow idle speed with transmission selector lever in "P" (Park) or "N" (Neutral). Remove cotter pin securing accelerator linkage trunnion on locking arm plate, remove washers, and separate linkage from locking arm. Insert Locking Arm Gauge, J-7652, over stop stud and hold locking arm plate securely against gauge. Turn trunnion on accelerator linkage until it aligns with and enters hole in locking arm plate freely, then install washers on trunnion and connect trunnion to locking arm plate. Install cotter pin and remove gauge.



Chevrolet - Remove cotter pin from swivel and remove swivel from regulator lever, then start engine and run at slow idle speed. Insert gauge pin *(NOTE - This is a .0625" pin furnished with accessory package)* over gauge bolt (located on housing adjacent to regulator lever) and hold regulator lever securely against gauge pin. Adjust swivel on long regulator rod until it will assemble to regulator lever. Replace swivel and cotter pin, then remove gauge pin.

CADILLAC CRUISE CONTROL WIRING DIAGRAM

CHEVROLET CRUISE CONTROL WIRING DIAGRAM

LINCOLN & MERCURY SPEED CONTROL WIRING DIAGRAM

Lincoln & Mercury - Remove cotter pin from accelerator linkage and pull linkage from exterior arm, then start and run engine until it operates at slow idle. Insert gauge pin over gauge bolt and hold exterior arm securely against gauge pin. *NOTE - Gauge pin is made from a 2" length of 5/16" copper tubing, and is supplied in Speed Control Kits.* Adjust swivel on throttle linkage until linkage will assemble to exterior arm. Replace linkage and cotter pin and remove gauge.

Control Cable: Cadillac, Chevrolet, Lincoln & Mercury - Turn selector knob counterclockwise as far as it will go without forcing, hold dust shield so it will not rotate and unscrew clamp nut. Let clamp nut slide down cable. *NOTE - This nut holds control cable in bottom of dust shield.* Pull control cable out of dust shield until ferrule at end of cable is free from bottom of dust shield. *NOTE - If ferrule is tight in dust shield, carefully pry the four fingers apart until ferrule slides out freely. In some cases it may be necessary to unscrew the dust shield from unit in order to pry the fingers apart. Hold hex fitting at top of dust shield so it cannot turn when unscrewing dust shield.* Reinsert ferrule in dust shield and push in lightly on control cable until it stops. *CAUTION* - Do not force cable beyond this point. Fingers of dust shield must clamp ferrule on its largest diameter. Again try to rotate selector knob counterclockwise only, in order to make sure it is at low setting (this will position control cable to dust shield). Tighten clamp nut on bottom of dust shield securely.

③ - With closed crankcase ventilator

DESCRIPTION: 4-barrel downdraft types of same general design used on previous models having the following special features In addition, some of the carburetors have a connection for closed crankcase ventilator tube

Auxiliary Throttle Valves: Velocity type valve located directly over secondary throttle valves in main body Auxiliary throttle valves action is controlled by counterweight on shaft and valve are not operated by throttle linkage On Chevrolet 3059S, 3060S, 3061S, auxiliary throttle valves are locked out when choke is operating and this lockout must be adjusted *See Adjustments below*

ADJUSTMENTS: *Make all adjustments in sequence indicated below*

Idling Adjustment: If necessary, make preliminary idle mixture and idle speed adjustments to enable engine to be warmed up Run engine until it reaches normal operating temperature with choke valve wide open and fast idle inoperative Then make adjustments as follows

Chevrolet (Single Carburetor) - Connect vacuum gauge and tachometer Set throttle stopscrew for correct idling speed Adjust each idle mixture screw for highest RPM and vacuum reading Reset idle speed

Chevrolet (Two Carburetors) - Set throttle stopscrew on **rear** carburetor for correct idle speed *(NOTE* - Throttle valves on **front** carburetor should be closed at idle speed) Adjust all idle mixture screws individually (rear carburetor first, front carburetor last) for best performance and engine idle "feel" Reset throttle stopscrew for correct engine RPM, readjust idle mixture screws, finally reset engine idle speed

Stud bak r - Set throttle stopscrew for correct idle speed Adjust both idle mixture screws equally for smooth idling performance, then turn screws out (richer mixture) until engine RPM shows a slight drop Reset engine idle speed

Idle Mixture Setting

Car & Carb.	Idle Screw Opening
Chevrolet 3059S, 3060S, 3061S	½-2 turns
Chevrolet 2613S, 2614S, 2626S, 2627S	¼-1¼ turns
Chevrolet 3181S, 3182S	¼ 1¼ turns
Studebaker 2829S, 2830S	½-1½ turns
Studebaker 3165S, 3166S	¼-1½ turns

Idle Speed Setting

Car Model	Engine RPM S.M. Trans.	Auto. Trans.
Chev Pass Car	475	① 450
Corvette (1 Carb)	475	① 450
Corvette (2 Carbs) ③	475	① 450
Corvette (2 Carbs,) ⑨	600	① 600
Studebaker	550-600	② 550-600

① - Transmission selector lever in "D" (Drive)
② - Transmission selector lever in "N" (Neutral)
③ - With hydraulic lifters and standard camshaft
⑨ - With mechanical lifters and special camshaft

Throttle Return Check (Dashpot) Adjustment: *Used with Automatic Transmission See "Throttle Linkage" under CARBURETOR on each car model page*

Accelerating Pump Stroke: *This is a linkage adjustment and not a seasonal change recommendation, and is dependent on operating conditions* Remove dust cover, place connector link in hole indicated in table below

Car & Carb.	Initial Stroke Setting
Chevrolet 2613S, 2614S, 2626S, 2627S	Inner Hole
Chevrolet 3059S, 3060S, 3061S	Outer Hole
Chevrolet 3181S, 3182S	Inner Hole
Studebaker (All)	Outer Hole

Pump Stroke Adjustment - Back off throttle stopscrew so that primary throttle valves are fully seated Hold a straightedge across dust cover boss at pump arm Flat on top of arm should be parallel with straightedge Adjust by bending pump connector link at lower angle

Metering Rods (Primary Side): No gauge required for this adjustment and no metering rods are used on secondary side With dust cover removed and primary throttle valves fully seated (as for Pump Stroke Adjustment), loosen setscrew in metering rod arm on pump countershaft just enough so that arm has a slight bind on shaft, then lift arm slightly and depress metering rod link until metering rods just bottom in bowl casting Position metering rod arm so that it just contacts link and tighten arm setscrew Adjust Atmospheric Idle Vent (below)

Float S tting: *CAUTION - Primary and secondary floats must be checked and adjusted separat ly and both Float L v l and Float Drop must b ch cked for each ass mbly*

Fl at L vel - Check and adjust as follows Remove bowl cover gasket (take out float hinge pins, remove float assemblies and intake needles attached, remove gasket, reinstall floats). Invert bowl cover. Install correct gauge for each float assembly (see table below) on bowl cover under center of floats with notched ends of gauge fitted tightly against sides of bowl cover casting. Both floats should just clear horizontal section of gauge (adjust by bending float arms as required) and each float should barely touch vertical uprights on gauge (bend arms sideways for this clearance). This sideways adjustment is extremely important to prevent floats hanging up on sides of bowl casting.

Float Level Setting

Primary Fl ats

Car & Carb.	H ight	Gaug N .
Chevrolet 2613S,14S,26S,27S	1/8"	T109-232
Chevrolet 3059S,60S,61S	5/32"	T109-236
Chevrolet 3181S,82S	1/8"	T109-232
Studebaker (All)	3/16"	T109-222

Secondary Fl ats

Car & Carb.	H ight	Gaug N .
Chevrolet 2613S,14S,26S,27S	1/4"	T109-223
Chevrolet 3059S,60S,61S	9/32"	T109-284
Chevrolet 3181S,82S	1/4"	T109-223
Studebaker (All)	3/16"	T109-222

Float Drop: Hold bowl cover assembly upright so floats hang down freely Use a scale to measure distance from machined surface of bowl cover (gasket removed) to bottom of float at free end (Chevrolet 3059S, 3060S, 3061S), to top of floats at center (Others) If distance not correct (see table below), adjust by bending stop tabs on float bracket

Float Drop Setting

Car & Carb.	Pri. Fl at	Sec. Fl at
Chevrolet 2613S,14S,26S,27S	5/8"	3/4"
Chevrolet 3059S,60S,61S	① 2"	① 2"
Chevrolet 3181S, 3182S	5/8"	3/4"
Studebaker (All)	11/16"	11/16"

① - See "Float Drop" above

Bowl Vapor Vent (Atmospheric Idl V nt) Adjustment (Exc. Studebaker): With dust cover and gasket installed, back out throttle lever stopscrew so that primary throttle valves are fully closed Check clearance between lower edge of vapor vent valve and dust cover Vent clearance should be 1/16" (2613S 2614S, 2626S, 2627S, 3181S,3182S), 3/32" (3059S, 3060S, 3061S) Adjust by removing dust cover and bending vapor vent valve

Automatic Choke· See table below for settings Adjust by loosening choke cover screws and rotating cover and coil assembly, then adjust connector rod

Automatic Ch k Setting

Car & Carb.	Ch k Setting
Chevrolet (All)	Centered
Studebaker (All)	1 Point Lean

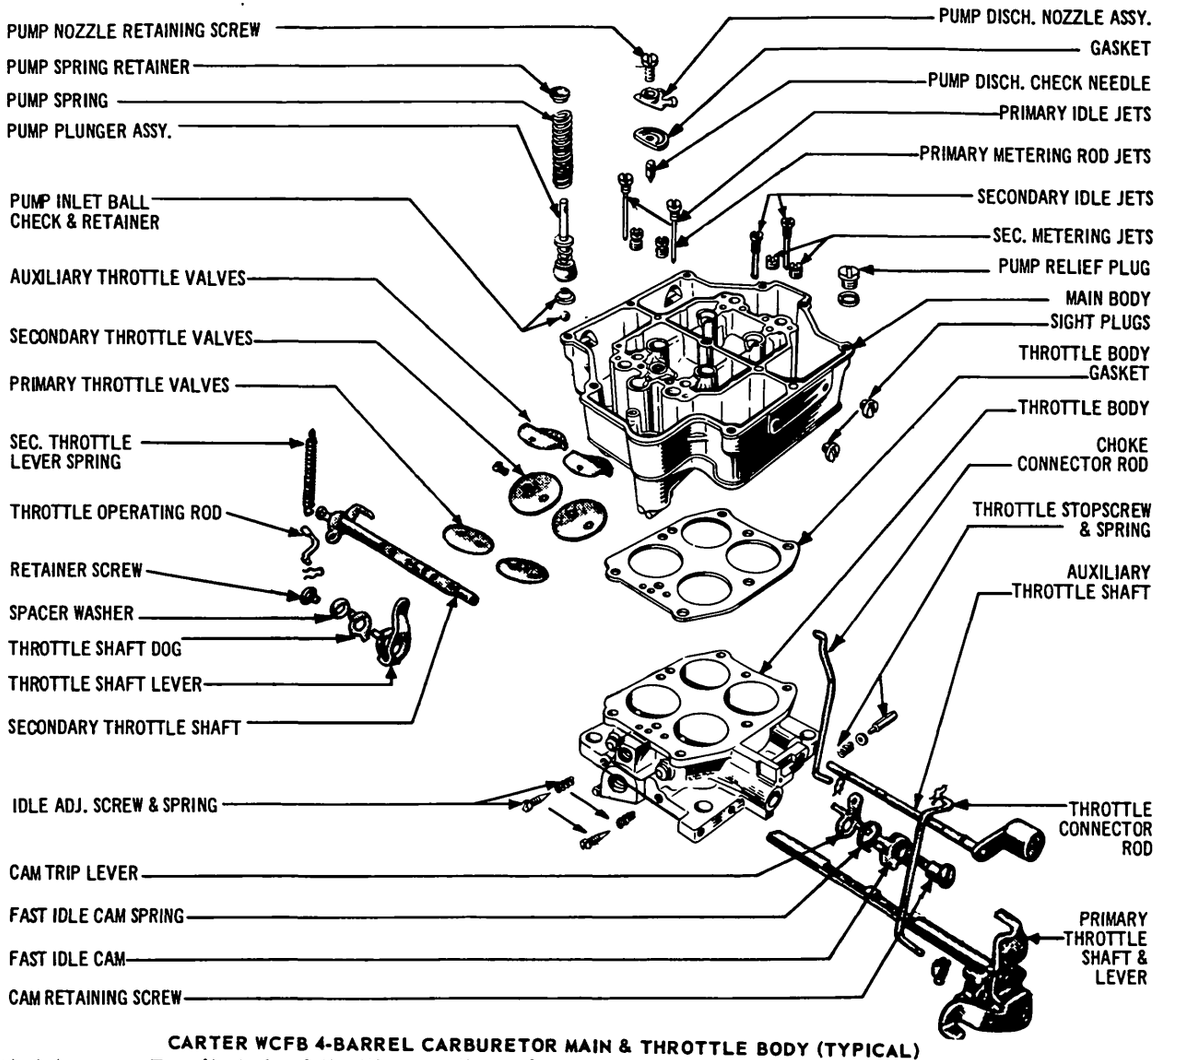
CONTINUED ON NEXT PAGE

1961 CARTER WCFB 4-BARREL CARBURETORS (C nt.)

Ch k R d: This adjustment is preliminary to checking and adjusting fast idle, unloader, and secondary throttle lockout. Loosen choke lever clamp screw and insert .020" wire gauge, Tool T109-29, between tang on fast idle cam and boss on throttle body casting (hold gauge in place by pressure on choke lever) and take up all slack in linkage. Hold choke valve tightly closed and tighten clamp screw.

Ch k Pist n L v r Adjustment (3059S, 3060S, 3061S): Bend a .026" wire gauge (T109-189) at a 90° angle 1/8" from end, then remove choke housing, gasket, baffle plate and block throttle valve about half open so fast idle cam does not contact adjusting screw. Open choke valve and insert wire gauge so bent portion is between top of slot in choke piston cylinder and bottom of slot in choke piston. Hold wire gauge in position and close choke valve by pressing on piston lever in choke housing until resistance is felt. Clearance between top of choke valve and air horn should be .080" (Gauge T109-234). To adjust, bend choke connector rod.

Fast Idl (Off Engin): Carb. No. 2614S, 2627S - With choke rod properly adjusted (see above) and choke valve tightly closed, bend fast idle adjusting tang until there is .018" clearance between throttle valve and bore of carburetor on side opposite idle port. *NOTE* - Make sure adjusting tang is on high step of cam while making adjustment.



Stud bak r (All) - With fast idle screw on high step of fast idle cam, there should be a clearance of .023" between throttle valve and bore on side opposite idle port. To adjust, turn fast idle screw.

Fast Idl (On Engin): Carb. No. 2614S, 2627S, 3059S, 3060S, 3061S - With idle adjusting tang on high step of fast idle cam, engine speed should be 1800 RPM (2614S, 2627S); 1600-1800 RPM (3059S,3060S,3061S). To adjust, bend fast idle adjusting tang.

Unl ad r: After choke rod adjusted (see above), rotate primary throttle valves to wide open position and close choke. Clearance between upper edge of choke valve (Chevrolet), lower edge of choke valve (Studebaker), should be 3/16" (2614S, 3059S, 3060S, 3061S (1/8" (2627S); 9/16" (All Studebaker carburetors). Adjust by bending unloader tang on throttle shaft lever with Tool T109-41. With correct setting, choke valve should have a slight drag on gauge.

S c ndary Thr ttl L v r Adjustment (Chevrolet 2613S, 2614S, 2626S, 2627S, 3081S, 3082S, 2829S; Studebaker 2830S, 3165S, 3166S): Primary and secondary valves should reach wide open at the same time. *NOTE - Secondary valves will be a few degrees from wide open position.* To adjust, bend throttle operating rod at upper angle with Tool T109-213. With primary and secondary throttle valves in tightly closed position, there should be .010-.030" clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

Chevrolet 3059S, 3060S, 3061S - Block choke valve wide open and back out throttle stopscrew so primary valves are seated in bores. With primary valves open 7/32" (Gauge T109-125), secondary valves should just start to open. To adjust, bend throttle operating rod. *NOTE - Secondary valves will be a few degrees from wide open position when primary throttle valves are wide open.* With primary and secondary valves tightly closed, there should be .010-.030" (Gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

CARTER WCFB 4-BARREL CARBURETOR MAIN & THROTTLE BODY (TYPICAL)

Secondary Throttle Lockout Adjustment (Chevrolet 2614S, 2627S; Studebaker 2829S, 2830S, 3165S, 3166S): Crack throttle valves and hold choke valve closed, then close throttle. Tang on secondary throttle lever should engage notch in lockout lever. To adjust, bend tang on secondary throttle lever. *NOTE* - With choke open, lockout lever should fall free allowing secondary throttle valves to open before primary valves reach wide open position.

Auxiliary Throttle Lockout Adjustment (Chevrolet 3059S, 3060S, 3061S): Crack throttle valves and hold choke valve tightly closed, then close throttle. Tang on lockout arm should freely engage notch in auxiliary throttle shaft dog. To adjust, bend tang on lockout arm.

OVERHAUL: *See 1957 Annual Data, Page 221, or later Manual edition.*

SERVICE PARTS: Gasket Set - Carter No. 286B, 307 or 359 (2613S, 2614S, 2626S, 2627S, 3181S, 3182S); No. 347 (3059S); No. 348 (3060S, 3061S); No. 303 (2829S, 2830S, 3165S, 3166S).

R carbur ti n Kit: Carter No. 1870N (2626S,2627S,3181S); No. 5023N (3059S); No. 5024N (3060S, 3061S).

Zip-Kit: Carter No. 900-112 (3059S); No. 90013 (3060S, 3061S).

CARTER DUAL "WCD"

RAMBLER — **Carter No.**
Classic 6 Cyl — 3170S

DESCRIPTION: Dual downdraft carburetors with automatic choke. Same design as used on previous models.

ADJUSTMENT: *Make all adjustments exactly as follows*
Idling Adjustment: Warm up engine thoroughly so that choke valve wide open and fast idle inoperative. Adjust throttle stopscrew for correct engine speed, then adjust both idle mixture screws equally for smooth running and highest RPM. Turn screws out for richer mixture. Recheck idle speed.

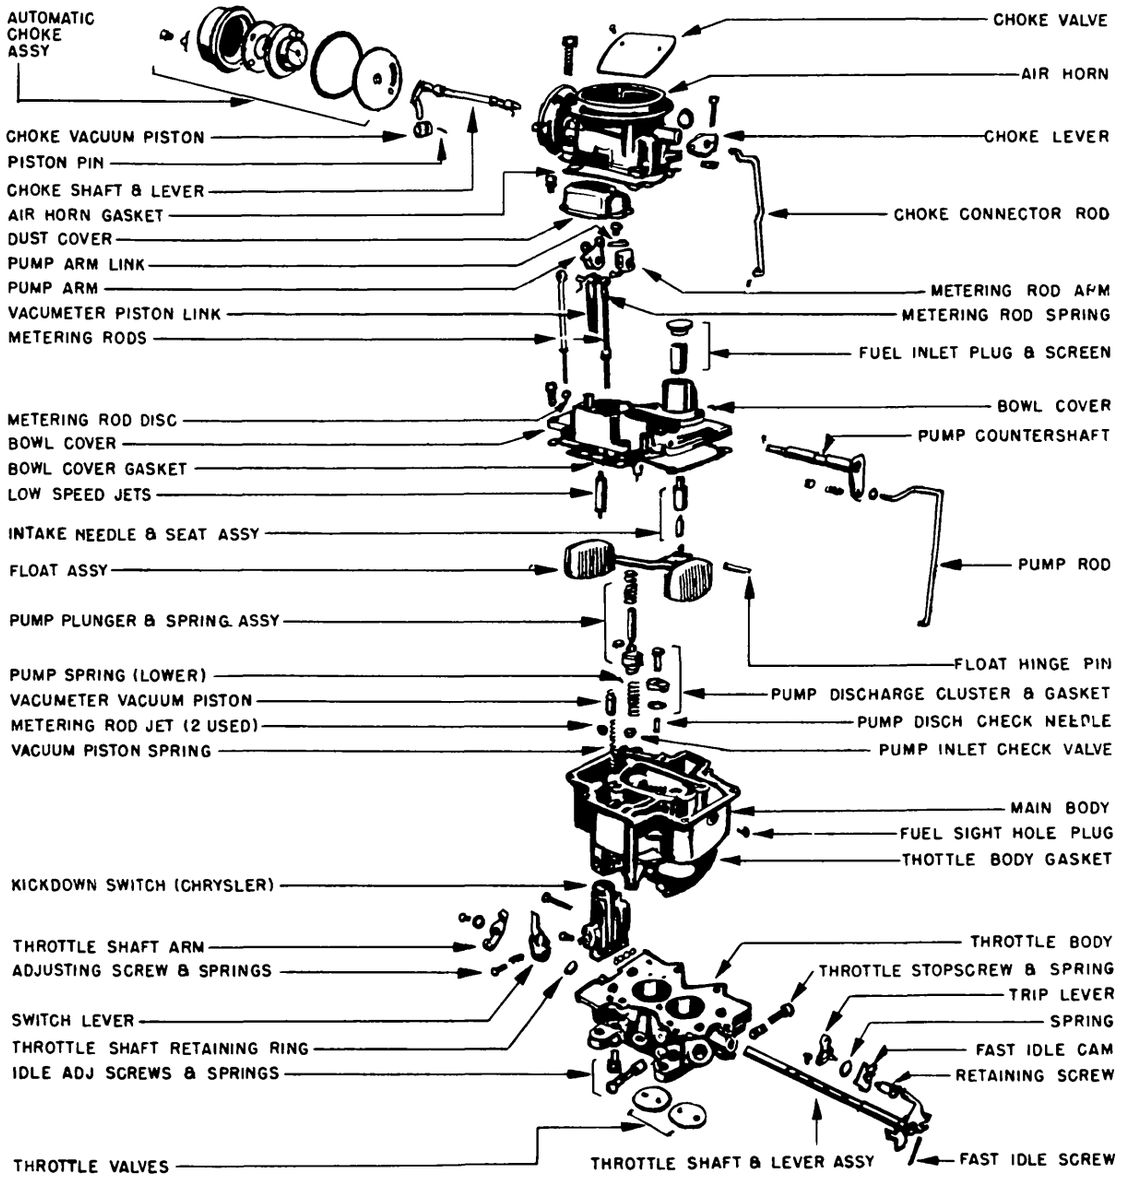
Idle Mixture Screw Setting

Car	Idle Screw Opening
Rambler	½-2 turns

Idle Speed Setting

Car	Synchro-mesh	Auto. Trans.
Rambler	550 RPM	② 475RPM

① - With selector lever in Neutral
② - 500 RPM with Air Conditioning turned ON



Accel erating Pump: Check and adjust pump stroke as follows. With pump connector link installed in outer hole (long stroke) of pump arm under dust cover on bowl cover, back off throttle stopscrew so that throttle valves fully closed. Place straightedge across dust cover boss directly above pump arm. Flat on top of pump arm should be parallel to straightedge. Adjust by bending throttle connector rod at upper angle using bending tool T109-213.

Metering Rods: *CAUTION - Check and adjust metering rods after Pump Stroke Adjustment has been completed.* **Metering Rod Adjustment** - No gauge required. With throttle stopscrew backed off and throttle valves fully closed, loosen metering rod arm clampscrew (on countershaft under dust cover on bowl cover). Press down on vacumeter link until both metering rods just bottom in carburetor casting, then rotate metering rod arm until finger on arm contacts lip on vacumeter link, carefully tighten clampscrew. *CAUTION* - Do not disturb arm position.

Float Level: *NOTE* - Float assembly consists of two floats (right and left hand) and auxiliary lever. Floats are adjusted separately and should be set for uniform height (float level or vertical adjustment).

Float Level Setting - With bowl cover and float assembly removed from carburetor, invert assembly, remove cover gasket, install correct gauge (see table below) on cover directly below floats with notched portions of gauge fitted over edge of cover casting. Make vertical and lateral adjustments on each float.

Vertical Adjustment - Top of each float should just clear horizontal portion of gauge. Adjust by bending float arms. *CAUTION* - Adjust both floats evenly.

CARTER "WCD" DUAL CARBURETOR

Lateral Adjustment - Sides of floats should barely touch vertical uprights of float gauge (necessary to prevent floats hanging up in bowl). Adjust by bending float arms.

Float Level Setting

Car	Float Level	Checking Gauge
Rambler	5/32"	T109-196

Fast Idle: *CAUTION - Two settings (1) and (2) required.*

(1) Fast Idle Cam Clearance - Loosen choke lever clampscrew on choke valve shaft, insert correct gauge (see Checking Gauge (1) in table below) between lip

CONTINUED ON NEXT PAGE

CARTER "WCD" (Cont.)

on fast idle cam and boss on flange casting. Hold choke valve tightly closed and remove all slack from linkage by pressing choke lever toward closed position, tighten choke lever clampscrew.

(2) Fast Idle Screw Setting - With choke valve tightly closed, tighten fast idle adjusting screw against high step of fast idle cam until throttle valve opening or clearance between edge of valve and carburetor bore on side opposite idle ports is correct (see Checking Gauge (2) in table below).

Fast Idle Setting & Checking Gauge

Car	(1)	(2)
Rambler	.010"	T109-200 .020" T109-29

Unloader: Hold throttle valve wide open and check choke valve opening or clearance between edge of valve and air horn wall. Adjust by bending unloader lip on throttle lever using bending tool T109-41.

Unloader Setting

Car	Choke Opening	Checking Gauge
Rambler	3/16"	T109-28

Automatic Choke: Adjust by loosening choke cover screws and rotating cover and coil assembly.

Automatic Choke Setting

Rambler ..... Centered (At Index)

THROTTLE VALVE SETTING: Check when overhauling carburetor.

Throttle Valve Setting

Car	Idle Port	Vacuum Spark Port
Rambler	① .095-.101"	② .028-.038"

① - Opening above upper edge of throttle valve.
② - Top of port above top edge of valve.

OVERHAUL: *See 1955 Annual Data, Pag 257, or later Manual edition.*

CARTER ABD 2-BARREL CARBURETORS

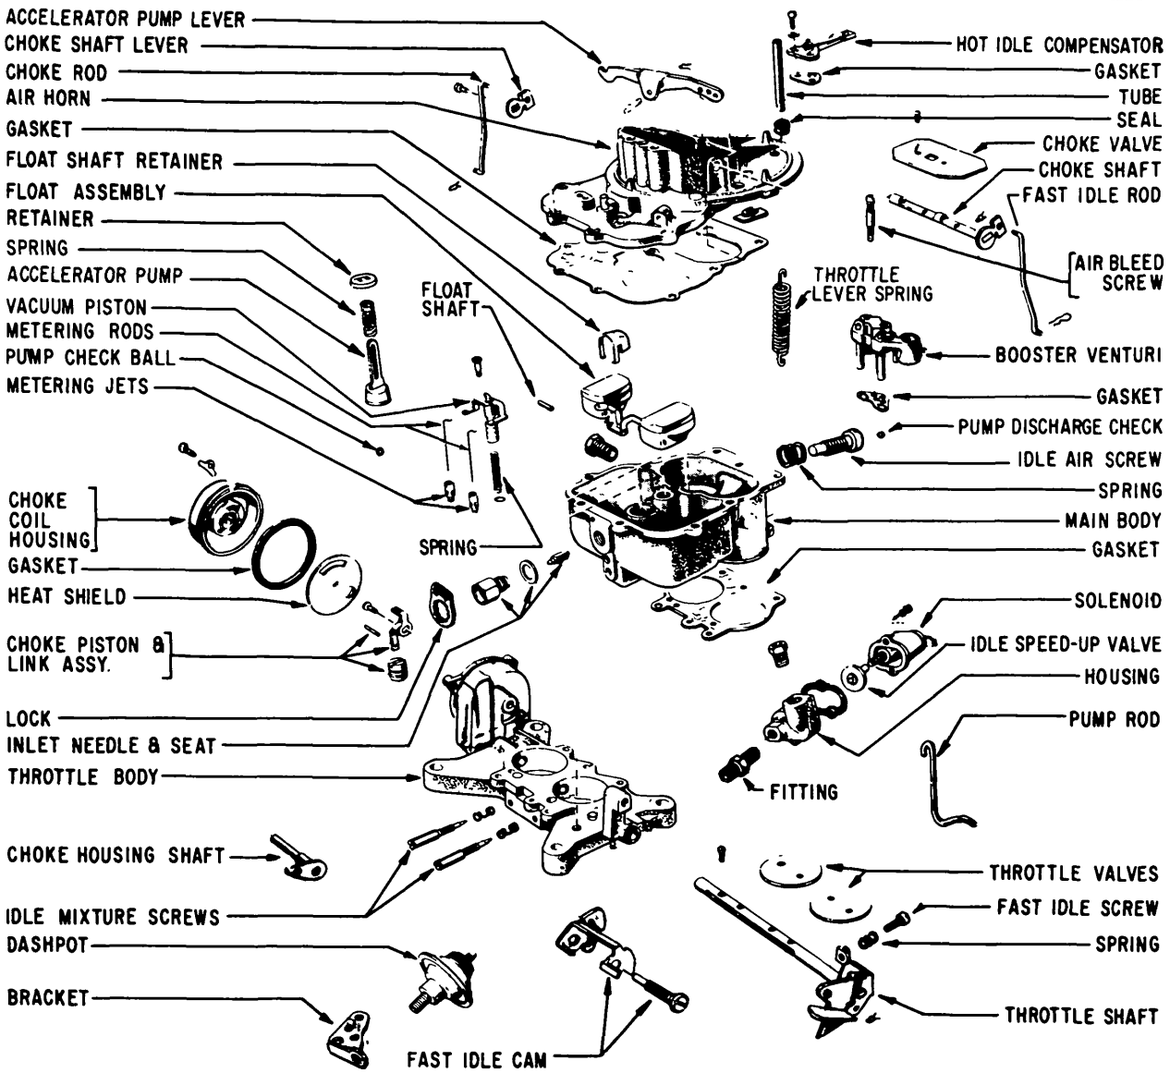
LINCOLN CONTINENTAL	Carter No.
430" Engine (Exc. Air Cond.)	3148S
430" Engine (Air Cond.)	3149S

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 LINCOLN "HIGH ALTITUDE" CARBURETOR IDENTIFICATION NOTE & SERVICE ADJUSTMENT CAUTION:* Production carburetors equipped with high altitude jets will be identified by a RED tag attached to carburetor air horn. On these carburetors, the accelerator pump rod and throttle closing spring should be positioned in summer (S) position regardless of ambient temperatures.

►*1961 LINCOLN CARBURETOR-TO-SPACER GASKET REWORK:* On engines having a carburetor spacer without the partial web, a gasket furnished in gasket and repair kits may be reworked, if necessary, for use on these engines by removing excess gasket material as follows: Install gasket on carburetor mounting studs over the spacer, then hold gasket firmly and cut contoured portion of gasket inner diameter so both sides are straight and parallel.

DESCRIPTION: Design is same as used on previous models except for the following new features:



Idle Air Bypass Syst m: Throttle valves are completely closed at slow idle speed. Air for closed throttle operation is taken from top of primary venturi through an adjustable orifice to throttle bores below throttle valves. An Idle Air Speed Screw controls the adjustable orifice and all idle speed adjustments are made with this screw. Throttle stop screw not used.

Idl Sp d-Up (Air C nditioned Cars): Consists of two separate devices as follows:

Initial Assist (Carbur t r) – An external air bypass passage and solenoid controlled valve on carburetor provides additional air below throttle valves when air conditioning compressor clutch is engaged. Upper end of tube is located in air horn. To check operation, remove air cleaner, then with air conditioner compressor operating, close end of tube with finger. Engine speed should decrease 30–40 RPM. *NOTE – It is not necessary to operat air conditioner when adjusting slow (hot) idl speed.*

Suppl mental Assist (Throttle Linkage) – Consists of a vacuum diaphragm operated rod connected to throttle linkage. Operation of vacuum diaphragm is controlled by a solenoid valve in vacuum line so that rod is pulled down and engine speed increased only when engine is idling with transmission selector lever in "P" (Park) or "N" (Neutral). *See "Idle Speed-Up Control Adjustment" below.*

ADJUSTMENTS: *NOTE – All adjustm nts xc pt float s tting and fast idle throttle clearance can be mad with carburetor installed on engin .*

CARTER ABD 2-BARREL CARBURETOR ASSEMBLY

Idle Mixture & Speed Setting: For initial adjustment, turn idle mixture screws (one for each throttle bore) 1–1½ turns open from a lightly seated position, then turn Idle Air Speed Screw 3½ turns open from a lightly seated position. *NOTE – On Air Conditioned cars, remove air cleaner and turn air conditioner off.* For final adjustment, with engine at normal operating temperature, adjust Idle Air Screw for correct idle speed of 450–475 RPM (transmission selector lever in "D"), or 500–550 RPM (transmission selector lever in "N"). Adjust each idle mixture screw for smooth idling and highest vacuum reading and engine RPM. Recheck and if necessary, reset idle speed, then recheck idle mixture setting.

Fast Idle Speed: With engine at normal operating temperature, transmission selector lever in "D" (Drive) and fast idle screw on lowest (slowest) step of cam, adjust fast idle screw to obtain 600-650 RPM.

Anti-Stall Dashpot: .090–.120" clearance between dashpot plunger and throttle operating lever with dashpot plunger held in to limit of travel and with throttle valves closed. To adjust, loosen locknut and rotate dashpot in bracket.

Ch k S tting: Centered (at index).

CONTINUED ON NEXT PAGE

CARTER ABD 2-BARREL CARBURETORS (Cont.)

Accelerating Pump: 17/32" from top of accelerator pump plunger to top of bowl cover with pump operating rod in outer hole (marked "W") of throttle lever with throttle valve closed. *NOTE – Accelerator pump lever has one hole for throttle return spring marked "W" (for Winter setting) and one hole marked "S" (Summer setting). If either the accelerator pump rod or throttle return spring is set in "W" or "S", the other must correspond.*

►*1961 LINCOLN "HIGH ALTITUDE" CARBURETOR IDENTIFICATION NOTE & SERVICE ADJUSTMENT CAUTION:* Production carburetors equipped with high altitude jets are identified by a RED tag attached to carburetor air horn. On these carburetors, the accelerator pump rod should be positioned in inner hole (marked "S") of throttle lever, and throttle closing spring should be positioned in hole marked "S" on accelerator pump lever, regardless of ambient temperatures.

Choke Valve & Piston Lever Linkage: Bend 1/8" of end of Tool T109-189 (.026" wire gauge) at a 90° angle, then insert bent end of gauge into choke housing piston bore so that it is between bottom of slot in choke piston and top edge of vacuum slot in choke housing. Close choke valve by pressing on piston lever until it stops, then check clearance between upper edge of choke valve and air horn which should be 5/32" (Tool T109-154). To adjust, use parallel jaw pliers and bend choke operating lever at the reduced area to obtain proper adjustment.

Unloader: 1/8" clearance between upper edge of choke valve and wall of air horn with throttle valves wide open. To adjust, use 1/8" gauge, Tool T109-36 or a 1/8" drill to check clearance. Bend tang on choke unloader lever as required.

Fast Idle Cam: With choke valve closed, fast idle adjusting screw should rest at index mark on high step of fast idle cam. To adjust, bend fast idle cam pickup lug on choke unloader lever as required.

Fast Idle Throttle Valve Clearance: With fast idle adjusting screw on index mark of cam, clearance between lower edge of valve and throttle bore should be .015".

Float Level: 5/16" measured at free end of float as follows: Press down on float shaft retainer and hold float and lever assembly in uppermost position against fuel inlet needle. Distance between top of float (end furthest from hinge pin) and top machined surface of main body should be 5/16" (Tool T109–280). Bend float lever arm as required to obtain proper alignment (parallel). Bend inlet needle tab as required for correct float level.

OVERHAUL: *See 1960 Annual Data, Page 268, or later Manual edition.*

SERVICE PARTS: Gasket Set – Carter No. 351.
Re–Carburetion Kit – Carter No. 5031N.
Zip–Kit – Carter No. 900–117.

① - With Closed Crankcase Ventilation.

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 RAMBLER CARBURETOR PRODUCTION CHANGE:* Carter Carburetor No. 3206S, replaced carburetor No. 3169S in production beginning with Engine Date Code 21111. Design of the later carburetor has been changed to eliminate the fuel bowl baffle and increase overall size of floats. Bowl venting has been changed to include an additional outside bowl vent passage.

►*1961 STUDEBAKER SIX FLAT SPOT OR ENGINE SURGE CORRECTION:* Install Metering Rod, Studebaker Part No. 1553351 (3159S); No. 1553350 (3161S). *NOTE* - This new metering rod will result in a slight reduction in fuel economy.

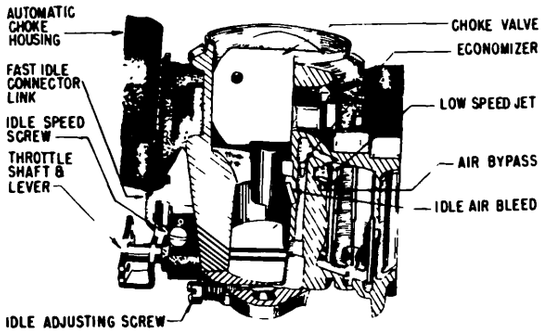
►*1961 STUDEBAKER FUEL LINE STOPPAGE CORRECTION:* Kinked fuel line at either tank or fuel pump can be corrected by installing a new type flexible hose, Part No. 1543933X2.

DESCRIPTION: Single barrel downdraft type with automatic choke.

ADJUSTMENT: Make all adjustments exactly as follows:

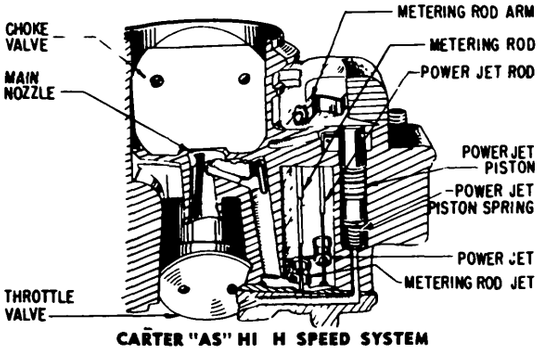
Idling Adjustment: Warm up engine thoroughly, so that choke valve is wide open and fast idle inoperative. See table for idle screw setting. Turn screw out for richer mixture. See car model pages for complete tune-up data.

Idle Mixture Setting



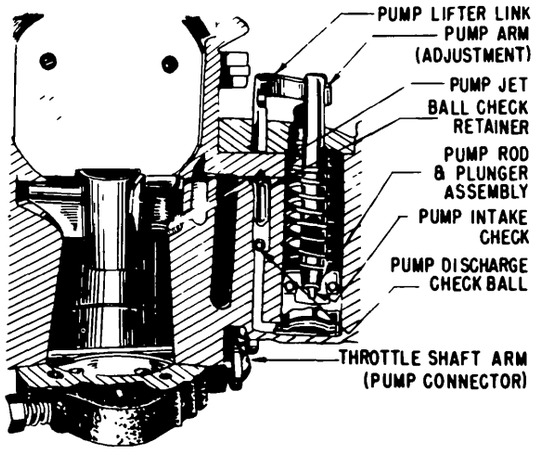
Car & Carb.	Idl Scr w Op ning
Checker 2858S	½-1¾ turns
Rambler (All)	1/2-1 1/4 turns
Studebaker (Exc. 3186S)	1/8-1 1/2 turns
Studebaker 3186S	1/2-2 turns

CARTER "AS" CARBURETORS



Idle Speed Setting

Car	
Checker	①400 RPM
Rambler (Exc. Air Cond.)	①475 RPM
Rambler (Air Cond.)	①③500 RPM
Studebaker (All Trans.)	②550 RPM



① - Auto. Trans. in "N" (Neutral).
② - Auto. Trans. in "N" (Neutral) or "P" (Park).
③ - With Air Conditioner turned on.

CARTER "AS" LOW SPEED SYSTEM

CARTER "AS" HIGH SPEED SYSTEM

CARTER "AS" PUMP SYSTEM

Float Level: "Split Type" float used on Checker Superba, "Single Type" float used on Rambler and Studebaker.

"Split Type" Floats - Remove bowl cover gasket and float pin retainer. Check each float separately while holding lip of float arm against seated needle. *CAUTION - Float pin must be at bottom of guide slots.* Place gauge squarely on top edge of bowl at free end of float. Ridge on top of float should just contact step of gauge. Adjust by bending lip on float arm. Make certain that floats clear sides of bowl. Adjust by bending float arms. Install float pin retainer, invert carburetor so that both floats rest against seated needle. Clearance between overlapping tangs on float levers should be .010"-.015". Adjust by bending long tang on left hand float. Recheck float level.

"Single Type" Floats - Check floats for side clearance. Bend float arms as required for free operation. Hold float pin retainer in place so pin is at bottom of slots, then invert carburetor so weight of floats alone seats the intake needle. The distance from top surface of body casting to top of each float at free end should

CONTINUED ON NEXT PAGE

CARTER "AS" CARBURETORS (C ntinued)

be as indicated in table below. Adjust by bending lip on float arm.

Fl at Setting

Car & Carb.	Checking Gauge	Float Setting
Checker 2858S	T109-282	1/4"
Rambler 3169S	T109-282	1/4"
Rambler 3206S	T109-196	5/32"
Studebaker(Exc.3186S)	T109-282	1/4"
Studebaker 3186S	T109-280	5/16"

Pump Adjustm nt: Top of pump arm that engages slot in pump shaft must be parallel to top surface of bowl cover with throttle in wide open position. Adjust by bending pump arm up or down as necessary.

M t ring R d Adjustment: With throttle wide open, metering rod should just bottom in carburetor casting. To adjust bend metering rod arm. When metering rod is properly adjusted, some movement can be noted around eye of metering rod retainer clip when throttle is moved slightly from wide open position. If rod is too low, it will tend to push metering rod retainer clip up. If rod is too high, it will be possible to push rod down.

Fast Idl Adjustm nt: Remove thermostat coil housing, gasket and baffle plate. Crack throttle valve and hold choke valve closed to rotate fast idle cam to fast idle position. Close throttle. Measure clearance between throttle valve and bore of carburetor (side opposite idle port) using gauge listed in table below. Adjust by bending choke connector rod at lower angle using bending tool T109-213.

Fast Idle Setting

Car & Carb.	Checking Gauge	Throttle Opening

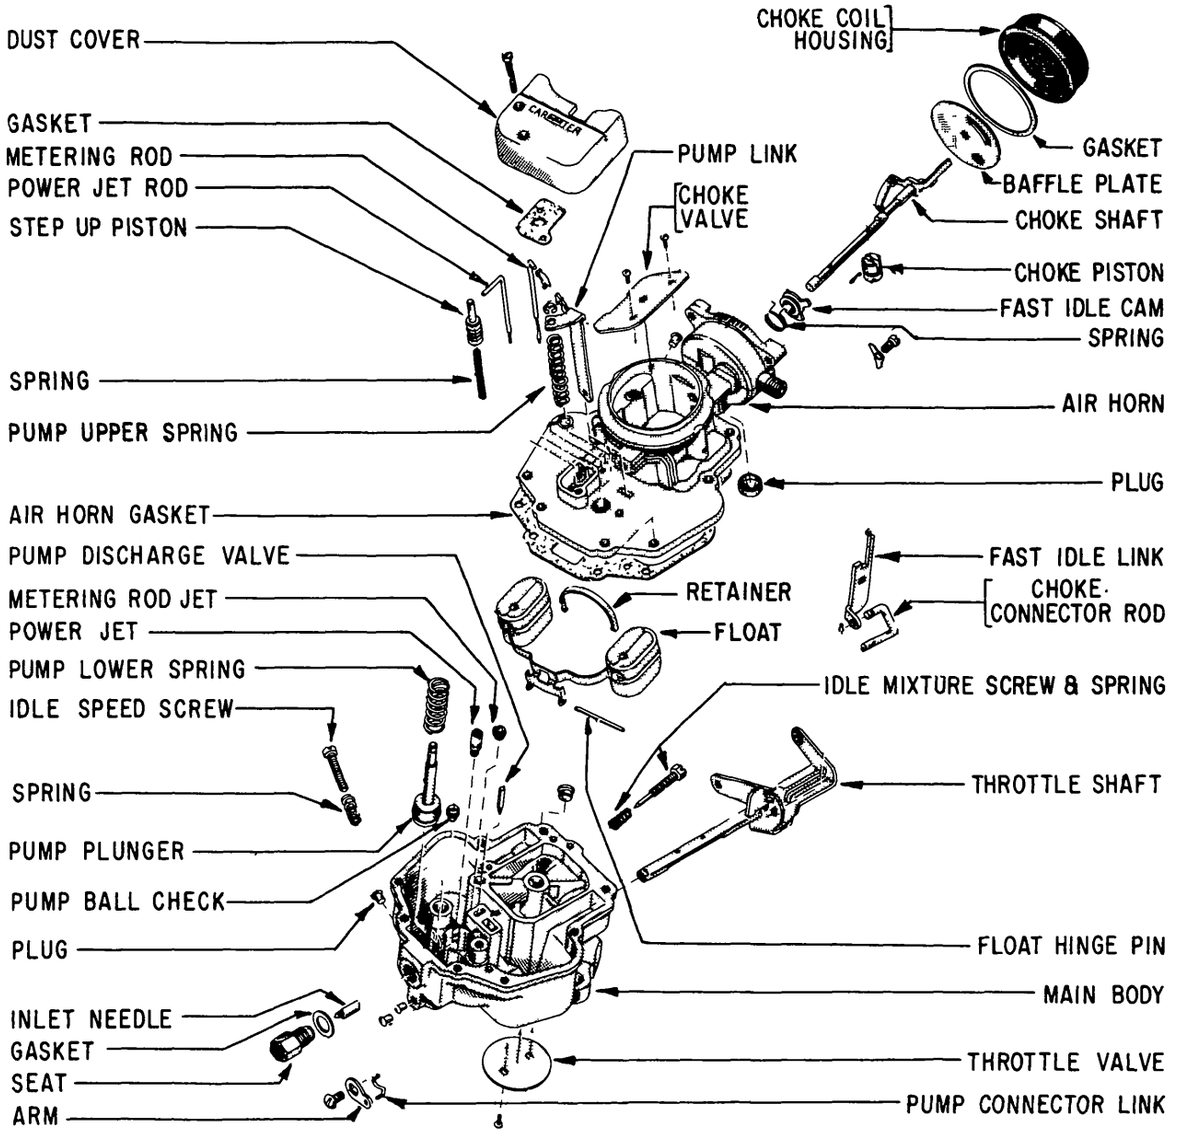
Rambler (All Carbs.)	T109-193	037"
Studebaker (All Carbs.)	T109-234	.065"

Unload r Adjustm nt: Hold throttle valve wide open and close choke valve without forcing it. Measure clearance between upper edge of choke valve and inner wall of carburetor air horn. See table below. To adjust, bend choke shaft unloader arm.



Unloader Setting

Car & Carb.	Checking Gauge	Choke Opening
Checker (All Carbs.)	T109-34	9/64"
Rambler (All Carbs.)	T109-36	1/8"
Studebaker (All Carbs.)	T109-28	3/16"

Aut matic Ch ke: Adjust by loosening cover screws and rotating cover and thermostatic coil assembly.

Automatic Ch k Setting

Car & Carb.	Setting
Checker 2858S	1 Point Rich
Rambler (All Carbs.)	Centered (On Index)
Studebaker (All Carbs.)	1 Point Lean

CARTER "AS" CARBURETOR

OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Take out two dust cover retaining screws, remove dust cover and gasket. Remove step-up jet piston, rod and spring from bowl cover. Disconnect spring clip from actuating link and remove metering rod and spring clip retainer. Take out throttle shaft arm screw, remove throttle shaft arm and pin assembly. Remove choke piston link-to-throttle valve arm lever connector rod retainer and remove rod. Take out cover retaining screws and remove bowl cover and gasket. Push accelerating pump plunger toward cover and disconnect it from actuating link, remove plunger and actuating link. Remove spring from pump plunger. Take out choke cover retaining screws, remove choke cover and coil assembly, gasket, and baffle. Slip fast idle link out of housing. Remove staking from ends of choke valve screws, remove screws, lift choke valve out. Disconnect fast idle cam spring from choke shaft lever, rotate choke shaft to withdraw choke piston from cylinder, re-

CONTINUED ON NEXT PAGE

CARTER "AS" CARBURETORS (Con.inued)

move choke shaft, lever, and piston assembly from housing. Disconnect piston by pushing out piston pin. Remove fast idle cam and spring assembly from choke housing. Remove float lever pin retainer, remove needle valve and seat assembly, remove float and pin assembly. Separate floats by taking out the retaining pin. Remove metering rod jet, step-up jet, and low speed jet. Remove pump discharge ball retainer and check ball. Remove idle mixture adjusting screw and spring, and idle speed screw and spring,

Inspection: Thoroughly clean and inspect all carburetor parts. *CAUTION* - Take care not to damage percolator tube which extends above top surface of carburetor bowl. Replace all worn or damaged parts.

Reassembly: Use all new gaskets. Reassemble all parts in reverse order to disassembly procedure and note the following points:

Accelerating Pump Jet Aim (Studebaker) - Check pump discharge jet by filling bowl with clean gasoline and operating pump plunger with several quick full strokes. Pump jet should be parallel to choke shaft and stream should strike side of small venturi about 1/8" down from top edge. Adjust by bending pump jet tube. *CAUTION - Use care not to damage metering end of tube.*

Assembling Air Horn to Body - Install body gasket on air horn. Install metering rod retainer on pump lifter link but **do not install metering rod**, insert pump lifter link through operating slot in air horn, place pump spring over pump plunger and install plunger in air horn, install fast idle link in choke piston housing. Hold pump plunger, lifter link, and gasket in position and lower air horn and bowl cover onto carburetor body.

Metering Rod Installation - Place metering rod retainer in position on actuating link. Lower metering rod into place until end of rod enters hole in retainer, push metering rod and retainer down into operating position, push retainer toward rod until retainer ears engage slot in arm on lifter link.

Carburetor Adjustments - Make all adjustments as listed above in ADJUSTMENT section.

Servic Parts

Gasket Sets - Carter No. 332 (2858S); No. 361 (3169S); No. 350 (3159S, 3161S, 3186S).

Re-Carburetion Kit - Carter No. 1936 (2858S); No. 5046 (3169S); No. 5034N (3159S); No. 5035N (3161S); No. 5036N (3186S).

Zip Kit - Carter No. 900-121 (3159S, 3161S); No. 900-128 (3186S); No. 900-127 (3169S).

CARTER "YF" CARBURETORS

RAMBLER	Carter No.
American (Deluxe & Custom)	2014S
WILLYS	
4 Cyl. "L" Head Jeep Dispatcher	2392S
4 Cyl. "F" Head Universal Jeep	938SD
4 Cyl. "F" Head 4x2, 4x4, 4WD	951SA
4 Cyl. "F" Head Fleetvan	3200S
4 Cyl. "F" Head Forward Control	938SD
6 Cyl. "L" Head All Models	2467S

DESCRIPTION: Single barrel downdraft type with automatic choke (Rambler), manual choke control (Willys). Same design as used on previous models.

ADJUSTMENT: *Make all adjustments exactly as follows:*

Idling Adjustment: Warm up engine thoroughly so that choke valve wide open and fast idle inoperative. Adjust throttle stopscrew for correct engine idle speed, then adjust idle mixture screw for smoothest running and highest RPM. Turn screw for richer mixture. Recheck idle speed.

Idle Mixture Screw Setting

Car & Carb.	Idle Screw Opening
Rambler 2014S	½-1½ turns
Willys 938SD, 951SA, 3200S	¾-1¾ turns
Willys 2392S	½-2 turns
Willys 2467S	1-2½ turns

Float Setting Adjustment: Invert air horn and float cover assembly allowing float to hang freely, then measure from top of float at free end to bowl cover (gasket removed). Adjust by bending lip which contacts intake needle (do not bend float arm).

►*CAUTION: On models with spring loaded intake needle, do not compress this spring when checking float level (will result in false reading and incorrect float setting).*

Idle Speed Setting

Car	Synchro-mesh	Auto. Trans.
Rambler	① 550 RPM	①② 475 RPM
Willys 4 Cyl.	600 RPM	② 600 RPM
Willys 6 Cyl.	550 RPM	

① - 500 RPM (Air Cond. Cars) with compressor operating.

② - Transmission selector lever in "N" (Neutral).

Accelerating Pump: Diaphragm type pump on all models, with ball check discharge valve (except 2467S), discharge needle (2467S). *CAUTION - On 2467S only, check pump adjustment whenever carburetor disassembled or pump linkage disturbed BEFORE checking and adjusting Metering Rod.*

Pump Adjustment (2467S) - With idle screw backed out so that throttle valves are fully seated, press down on upper end of diaphragm shaft until it is bottomed in diaphragm housing (Tool T109-212 may be used to hold diaphragm shaft down in this position). In this position, metering rod arm should contact lifter link at outer end nearest the springs. Adjust by bending pump connector link at lower angle using bending Tool T109-213. *CAUTION - Bending link at any other point may cause binding of pump lifter link.*

Metering Rod Adjustment: With throttle valve seated in bore of carburetor, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber. Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod. Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at outer end nearest the springs and at supporting lug. Adjust by bending lip of metering rod arm to which metering rod is attached.

Automatic Choke: *Used on Rambler 2014S only, Willys carburetors have manual choke control.* Adjust by loosening cover screws and rotating cover and thermostatic coil assembly.

Automatic Choke Setting

Rambler 2014S	1 Point Lean

Fast Idle Adjustment (Manual Choke Control): With choke valve in wide open position, check to see that lip on fast idle arm is in contact with boss on carburetor body casting. To adjust, bend fast idle arm rod at lower offset.

Fast Idle Adjustment (Automatic Choke Control): Remove thermostatic coil housing gasket and baffle plate. Crack throttle and hold choke valve fully closed, then close throttle. With fast idle cam revolved to fast idle position, hold choke valve and throttle valve closed as far as possible, there should be .054" clearance (Gauge T109-193) between throttle valve and bore of carburetor (side opposite idle ports). Adjust by bending connector link at lower angle.

Unloader Adjustment (Automatic Choke Control Carbs.): *NOTE - This adjustment must be made after fast idle adjustment.* Hold throttle valve in wide open position and close choke valve as far as possible without forcing. Clearance between lower edge of choke valve and inner wall of air horn should be 9/32" (Gauge T109-126). Adjust by bending arm of choke trip lever.

Float Level Setting

Car & Carb.	Float Setting	Checking Gauge
Rambler 2014S	1/2"	T109-83

Willys 2392S, 2467S	9/32"	T109-126

OVERHAUL: *See 1956 Annual Data, Page 258, or later Manual edition.*

Servic Parts

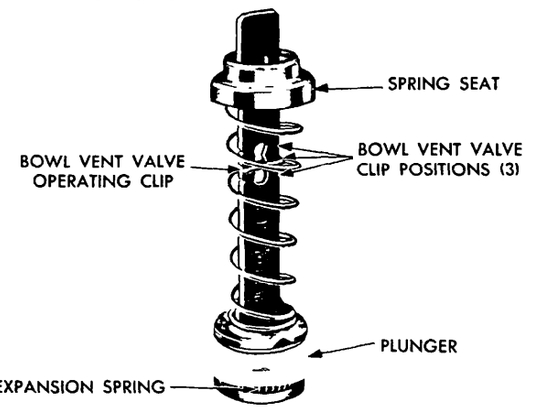
Gasket Set: Carter No. 206S (938SD, 951SA); No. 216 (2014S) No. 200 (2392S); No. 241 (2467S).

Re-Carburetion Kit - Carter No. 1764R (938SD, 951SA); No. 1590N (2014S); No. 1546N (2392S); No. 1849N (2467S).

Zip-Kit - Carter No. 900-31 (938SD, 951SA); No. 900-38 (2014S); No. 900-77 (2392S); No. 900-78 (2467S).

CARTER BBD DUAL

CHRYSLER & DESOTO	Carter No.
361" & 383" Engs. (Std.)	2923SA
361" & 383" Engs. (CCV) ①	3132S
DODGE V8	
318" Eng., Synchro–mesh (Std.)	2921S
318" Eng., Auto. Trans. (Std.)	2922S
361" Eng. (CCV) ①	3132S
PLYMOUTH	
318" Eng., Synchro–mesh (Std.)	2921S
318" Eng., Auto. Trans. (Std.)	2922S



① – Closed Crankcase Ventilation.

►*1961 DODGE & PLYMOUTH 318" ENGINE HARD STARTING CORRECTION:* Hard starting may be caused by an improperly positioned air cleaner. To index air cleaner properly, place loop end of clamp so it is positioned on right side, 2" to rear of centerline of air cleaner.

►*HARD COLD WEATHER STARTING CORRECTION:* This condition may be caused by choke vacuum unloader piston sticking. To correct, remove air cleaner and squirt a suitable carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke valve to flush out gum formation.

DESCRIPTION: Two–barrel downdraft type with "Cross–Over" type automatic choke. Design is similar to previous models having the following features:

Bowl Vapor Vent (2923SA, 3132S): Consists of an atmospheric vent in bowl cover flange which is closed by a rubber grommet on a spring arm (saxophone key). A loose lever on pump countershaft opens bowl vent when throttle valve is closed. Bowl vapor vent adjustment should be checked whenever accelerator pump setting is changed.

ACCELERATING PUMP PLUNGER ASSEMBLY

Bowl Vapor Vent (2921S, 2922S): Consists of an atmospheric vent in bowl cover flange at slot for accelerator pump shaft. The vent valve which is installed over the accelerator pump shaft is operated by a special clip (adjustable) on pump shaft that opens vent when throttle valves are closed. *NOTE – If pump rod is installed in either the long or short stroke hole in throttle lever, it will be necessary to move clip (located under vent valve) either up or down to compensate for change in pump stroke.*

Fast Idle (2923SA, 3132S): Fast idle cam is located directly on end of choke shaft. Fast idle lever is pivoted on side of main body and is linked to throttle lever by a fast idle connector rod. The fast idle adjustment screw is located on upper end of fast idle lever and contacts the fast idle cam. *See "Fast Idle Adjustment" below.*

Fast Idle (2921S, 2922S): Fast idle cam is located on carburetor main body adjacent to throttle lever and is linked to choke valve shaft lever by a connector rod. The fast idle lever is pivoted on throttle valve shaft and contacts the fast idle cam. The fast idle adjusting screw is on fast idle lever. *See "Fast Idle Adjustment" below.*

Automatic Choke (Cross-Over Type) All Models - This type of automatic choke is a separate unit located in well in intake manifold (in exhaust cross-over passage) and is linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder on the air horn and is linked directly to choke valve. *See "Carter Cross–Over Type Automatic Choke" in 1957 Annual Data, Page 244, or later Manual editions.*

ADJUSTMENTS: *Make all adjustments exactly as detailed below.*

►*IDLE SETTING CAUTION:* When making Idle Speed & Mixture adjustments, note the following: Turn headlights on High Beam to compensate for alternator load (alternator charges battery at idle speed). On automatic transmission cars (except Ram Induction Engines), loosen nut on sliding link of carburetor–to–bellcrank rod so transmission internal stop will not interfere with carburetor throttle lever. When adjustments completed, move carburetor throttle rod to rear against its stop and tighten locknut.

Idle Adjustment: Make preliminary setting of both idle mixture screws by turning each screw in until it is lightly seated and then backing screw out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative.

Idle Mixture - With engine at normal operating temperature and idling at correct idle speed, adjust idle mixture screws until engine operates smoothly. Recheck engine idle speed, adjust for correct engine RPM.

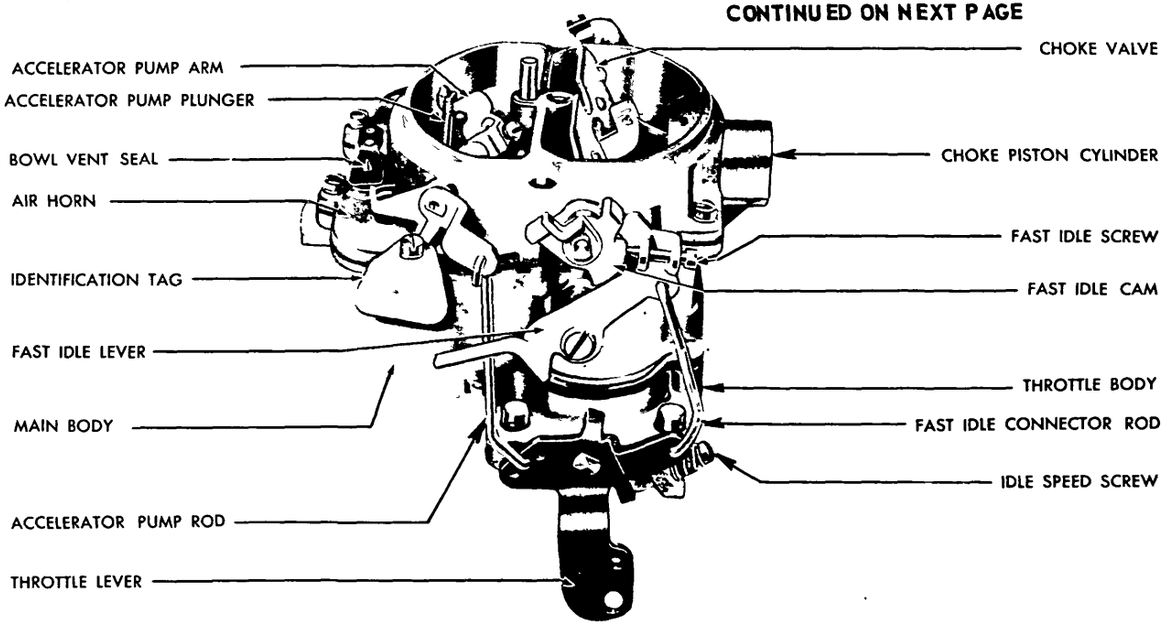
Idle Mixture Setting

Carburetor	Idle Screw Opening
2921S, 2922S	1 turn
2923SA, 3132S	1/8–1½ turns

Idle Speed Setting

Car	Synchro-mesh	① Auto. Trans.
Chrysler		② 500 RPM
DeSoto	500 RPM	② 500 RPM
Dodge & Plymouth	500 RPM	③ 500 RPM

① - Automatic transmission in "N" (Neutral) position.



② - 575 RPM on Air Conditioned cars.

③ – 550 RPM (2921S, 2922S); 575 RPM (3132S) on Air Conditioned cars.

Accelerating Pump (2923SA, 3132S): Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting as indicated below: *CAUTION – Bowl vapor vent adjustment must be checked whenever pump setting is changed.*

Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valves fully closed. Make certain that pump connector rod engaged in center hole (medium stroke) of throttle lever. Use scale to measure distance from top surface of bowl cover to top of pump plunger shaft (within air horn - remove air cleaner for access). This distance should be 1"±1/64" (all models). Adjust by bending connector rod at lower angle.

CONTINUED ON NEXT PAGE

CARTER BBD CARBURETOR ASSEMBLY (2923SA & 3132S)

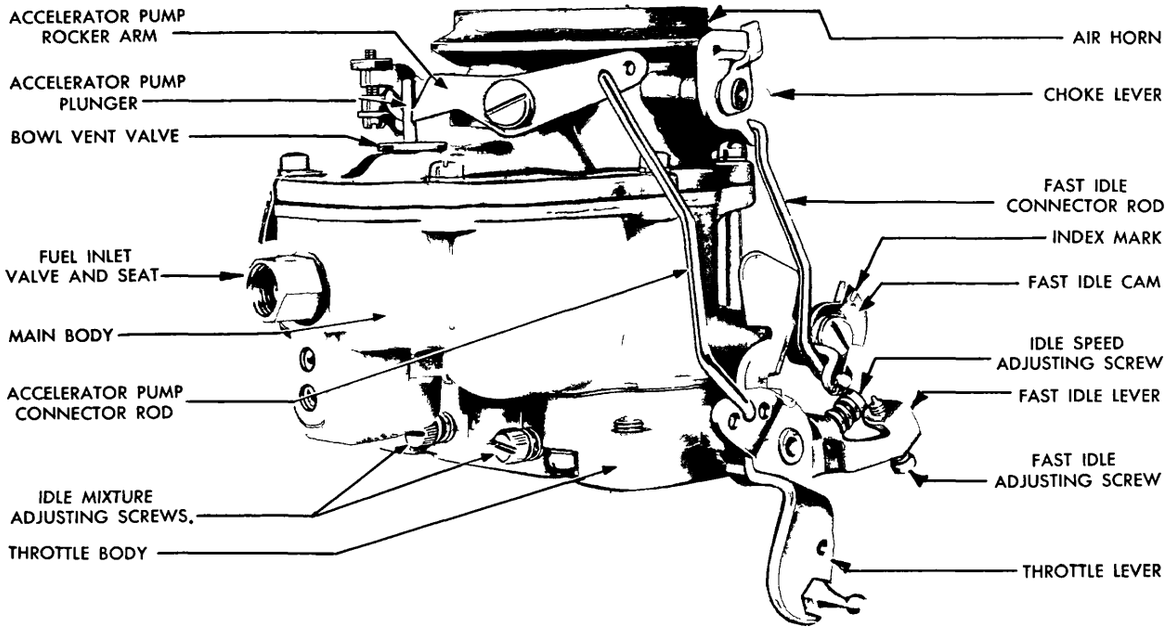
CARTER BBD DUAL (C nt.)

Pump Seasonal Setting - Standard setting is with connector rod engaged in center hole of throttle lever (medium stroke). Outer hole will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).

Accelerating Pump (2921S, 2922S): Three holes in throttle lever and two holes provided in pump arm for connector rod engagement to provide seasonal setting as indicated below. *CAUTION – Bowl vapor vent adjustment must be checked whenever pump setting is changed.*

Pump Stroke Adjustment - Back off throttle stopscrew so that throttle valves fully closed. Make certain that connector rod engaged in center hole of throttle lever and inner hole of pump arm Use scale to measure the distance from top surface of bowl cover to top of pump plunger shaft. This distance should be 1 1/8" (All models) Adjust by bending connector rod at lower angle.

Pump Seasonal Setting - Std setting is with connector rod engaged in center hole of throttle lever and inner hole of pump arm (Medium Stroke) Outer hole in throttle lever will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).



Float Level: To check float level, remove air horn and bowl cover assembly, and gasket Place gauge (see table below) squarely on edge of bowl at free end of floats Hold float arm lip firmly against seated needle valve Ridge or crown on each float should just touch step on gauge Adjust by bending float lip *(NOTE* - If one float lower than the other, first equalize floats by bending float arm, then adjust floats by bending lip).

Float Level Setting

Carburetor	Checking Gauge	Float Level
2921S, 2922S	T109–239	9/32"
2923SA, 3132S	T109–280	5/16"

Bowl Vapor Vent Adjustment (2923SA, 3132S): With throttle valves fully closed, vapor vent opening or clearance between heel of rubber grommet on vent arm and seat on cover should be .067–.080" (Gauge T109–234) Adjust by bending lip on vapor vent arm. *CAUTION - Setting should be checked whenever pump stroke setting is changed.*

2921S, 2922S – With throttle valves held closed, clearance between bowl vent valve and air horn should be .060" (use a .060" drill shank). To adjust, bend accelerator pump rod at lower angle. *CAUTION – If pump rod is installed in either the long or short stroke hole, it will be necessary to move the hairpin clip located directly under the bowl vent valve, either up or down to compensate for change in pump stroke and to maintain proper adjustment.*

CARTER BBD CARBURETOR ASSEMBLY (2921S & 2922S)

Fast Idle (On Car): With engine at normal operating temperature, adjust speed to 1375-1425 RPM with fast idle screw on index mark of cam.

Fast Idle (Off Car): Two adjustments required as follows:

Fast Idle Linkage Adjustment (2923SA, 3132S) - With choke valve tightly closed and lug on fast idle cam contacting lug on outer lever, align index mark on fast idle cam with center of fast idle adjusting screw. To adjust, bend lip on choke shaft lever.

Fast Idle Adjustment (2921S, 2922S) - With choke valve tightly closed and lip on inner choke shaft lever contacting lug on outer lever, align index mark on fast idle cam with adjusting screw To adjust, bend lip on inner choke shaft lever.

Fast Idle Setting

Carburetor	Checking Gauge	Throttle Opening
2923SA, 3132S	T109-44	.018"
2921S, 2922S	T109-44	.015"

Fast Idle Throttle Valve Opening (All Models) - Back out idle speed adjusting screw, close choke valve tightly. Fast idle screw should be in line with index mark on fast idle cam (highest step of cam). Turn fast idle screw in or out until correct throttle valve opening is secured (see table above). Check by inserting gauge between lower edge of throttle valve and carburetor wall on side opposite idle ports.

Unloader: To check, close choke valve tightly, open throttle valves wide (choke valve will open slightly). Check choke valve opening or clearance by inserting gauge (see table below) between upper edge of choke valve and air horn wall. Adjust by bending unloader finger on fast idle arm.

Unload r Setting

Carburetor	Checking Gaug	Chok Setting
2923SA, 3132S	T109-32	15/64"

CARTER BB UPDRAFT CARBURETOR

CHEVROLET TRUCKS — **Carter No.**

1961 6 Cyl. Forward Control Models 871SC

►**ACCESS TO CARBURETOR (for Adjustment or Removal):** **Forward Control Models**—Remove toe pan attaching screws, disconnect wires at stop light switch, disconnect accelerator pedal rod from throttle control rod, remove toe pan.

DESCRIPTION: Plain tube, updraft type of same design as used on previous Chevrolet models

ADJUSTMENT & SERVICING: *See complete "Carter (BB) Updraft Type" carburetor in Carburetor Section of Manual and set this carburetor to the following specifications:*

IDLING ADJUSTMENT

Idle Screw Setting—½-1½ turns open (turn screw out for richer mixture).

Idle Speed—450-500 RPM (Std. Trans.), 400-450 RPM (Auto. Trans. in Neutral).

FLOAT LEVEL SETTING

Float Level—0-1/32" (Carter Gauge T109-49 or Chevrolet J-818-13A) from top of float to top edge of bowl with needle valve seated.

CAUTION—Use 1/32" side of gauge (other side used for 1/16" settings).

Intake Needle & Seat Assembly— Carter No. 25-44S

ACCELERATING PUMP

Pump Seasonal Setting—Short Stroke—Summer, Long Stroke—Winter.

Pump Stroke - 9/16" (Short Stroke) with connecting screw in holes in throttle lever and pump link nearest throttle shaft, 1" (Long Stroke) with screw in holes farthest from shaft.

THROTTLE VALVE SETTING

Idle Port—.005-.009" from top of lower idle port to lower edge of throttle valve.

Vacuum Spark Port—.000-.004" top of port below lower edge of throttle valve.

NOTE—Above specifications apply with throttle valve tightly closed.

SERVICE PARTS

Gasket Set - Carter No. 202.

Repair Pkg. (With Std. Metering Jet) - Carter No. 1539A.

① — Closed Crankcase Ventilation.

►CHANGES, CAUTIONS, CORRECTIONS

►*HARD COLD WEATHER STARTING CORRECTION:* This condition may be caused by choke vacuum unloader piston sticking. To correct, remove air cleaner and squirt a suitable carburetor cleaner, lacquer thinner or alcohol through piston link opening while operating choke valve to flush out gum formation.

DESCRIPTION: Single barrel downdraft type similar to design used on previous models.

ADJUSTMENTS: *Make all adjustments exactly as listed below.*

Idle Adjustment: Make preliminary setting of idle adjusting screw by turning screw in until it is lightly seated and then turn screw out exactly 1 turn. Warm up engine to normal operating temperature so that choke valve is wide open and fast idle inoperative. Set engine idle speed to correct figure, then adjust idle mixture as follows:

Idle Mixture Setting - With engine at normal operating temperature, adjust idle mixture screw for highest RPM, then turn mixture screw in until speed starts to drop. Turn screw out just enough to recover engine speed that was lost. Readjust idle speed screw for correct engine idle speed.

Idle Mixture Setting

Carburetor	Idle Screw Setting
All (Exc. 3097S & 3129S)	¼—1½ turns
3097S, 3129S	1—2 turns

►*IDLE SETTING CAUTION:* When making Idle Speed & Mixture adjustments, turn headlights on (high beam) to compensate for alternator load (alternator charges battery at idle speed). On automatic transmission cars, unsnap ball joint connection at accelerator shaft bellcrank (except Valiant); loosen sliding link of bellcrank —to—transmission rod (Valiant), so transmission internal stop will not interfere with carburetor throttle lever. When adjustments completed, screw ball joint up or down until ball on bellcrank will mate exactly with socket (except Valiant); tighten sliding link locknut (Valiant).

Idle Speed — 550 RPM (All Models). *See "Idle Setting Caution" above.*

Accelerating Pump: Three holes provided in throttle lever for pump connector rod engagement to provide seasonal pump setting as listed below.

Pump Stroke Adjustment — Back off throttle stop-screw so that throttle valve fully closed. Make certain that connector rod engaged in center hole (Exc. 3097S & 3129S); in upper hole (3097S, 3129S) of throttle lever. Use a scale to measure distance from top surface of bowl cover to top of pump plunger shaft. This distance should be 27/32" (Exc. 3097S & 3129S); ¾" (3097S & 3129S). If height not correct, adjust by bending rod at lower angle using Tool T109—213.

Pump Seasonal Setting - Standard setting is with pump connector rod engaged in center hole of throttle lever. Outer hole in throttle lever will provide maximum stroke (greater discharge), and inner hole minimum stroke (less discharge).

Float Level: To check float level, remove air horn and bowl cover assembly, and gasket. Place gauge (see table below) squarely on top edge of bowl at center of floats. Remove float pin retainer, hold float arm lip firmly against seated needle valve with float pin at bottom of the guide slots. Ridge or crown on each float should just touch step on gauge. Adjust by bending float lip (*NOTE* - If one float lower than the other, first equalize floats by bending float arm then adjust both floats by bending the lip). Reinstall float pin retainer.

Float Level — (All Exc. 3097S & 3129S) 7/32" (Gauge T109—239). **(3097S & 3129S)** 9/32" (Gauge T109—239).

Fast Idle Cam Index Setting - With choke valve tightly closed and choke connector rod in upper end of slot in cam, align center of adjusting screw with index mark on cam. To adjust, bend throttle connector rod.

Fast Idle Throttle Valve Clearance — With adjusting screw on index mark of cam, there should be .030" — Gauge T109—29 (Exc. 3097S & 3129S); .026" — Gauge T109—189 (3097S & 3129S) clearance between lower edge of throttle valve and bore.

Fast Idle Speed — 1800 RPM (Synchro—mesh), 1600 RPM (Auto. Trans.) with adjusting screw on second step of fast idle cam.

Unloader: After completing fast idle adjustment (above), hold throttle valve in wide open position, close choke valve as far as possible without forcing. Measure choke valve opening or clearance between upper edge of valve and air horn wall using gauge listed in table below. Adjust by bending arm on choke trip lever which actuates choke lever using bending tool T109-214. Reassemble and adjust automatic choke (below).

Unloader Setting

Carburetor	Checking Gauge	Choke Opening
All (Exc. 3097S & 3129S)	T109—166	11/64"
3097S & 3129S	T109—28	3/16"

Automatic Choke: The automatic choke is a separate "Cross-Over" type mounted in a well directly over exhaust passage in exhaust manifold and linked to choke valve lever by a connector rod. Choke vacuum piston is located in a cylinder in carburetor air horn and linked directly to choke valve. *See "Carter Cross-Over Type Automatic Choke" in 1957 Annual Data, Pag 244, or later Manual editions.*

Automatic Choke Setting

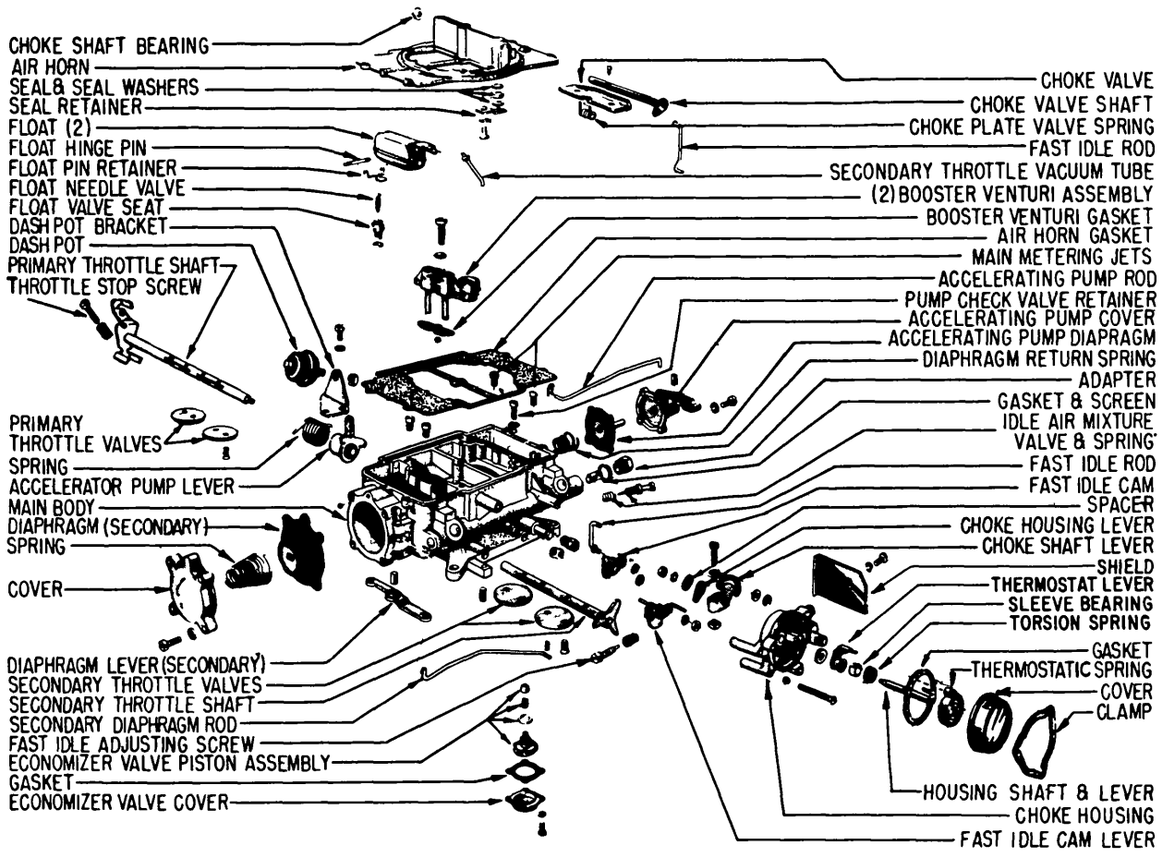
② - With Closed Crankcase Ventilation.
③ - Service Replacement.



►*1961 FORD & MERCURY V8 HARD COLD STARTING CORRECTION:* This condition may be due to choke valve not closing completely because of a defective thermostatic coil spring or dirt and oil between choke housing shaft and bushing. Check spring as follows: Remove thermostatic coil housing and gasket, then unhook long tank of choke spring contacting bent lug on thermostat lever. If the included angle of tang ends do not compare with those shown in illustration, replace the spring. If spring is satisfactory, thoroughly clean choke components, shaft and bushing, then check and adjust all required settings in choke linkage. Use spring, Part No. C1AE–9A590–B (292" & 352" Engs.); C1AE–OA590–A (390" Eng.).

COLOR-YELLOW DI-CHROMATE

THERMOSTATIC COIL SPRING

FORD 4-BARREL CARBURETOR ASSEMBLY

DESCRIPTION: Same design as used on previous models.

ADJUSTMENTS: Adjustments are the same for 2–Barrel and 4–Barrel carburetors except as noted below.

Idle Mixture Setting: Initial setting is 1–1½ turns open from a lightly seated position. With engine at normal operating temperature, turn both idle mixture screws in until engine runs roughly from lean mixture, then turn screws out until engine begins to roll. Finally turn screws in just enough for smooth running (favor a slightly rich mixture).

Idle Speed Setting (Hot Engine): 292" & 352" Synchro–mesh – 500–525 RPM. **390" Std. & Police Synchro–mesh** – 575–600 RPM. **390" High Performance Synchro–mesh** – 700 RPM. **All Engines Auto. Trans.** – 450–475 RPM with selector lever in "D" (Drive).

►*AIR CONDITIONED CAR IDLE SPEED NOTE: Operate air conditioner at least 20 minutes before setting idle speed.*

Anti-Stall Dashpot (Auto. Trans. Cars): *See Car Model pages for adjustment specifications.*

Acc l rating Pump Str k : Install pump operating rod in No. 4 (top) hole for winter operation and in No. 2 hole for summer operation. *NOTE - On V8 engine operating in an ambient temperature of 75°F or over, install operating rod in No. 1 hole.* Opposite end of rod must be installed in outer hole of pump arm for summer and winter operation.

►*ACCELERATING PUMP PLUNGER TRAVEL NOTE:* Pump plunger travel should be 5/32" ± 1/64" when throttle lever is moved from normal closed idle to fully open position with pump operating rod in top hole of overtravel lever and in outer hole of pump operating link. If not within limits, move rod to inner hole of operating link and recheck. If still not within limits, bend overtravel lever tab that contacts throttle lever to provide proper travel.

Float Level: To check float level, remove air horn and bowl cover, then hold float in upper position with needle valve closed. Measure from gasket surface on main body to top of float, not on end of radius (2-Barrel); 1/8" from free end of float and 5/16" from side of float adjacent to inside wall of fuel bowl (4-Barrel). Distance should be 29/64" ± 1/64" (2–Barrel); 21/32" ± 1/64" (4–Barrel). To adjust, bend tab on float arm.

Fuel Level: With correct float setting, fuel level should be 29/32"±1/32" below machined surface of main body. *NOTE - Fuel level is the same for secondary float on 4-Barrel carburetors.*

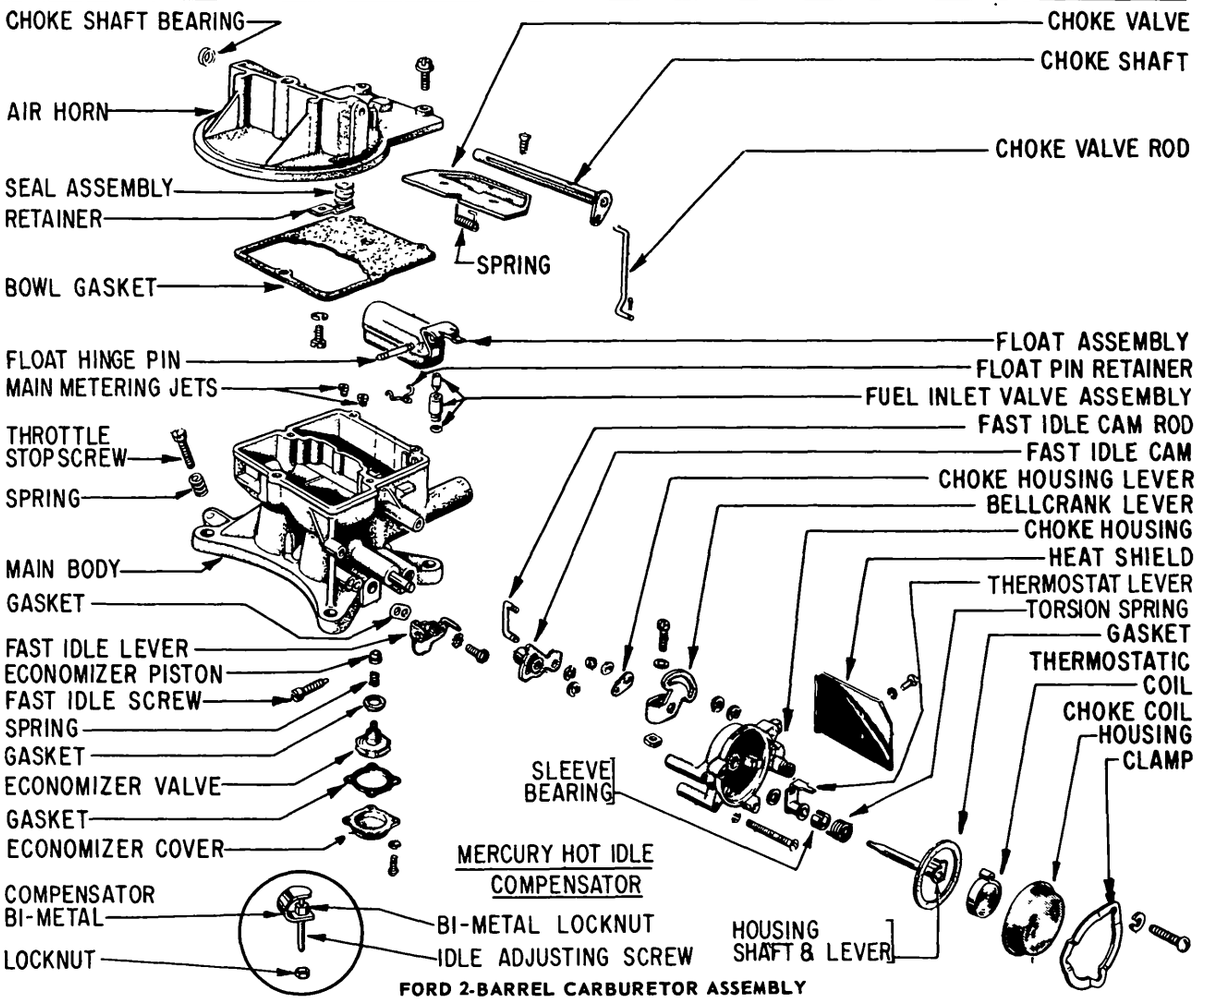
CONTINUED ON NEXT PAGE

1961 FORD 2 & 4-BARREL CARBURETORS (C nt.)

valves in closed position and fast idle screw resting on step of fast idle cam, turn fast idle screw to obtain 1500 RPM (synchro-mesh transmission cars); 1700 RPM (automatic transmission cars).

► *FAST IDLE ADJUSTMENT NOTE:* For a more accurate fast idle setting, it is recommended that engine be stopped when turning the fast idle screw. Check fast idle speed after each adjustment. If necessary to change the adjustment, stop engine and estimate the amount fast idle screw must be turned for desired speed. Repeat as necessary.

Automatic Ch k : Loosen thermostatic coil housing clamp retaining screws and align index mark on coil housing with middle index on choke housing (synchro-mesh cars, except 390" engine); 2 points lean (automatic transmission cars and all 390" engines).



Fast Idl Cam & B llcrank Lever Adjustment: Loosen bellcrank lever clampscrew and open throttle valve slightly, then manually close choke valve. Rotate bellcrank lever on choke housing shaft in the direction that will lift fast idle cam rod. Position bellcrank lever on choke housing shaft so a clearance of .040" will be obtained between fast idle cam and cam stop on rear of choke housing. *NOTE – To maintain proper vertical alignment between bellcrank lever and fast idl cam, th b llcrank lev r must be positioned against "E" ring retain r on choke housing shaft.* Tighten bellcrank lever clamp sufficiently to prevent lever turning on shaft.

S c ndary Thr ttle Valv Adjustment (4–Barrel Carbs.): Hold secondary throttle valves closed and turn secondary throttle shaft lever adjusting screw out until secondary throttle valves stick in bores and there is a .009" clearance between the screw and secondary throttle lever. **Th n turn scr w in one full turn.**

Chok Plate–t –Ch ke H using Shaft Adjustment: Rotate thermostatic coil housing 90° counterclockwise (in rich direction), then press choke plate open until resistance is felt. At this point there should be .110" (Ford 292" Eng.); 140" (Ford 352" & 390" Eng.); 1/8" (Mercury 292" Eng.); 5/32" (Mercury 352" Eng.); 3/16" (Mercury 390" Eng.) clearance between front lower edge of choke plate and vertical wall of air horn. If clearance less than specified, remove choke coil housing and hold thermostat coil lever firmly against stop in housing, then press choke plate with enough force to bend tang on choke housing shaft lever required amount. If clearance is more than specified, first reduce clearance to less than required amount by holding thermostat coil lever clockwise as far as it will go, then move choke plate toward closed position to bend tang on shaft lever more than required amount. Recheck clearance and adjust as indicated above for clearance less than specified.

OVERHAUL: *See 1958 Annual Data, Page 269, or later Manual dition and not th following:*

Ch k H using R m val & Disassembly: Remove choke shield, then disconnect fast idle cam pickup lever at fast idle cam. Remove thermostatic coil spring housing and gasket. Remove choke housing-to-main body screws and lockwashers and remove choke housing. Remove choke housing lever attaching nut, spacer and lever, then loosen screw on bellcrank clamp and slide bellcrank off choke housing shaft and lever assembly. Remove retainer from choke housing shaft and lever assembly and slide shaft out of choke housing. Remove thrust washer from choke housing shaft. Slide thermostatic coil lever and bushing assembly off choke housing shaft (allow for twisting action of torsion spring when parts are separated). Remove torsion spring and white sleeve bearing from thermostatic coil lever and bushing assembly. To reassemble and install, reverse above procedure.

FORD 2-BARREL CARBURETOR ASSEMBLY

Choke Housing Reassembly & Installation: Install white sleeve bearing and torsion spring on thermostat lever and bushing assembly. *NOTE :* Long tang of spring should be positioned against stop on thermostat lever. Slide thermostat lever, bushing and spring assembly on choke housing shaft. Engage short tang of spring on tang of integral choke shaft lever and wind the spring up approximately one-half revolution by turning choke housing shaft as thermostat lever is positioned against choke shaft lever. Engage tang of choke shaft lever in slot provided in thermostat lever. Install thin thrust washer on choke shaft, then install complete choke housing shaft and lever assembly in choke housing so that thermostat lever is at top of choke housing. Install choke housing shaft retainer. Install bellcrank lever assembly on choke housing shaft and position it so that lever is against shaft retainer and the slot portion is to front of choke housing. Tighten clampscrew sufficiently to hold bellcrank lever in position, then adjust *(see "Fast Idle Cam & Bellcrank Lever Adjustment" above).*

SERVICE PARTS: Gasket Set – Ford & Mercury Part No. COAZ–9502–A (COAE–9510–AB, AC, AF, AG, COAZ–9510–A, C1AE–9510–AA, AB, AC, AD, AE, AF, Y, Z,). C1AZ–9502–A (C1AZ–9510–AG, AH, AK, AL).

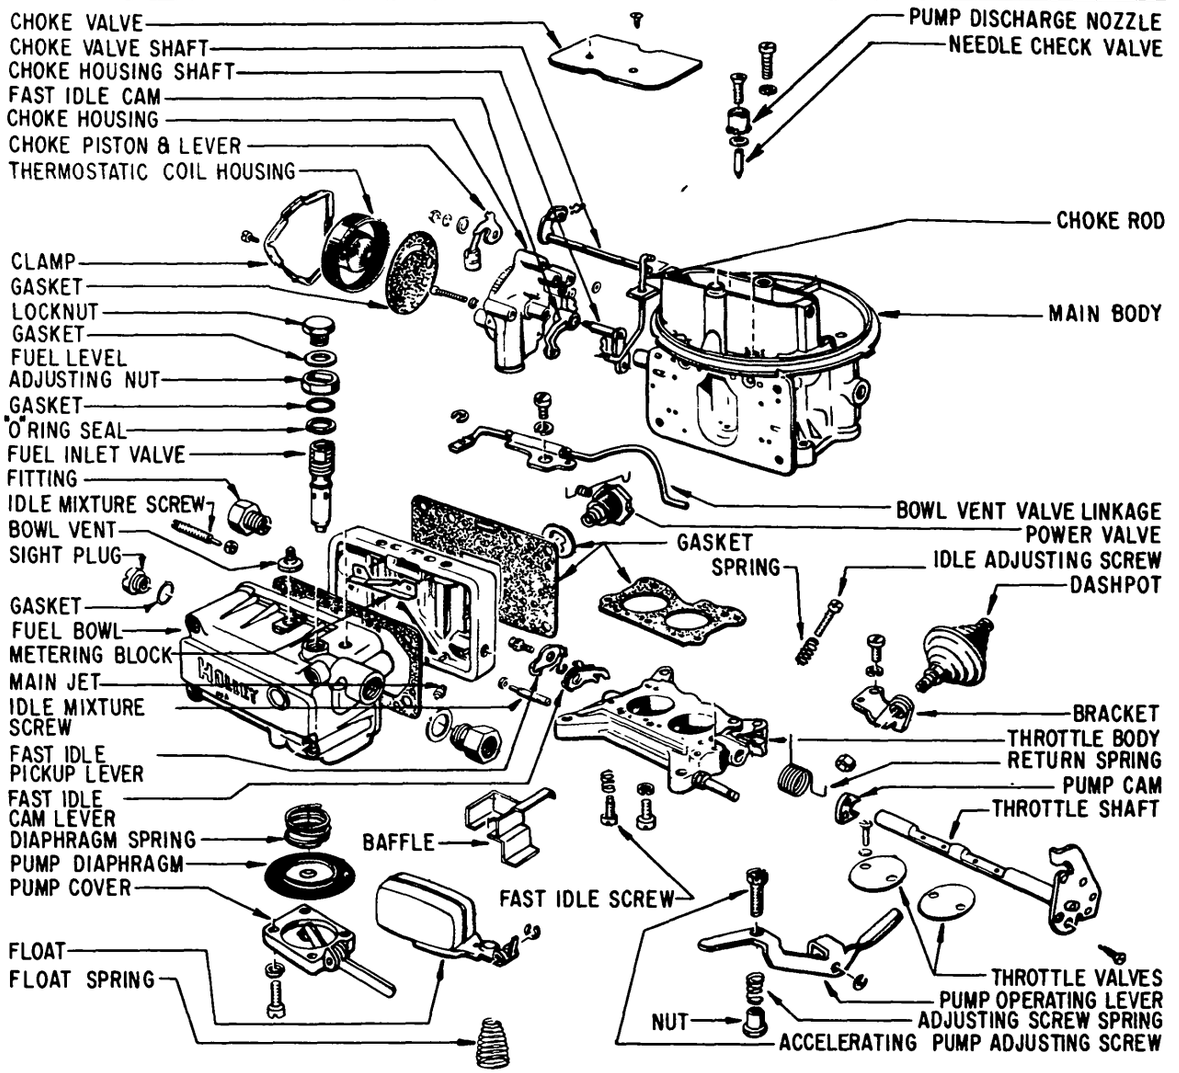
Ⓒ - Without hand throttle. ② - With hand throttle.
③ - Closed Crankcase Ventilation.

DESCRIPTION: 2&4–Barrel carburetors are of same design used on previous models except as follows:



Front & Rear Carburetors (Ford 390" High Performance Engin): These carburetors are same as the center carburetor except that choke system and fast idle mechanism have been eliminated.

ADJUSTMENTS: Idl Mixtur Setting (Exc. Ford Triple Carbs.)– Initial adjustment is 1 turn open (Rambler); 1–1½ turns open (Ford Pass. Cars & Truck) from a lightly seated position. For final adjustment, bring engine to normal operating temperature and place transmission selector lever in "N" (neutral). Turn both idle mixture screws in until engine runs rough from a lean mixture, then turn screws out until engine rolls from rich mixture. Finally turn screws in just enough for smooth idling at highest RPM and highest vacuum. Reset engine idle speed to correct RPM (see table below).

Idl Mixtur S tting (F rd Triple Carbs.): Initial adjustment is ¾ turn open (front & rear carburetors); 1 turn open (center carburetor) from a lightly seated position. For final adjustment, proceed as for other models (see above), adjusting each carburetor individually, starting with the center carburetor, followed by front carburetor, then rear carburetor.

Initial Idl Sp d Setting (F rd Triple Carbs.): Back off idle speed adjusting screws on front and rear carburetors enough to allow throttle plates to seat in throttle bores, then turn idle speed screws inward until screw end just touches throttle shaft arm. **Turn screws in n additi nal full turn.**

Synchr nizing Thr ttl Linkag (F rd Tripl Carbs.): Disconnect linkage at front and rear carburetors and at bellcrank lever (center carburetor–to–bellcrank rod). Adjust length of front carburetor rod so that, when installed, throttle lever on front carburetor will be against wide open throttle stop when center throttle lever is in wide open position against stop. Adjust length of rear carburetor rod in same manner, then install front and rear carburetor rods on throttle levers and tighten rod lock nuts. Adjust length of center carburetor–to–bellcrank rod to 7¼" (center–to–center) and install rod on bellcrank lever. Disconnect accelerator–to–bellcrank lever rod at bellcrank lever, then on standard transmission cars, adjust length of accelerator–to–bellcrank rod to obtain wide open throttle when accelerator pedal is depressed to floor. On Overdrive transmissions, depress accelerator pedal enough to close overdrive kickdown switch, then with accelerator in this position, adjust length of accelerator–to–bellcrank rod to obtain wide open throttle on center carburetor. *NOTE – With the above adjustm nt, it will n t b p s- sible to obtain maximum throttle (in overdrive). To obtain maximum throttle position (in overdrive), it will be necessary to shorten the accelerator rod to prevent engagement of overdrive switch (thus eliminating any kickdown).* Assemble rod to bellcrank lever and tighten clevis locknut.

HOLLEY 2-BBL. CARBURETOR (TYPICAL)

Idle Speed (Hot Engine) Setting: With engine at normal operating temperature, fast idle screw backed off so it does not touch fast idle cam, choke valve wide open, and transmission in neutral (Synchro-mesh), in proper range (Auto. Trans. - see table below), adjust engine idle speed to correct RPM (see table below).

CONTINUED ON NEXT PAGE

1961 HOLLEY 2 & 4-BARREL CARBURETORS (Cont.)

Car Model	S.M. Trans.	Auto. Trans.
Ford Pass. Car ..... ④	575-600 RPM	①450-475 RPM
Ford Truck (2-Bbl.Carb.)	500-550 RPM	①475-525 RPM
Ford Truck (4-Bbl.Carb.)	525-575 RPM	①475-525 RPM
Rambler	③550 RPM	②③475 RPM

① - Transmission in "D" (Drive).
② - Transmission in "N"(Neutral).
③ - 500 RPM on Air Cond. Cars (compressor on).
④ – 750 RPM (390" Eng. with Triple Carburetors). Idle speed adjusting screw on center carburetor only.

Anti-Stall Dashpot (Automatic Transmission Cars): *See "Carburetor" on individual car model pages.*

Accelerating Pump Over-Ride Adjustment: Hold throttle valves wide open and depress pump arm fully. Distance between pump lever adjusting screw hex head and pump arm should be .015" (Exc. Rambler 2-Barrel Carbs.). To adjust, hold hex nut stationary and turn screw on pump lever. On Rambler 2-Barrel carburetors, turn screw on pump lever in until it just contacts pump lever, then tighten screw ¼ turn. Check accelerating pump to make sure that when throttle lever starts to move that pump lever also starts to operate.

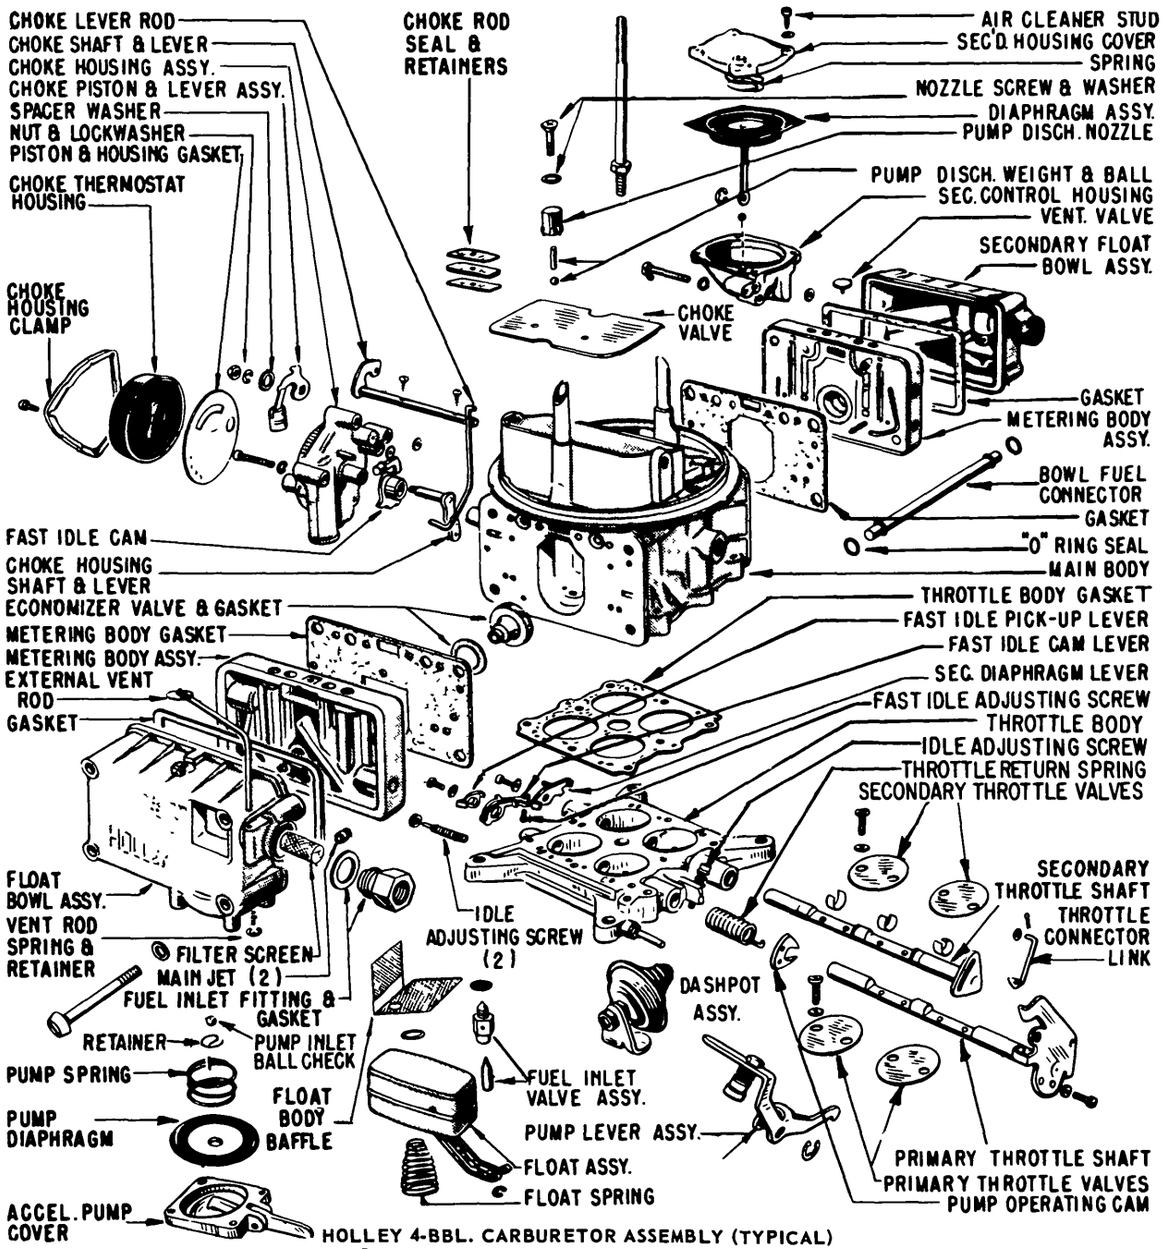
Accelerating Pump Stroke Adjustment: *NOTE - This is a s asonal setting on all models.*

Normal (Summer) Setting - Install pump cam screw in No. 1 hole in cam. *NOTE - This provides minimum stroke.*

Winter Setting - Install pump cam screw in No. 2 hole in cam. *NOTE - This provides maximum stroke.*

Fu l Bowl Vent Setting (Rambler): With throttle valves fully closed, distance between top of fuel bowl and vent button should be .050-.070". To adjust, bend vent arm of accelerating pump lever. *CAUTION - Do not bend vent valve rod.*

Fl at Level (Dry Setting - On Bench): *NOTE - Float level settings are intended for initial bench adjustment only. After carburetor installed on engine, the fuel level must be checked and the necessary float level adjustments made. See "Fuel Level" below. Float level will be correct when fuel level is adjusted.* With fuel bowl inverted lower side of float should be parallel to fuel bowl (except Ford 390" Eng. with Triple Carbs. & Ford Trucks). On Ford 390" Eng. with Triple Carbs. & Ford Trucks, distance from lower side of float to fuel bowl should be 7/8" (2–Barrel Carbs. & Primary Float on 4–Barrel Carbs.); ¾" (Secondard Float on 4–Barrel Carbs.). To adjust level, loosen top lock screw on needle and seat assembly and rotate adjusting nut as necessary.



Fuel Level: With vehicle on a level floor, bring engine to normal operating temperature, then remove air cleaner and stop engine. Remove sight plug in end of fuel bowl (use container to catch fuel). Fuel level within bowl should be at lower edge of sight plug hole (+1/16"). To adjust, proceed as follows:

Fuel Level Too High - With engine stopped, loosen lockscrew on top of fuel bowl just enough to allow rotation of nut underneath. *CAUTION - Do not loos n lockscrew or attempt to adjust fuel level with engine running.* Turn adjusting screw ½ turn clockwise to lower fuel level below specifications. Tighten lockscrew, then run engine to stabilize fuel level. Check fuel level at sight plug hole. If level is not below specified level, repeat above step. With fuel level below specified level, turn adjusting nut in increments of 1/6 turn until correct fuel level is obtained. *NOTE - 1/6 turn of adjusting nut will change fuel level at sight plug opening 3/64".*

Fu l L v l T Low - Proceed as for "Fuel Level Too High" except that it will not be necessary to initially decrease fuel level below specifications.

Unloader (Rambler): With throttle valves in wide open position, distance from top of choke valve to wall of air horn should be 3/16". To adjust, bend tab on throttle shaft lever (where it contacts fast idle cam).

Fast Idle - Off Engin (Rambler): With choke valve fully closed and fast idle adjusting screw on high step

HOLLEY 4-BBL. CARBURETOR ASSEMBLY (TYPICAL)

CONTINUED ON NEXT PAGE

1961 HOLLEY 2 & 4-BARREL CARBURETORS (Cont.)

of fast idle cam, the clearance between throttle valve and bore on side opposite idle ports should be .024" (Rambler 2-Barrel); .016" (Rambler Series 20 4-Barrel); .025" (Rambler Series 80 4-Barrel). To adjust, turn fast idle adjusting screw.

Fast Idl – On Engin : (F rd Pass. Cars, except 390" Eng. with Tripl Carbs.) – With fast idle cam in slow idle position (bottom step on cam contacting fast idle screw), turn fast idle screw until it just touches lowest step on fast idle cam, then back screw off ¼ turn.

F rd Pass. Cars With 390" Eng. and Triple Carbs. – With fast idle screw on top step of fast idle cam and engine at normal operating temperature, adjust fast idle screw to obtain an engine speed of 1800 RPM.

Ford Trucks - *NOTE - On 2-Barrel carburetors, fast idle will be properly adjusted when engine hot idle is adjusted.* On 4-Barrel carburetors proceed as follows: With engine at normal operating temperature and "hot" idle speed adjusted, place primary throttle valves in closed position and check clearance between fast idle cam and head of fast idle screw. Clearance should be .010-.015". If clearance not correct, remove governor housing and insert a .060" rod into hole in end of fast idle screw fitting to prevent it turning, then turn fast idle screw as necessary for desired clearance. *NOTE - ¼ turn of screw (in or out) will change clearance approximately .008".*

Rambler - With engine at normal operating temperature, place fast idle screw on high step of fast idle cam and adjust engine RPM to approximately 1700 RPM.

Automatic Choke Setting (Exc. Ford Trucks): Loosen choke cover retaining clamp screws and rotate cover to align index mark on cover with correct mark on choke housing as indicated in table below.

Aut matic Ch k S tting

Car & Carb.	Ch ke Setting
Ford Pass. (Exc. Triple Carbs.)	1 notch rich
Ford Pass. (Triple Carbs.)	Centered (At Index)
Rambler (2–Bbl. Carb.)	1 notch rich
Rambler (4–Bbl. Carb.)	1 notch lean

OVERHAUL: *See 1958 Annual Data, Page 274, or later Manual editions and note the following:*

Balance Tube (Ford Truck): Install balance tube "O" rings and washers so balance tube extends equally from faces of primary and secondary metering bodies.

SERVICE PARTS: Gasket Set – Ford No. C1AZ–9502–B (C1AE–9510–AM); No. C1TZ–9502–A (C1TE–9510–A, AM); No. B9A–9502–A (C1TE–9510–AE, AF, AG, E, K, L, C1AE–9510–AU, AV). Holley No. 85G–963 (1957–1, 1958–1).

© - Part No. stamped on carburetor.
② - Closed Crankcase Ventilation.

►*CARBURETOR IDENTIFICATION NOTE: Part number is stamped on flat surface of main body at fuel inlet.*

►*HIGH FUEL CONSUMPTION CORRECTION (EXC. ECONOMY CARBS):* Power valve may be damaged or improperly installed. Check diaphragm for tears and replace if necessary, then install as follows: Be sure there are no restrictions in vacuum passages of cover, then install screws through cover. Carefully thread screws through diaphragm and plate and install gasket next to plate. Hold assembly together (do not allow diaphragm to drop away from cover) and locate the assembly squarely on carburetor bowl and tighten the screws to 13-17 inch pounds evenly. *CAUTION - Do not overtighten cover screws.*

HOLLEY MODEL 1904 "VISI-FLO" CARBURETOR (WITH MANUAL CHOKE)

DESCRIPTION: Single barrel downdraft type with either manual or automatic choke. Designs are similar to previous models and have the following features:

Holley Model 1904: Main nozzle tube is pressed into venturi wall directly below choke valve axis and discharges into a cutout section of choke valve. A fuel distribution pin (crosswise in choke shaft) extends into air stream and improves nozzle action. Pump discharge nozzle is a separate part mounted on upper ledge of venturi and is retained by a special nozzle retainer screw. *NOTE - This nozzle must be adjusted after carburetor is installed on engine.*

Holley Model 1908: Main nozzle tube and pump discharge nozzle are pressed into wall of venturi and are not removable. Choke valve plate is linked to choke shaft and lever assembly, choke valve plate is mounted in upper part of air horn. On models with automatic choke, fast idle cam is mounted on choke shaft (behind choke housing) and, on Rambler models, serves as a stop for idle speed adjusting screw (separate fast idle adjustment not required). On Comet models, a separate fast idle adjusting screw is provided.

Spark Control Valve (Holley 1904 & 1908 Models, Except Rambler): This unit is a spring loaded diaphragm type valve located in distributor control vacuum passage terminating at throttle valve edge (manifold vacuum). The valve is normally open but closes momentarily during acceleration (when manifold vacuum drops) to prevent excessive distributor advance (second port terminating at venturi provides vacuum to control distributor under these conditions). The valve also provides an intermediate distributor retard position under load conditions when normal spark advance would be too great and where wide open throttle spark retard is not required. No adjustment is provided.

ADJUSTMENT: Make all adjustments as follows:

Idling Adjustment: If initial adjustment required to warm engine, turn idle mixture screw in until lightly seated, then back screw out 1-1½ turns (Exc. Rambler); 1¼ turns (Rambler). Operate engine at fast idle until normal operating temperature reached, then adjust as follows:

Idle Mixture - With engine at normal operating temperature (choke valve wide open, fast idle inoperative), adjust idle speed (see below), turn idle mixture adjusting screw in until engine runs rough from lean mixture, then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough so that engine

CONTINUED ON NEXT PAGE

HOLLEY "VISI-FLO" CARBURETORS (C ntinued)

idles smoothly. This will provide a slightly rich mixture which is desired. Recheck idle speed.

Idle Speed -With engine at normal operating temperature so that throttle stopscrew resting on lowest point of fast idle cam (choke lever), adjust stopscrew for correct idle speed as listed in table below. *NOTE* - On Fordomatic cars, set hand brake to hold car and place selector lever in Neutral, then recheck idle speed with selector lever in Drive "D" position.

	Idl Speed Setting	
Car Mod l	Synchro-mesh	Auto. Trans.
Comet & Falcon	500-525 RPM	②475-500 RPM
Ford & Mercury	500-525 RPM	②475-500 RPM
Ford Trucks	500-550 RPM	②475-525 RPM
Rambler	①550 RPM	③①475 RPM

① - 500 RPM on Air Conditioned Cars, with compressor operating.
② - Transmission in "D" (Drive) Range.
③ - Transmission in "N" (Neutral).

Anti-Stall Dashpot Adjustment (Exc. Rambler): *See CARBURETOR on Car Mod l pages.*

Accelerating Pump: Seasonal adjustment provided by two holes in throttle lever for pump link engagement:
Inner Hole - Normal or hot weather (short stroke).
Out r Hole - Cold weather operation (long stroke).

Fu l L v l: *See tabl below for fuel level and checking gaug* . To check fuel level, remove Power Valve diaphragm cover and valve assembly. Install checking gauge in this opening and crank engine to fill bowl. Fuel in bowl should touch "Low" gauge pin and should not touch "High" gauge pin. If adjustment required, remove float bowl and install dummy bowl (with open top) using three of the regular retaining screws. Adjust by using bending tool to bend float arm tab, recheck fuel level before installing regular bowl.

RAMBLER NOTE - Use scale inserted through power valve mounting hole to measure fuel level.

	Fu l Level Setting	
Car M d l	①② Fuel Level	Checking Gauge
Comet	23/32"	9550-AE-4
Falcon	23/32"	T52L-9550-AEE
Ford Pass.	11/16"	T52L-9550-AEE
Mercury	11/16"	9550-AE-3
Econoline Trucks	23/32"	T52L-9550-AEE
Ford Trucks (Exc. 262" Eng.)	11/16"	T52L-9550-AEE
Ford Trucks (262" Eng.)	3/4"	
Rambler	3/4"	Use Scale

① - Plus or Minus 1/32".
② - Below mounting surface of power valve.

Fl at Level: *This is a bench check and Fuel Level should be checked after carburetor has been installed on engine.* On all models, use float gauge furnished in repair package (see table below). *NOTE - On Rambler models, if gauge is not furnished with repair package, us Holley Tool No. indicated in table.* With bowl removed and carburetor inverted, place gauge on bowl mounting flange at free end of float. Lowest point on float should clear lower leg of gauge. Adjust by bending small tab on float lever that contacts head of fuel inlet needle.

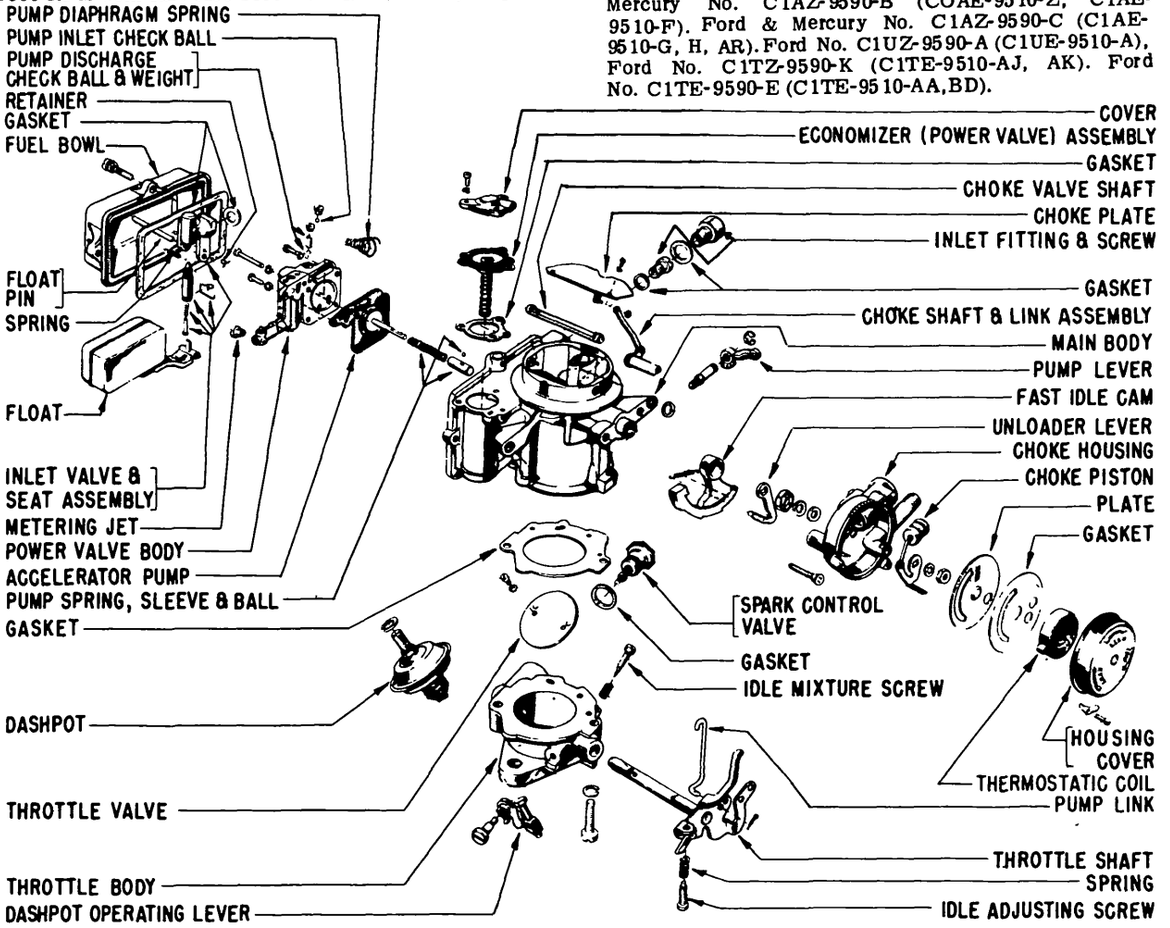
	Float L v l Setting	
Car Model	① Float L v l	Checking Gaug
Comet & Falcon	11/64"	MC-157
Ford Pass. Cars	13/64"	MC-157
Ford Trucks	13/64"	MC-157
Mercury	13/64"	9590-1
Rambler		②J-10-231

① - Plus or minus 1/64". ② - Holley Tool number.

Power Valve: *NOTE - Used on all carburetors except "Economy Models".* No adjustment provided. Power valve opens when manifold vacuum drops to 4-7" Hg.

Spark Control Valve (Except Rambler): Spark control valve is not adjustable.

Automatic Choke (Rambler & Comet): Adjust by loosening cover retaining screws and rotating choke cover and thermostatic coil assembly. Choke should be set at Index (Exc. Rambler R-2381-1); 3 point Lean (Rambler R-2381-1). *NOTE* - On Comet models, do not vary choke setting more than two points



Fast Idle (Except Comet): No adjustment required.

Fast Idle (Comet): After hot (slow) idle speed properly adjusted, adjust fast idle screw for an engine speed of 1600 RPM with fast idle screw on first (lowest) step of fast idle cam.

Unload r (Comet & Rambler): With throttle valve in wide open position and choke valve closed against unloader lever, clearance between edge of choke valve and wall of air horn should be 1/4" (Comet), 7/16" (Rambler). To adjust, bend unloader tab on throttle lever.

OVERHAUL: *See 1960 Annual Data, Page 289, or later Manual edition.*

SERVICE PARTS: Gasket Set - Comet No. C1KY-9502-A (C1GE-9510-A,B,C,D,E,F,G,H). Ford No. CODZ-9502-A (CODE-9510-A,B,C,D, C1DE-9510-A,C,D,E,F, C1TE-9510-AR, C1UE-9510-A). Ford & Mercury No. B8A-9502-C (COAE-9510-E,U,Z, C1AE-9510-E,F). Ford No. C1TZ-9502-B (C1TE-9510-V,Y,Z,AA,AC,AD,AJ, AK,AL,BD).

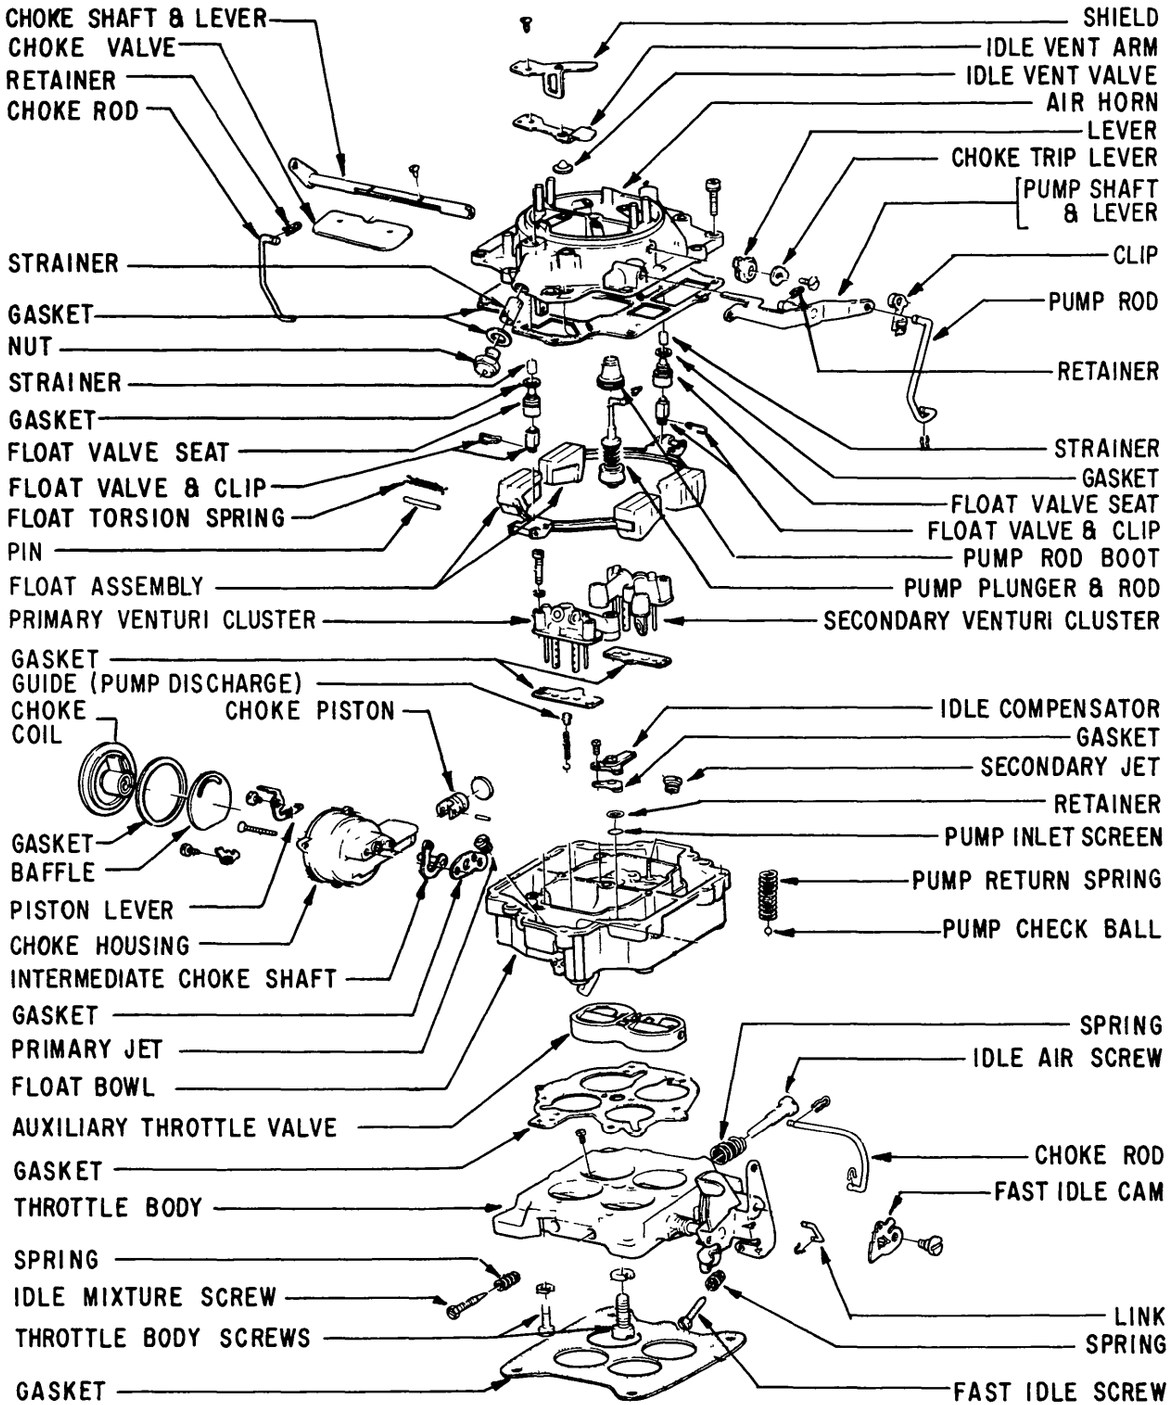
►CHANGES, CAUTIONS, CORRECTIONS



►*1961 CADILLAC HARD COLD STARTING CORRECTION:* Hard starting may be caused by choke valve sticking in a slightly open position (as little as 1/32" open from a fully closed position will cause hard starting). To check for sticking, hold throttle valve slightly open and by pushing on choke valve, feel for interference. Correct by removing choke valve and filing off the burr or contact point, using a fine toothed file. *NOTE - A bright or polished area on air horn will indicate point of interference.*

►*BUICK HARD "HOT" STARTING & POOR IDLE CORRECTION:* On later carburetors, make sure the throttle body gasket is a "vented" type having vent slots adjacent to secondary throttle bore holes in gasket. Early type gaskets were "solid" and should be used only on carburetors having four drilled vent holes.

►*1961 PONTIAC TEMPEST ENGINE SURGE CONDITION CORRECTION:* A surge condition when operating under a load at cold temperature can be corrected by installing jets, Part No. 7001860 jets to replace jets, Part No. 7001498. Later production carburetors have the new jet.

►*1961 PONTIAC TEMPEST 4-CYL. (AUTOMATIC TRANS.) STALL AFTER START CORRECTION:* Set choke 2 notches rich from index. On carburetors not

CONTINUED ON NEXT PAGE

ROCHESTER 4-BBL. CARBURETOR (TYPICAL)

1961 ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

having change letter "B" or higher on tag, install new choke piston, Part No. 7020357 in addition to setting choke 2 notches rich.

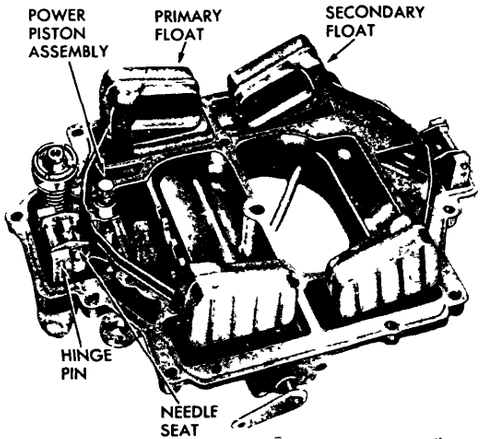
►*1961 PONTIAC TEMPEST 4-CYL. (SYNCHRO-MESH TRANS.) STALL AFTER START & LEAN DURING WARM-UP CORRECTION:* On carburetors not having change letter "B" or higher, set choke one notch rich from index. Change fast idle speed from 2500 to 2800 RPM. Install Exhaust Manifold Heat Control Valve Thermostat Spring, Part No. 531972. Install Choke Piston, Part No. 7020357. *NOTE - Carburetors with change letter "B" or later on tag should be set to the above specifications.*

DESCRIPTION: 4-barrel downdraft type with automatic choke. Design is similar to carburetors used on corresponding previous models.

ADJUSTMENTS: *Make all adjustments in sequence given below (except for Idle Speed & Mixture adjustments).*

►*CADILLAC & PONTIAC TEMPEST IDLE SPEED SETTING NOTE:* Throttle valves are completely closed at low idle speed and air is admitted through Idle Air System which consists of a bypass passage (primary side only) through which air for closed throttle operation is taken from above the throttle valves through a metered (non-adjustable) orifice and an adjustable orifice to each primary bore. An idle speed screw (single screw for both primary bores) controls the adjustable orifice and all idle speed adjustments are made with this screw (throttle stopscrew not used).

►*IDLE SETTING CAUTION (CARS WITH IDLE COMPENSATOR):* Make sure that idle compensator is closed when adjusting idle speed. If necessary, idle compensator valve can be closed with a pencil. After idle speed is adjusted, press down on idle compensator valve to see if speed is affected. If speed drops, readjust idle speed, being sure that compensator valve is closed.



Idl Sp ed & Mixture Setting (Except Cadillac & Pontiac Tempest): If preliminary adjustment required to warm up engine, set both idle mixture screws 1½ turns open from a lightly seated position. With engine at normal operating temperature (choke valve wide open and fast idle inoperative so that engine idles at hot or slow idle speed), set throttle stopscrew for correct idle speed as listed below. Adjust both primary idle mixture adjusting screws equally so that engine idles smoothly and RPM is at maximum (see special notes below). Recheck idle speed.

►*BUICK NOTE:* Turn each adjusting screw in until engine begins to lag or run unevenly from lean mixture then turn screw out until engine begins to roll from rich mixture, finally turn screw in just enough to provide smoothest operation. Adjust both screws alike.

►*CHEVROLET NOTE:* Turn adjusting screw in to lean mixture until engine is moderately rough (slight vacuum and RPM drop), then turn screw out ¼ turn to enrich mixture. Adjust both screws alike.

►*OLDSMOBILE NOTE:* After adjusting idle mixture screws (above) for smoothest idle with highest RPM, turn each adjusting screw out ¼ turn (vacuum and RPM will drop off slightly).

Idle Speed & Mixture Setting (Cadillac & P ntiac T mp st): *CADILLAC NOTE - Disconnect parking brake vacuum diaphragm line from neutral safety switch and tape over switch opening to prevent any air leak (hose must be disconnected at this connection only).* With engine at normal operating temperature, transmission in "N" (Neutral), choke valve fully open and carburetor on "slow" idle (throttle valves fully closed), connect a tachometer to engine. On Cadillac, loosen front and rear throttle valve jam nuts at carburetor throttle lever trunnion. On all cars, place automatic transmission in "D" (Drive), then adjust engine idle to specified idle speed (see below) using the idle air bypass screw (idle speed adjusting screw) on throttle body. Turn one idle mixture screw until highest engine RPM is reached and highest vacuum is obtained at the same time, then repeat this operation with other idle mixture screw. Check and reset engine idle speed. Repeat idle mixture adjustment until turning the idle mixture adjusting screws will not increase engine RPM and the smoothest engine idle is obtained. *CAUTION - Idle mixture screws must be adjusted last and must always be readjusted when the idle speed screw setting is changed.*

Chevrolet ③	475	④450
Oldsmobile ⑤	550	④500
Oldsmobile F-85 ⑤	550	④⑥500
Tempest (Exc. Air Cond.)	680-700	580-600
Tempest (Air Cond.) ①	680-700	④630-650

① - With Air Conditioner turned OFF.
② - Selector lever in "N" (Neutral) or "P" (Park).
③ - With Air Conditioner operating.
④ - Selector lever in "D" (Drive).
⑤ - Air Conditioner turned OFF (Carburetors with Idle Compensator), turned ON (Carburetors without Idle Compensator).
⑥ - 550 RPM on Air Conditioned Cars.

Anti-Stall Dashp t & Thr ttl R turn Check Adjustment: *See "Throttle Linkag Adjustment" under CARBURETOR on each car model page.*

Float Setting: *Both Primary and Secondary Float Assemblies must be checked and adjusted separately and FLOAT LEVEL & FLOAT DROP (Vacuum Assist Spring on carburetors with this feature) must be check d for each assembly.* Remove bowl cover and float assemblies from carburetor but do not remove bowl cover gasket.

Primary Float Level Adjustment (Exc. Chevrolet & Pontiac Tempest): *NOTE - Pump side of gauge should always face pump assembly when checking float adjustment.* With air horn inverted and gasket in place, install float level gauge under heel of primary float. With gauge vertical, float should just touch gauge. To adjust, bend float arms at rear. Slide gauge under toe of floats. Lower surface of floats should just touch gauge. Bend float arm adjacent to float as necessary. Lower surface of floats should be parallel with air horn surface and gauge should slide freely under floats. With gauge still under floats, hold lug on lower surface of gauge against outside of air horn casting. Floats should center in cutout portion between gauge legs. To adjust, bend float arms horizontally until floats are centered at heel and toe. Move float assembly from side to side at hinge pin and check to make sure floats do not rub sides of gauge legs.

Primary & Secondary Float Level Adjustment (Chevrol t & Pontiac Tempest): *Both floats are adjusted in same manner. On Chevrolet carburetors, different gauges and settings are required for primary and secondary floats as listed in table below.* With bowl cover and float assembly inverted and gasket in place, install correct float level gauge over floats and against curvature of air horn so that gauging legs rest on cover gasket with locating lugs on inner legs extending into air horn. Make two adjustments as follows: 1) With gauge vertical, upper surface of floats should just touch edge of cutouts in float gauge. Adjust by bending arm at rear. 2) With gauge still in place and centered in air horn, floats should be centered between gauge legs. Adjust by bending float arms horizontally. Check adjustment by moving float assembly from side to side at hinge pin. Floats must not rub on sides of gauge legs.

Secondary Float Level Adjustment (Exc. Chevrolet & Pontiac Tempest): After checking primary floats (above) invert float gauge and install over heel end of secondary floats so that gauging legs rest on cover gasket with locating lugs on inner gauge legs extending into air horn. Make two adjustments as follows: 1) With gauge vertical, upper surface of floats should just touch edge of cutouts in gauge. Adjust by bending float arm at rear. 2) With gauge still in place and centered in air horn, floats should be centered between gauge legs. Adjust by bending float arms horizontally. Check adjustment by moving float assembly from side to side at hinge pin. Floats must not rub on sides of gauge legs. Then check and adjust float toe (following).

Secondary Float Toe Adjustment (Buick): With air horn inverted and gasket in place, distance from center of dimple on side of float at toe to gasket should be 3/8". To adjust, bend toe of float as necessary while holding float arm adjacent to float. Recheck float heel adjustment if toe adjustment is necessary.

CONTINUED ON NEXT PAGE

1961 ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

Primary & Secondary Float Toe Adjustment (Pontiac T mpest): Measure and adjust in same manner as for Buick above. Distance from gasket to dimple should be 9/16" (both float assemblies).

S c ndary Float Toe Adjustment (Cadillac & Oldsmobile): With bowl cover and float assembly inverted, raise gasket and sight across flat surface of cover at toe end of secondary floats. Toe end of each float must be FLUSH with this surface. Adjust by bending float arm at point close to float. *CAUTION - After making this adjustment, recheck float level and adjust if necessary.*

Float Level Setting

Car M del	Primary Height & Gauge No.	Secondary Height & Gauge No.
Buick (All)	9/64" BT-178	1 3/8" BT-171
Cadillac	15/64" BT-172	1 3/8" BT-172
Chevrolet	1 33/64" BT-182	1 37/64" BT-183
Oldsmobile	9/32" BT-171	1 3/8" BT-171
Oldsmobile F-85	7/32" BT-198	1 3/8" BT-198
Pont. Tempest	1 21/64" BT-196	1 21/64" BT-196

Primary Float Vacuum Assist Spring Adjustment (Cadillac & Oldsmobile): With bowl cover and float assembly held upright, hold vacuum piston in full up position, jounce floats slightly to make certain that the vacuum assist spring cup is not binding on piston stem. Use a scale to measure from face of gasket to center of dimple on side of primary float at toe (free end) with power piston held in up position. If this dist ance is not 1 3/32" (Cadillac), 1 3/64" (Oldsmobile, Exc. F-85), 29/32" (Oldsmobile F-85), adjust by bending tang on float arm which engages power piston stem. Use bending tool BT-142,

Fl at Drop Setting: *Check the Float Drop after Float L vel Setting & Vacuum Assist Spring adjustments have been made.*

Primary & Secondary Float Drop Adjustment (Except Ch vrolet) - *NOTE - On carburetors with Vacuum Assist Spring Primary Floats, vacuum assist piston must be fully extended in the "down" position when ch cking float drop of primary floats.* With bowl cover and float assembly held upright, use a scale to measure from face of gasket to center of dimple on side of floats at toe (free end). *CAUTION - On vacuum assist spring type primary floats, make certain that piston is fully extended so that float is positioned by stop tang on rear of float arm rather than by tang engaging vacuum piston stem.* If this distance not correct as shown in table below, adjust as follows: Bend tang at rear of float arm toward needle seat(or balance spring) to decrease drop and away from needle seat(or balance spring) to increase drop.

Float Drop Setting

Car Model	Primary Floats	Secondary Floats
Buick (Exc.Spec.)	1 7/16"	1 5/16"
Buick Special	1 9/16"	1 7/16"
Cadillac	1 1/2"	1 5/16"
Chevrolet	2 1/4"	2 1/4"
Oldsmobile(Exc.F-85)	1 1/2"	1 5/16"
Oldsmobile F-85	1 1/2"	1 3/8"
Pontiac Tempest	1 1/4"	1 1/4"

Primary & Sec ndary Fl at Dr p Adjustm nt (Chevr let) - With bowl cover and float assembly held upright, use a scale to measure from face of gasket to lowest portion of float(bottom of float at center). This distance should be as indicated in table (above). Adjust by bending tang at rear of float arm toward needle seat to decrease float drop, away from needle seat to increase float drop.

Accelerating Pump Adjustment (Except Buick, Buick Special, Oldsmobile F-85 & Pontiac Tempest): *CAUTION - This is a linkage adjustment and not a seasonal change recommendation.* Back out slow idle speed and fast idle speed screws until throttle valves are completely closed. *NOTE - On Oldsmobile (Except F-85), pump rod must be connected in INNER hole of pump arm.* Hold throttle valves in closed position and place correct gauge(see table below)on top of air horn next to pump plunger. End of plunger shaft should slide freely into hole on gauge marked "Pump". If height not correct (see table below), adjust by bending pump rod with bending tool BT-18.

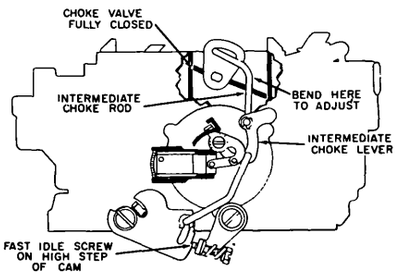
Buick, Buick Special, Oldsmobile F-85 & Pontiac Tempest - Back out slow idle speed and fast idle speed screws until throttle valves are completely closed. Pump rod must be connected in CENTER hole of pump arm (Buick and Buick Special); in OUTER hole of pump arm, furthest from pump arm shaft (Oldsmobile F-85). *NOTE - Single hole only in pump arm of Pontiac Tempest.* Hold throttle valves closed, then measure distance between top surface of air horn and bottom of horizontal portion of pump plunger shaft. If distance not correct (see table below), adjust by bending pump rod.

Accelerating Pump Stroke Setting

Car Model	Gauge No.	Pump Shaft Height
Buick (Exc. Spec.)	Scale	① 1 1/64"
Buick Special	Scale	① 61/64"
Cadillac	BT-180	27/32"
Chevrolet	BT-145	1 1/16"
Oldsmobile(Exc.F-85)	BT-166A	② 1 1/64"
Oldsmobile F-85	Scale	③ 1 1/64"
Pontiac Tempest	Scale	15/16"

① - With pump rod in center hole of pump arm.
② - With pump rod in inner hole of pump arm.
③ - With pump rod in outer hole of pump arm (furthest from pump arm shaft).

Atmospheric Idle Vent Adjustment: Cadillac & Oldsmobile F-85 - *NOTE - Make fast idle adjustment before adjusting idle vent.* With fast idle screw on high step of fast idle cam, vent valve should just be closed. To adjust, bend tang on pump lever.



Chevrolet & Oldsmobile (Exc. F-85) - Place combination "Pump" and "Vent" gauge, BT-145 (Chevrolet); BT-166A (Oldsmobile) next to pump plunger shaft. Open throttle valves to point where vent valve is just closed. With throttle valves held in this position, hole in gauge marked "Vent" should slide freely over pump shaft. To adjust, bend tang on pump lever. If a scale is used, distance from top of air horn to bottom of pump plunger shaft should be 3/32" (Chevrolet); 29/32" (Oldsmobile).

Pontiac Tempest - Measure distance from top of air horn casting to bottom of pump plunger rod (primary throttle valves opened to a point where idle vent valve just closes). This distance should be 55/64". To adjust, bend tang on pump lever.

Interm diat Ch k R d Adjustm nt (Exc pt Oldsm bil): *NOTE - This rod connects l ver on choke valv shaft to choke lever on automatic choke housing.* Hold choke valve completely closed and bend intermediate choke rod as necessary so choke piston is flush with end of choke piston sleeve.

Oldsmobile & Oldsmobile F-85 - *NOTE - Mak fast idle adjustment before adjusting int rm diat ch k rod (see below).* With fast idle properly adjusted, place fast idle screw on high step of fast idle cam and raise intermediate choke lever to its full up position. Make sure all lash is removed from rods in slots. Choke piston should be flush with end of choke piston sleeve. To adjust, bend intermediate choke rod to correctly position choke piston.

Automatic Choke Setting (All Mod ls): Loosen three retaining screws and rotate thermostat cover until index mark is in line with correct mark on housing (see table below). Tighten cover retaining screws. *NOTE - "Centered" point on housing is indicated by a raised section on housing casting.*

OLDSMOBILE CHOKE & FAST IDLE LINKAGE

Automatic Ch k Setting

Car Model	Ch k S tting
Buick (All)	Centered (At Index)
Cadillac	1 Point Rich
Chevrolet	Centered (At Index)
Oldsmobile (All)	Centered (At Index)
Pontiac Tempest(Synchro-mesh)	① 1 Point Rich
Pontiac Tempest(Auto. Trans.)	① 2 Points Rich

① - Supersedes previous setting of "Centered (At Index)".

Fast Idle Setting: *NOTE - Chevrolet Fast Idle adjustment will be correct when "slow idle" speed and choke rod adjustments have been made. On other models, the "On Engine" fast idle adjustment must be made after carburetor installed to insure proper warm-up p rformance.*

"Off Engine" Adjustment - Turn fast idle screw against high step of fast idle cam until throttle valve opening or clearance between edge of throttle valve and bore on side opposite idle mixture adjusting screws is correct as shown in table below.

Fast Idle Setting

Car Model	Throttl Valv Op ning	Ch cking Gaug
Buick (Exc. Spec.)	.028"	BT-79
Buick Special (Auto. Trans.)	.028"	BT-79
Buick Special (S.M. Trans.)	.020"	BT-67
Cadillac	.024"	BT-90
Oldsmobile (All)	.024"	BT-90
Pontiac Tempest	.028"	BT-79

CONTINUED ON NEXT PAGE

1961 ROCHESTER 4GC 4-BARREL CARBURETORS (Cont.)

"On Engine" Adjustment - With engine at normal operating temperature, rotate fast idle cam so that fast idle adjusting screw is on high step of cam (except Buick & Buick Special); on low step of cam (Buick & Buick Special). Start engine and adjust fast idle screw for correct engine RPM as shown in table below. *NOTE - On Chevrolet, fast idle engine RPM will be correct after hot or slow idle speed has been correctly set.*

Fast Idle Speed

Car Model	Engine RPM
Buick (All)	①650
Cadillac	1700
Oldsmobile (Exc. F-85)	1600
Oldsmobile F-85	1900
Pontiac Tempest (Synchro-mesh)	②2800
Pontiac Tempest (Auto. Trans.)	3000

① - With fast idle screw on low step of fast idle cam.
② - Supersedes previous fast idle speed of 2500 RPM.

Choke Rod Adjustment: *NOTE - On all cars except Oldsmobile & Oldsmobile F-85, this rod connects choke valve shaft to fast idle cam. On Oldsmobile and Oldsmobile F-85, the rod connects intermediate choke lever to fast idle cam.* Rotate choke valve and fast idle cam until fast idle screw (slow idle screw on Chevrolet) is in contact with SECOND step of fast idle cam and against shoulder of highest step of cam. On Oldsmobile, raise intermediate choke lever to full up position making sure intermediate rod and choke rod are at upper limit of travel in the slots and that all lash in removed. On all models, bend choke rod to obtain specified clearance between choke valve and dividing wall of air horn. See table below.

Choke Rod Setting

Car Model	Choke Opening	Gauge No.
Buick (Exc. Special)	.052"	BT-68
Buick Special	.045"	BT-131
Cadillac	.040"	BT-102
Chevrolet	.043"	BT-131
Oldsmobile (All)	.052"	BT-68
Pontiac Tempest	.055"	BT-68

Unloader Adjustment: After choke rod adjusted (see above), move throttle lever to wide open position and make sure that choke trip lever is in contact with choke counterweight. Measure choke valve clearance between upper edge of choke valve and dividing wall of air horn (see table below for gauge and clearance specifications). Adjust by bending tang on fast idle cam using Tool BT-69.

Unloader Setting

Car Model	Choke Opening	Gauge No.
Buick (All)	.128"	BT-135
Cadillac	.125"	BT-102
Chevrolet	.235"	BT-131
Oldsmobile (All)	.115"	BT-90
Pontiac Tempest	.152"	BT-119

Secondary Throttle Lockout Adjustment: Close choke valve fully so that lockout lever tang is engaged in slot of fast idle cam. Measure clearance between side of lockout lever tang and edge of slot in cam (use feeler gauge). Clearance should be .015" (all models). Adjust by bending tang on fast idle cam using Tool BT-91A (Exc. Oldsmobile), BT-69 (Oldsmobile).

Secondary Throttle Contour Adjustment: Open choke valve fully so that tang on lockout lever is positioned over contoured section of fast idle cam. Measure clearance between tang and edge of fast idle cam (use feeler gauge). If clearance is not .030" (Buick & Oldsmobile); .015" (others), adjust by bending tang up or down using bending tool BT-91-A.

Secondary Actuating Lever (Oldsmobile): Back off slow idle adjusting screw so throttle valves are tightly closed (fast idle cam must be in hot or slow idle speed position). Hold throttle valves closed and measure clearance between tang at bottom of secondary actuating lever and primary throttle valve lever with a feeler gauge. This clearance should be .005-.025" and uniform over full length of tang. To adjust, hold throttle open and bend tang on actuating lever using bending tool BT-18.

OVERHAUL: *See 1958 Annual Data, Page 279, or later Manual editions.*

Service Parts

Gasket Kit - Rochester No. 7015940 (Buick, Exc. Special); No. 7016154 (Buick Special); No. 7015941 (Cadillac); No. 7015947 (Chevrolet 283" Eng.); No. 7015948 (Chevrolet 348" Eng.); No. 7015954 (Oldsmobile, Exc. F-85); No. 7016145 (Oldsmobile F-85); No. 7016144 (Pontiac Tempest).

Repair Kit - Rochester No. 7015920 (Buick, Exc. Special); No. 7016153 (Buick Special); No. 7015921 (Cadillac); No. 7016036 (Chevrolet 283" Eng.); No. 7016037 (Chevrolet 348" Eng.); No. 7015934 (Oldsmobile, Exc. F-85); No. 7016131 (Oldsmobile F-85); No. 7016130 (Pontiac Tempest).

Off-Car Kit - Rochester No. FR-104 (Buick, Exc. Special); No. FR-105 (Buick Special); No. FR-204 (Cadillac); No. FR-305 (Chevrolet 283" Eng.); No. FR-306 (Chevrolet 348" Eng.); No. FR-504 (Oldsmobile, Exc. F-85); No. FR-505 (Oldsmobile F-85); No. FR-603 (Pontiac Tempest).

1961 ROCHESTER FUEL INJECTION

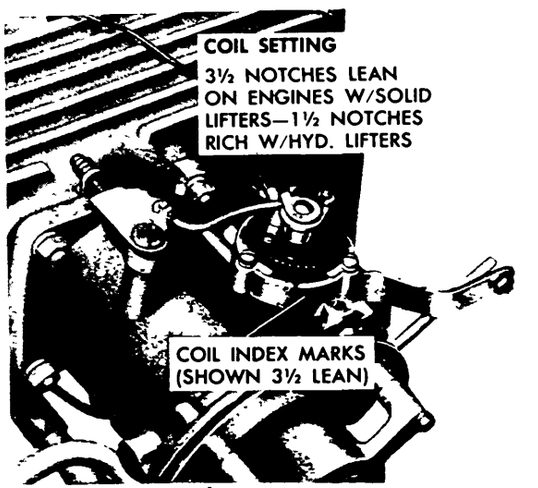
Corvette (1961)

DESCRIPTION: Fuel injection design is similar to design used on previous models.

ADJUSTMENT

►*ADJUSTMENT NOTE: Make all adjustments in the order indicated below.*

Idle Speed & Mixture: For an initial adjustment, turn both the idle air adjustment screw (located below and to rear of fuel enrichment housing and facing left side of car), and the idle fuel adjustment screw (located below and to rear of fuel enrichment housing - this screw faces rear of car and is closer to side of engine than idle air adjustment screw), two full turns open from a fully seated position. With engine at normal operating temperature and running, adjust air adjusting screw to obtain best possible idle speed. Adjust idle fuel adjusting screw to smooth out the idle speed. Readjust idle air adjusting screw and fuel adjusting screw until best idle is obtained at approximately 500 RPM (Auto. Trans. in "DR"), 600 RPM (Std. Trans.), 700 RPM (with solid lifter camshaft).



Throttle Linkage Adjustment (Synchro-mesh Trans.): With accelerator pedal pressed to floor and throttle bellcrank rotated so throttle valves are in wide open position, adjust upper bellcrank rod for free entry into bellcrank lever.

Throttle Linkage Adjustment (Automatic Trans.): *See "CARBURETOR" on car model page.*

Cold Enrichment Coil Adjustment: Scribe mark on coil cover should be set 1½ notches rich (Exc. 315 HP Eng.); 3½ notches lean (315 HP Eng.) from scribe mark on housing.

Cold Enrichment Rod Adjustment (Corvette): To hold trip lever and the counterweight tab together, twist the attaching screw its full limit clockwise. Note point where fast idle screw contacts cam. If rod length is correct, fast idle screw will just touch at center of high step of cam. Otherwise bend rod to lengthen or shorten as required to provide correct adjustment.

TROUBLE SHOOTING & DIAGNOSIS: *See 1959 Annual Data, Page 287, or later Manual edition.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 OLDSMOBILE SERIES 88 FLOAT LEVEL & FLOAT DROP PRODUCTION CHANGE & SERVICE CAUTION:* Float level and float drop settings are different for early and later carburetors. *See "Float Level" & "Float Drop" Adjustments below.*

►*1961 OLDSMOBILE F-85 CARBURETOR LOADING AT 3/4 TO FULL THROTTLE DURING WARM-UP CORRECTION:* Adjust unloader setting to .250". This setting supersedes previous setting of .160".

►*1961 OLDSMOBILE F-85 CARBURETOR LOADING DURING CHOKE OPERATION CORRECTION:* Adjust automatic choke setting to 1 notch lean. This setting supersedes previous setting of "Centered (On Index)".

►*1961 PONTIAC (EXCEPT TEMPEST) WITH AUTOMATIC TRANSMISSION, LEAN CONDITION DURING WARM-UP CORRECTION:* On carburetors prior to change "A" as indicated on carburetor identification tag, install the following modification kit: Part Nos. 7020464 (Carb. No. 7019070, 7019071, 7019072 & 7019073); Part No. 7020465 (Carb. Nos. 7019074, 7019075, 7019076 & 7019077).

►*1961 PONTIAC (EXCEPT TEMPEST) CARBURETOR FLOODING CORRECTION & PRODUCTION CHANGE:* On early carburetors with a "flat" type bowl cover-to-float bowl gasket, install later type "domed" gasket. Part No. 7021007. This new gasket increases clearance between top of float and bowl cover.

►*1961 PONTIAC TEMPEST "STUMBLE" (IN HIGH TEMPERATURE AREAS) CORRECTION:* Install accelerating pump connector rod in INNER hole of pump shaft lever. *CAUTION - Do not make pump rod adjustment (see below) with connector rod in inner hole.*

►*1961 PONTIAC (EXCEPT TEMPEST) THROTTLE ROD INSTALLATION CHANGE FOR IMPROVED COLD STARTING:* On early cars with throttle rod connected in upper hole of carburetor throttle lever, change it to the middle hole. Later cars have the change made in production.

DESCRIPTION: Dual (2-Barrel) downdraft carburetor with manual choke control (2G), automatic choke (2GC). Carburetors are similar to previous models and have the following features.

Idle Air Compensator (Chevrolet 7019018, Oldsmobile 7019058, & Pontiac 7019072, 7019073, 7019076, 7019077) - Consists of a thermostatically controlled idle air bypass which opens during prolonged hot idling to supply additional air at a point below the throttle valves to offset enriching effects of high engine temperature. This idle compensator must be held closed when making idle mixture adjustment.

Idle Compensator (Oldsmobile F-85) - This "Carb-Airator" is a separate unit attached to carburetor on air conditioned cars to assist in reducing rich fuel and air mixture during hot idling. *See "Carb-Airator Adjustment" below.*

Automatic Choke Assembly (Oldsmobile 7019052, 7019058, Pontiac 7019070, 7019071, 7019072 & 7019073) - Choke assembly is mounted on throttle body and linked to choke shaft lever by an intermediate choke rod. This intermediate choke rod must be adjusted for correct choke operation.

Automatic Choke Assembly (Except Above) - Choke assembly is mounted on air horn and directly connected to choke shaft. Intermediate rod adjustment not required.

ADJUSTMENT: *Make all adjustment exactly as follows:*

Idling Adjustment (Except Pontiac 7015070 & 7015072 Carburetors): If preliminary adjustment required to warm up engine, turn both idle mixture screws in until lightly seated, then back each screw out 1½ turns. Operate engine until normal operating temperature is reached with choke valve wide open and fast idle inoperative. Connect tachometer and vacuum gauge to engine, then adjust throttle stopscrew for correct engine idle speed (see table below). Adjust each idle mixture screw for smoothest idle performance with highest manifold vacuum and engine RPM (see special notes below).

Idling Adjustment: If preliminary adjustment required to warm engine, turn both idle mixture screws in until lightly seated, then back each screw out 1½ turns. Operate engine until normal operating temperature is reached with choke valve wide open and fast idle inoperative. Connect tachometer and vacuum gauge to engine, then adjust throttle stopscrew for correct engine idle speed (see table below). Adjust each idle mixture screw for smoothest idle performance with highest manifold vacuum and engine RPM *see special notes below.* *CAUTION - On cars with Idle Air Compensator, hold compensator valve closed by pressing in on spring-loaded button on side of main body (Chevrolet), removing air cleaner and pressing down on valve in air horn (Oldsmobile).* Recheck engine idle speed. *CHEVROLET NOTE* - Idle mixture adjustment can be made by leaning the mixture (turn screws in) for a moderate rough idle with slight vacuum and RPM loss, and then richening the mixture by turning the screws out ¼ turn.

OLDSMOBILE NOTE - After adjusting both idle mixture screws for highest manifold vacuum and engine RPM, turn each screw out ¼ turn for slightly richer mixture. Recheck idle mixture and idle speed after air cleaner installed.

Car Model	Idle Speed Setting Synchro-mesh	Auto. Trans.
Buick (Exc. Spec.)		①②525 RPM
Buick Special	525 RPM	①②525 RPM
Chevrolet Pass.	475 RPM	③450 RPM
Chevrolet Truck	475 RPM	③450 RPM
Oldsmobile (Exc. F-85)	550 RPM	③500 RPM
Oldsmobile F-85	550 RPM	③④500 RPM
Pontiac (Exc. Tempest)	⑤480-500 RPM	③⑤480-500 RPM
Pontiac Tempest	⑥580-600 RPM	③⑥580-600 RPM

① - 575 RPM on Air Conditioned cars.
② - Transmission selector lever in "N" or "P".
③ - Transmission selector lever in "D".
④ - 500 RPM on Air Conditioned cars.
⑤ - 540-560 on Air Conditioned cars with Air Cond. OFF.
⑥ - With Air Conditioner OFF.

Throttle Return Check (Dashpot) Adjustment: Used on Chevrolet and Oldsmobile with automatic transmission. *See "Throttle Linkage Adjustment" under CARBURETOR on each car model page for adjustment data.*

Float Level: *CAUTION - Two separate adjustments (Float Level & Float Drop) required.*

Float Level Setting (Chevrolet Pass. Cars & Truck, Buick Special & Pontiac Tempest) - Remove and invert bowl cover and float assembly but DO NOT remove cover gasket. Install correct float gauge (see table below) over float with side of gauge resting against pump side of power piston shaft, and with outer leg of gauge in line with center of float. Bend float hinge arm so float just clears top edge of gauge cutout and sides of float are parallel with gauge legs.

Float Level Setting (Buick, Exc. Special; Oldsmobile, & Pontiac, Exc. Tempest) - Remove and invert bowl cover and bowl assembly but DO NOT remove gasket. Install correct float gauge (see table below) on bowl gasket at free end of float. Lower edge (sharp edge) of float seam should just touch gauge. Adjust by bending float hinge arm.

ROCHESTER 2G & 2GC (C nt.)

Fl at Lev l Setting

Car & Carb.	Float Level	Checking Gauge
Buick 7019042	11/16"	BT-184
Buick Special (All)	1 17/64"	BT-188
Chevrolet Pass. (All)	1 23/64"	BT-152
Chevrolet Truck (All)	1 23/64"	BT-152
Oldsmobile 88 (All) Early ①	11/16"	BT-179
Oldsmobile 88 (All) Later ②	1/2"	BT-197
Oldsmobile F-85 (All)	35/64"	BT-187
Pontiac 7019070,71,72,73	5/8"	BT-177
Pontiac 7019060,74,75,76,77	11/16"	BT-176
Pontiac Tempest (All)	1 17/64"	BT-188

① - Carburetors with "A" or no letter on tag.
② - Carburetors with "B" or later on tag.

Float Drop Setting (All Models) - Hold bowl cover and float assembly upright so that float hangs down at bottom of travel. Measure distance from lower face of cover gasket to bottom of float at free end using a scale or combination gauge (see table below). Adjust by bending tang on rear of float hinge arm toward intake needle seat to decrease drop, or away from needle seat to increase drop.

Fl at Drop Setting

Car & Carb.	Float Drop	Checking Gauge
Buick 7019042	1 29/32"	BT-184
Buick Special (All)	1 29/32"	BT-188
Chevrolet Pass. (All)	1 29/32"	BT-152

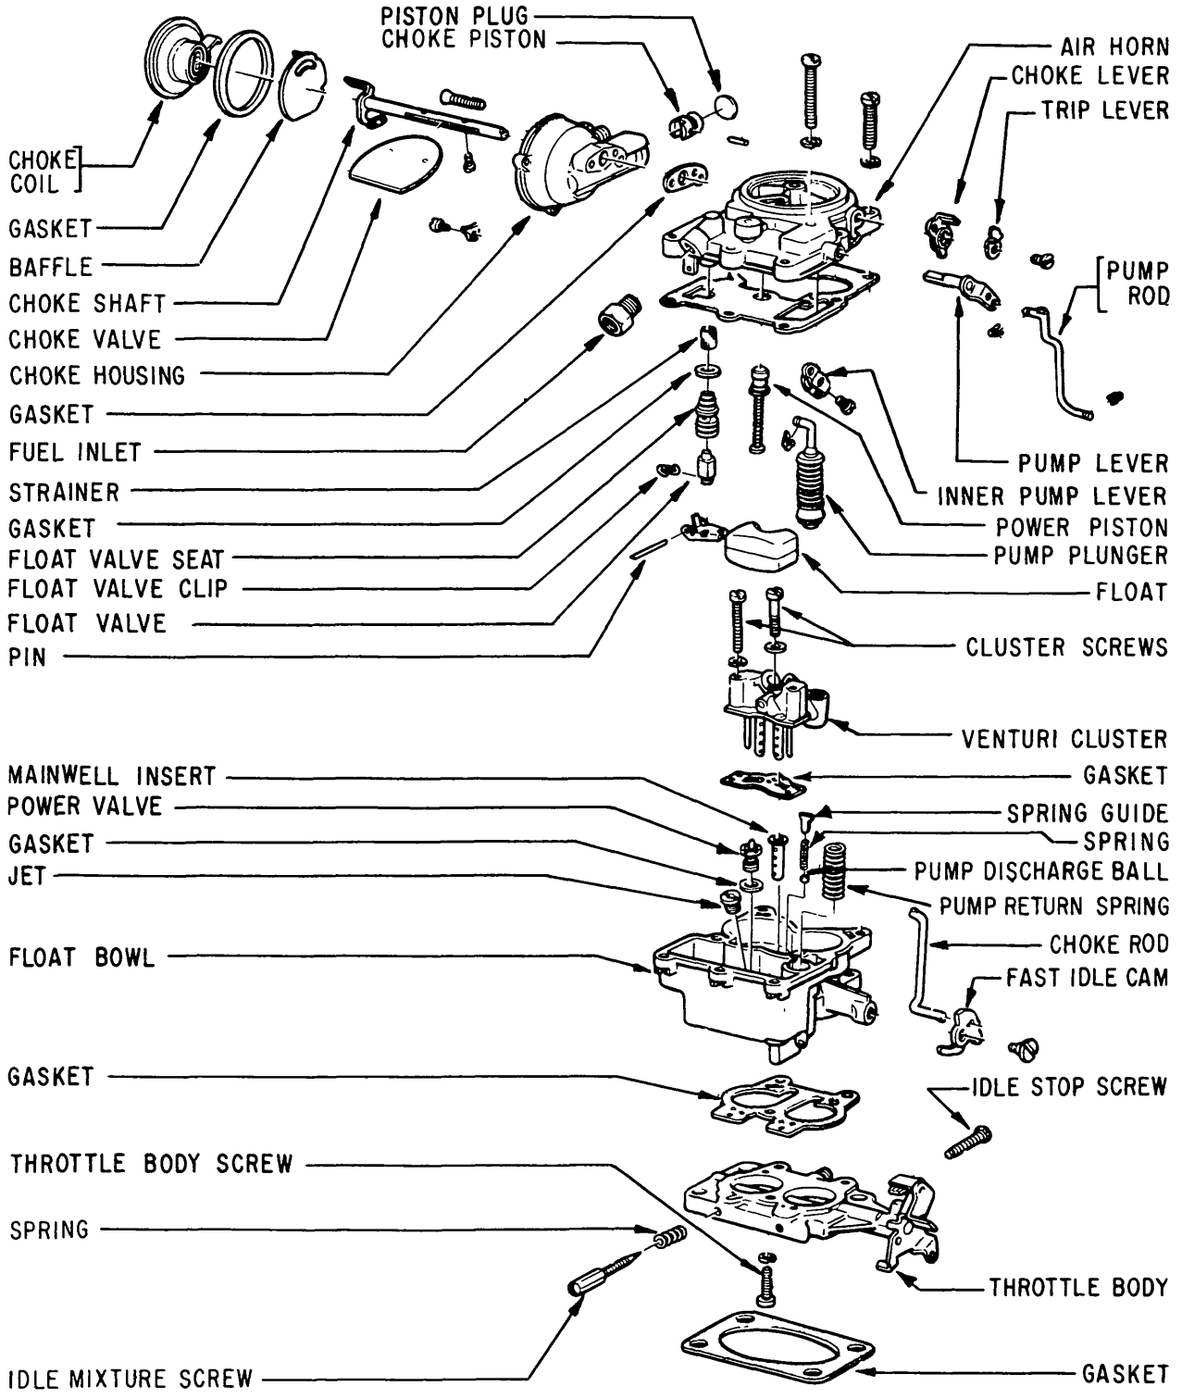
Oldsmobile 88 (All) Early ①	1 29/32"	
Oldsmobile 88 (All) Later ②	1 13/16"	
Pontiac, Exc. Tempest (All)	1 3/4"	BT-177
Pontiac Tempest (All)	1 29/32"	BT-188



① - Carburetors with "A" or no letter on tag.
② - Carburetors with "B" or later on tag.

Accelerating Pump R d: *CAUTION - On Buick Special, Oldsmobile F-85 & Pontiac Tempest, pump connector rod MUST be positioned in OUTER hole (furthest from pump shaft) of accelerating pump shaft lever. Other carburetors have a single hole.* With throttle stopscrew (and Fast Idle Screw on Oldsmobile Series 88) backed out so that throttle valves are completely closed, measure distance from top of air horn ring (Buick, except Special, Oldsmobile 88 & Pontiac, except Tempest); from top of air horn surface (Oldsmobile F-85); from top of pump housing (Buick Special, Chevrolet Pass. Cars & Trucks, and Pontiac Tempest) to top of pump connector rod with a scale or combination gauge (see below). *NOTE - If gauge is used, leg of gauge should just touch top of connector rod.* To adjust, bend pump connector rod with Tool BT-18.

Acc lerating Pump Rod Setting

Pontiac 7019060,74,75,76,77	1 1/8"	BT-176
Pontiac Tempest	1 3/32"	BT-188

CONTINUED ON NEXT PAGE

ROCHESTER "2GC" CARBURETOR (TYPICAL)

ROCHESTER 2G & 2GC (C nt.)

Idl Vent: Adjust only after Accelerating Pump Rod Setting has been checked and adjusted. Use the same gauge (installed in same manner) as for pump rod setting (above). *NOTE - On Oldsmobile (Exc. F-85) & Pontiac, invert gauge so that leg marked "Vent" is down toward pump connector rod.* Slowly open throttle valves to point where vent valve just closes (rubber valve seats on pump housing on air horn). At this point, edge of cutout in gauge marked "Vent" (Chevrolet), or lower end of gauge marked "Vent" (Oldsmobile 88 & Pontiac), should just touch top of pump connector rod. Adjust by bending tang on pump lever which contacts vent valve arm.

Idle Vent Setting

Car & Carb.	Vent Setting	Checking Gauge
Chevrolet (All)	49/64"	BT-152
Oldsmobile 88	1 11/32"	BT-179 or 197
Pontiac 7019060,74,75,76,77	1 5/64"	BT-176
Pontiac 7019070,71,72,73	1 17/64"	BT-177

Intermediate Choke Rod Adjustment: Oldsmobile 7019092 & 7019058 - *NOTE - Vacuum piston has two grooves at outer end, and choke shaft lever has three holes for installation of intermediate rod.* With intermediate choke rod installed in inboard hole (nearest choke shaft), piston must be flush to 1/32" out of piston bore. With intermediate rod in center hole, first "V-groove" in piston must be flush with edge of piston bore. With intermediate rod in outboard hole, second "V-groove" must be flush with edge of piston bore. To adjust, bend intermediate choke rod. *NOTE - Normal position of rod in choke lever is "center" hole. To tailor for temperature and climatic conditions, see "Automatic Choke Setting" below.*

Intermediate Choke Rod Adjustment: Pontiac 7019070, 71,72 & 73 - Remove choke cover and thermostatic coil assembly, gasket and baffle plate. Hold choke valve completely closed by lifting up on intermediate lever. In this position, inner end of vacuum piston should be flush with end of choke piston bore. Adjust by bending intermediate choke rod.

Automatic Choke Setting (All 2GC Carburetors): Adjust by loosening retainer screws on choke cover and rotating cover and coil assembly. Centered setting is with scribed index mark on cover in line with center (longest) mark on housing. *NOTE* - Choke valve should be lightly closed at room temperature (75°F).

Automatic Choke Setting

Car Model	Setting
Buick (Exc. Special)	1 Point Rich
Buick Special	Centered (At Index)
Chevrolet Pass. (7019008,18)	Centered (At Index)
Chevrolet Pass. (7019007)	1 Point Lean
Oldsmobile 88	Centered (At Index)
Oldsmobile F-85	ℂ 1 Point Lean
Pontiac & Pontiac Tempest	Centered (At Index)

℃ - Supersedes previous setting of "Centered" (At Index).

► *1961 OLDSMOBILE (EXC. F-85) CHOKE SETTING "TAILORING" FOR CLIMATIC & TEMPERATURE CONDITIONS:* Moving intermediate choke rod to next OUTER hole (away from choke shaft) will provide richer mixture during warm-up for acceleration or load. Moving intermediate rod to next INNER hole will provide leaner mixture under same operating conditions.

Fast Idle (2GC Carburetors): Adjust each model as follows:

All Models (Except Oldsmobile 88) - No separate fast idle adjustment required as fast idle speed is automatically set when hot (or slow) idle speed is adjusted (same screw controls both settings).

Oldsmobile 88 - As a preliminary adjustment (with carburetor off engine), close choke valve and place fast idle screw on high step of fast idle cam. Adjust fast idle screw for a throttle valve opening of .030" (Gauge BT-121) measured between edge of valve and carburetor bore on side opposite idle adjusting screw. Make final adjustment with carburetor on engine as follows: Connect tachometer, place transmission selector lever in "N" (Neutral) position, then rotate fast idle cam so fast idle screw is on high step of cam. With engine at normal operating temperature, adjust fast idle screw for an engine speed of 1900 RPM. *NOTE - Set engine speed at 2200 RPM for sub-zero operation.*

Choke Rod: Buick (Exc. Special), Oldsmobile F-85 & Pontiac (Exc. Tempest) - Turn idle screw into normal idle position (1½ turns open), then place idle screw on second step of fast idle cam and against shoulder of high step. Distance between upper edge of choke valve and wall of air horn should be as indicated in table (see below). To adjust, bend counterweight tang.

Buick Special, Chevrolet, Oldsmobile 88 & Pontiac Tempest - Position fast idle screw (Oldsmobile 88), idle speed screw (others), on second step of fast idle cam, then close choke valve until screw is against shoulder of high step. *NOTE - On Oldsmobile 88, press up on intermediate choke lever and make sure that intermediate rod is at end of slot in intermediate lever.* In this position, choke valve opening, or clearance between upper edge of choke valve and air horn wall should be as indicated in table (see below). To adjust, bend choke lever tang (Exc. Oldsmobile 88); choke rod (Oldsmobile 88).

Choke Rod Setting

Car & Carb.	Choke Valve Opening	Checking Gauge
Buick (Exc. Special)	.036"	BT-185
Buick Special	.052"	BT-190
Chevrolet Pass.	.089"	BT-108
Oldsmobile 88	.150"	BT-159
Oldsmobile F-85	.082"	BT-191
Pontiac 7019070,71,72,73	.080"	BT-195
Pontiac 7019060,74,75,76,77	.056"	BT-167
Pontiac Tempest	.052"	BT-190

Unloader (2GC Carburetors): Move throttle valves to wide open position (see Pontiac Note below) so that choke valve is partially open. Measure the choke valve opening or clearance between upper edge of valve and air horn wall using correct gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever using bending tool BT-69.

PONTIAC CHECKING NOTE - It is recommended that the throttle valves be opened by depressing accelerator pedal forcibly to the floor (by someone sitting in driver's seat) to simulate actual driving conditions. Make certain that pedal does not strike hump over transmission. Above procedure will eliminate all variances in linkage, floor mat, or pedal location.

Unloader Setting

Car Model	Choke Valve Opening	Checking Gauge
Buick (Exc. Special)	.081"	BT-186
Buick Special	.157"	BT-189
Chevrolet	.360"	BT-108
Oldsmobile 88	.163"	BT-162
Oldsmobile F-85	ℂ .250"	Use ¼" drill
Pontiac (Exc. Tempest)	.163"	BT-168
Pontiac Tempest	.157"	BT-189

℃ - Supersedes previous setting of .160".

OVERHAUL: *See 1960 Annual Data, Page 301, or later Manual edition.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 PONTIAC (EARLY) THROTTLE ROD INSTALLATION CHANGE FOR IMPROVED COLD STARTING:* If throttle rod is attached in top hole of carburetor throttle lever, change it to the middle hole. Cars built after Oct. 10, 1960 have the throttle rod installed in middle hole during production.

►*1961 PONTIAC 7013063 & 7013065 CARBURETORS FLOODING CORRECTION & PRODUCTION CHANGE:* On early carburetors with "flat" type bowl cover–to–float bowl gasket, install later type "domed" gasket, Part No. 7021007. This new gasket increases clearance between top of float and bowl cover.

DESCRIPTION: Carburetor design is same as used on previous models.

ADJUSTMENTS: Idle Speed & Mixture - *CAUTION - Make sure that front and rear carburetor throttle valves are fully closed.* With engine at normal operating temperature, automatic choke not operating (choke valve wide open and fast idle inoperative so engine idles at hot or slow idle speed), and transmission selector lever in "D" (Drive) range on automatic transmission cars, proceed as follows: *NOTE - Carburetor air cleaner must be installed.* Set idle speed to correct engine RPM (see table below). Turn one idle mixture screw in or out to obtain highest vacuum and engine RPM, then repeat with other idle mixture screw (center carburetor only). Reset engine idle speed, then readjust idle mixture screws until highest engine RPM and smoothest idle is obtained with the highest vacuum.

►*IDLE SPEED ADJUSTMENT NOTE (Carburetors With Idle Compensator):* **This valve must be closed when idle speed is adjusted.** Press in on button located in in idle compensator cover plate to hold valve closed during idle speed adjustment.

Idle Speed Setting

Car Model	Synchro-mesh Trans.	Automatic Trans.
Chevrolet (Std. Engine) ①	475 RPM	③450 RPM
Chevrolet (High Perf. Eng.) ①	600 RPM	③600 RPM
Pontiac (No Air Cond.)	480-500 RPM	③480-500 RPM
Pontiac (With Air Cond.) ②	540-560 RPM	③540-560 RPM

① - With Air Conditioner turned "ON".
② - With Air Conditioner turned "OFF".
③ - Transmission selector lever in "D" Drive Range.

Throttle Return Check Adjustment: *See CARBURETOR on car model pages.*

Float Level: *CAUTION - Two separate adjustments (Float Level & Float Drop) required. Float level adjusted differently on Chevrolet as detailed below.*

Float Level Setting (Chevrolet) - Remove and invert bowl cover and float assembly but do not remove cover gasket. Install correct float gauge (see table below) over float next to power piston stem. Top of float should just clear top edge of gauge cutout and sides of float should be parallel to gauge legs. Adjust by bending float hinge arm.

Float Level Setting (Pontiac) - Remove and invert float bowl cover and float assembly but do not remove cover gasket. Install correct float gauge (see table below) on cover gasket at free end of float with longer leg of gauge "T" seating squarely on gasket. Edge of seam on float should just clear upper edge of gauge. Adjust by bending float hinge arm near hinge pin.

Float Level Setting

Car & Carb.	Float Level	Checking Gauge
Chevrolet (End Carbs.)	1 27/64"	BT-157
Chevrolet (Center Carb.)	1 21/64"	BT-153
Pontiac (All Carbs.)	23/32"	BT-175

Float Drop Setting (All Models) - Hold bowl cover and float assembly upright so float hangs down at bottom of travel. Measure distance from lower face of cover gasket to bottom of float at free end using a scale or the float level gauge (with end of longer leg of gauge against gasket bottom of float should be even with scribed line on gauge). Adjust by bending tang on rear of float arm toward intake needle seat to decrease drop or away from needle seat to increase drop.

Float Drop Setting

Car Model	Float Drop	Checking Gauge
Chevrolet (All)	1 29/32"	BT-157
Pontiac (All)	1 3/4" Min.	BT-175

Accelerating Pump Rod: *CAUTION - This is a linkage adjustment and not a seasonal setting.* With throttle valves completely closed (throttle stopscrew and fast idle screw backed off on center carburetor), check distance from top of air horn or pump housing to top of pump connector rod as follows: On Chevrolet, invert float gauge (see table below) and place gauge on top of pump housing on air horn with extended leg of gauge down toward pump connector rod. On Pontiac, place float gauge squarely across top edge of air cleaner ring on air horn with "Pump" end of gauge "T" down toward connector rod. On all models, end of gauge should just touch top of pump connector rod. Adjust by bending pump connector rod.

Accelerating Pump Rod Setting

Car Model	Setting	Checking Gauge
Chevrolet (All)	15/16"	BT-157
Pontiac (Center Carb.)	1 1/8"	BT-175
Pontiac (End Carbs.)	55/64"	BT-175

Idle Vent (Pontiac Cent r Carb.): *NOTE - Adjust only after Accelerating Pump Rod Setting has been checked and adjusted.* Use same gauge installed in same manner as for pump rod setting check (above) except that gauge should be inverted so that leg marked "Vent" is down toward connector rod. Slowly open throttle valves to point where vent valve just closes (rubber valve seats on pump housing on air horn). At this point, top of connector rod should just touch end of gauge. Adjust by bending tang on pump lever which contacts vent valve arm. Vent setting should be 1 1/32" (Gauge BT-175).

Vacuum Switch Setting (Center Carb.): *Check and adjust each model as follows:*

Chevrolet - With throttle valves completely closed and actuating post in vacuum switch in extreme "up" position, clearance between tang on pump lever and vacuum switch actuating post should be 1/32". Adjust by loosening switch retaining screws and moving switch assembly up or down as required. Tighten retaining screws.

Pontiac - With throttle valves wide open, measure distance from top of switch housing to top of sliding switch post. This distance should be 1 3/32". To adjust, loosen two switch retaining screws holding switch on bracket, then move switch up or down as required. Check adjustment by opening and closing throttle valves with sliding switch post in upward position. Inside edge of vacuum switch closing tang must clear side of switch post.

Automatic Choke (Center Carb.): Adjust by loosening choke cover retaining screws and rotating cover thermostatic coil assembly. Center setting is with scribed index mark on cover in line with center mark on housing. *NOTE* - With this setting, choke valve should be lightly closed at 75°F.

Automatic Choke Setting

All Models	Centered (At Index)

Fast Idle Setting: *NOTE - Chevrolet & Pontiac fast idle adjustment will be correct after "slow idle" speed and choke rod adjustments have been made (see below).*

Choke Rod (Center Carb.): Place idle screw on second step of fast idle cam next to high step. With choke trip lever in contact with choke counterweight lever, clearance between upper edge of choke valve and air horn wall should be as indicated in table below. To adjust, bend tang on choke counterweight.

Choke Rod Setting

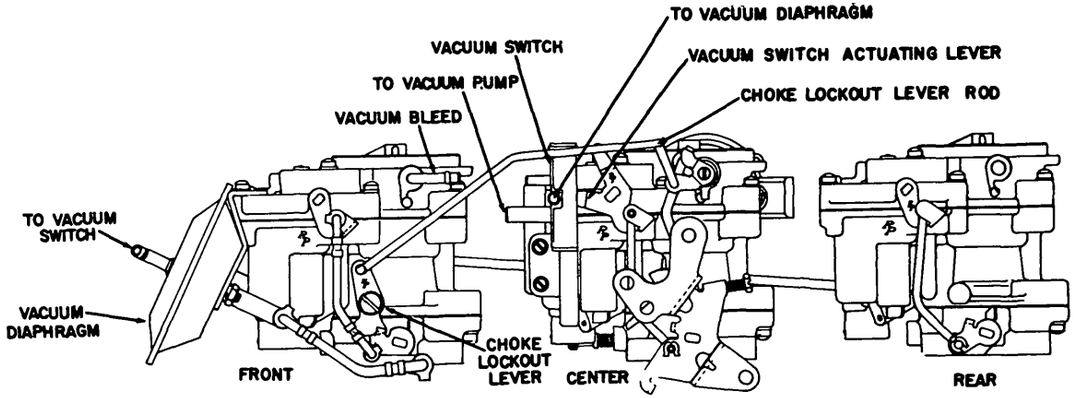
Car Model	Clearance	Checking Gauge
Chevrolet	.089"	BT-108
Pontiac	.056"	BT-167

Unloader (Center Carburetor): With throttle valves held wide open, clearance between upper edge of choke valve and side of air horn wall should be as indicated in table below. To adjust, bend tang on throttle lever as necessary to obtain correct clearance.

►*PONTIAC CHECKING NOTE:* It is recommended that the throttle valves be opened by depressing accelerator pedal forcibly to the floor (by someone sitting in drivers seat) to simulate actual driving conditions. Make certain that pedal does not strike hump over transmission. Above procedure will eliminate all variances in linkage, floor mat, or pedal location.

CONTINUED ON NEXT PAGE

1961 ROCHESTER TRIPLE CARBURETORS (C nt.)



Car Model	Unloader Setting Clearance	Checking Gauge
Chevrolet	.360"	BT-108
Pontiac	.163" ①	BT-168

① - .143-.183" permissible.

Ch ke Lockout (Chevrolet): *NOTE - This adjustment n t required on Pontiac models as the end carburetors ar locked out by temperature controlled vacuum valve.* This adjustment will insure that end carburetors are locked out and center carburetor only will operate during automatic choke operation. To check setting, hold choke valve (center carburetor) in wide open position, hold throttle valves in front carburetor slightly open, then measure clearance between lockout lever and throttle lever on front carburetor, This clearance should be .030". Adjust by bending lockout rod.

Ch ke Lockout Lever Contour (Chevrolet): Hold throttle valves in front carburetor completely closed. With choke valve on center carburetor completely closed and lockout lever rod connected, clearance between contoured portion of lockout lever and tang on throttle lever of front carburetor should be .015". Adjust by bending tang on throttle lever up or down as required.

Throttle Linkage (Front-to-Rear Carburetors): Disconnect throttle rod at rear carburetor throttle lever. With front and rear carburetor throttle valves completely closed, throttle rod end should center in slot in the throttle lever. Adjust by bending rod at existing bend, then connect rod.

ROCHESTER TRIPLE CARBURETOR INSTALLATION (TYPICAL)

Vacuum Diaphragm Link: With end carburetor throttle valves completely closed and vacuum diaphragm stem fully extended, end of vacuum unit actuating link should fit freely in hole in throttle lever on front carburetor. Adjust by bending actuating link.

OVERHAUL: *See 1960 Annual Data, Page 301, or later manual edition.*

SERVICE PARTS: Gasket Sets – Rochester Part No. 7015956 (Carb. No. 7013026); No. 7015957 (Carb. No. 7013063, 7013065); No. 7015972 (Carb. No. 7013015, 7013017); No. 7015973 (Carb. No. 7013016, 7013020); No. 7016146 (Carb. No. 7013064); No. 7016148 (Carb. No. 7019067, 7019069).

Repair Kit – Rochester Part No. 7015923 (Carb. No. 7013016, 7013020, 7013974); No. 7015939 (Carb. No. 7013063, 7013065); No. 7013953 (Carb. No. 7013026); No. 7015971 (Carb. No. 7013015, 7013017); No. 7016124 (Carb. No. 7019067, 7019069); No. 7016125 (Carb. No. 7013064).

ROCHESTER "H" CORVAIR CARBURETOR

CORVAIR PASS. CARS & TRUCKS	Rochester Carb. No.
Std. Eng., Synchro–mesh (Early)	7019101
Std. Eng., Synchro–mesh (Late)	7019111
Std. Eng., Powerglide (Early)	7019100
Std. Eng., Powerglide (Late)	7019110
High Perf. Eng. (Early)	7019107
High Perf. Eng. (Late)	7019117

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 CORVAIR (ALL SERIES) ERRATIC IDLE OR PERIODIC MISS CORRECTION:* If smooth idle not obtained after correct adjustment of accelerator linkage and carburetor synchronization (with correct fast idle setting of .045"), drill throttle plates as follows: Remove carburetors from engine and drill a 1/16" hole (80 HP Eng.); 3/32" hole (98 HP Eng.) in each throttle plate ¼" from edge in vicinity of carburetor idle air bleed passage (see illustration below for exact location). *NOTE – It is not necessary to remove throttle plates for drilling.* Clean burrs from drilled holes and blow out throttle bore with air. Reinstall carburetor, check synchronization and fuel mixture.

►*1961 CORVAIR ENGINE SURGE CORRECTION (CARB. NOS. 7019100 & 7019107):* On Carburetor No. 7019100, install Main Metering jet, Part No. 7002650 and Venturi Cluster, Part No. 7020344 to replace the original parts. On Carburetor No. 7019107, install Main Metering Jet, Part No. 7002651, Venturi Cluster, Part Nq. 7020342, Cluster Gasket, Part No. 7020195, and Main Well Insert, Part No. 7009212.

►*1961 FAST IDLE SETTING SPECIFICATION CHANGE:* Fast idle setting (clearance between fast idle speed screw and tang on throttle lever) has been changed from .030" (Synchro–mesh); .010" (Powerglide), to .045" for all carburetors. This increased clearance will correct excessive fast idle speed during engine warm–up.

►*1961 CORVAIR FLAT SPOT ON ACCELERATION CORRECTION (CARB. NO. 7019100):* If this condition exists on carburetors with two holes in accelerating pump actuating lever, check to see if pump is on index (scribe mark on accelerator pump shaft lever in line with cast tang on carburetor bowl cover). If pump is on index, proceed as follows to correctly adjust pump stroke: Disconnect pump rod from inboard hole in lever and connect rod to outboard hole, then bend pump rod to align index mark with cast tang. Disconnect rod from outboard hole and connect to inboard hole of lever. *Index markings should then be disregarded. DO NOT RE–INDEX.*

DESCRIPTION: Single barrel downdraft type with manual choke assembly. Similar to design of previous models.

ADJUSTMENTS: Make all adjustments in the order indicated below.

Synchronizing Carburetors & Final Idle Speed, Fast Idle, & Mixture Adjustments: *See CARBURETOR on car model page.*

Initial Adjustments: *NOTE – For final adjustments and carburetor synchronizing, see CARBURETOR on car mod l pag .*

Idl Sp d – Place a .003" feeler gauge between idle speed screw and carburetor throttle shaft lever, then turn screw in until it just contacts gauge. Remove gauge and turn screw in 1½ additional turns.

Fast Idle – With choke valve fully open, place a .045" feeler gauge between fast idle screw and tang on throttle lever, then turn fast idle screw in until it just contacts gauge.

Idle Mixture – 1½ turns open from a lightly seated position.

Idle Speed (Final): The idle speeds indicated in table below are the final engine speeds which should be obtained after carburetors have been properly synchronized.

Engine	Idle Speed Final S tting Synchr –m sh	①Aut . Trans.
80 HP Eng	500 RPM	500 RPM
98 HP Eng	600 RPM	500 RPM
All (With Air Cond.)	② 650 RPM	②650 RPM

① – Transmission selector lever in "D" (Drive).
② – Air Conditioner turned OFF.

Fast Idle Speed (Final): *NOTE – Sam as for "initial adjustment".* With choke valve fully open, place a .045" feeler gauge (supersedes previous .010" & .030" settings for auto. trans. and synchro–mesh respectively) between fast idle screw and tang on throttle lever, then turn fast idle screw in until it just contacts gauge.

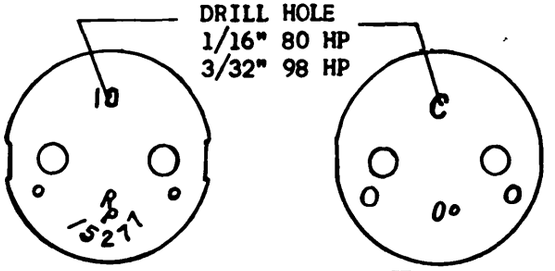
Float Level: With bowl cover inverted, gasket in place, distance from top of float (at highest point) to gasket on bowl cover should be 1 13/64" (Gauge BT–174). *NOTE – Floats must be parall l within 1/32" and must be centered between gaug l gs.* To adjust, bend float tang.

Fl at Drop: With bowl cover held upright and float hanging free, distance between cover gasket and bottom

CONTINUED ON NEXT PAGE

ROCHESTER "H" CORVAIR CARBURETOR (C nt.)

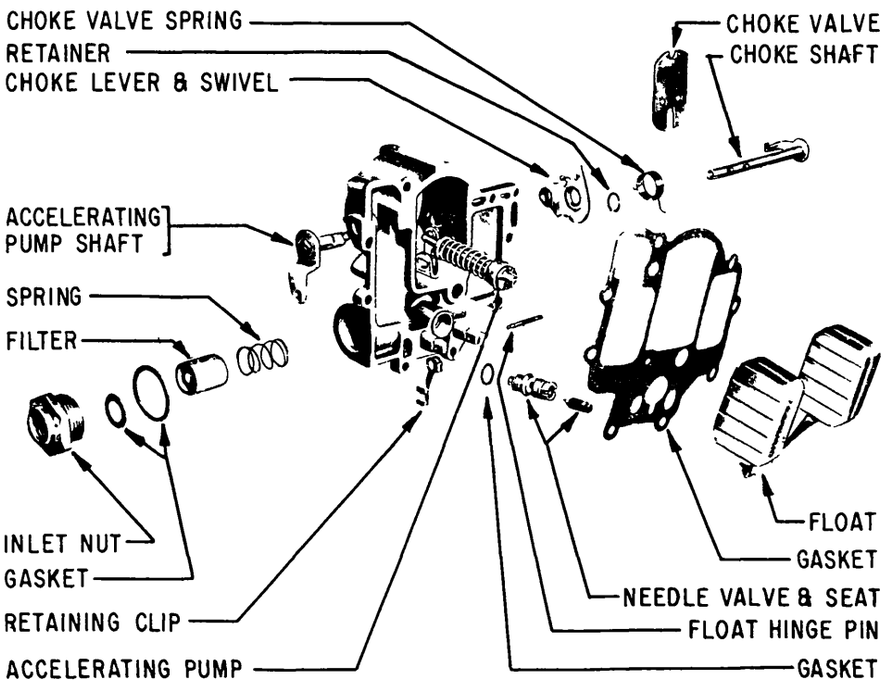
of float (at free end) should be 1¼". To adjust, bend tang at end of float hinge arm.



Pump R d: Back off idle speed screw until throttle valve is completely closed, then while holding throttle valve closed, check to see that scribe mark on accelerator pump lever is aligned with the mark cast into bowl cover. To adjust, bend pump rod at lower end.

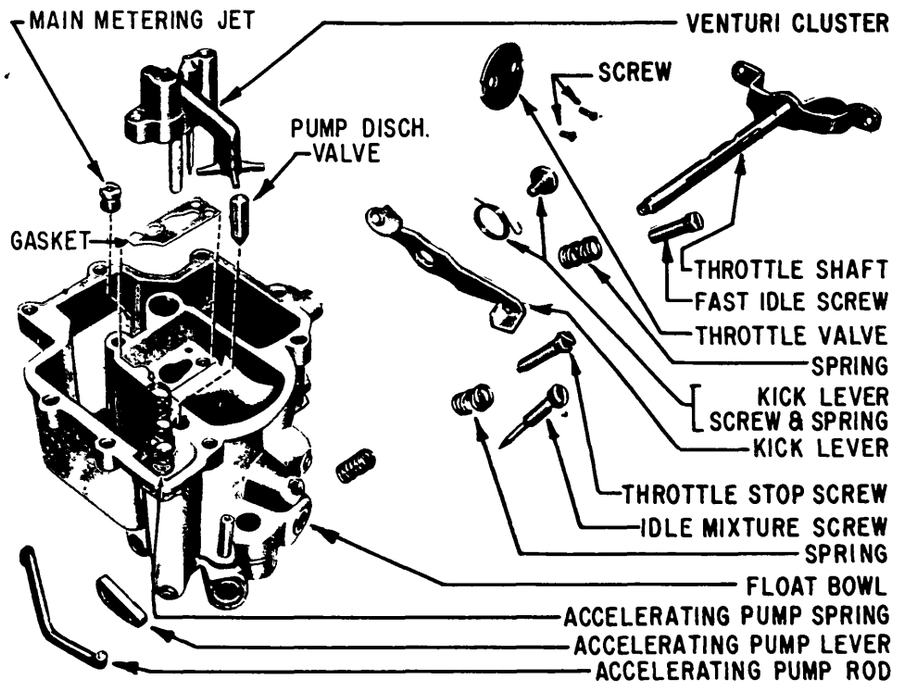
► *1961 CORVAIR FLAT SPOT ON ACCELERATION CORRECTION (CARB. NO. 7019100): See "Changes, Cautions, Corr ctions" above.*

OVERHAUL: Disass mbly – Disconnect pump rod from pump lever, then remove fuel inlet nut, gasket, filter element, and spring. Remove bowl cover assembly and gasket (note location of the two longer screws on either side of accelerator pump). Remove floats and float needle. If necessary, needle seat and gasket may be removed with a large screwdriver. To remove accelerator pump, remove "C" clip, then remove shaft and lever. Remove two screws attaching venturi cluster to bowl assembly and lift out cluster, gasket and main well insert. Remove pump discharge valve, idle mixture adjusting screw and spring. If necessary, remove choke valve retaining screws and slide choke valve out of shaft. Remove choke shaft, spring, choke lever and throttle kick cam from air horn. Remove fast idle cam attaching screw, spring and throttle kick lever. If necessary, remove throttle valve retaining screws and remove throttle valve and shaft assembly.



Inspection: Clean all parts in solvent or carburetor cleaner (do not immerse pump plunger or gaskets in carburetor cleaner). Blow out all passages with air. Check all parts for wear and replace as necessary. Check to see that main well tube is not bent. It should be exactly 90° from body.

Reassembly: Install throttle shaft and valve, if removed, carefully centering valve in bore. Replace main well insert, venturi cluster and gasket in bowl assembly and install the two screws and lockwashers. *NOTE*–Holes in main well insert must be aligned with holes in main well tube. Install accelerating pump and "C" clip, making sure that return spring is in place in bowl assembly. Install pump discharge valve. Replace needle. seat and float needle, float, pin, and new gasket, then adjust float level and float drop. Replace filter, gasket, and inlet nut. With a new gasket installed on bowl cover assembly, install cover assembly on bowl. Install six screws and lockwashers (install the two longer screws in original positions on either side of accelerating pump). Install pump and pump rod lever and secure with clip.



THROTTLE VALVE PLATES

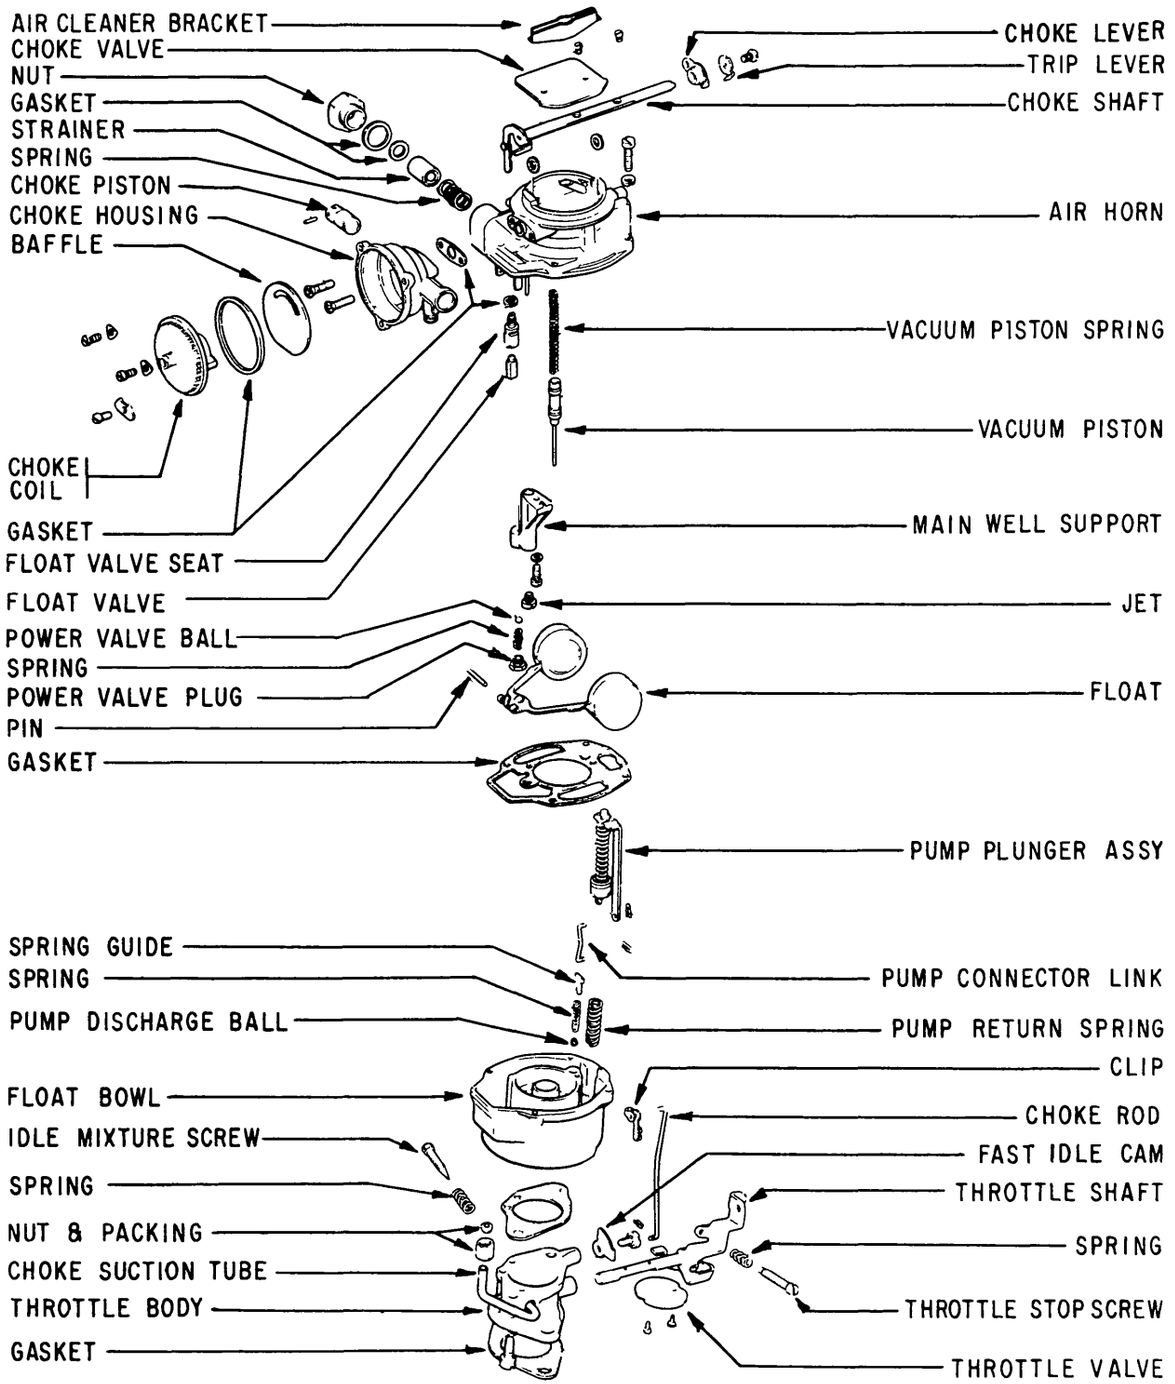
►CHANGES, CAUTIONS, CORRECTIONS

►*1961 CHEVROLET PASS. CAR INCONSISTENT AUTOMATIC CHOKE "COME–OFF" DURING ENGINE WARM–UP CORRECTION:* Install later type choke piston, Part No. 7020438, identified by a distance of 9/32" between lever pin hole and shoulder on piston (this measurement on early pistons was 7/32"). Carburetors stamped "A" or later on brass identification tag have the above change made in production.

DESCRIPTION: Single barrel downdraft carburetor with manual choke control (Model B), automatic choke (Model BC). Design is similar to previous carburetors except that the Model B carburetor used on Pontiac Tempest has an adjustable positive idle stop (eccentric washer).

►*FUEL STRAINER NOTE:* Strainer screen (under fuel inlet fitting nut) can be removed for cleaning. Replace filter every 15,000 miles or sooner if needed.

ADJUSTMENTS: Make all adjustments exactly as detailed below.



Idling Adjustment: If preliminary setting is required to warm up engine, turn idle mixture screw in until lightly seated, then back screw out correct number of turns (see table below). Start engine and allow to idle until normal operating temperature is reached, then adjust as follows:

Idle Mixture - With engine at normal operating temperature and idling at correct speed (see below), turn idle mixture adjusting screw in or out until smoothest engine performance is secured. Recheck idle speed.

Idle Mixture Setting

Car Model	Idle Screw Opening
Chevrolet Pass	1½ turns
Chevrolet Truck	1½–2½ turns
Pontiac Tempest	1½ turns

CONTINUED ON NEXT PAGE

ROCHESTER "BC" CARBURETOR (TYPICAL)

ROCHESTER "B" & "BC" (C ntinu d)

Idle Speed - With engine at normal operating temperature, adjust throttle stopscrew for correct idling speed as listed below (*CAUTION* - On "BC" carburetors, stopscrew must be resting on lowest step of fast idle cam when adjustment being made)

Idl Speed Setting

Car M d l	Synchro–mesh	Auto. Trans.
Chevrolet Pass.	475 RPM	①450 RPM
Chevrolet Trucks	475 RPM	①450 RPM
Pontiac Tempest	③680–700 RPM	①②580–600RPM

① – Automatic transmission in "D" (Drive).
② – 630–650 RPM on Air Conditioned Cars.
③ – Air Conditioner turned off.

Throttle Return Check (Pontiac "BC" Carbs.): *See CARBURETOR on car model page.*

Float Level *CAUTION - Two separate adjustments required as follows*

1) Fl at L vel S tting - *CAUTION - When removing air horn and bowl cover on 'BC' carburetors, disconnect heat suction tube at upper coupling nut and use care not to disturb seal at lower end of tube* Invert bowl cover and float assembly but DO NOT remove cover gasket Install gauge (see table below) over floats with center tang on gauge in main discharge nozzle on cover Bend float arms **v rtically** so that each float just touches top of cut-out in gauge, bend arms **horizontally** so that each float is centered in gauge cut-out Check setting by tilting assembly 90° to each side to make certain that floats do not touch gauge *(CAUTION* - This setting necessary to insure that floats will not rub on sides of float bowl).

Fl at Level Setting

Mod l	Ch cking Gauge	Float Setting
All Carbs	③ M-250	1 9/32"

③ – Chevrolet No. 3696192. Pontiac No. J–9190.

2) Fl at Drop S tting - Hold bowl cover assembly upright so that floats drop down to limit of travel Measure distance from lower face of gasket on cover to bottom of floats at center using a scale This distance should be 1¾" (All Carburetors) Adjust by bending tang at rear of float assembly

P sitive Idl Stop Eccentric (Pontiac Tempest Manual Chok Carbs.): *NOTE – Not necessary to adjust unless eccentric becomes loose or is removed.* With choke valve wide open, rotate eccentric washer to a position where a clearance of 001–.006" is maintained between upper end of "kick–lever" and the "kick–cam". Secure eccentric washer in place with screw.

Fast Idl ("BC" Carburetors) *NOTE* - Fast idle speed is automatically set when hot or slow idle speed is adjusted (same screw controls both settings) Adjust fast idle cam position as follows

Fast Idl Cam P siti n - Rotate fast idle cam until throttle stopscrew is on second (next to highest) step of cam and against the shoulder of the highest step Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below) If clearance not correct, adjust by bending choke connector rod at central angle using bending tool BT–18.

Fast Idle Cam Setting

Car & Carb.	Choke Opening	Checking Gauge
Chevrolet "BC" Carbs	.040"	BT–102
Pontiac "BC" Carbs	.081"	BT–193

Unloader ("BC" Carburetors)· Open throttle valves to wide open position which will open choke valve slightly Check choke valve opening or clearance between lower edge of valve and air horn wall using correct gauge (see table below) If clearance not correct, adjust by bending tang on throttle lever which contacts fast idle cam with bending tool BT–69.

Unloader Setting

Car & Carb.	Choke Opening	Checking Gauge
Chevrolet "BC" Carbs	230"	BT–99
Pontiac Tempest "BC" Carbs	161"	BT–195

Automatic Choke· Adjust by loosening three retainer screws on choke cover and rotating cover and coil assembly Centered setting is with scribed index mark on cover in line with longest (center) cast mark of scale on housing

Choke Setting

Model	Choke Setting
Chevrolet Pass. (Synchro–mesh)	1 notch rich
Chevrolet Pass. (Auto. Trans. Exc. Gov.)	2 notches rich
Chevrolet Pass. (Auto. Trans. & Gov.)	Centered (At Index)
Pontiac Tempest (All Trans.)	① 2 notches rich

① – Supersedes previous setting at index.

OVERHAUL: Disassembly – On manual choke carburetors, remove choke control bracket and air horn attaching screws, then hold throttle kicker in vertical position (free of cam) and lift bowl cover assembly off fuel bowl being careful not to damage floats. *NOTE – It is not necessary to remove eccentric washer (positive throttle stop) on Pontiac carburetors.* On automatic choke carburetors, disconnect choke heat suction tube at choke housing, then remove choke coil cover assembly, gasket and baffle plate. *CAUTION – Do not disconnect choke heat suction tube from throttle body.* On Pontiac automatic choke carburetors, remove throttle return check and bracket. On all automatic choke carburetors, remove fast idle connector rod, and retaining screw on opposite end of choke shaft, then remove choke trip lever, washer and counterweight. Remove choke valve screws and remove valve, then rotate shaft until vacuum piston clears housing bore and remove shaft assembly from air horn. Remove air horn, being careful not to damage floats. On manual choke carburetors, remove choke valve screws and valve, then remove retaining ring from groove in shaft boss and slide shaft, spring, and lever assembly out of air horn. Remove throttle kicker, lever and spring. On all carburetors, hold pump plunger down in cylinder and remove retainer from pump link, then remove link from throttle lever and plunger and lift plunger from bowl. Remove plunger spring and ball check from bottom of pump cylinder. Turn pump discharge guide until it can be removed, then remove discharge spring and ball by inverting the assembly. Remove throttle body, idle mixture screw and spring. On automatic choke carburetors, remove fast idle cam. On all carburetors, remove float hinge pin from air horn and remove float assembly, then remove needle seat and gasket. Remove main metering jet and power valve from main well support, being careful not to lose check ball and spring when removing power valve. Remove main well attaching screw, support, and gasket, then remove power piston and spring. *CAUTION – Do not remove idle tube which is pressed into air horn ass mbly.*

►*THROTTLE VALVE ASSEMBLY CAUTION: Do not remove throttle valve. If throttle valve assembly is damaged or worn, replace complete throttle body assembly.*

Cleaning & Inspection: Wash all parts except choke coil housing and pump plunger in carburetor cleaning solvent and blow dry with air. Blow out all passages with air and inspect for carbon deposits. Inspect all parts for wear or damage.

Reassembly: Reverse disassembly procedure and note the following

Choke Valve – Install choke valve with "RP" mark on valve toward top of carburetor.

Pump Intake Ball Check – If ball check is aluminum, install ball in bottom of pump cylinder and see that it lifts freely from its seat.

►*HEAT SUCTION TUBE SERVICING NOTE:* If tightening of loose seal with Tool BT–45 does not correct leakage, install new seal as follows. With carburetor fully assembled, loosen throttle body–to–bowl casting screws, then insert flared end of heat suction tube into hole in throttle body and tap seal lightly into position with Tool BT–45. Rotate tube while tapping to insure starting uniformly into throttle body. Tighten coupling nut at upper end of tube finger tight, using new packing on tube. Use a light hammer and Tool BT–45 to spread seal securely in throttle body (rotate tool to secure uniform spreading of seal). Loosen coupling nut at upper end of tube and check tube tightness in throttle body (tube should not turn). Tighten coupling nut securely, then tighten throttle body–to–bowl casting screws. Check seal for leaks after carburetor installed on engine.

SERVICE PARTS: Gasket Sets – Rochester No. 7015965 (Carb. No. 7015011, 7015021), No. 7006126 (Carb. No. 7015013), No. 7015966 (Carb. No. 7013003, 7013005, 7013955, 7019000, 7013956), No. 7016142 (Carb. No. 7019061, 7019062).

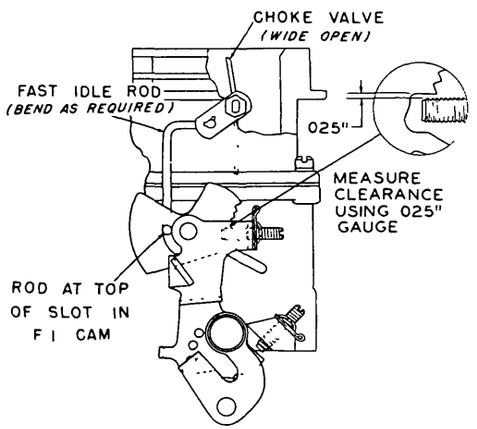
1961 STROMBERG "WW" BUICK, DODGE, PLYMOUTH

BUICK	Stromberg Code No.
1961 364" Eng	WW 7–114A
DODGE DART & PLYMOUTH	
1961 V8 318" Eng. (Synchro–mesh)	WW 15–43
1961 V8 318" Eng. (Auto. Trans.)	WW 15–44
1961 V8 318" Eng. (All Trans.) CCV①	WW 15–45

① – Closed crankcase ventilation.

► *1961 DODGE & PLYMOUTH HARD COLD WEATHER START CORRECTION:* Hard starting may be caused by choke piston sticking. To correct, remove gum formation by removing air cleaner and squirting carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke to flush out gum formation.



► *1961 DODGE & PLYMOUTH HARD STARTING CORRECTION:* This condition may be caused by interference between air horn and choke lever. When properly positioned, looped end of air cleaner clamp should be on right side approximately 2" to rear of centerline of air cleaner.

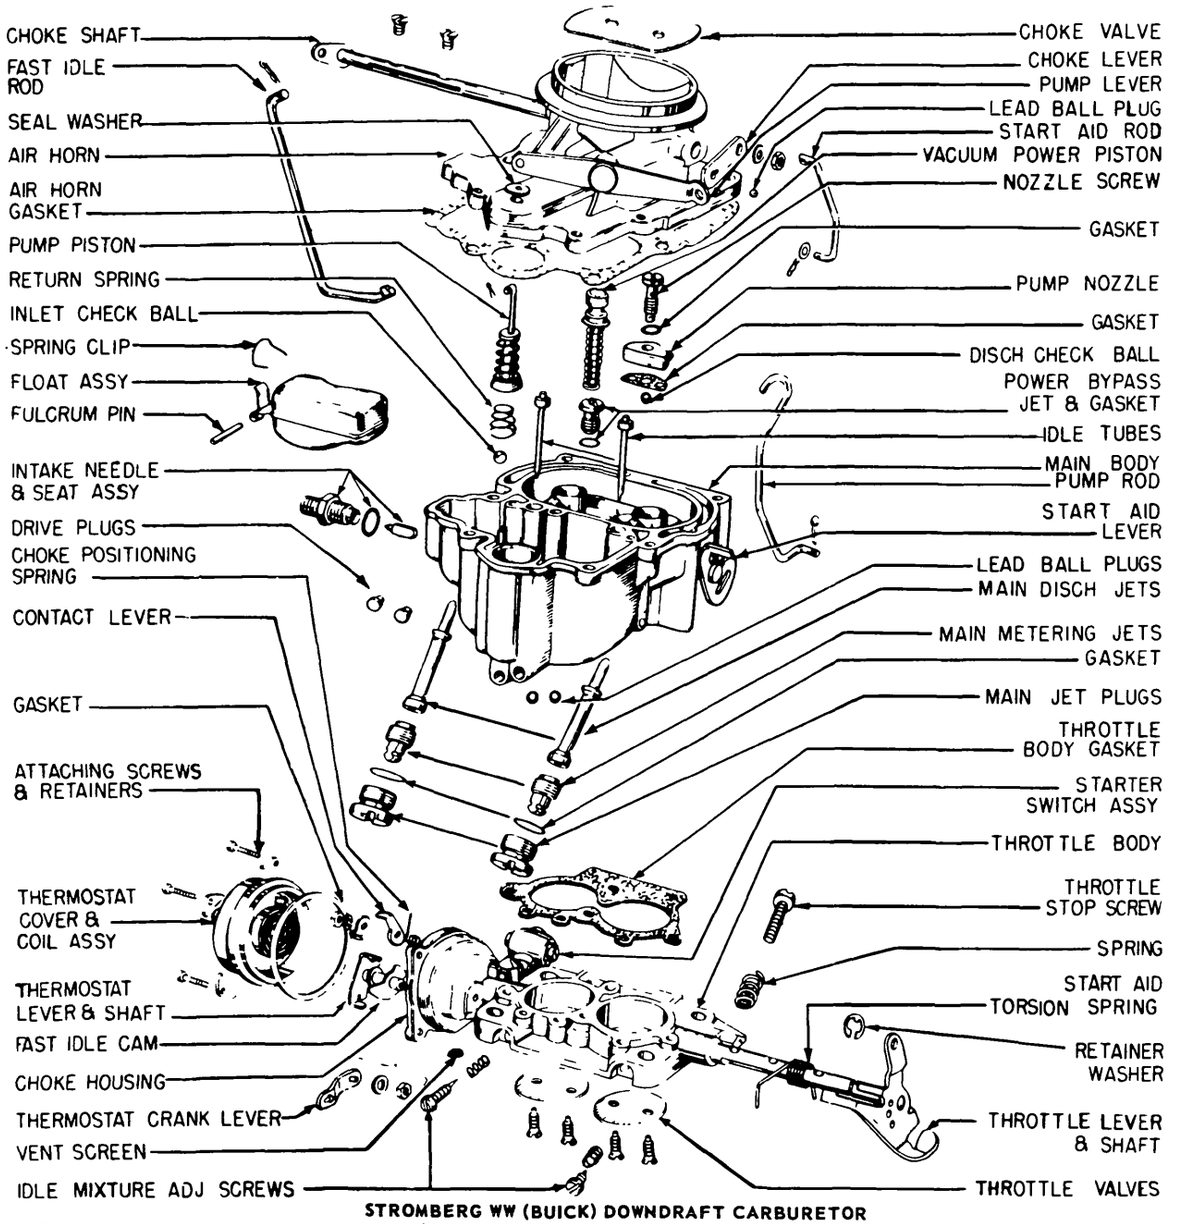
DESCRIPTION: Dual downdraft of same design used previously. On Buick, integral choke is mounted on throttle body. On Dodge and Plymouth, automatic choke is "Cross–Over" type mounted in well in intake manifold. On all models, the automatic choke assembly is connected to choke shaft lever by linkage.

ADJUSTMENTS: Make all adjustments as outlined below.

► *1961 DODGE & PLYMOUTH IDLE SETTING CAUTION:* When making Idle Speed & Idle Mixture adjustments, turn headlight high beam on to compensate for alternator load. On automatic transmission cars, loosen nut on sliding link of carburetor–to–bellcrank rod so transmission internal stop will not interfere with carburetor throttle lever. When adjustments completed, move sliding link to rear against its stop and tighten locknut.

Idle Adjustment: For initial setting, turn idle mixture screws 1½ turns open (Buick); 1¼ turns open (Dodge & Plymouth) from a lightly seated position. Bring engine to normal operating temperature with choke valve wide open and fast idle inoperative. Set engine idle speed (see below), then adjust idle mixture as follows:

BUICK FAST IDLE



Idle Mixture – Turn both idle mixture adjusting screws in equally until engine begins to run roughly from lean mixture. Then turn screws out until engine rolls from rich mixture. Now set screws about halfway between these positions where smoothest idle is obtained. On Buick, favor a slightly rich mixture. Recheck idle speed.

Idle Speed – Adjust by turning throttle stop screw located on boss on throttle body for desired speed as follows:

Car Model	Idle Speed Setting Engine Speed
Buick	①② 525 RPM
Dodge & Plymouth	③④ 500 RPM

① – With transmission in "N" or "P".
② – 575 RPM on Air Conditioned cars.
③ – 550 RPM on Air Conditioned cars.
④ – Headlights turned on. See *"Idle Setting Caution"* above.

CONTINUED ON NEXT PAGE

STROMBERG WW (BUICK) DOWNDRAFT CARBURETOR

1961 STROMBERG "WW" (Cont.) BUICK, DODGE, PLYMOUTH

Fast Idl (On Car): Buick – With engine at normal operating temperature and automatic transmission in "D" (Drive) or "P" (Park), place fast idle adjusting screw on lowest step of fast idle cam, then adjust fast idle screw to obtain an engine speed of 625 RPM.

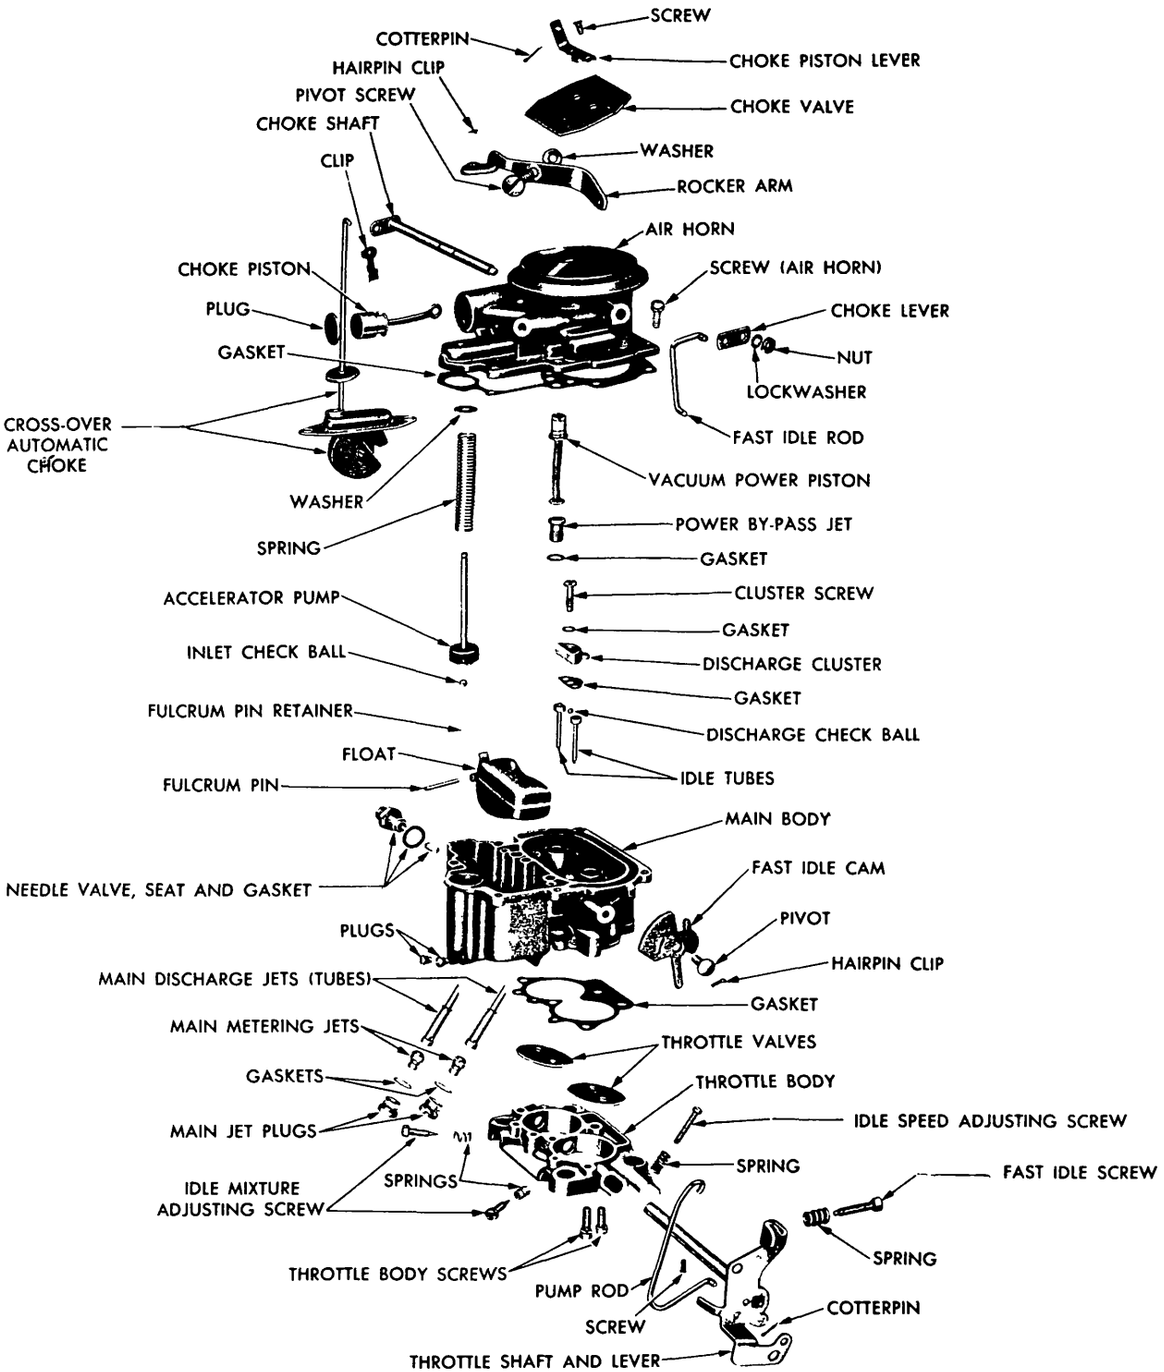
D dg & Plym uth – With engine at normal operating temperature and fast idle adjusting screw contacting top step of fast idle cam, adjust engine speed to 1250 RPM.

Fl at L v l: Buick – Hold float arm tang against float needle, then check float level with Gauge J–9311–1 (without float bowl gasket). Top of float at highest point should just touch center of gauge (3/16" below float bowl gasket surface). To adjust, bend float arm tang. Make sure float is centered and does not rub walls of bowl.

D dg & Plym uth – *NOTE – Fuel inlet needle is rubb r tipp d. Do not allow more than weight of float to r st on n dl wh n checking float level.* Invert float bowl and check distance between surface of fuel bowl (gasket removed) and top of float at center with Gauge 73605 or a "T" scale. This measurement should be 7/32". To adjust, hold float at bottom of *bowl and bend tang on float as necessary. CAUTION – When b nding float tang, do not allow tang to push against n edl . When float is correctly set, float tang should b p rp ndicular to n dle or slanted not more than 10° away from n dl .*

► *ADJUSTMENT NOTE: Make following adjustments in th order indicated.*

Fast Idl Cam: Buick – With choke valve held wide open and fast idle rod at top of slot in fast idle cam, fast idle screw must clear lowest step of cam with a clearance of .025" (between upper side of fast idle screw and cutout section of cam). See illustration. To adjust, bend fast idle rod at upper angle with Tool J–5197.



Fast Idl (Off Car) & Cam Position Adjustment: Dodge & Plym uth – Back throttle stop screw out far enough to clear throttle lever tang when throttle valves are closed, then hold throttle valves in closed position. Turn fast idle screw out so it can be positioned on **s c nd st p** (against top step), and **turn fast idle scr w in 8 turns.** Distance between edge of choke valve and air horn wall should be 13/64". To adjust, bend fast idle rod at upper angle.

Unl ad r: Buick – Close choke valve lightly, then fully open throttle to kick choke valve open. Clearance between choke valve and wall of air horn should be .144" (No. 27 drill). To adjust, bend ear of throttle lever as required.

D dg & Plym uth – Close choke valve lightly, then fully open throttle valves. Clearance between choke valve and wall of air horn should be 15/64" (No. 1 drill). To adjust, bend tang on throttle lever

Chok Vacuum Piston: All Models – Bend a .040" wire gauge so it will engage in slot at bottom of choke vacuum piston cylinder, then with gauge in place, lightly close choke valve until inner end of piston grips gauge at end of slot. Measure choke valve opening or clearance between upper edge of choke valve and air horn wall using correct size gauge or drill rod (see table below). To adjust, bend ear on piston lever.

CONTINUED ON NEXT PAGE

STROMBERG WW (DODGE & PLYMOUTH) DOWNDRAFT CARBURETOR WITH CROSS-OVER CHOKE

1961 STROMBERG "WW" (C nt.) BUICK, DODGE, PLYMOUTH

Choke Vacuum Piston Setting

Car Model	Choke Opening
Buick (All)	.425"
Dodge & Plymouth (All)	31/64"

Accelerating Pump: Buick – With throttle valves fully closed (throttle stopscrew backed out) and pump rod in center hole, measure distance from top of accelerator pump plunger rod to top of air horn. This measurement should be 7/8". To adjust, bend pump rod at lower angle. *NOTE – After pump rod adjustment, turn throttle stop screw (with throttle valves closed) in to just contact throttle lever, then turn screw in 1½ turns for initial idle speed setting.*

Accelerating Pump & Idle Vent: Dodge & Plymouth – *NOTE – This is a combination adjustment. Accelerating pump travel is automatically set when bowl vent is properly adjusted.* Back off idle adjusting screw and open choke valve so that when throttle valves closed, fast idle screw will not contact cam. Place pump rod in center hole in throttle lever and pump vent clip (located on pump stem under bowl vent valve) in center notch. With throttle valves closed tightly, clearance between bowl vent and bowl vent seat should be 5/64" (pump travel should measure 9/32" – 5/16"). To adjust, bend pump rod at lower angle with Tool T109–213.

►*DODGE & PLYMOUTH ACCELERATING PUMP ADJUSTMENT CAUTION: If pump rod is moved to either the short or long stroke position, a corresponding change must be made in location of bowl vent clip, and the amount of lift of bowl vent rechecked and adjusted.*

Choke Thermostat Lever: Buick – Close choke valve by applying a light pressure to thermostat lever, then measure distance from lower edge of thermostat coil spring pick–up lever (inside choke housing) to center of bottom thermostat cover retaining screw hole. This distance should be 1". To adjust, bend choke rod at upper angle with Tool J–5197.

Automatic Choke: Buick – Centered (On Index).

Automatic Choke: Dodge & Plymouth – "Cross–Over" type mounted in well in intake manifold. *See "Stromberg Cross–Over Automatic Choke".*

Anti–Stall Dashpot: Buick – *See CARBURETOR on car model page.*

OVERHAUL: Buick – *See 1958 Annual Data, Page 292, or later Manual editions and see additional overhaul data below.*

Dodge & Plymouth: *See 1958 Annual Data, Page 294, or later Manual editions.*

►*BUICK OVERHAUL NOTE:* Accelerating pump lever fulcrum screw has a left hand thread. Choke piston assembly can be removed by driving a sharp awl through center of plug and prying plug out. To install, insert piston and lever assembly, then install a new aluminum expansion plug and expand it firmly in place.

SERVICE PARTS: Gasket Sets – Buick No. 1348370 (WW 7–114A); Mopar No. 1631368 (WW 15–43 & 45); Mopar No. 2275255 (WW 15–44).

Repair Kits – Buick No. 1348163 (WW 7–114A); Mopar No. 2240455 (WW 15–43 & 45); Mopar No. 2240457 (WW 15–44).

1961 STROMBERG "WWC" CHRYSLER, DE SOTO, DODGE CARBURETORS

CHRYSLER, DESOTO, DODGE	Stromberg No.
361" Engine	WWC 3-188, 188A

►*1961 DODGE HARD COLD WEATHER START CORRECTION:* Hard starting may be caused by choke piston sticking. To correct, remove gum formation by removing air cleaner and squirting carburetor cleaner, lacquer thinner, or alcohol through piston link opening while operating choke to flush out gum formation.

DESCRIPTION: 2–Barrel downdraft type of same design as previous models.

ADJUSTMENT: Make all adjustments as follows:

Idle Setting: For initial setting, set idle mixture screws (located in throttle body below float chamber) ½ to 5/8 turn open from a lightly seated position, then bring engine to normal operating temperature with choke fully open and carburetor off fast idle.

Idle Speed – 500 RPM with transmission in "N" (Neutral). *NOTE – 550 RPM with air conditioning compressor operating (if so equipped).* Adjust idle speed with throttle stop screw on throttle body casting.

Idle Mixture – Turn both idle mixture screws in equally until engine begins to run rough, then turn screws out until engine rolls (from rich mixture). Now turn screws in to a point about halfway between these two positions where smoothest idle is obtained. *NOTE – Both screws must turn equally.* Recheck idle speed.

Fast Idle Speed (On Car): With engine at normal operating temperature and fast idle screw on TOP step of fast idle cam, adjust fast idle screw to obtain an engine speed of 1400 RPM.

Fast Idle (Off Car) & Cam Position Adjustment: Back throttle stop screw out far enough to clear throttle lever tang when throttle valves are closed, then hold throttle valves in closed position. Turn fast idle screw out so it can be positioned on **second step** of cam (against top step), and **turn fast idle screw in 3½ turns.** Distance between edge of choke valve and air horn wall should be ¼". To adjust, bend fast idle rod at upper angle.

Unloader: With choke valve held lightly closed, open throttle valves to wide open position. Clearance between top edge of choke valve and wall of air horn should be ¼" (use ¼" drill to measure). To adjust, bend tang (long narrow extension) on throttle lever with Tool T109–214. Make sure throttle valves fully open and close when choke valve is wide open.

Accelerating Pump: With throttle valves fully closed, pump travel from fully closed to fully open positions should be 9/16", measured at small raised boss near connecting rod end of pump lever. To adjust, bend pump rod at right angle bend. *NOTE – Pump rod must be installed in center slot of pump arm.*

Bowl Vent Valve: With idle speed screw backed out, hold throttle valves in closed position and choke valve wide open. Opening of vent valve at center of hole, with rubber valve hanging free, should be 5/64". To adjust, bend bowl vent lever (extension of accelerator pump lever).

►*CAUTION: Make sure the vent valve is not distorted and that it properly seals the bowl vent hole when throttle valve is open.*

Choke Vacuum Piston: With bowl cover removed, insert a No. 59 drill (.041") through vacuum passage on underside of choke piston cylinder and engage the top groove of vacuum piston. Apply a light pressure against choke valve to take up slack, then measure clearance between top of choke valve and wall of air horn which should be .182" (No. 14 drill). To adjust, bend ear on choke connector rod bracket on choke valve.

Float Level: With float installed in float bowl and lip of float held against inlet needle, distance from top of float at center to top of float bowl (gasket removed) should be 1/8". Use Gauge 73725 or "T" scale. To adjust, bend lip of float with Tool 73605.

►*FLOAT LEVEL CHECKING NOTE:* With carburetor installed on engine, the air horn can be removed as follows: Remove three short air horn-to-main body attaching screws, then remove one long air horn-to-throttle body screw next to fuel bowl. Assemble a short screw through main body flange and thread into throttle body. Remove long screw from side away from fuel bowl and on opposite side, then assemble a short screw through main body flange. Securely tighten the short screws, then remove remaining two long screws and lift off air horn. Assemble air horn to main body by reversing removal procedure.

Automatic Choke: Cross–Over type mounted in well in intake manifold. *See "Stromberg (Cross–Over) Typ Automatic Choke".*

OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Remove hairpin from fast idle rod and from pump rod, then remove rods. Remove three air horn attaching screws, four main body-to-throttle body screws, then lift off air horn assembly and gasket. Remove main body and gasket from throttle body.

Air Horn - Remove accelerating pump piston and spring from air horn, then remove spring from pump piston. Remove vacuum power piston using a block of wood and small open end wrench as a pry. Remove choke lever attaching nut and lockwasher and remove lever. Remove vacuum piston link cotter pin, then remove choke valve plate, choke valve, and choke shaft. Remove welch plug and choke piston. Remove pump lever, external vent attaching screw, external vent spring and grommet.

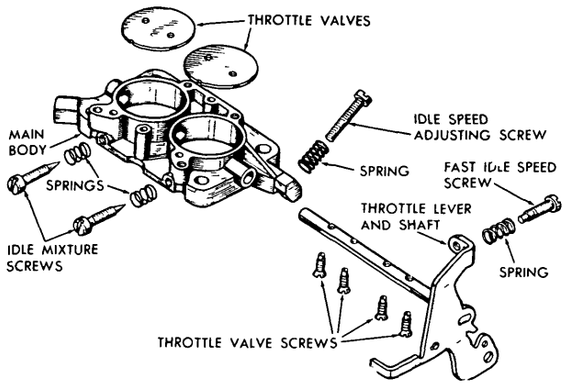
Main Body - Remove baffle, fulcrum pin spring, float, and fulcrum pin. Remove needle valve, seat and gasket. Invert carburetor and catch pump inlet ball check. Remove venturi cluster attaching screws, cluster assembly, and gasket. Remove power bypass jet and gasket, then use Tool T109-173 and remove the two main metering jets.

Throttle Body - Remove idle mixture screws and springs from throttle body. *NOTE - It is not advisable to remove throttle shaft or valves unless necessary to install new parts.* If these parts must be removed, scribe throttle valves along side of throttle shaft and mark valves and throttle body to assure reassembly in same position and barrel, then remove screws, throttle valves, throttle shaft and lever.

Cleaning & Inspection: Clean all metal parts in Bendix Metaclean. *CAUTION - Do not use metaclean to clean non-metallic parts.* Blow out drilled passages and

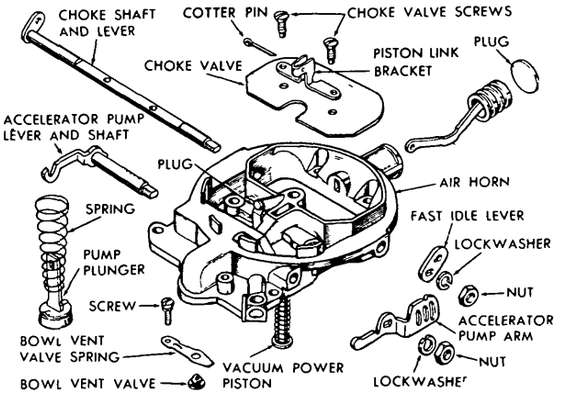
CONTINUED ON NEXT PAGE

STROMBERG "WWC" (CHRYSLER, DE SOTO, DODGE) (C ntinued)



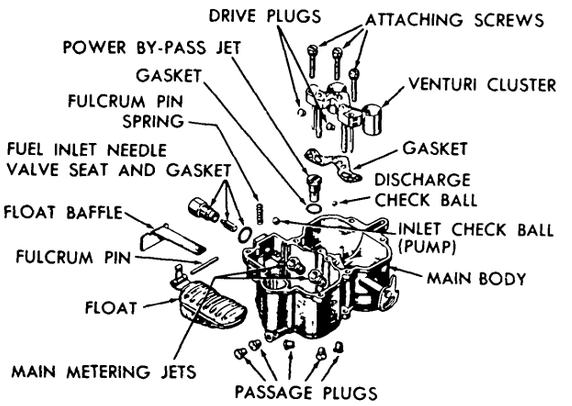
parts with air. Inspect housing for damage, wear, burrs or warpage. Check throttle shaft for excessive wear in throttle body. If wear is extreme, it is recommended that throttle body be replaced rather than installing a new shaft in throttle body.

Reassembly: Throttle Body - If throttle shaft and valves were removed, insert throttle shaft in throttle body and assemble throttle valves in same position and barrel that valves were removed from, leaving screws loose. Close throttle, align valves to scribe marks and check for best closing before tightening screws. *NOTE - Throttle valves must be installed with notch toward idle discharge holes.* Replace idle mixture screws and springs. Turn each needle valve in lightly against its seat, then back out each valve one full turn. If removed, replace slow idle stop screw, fast idle stop screw, and springs.



Main Body - Replace drive plugs and lead plugs if removed, then assemble main metering jets in main body and tighten securely with Tool T109-173. Install power bypass jet and new gasket and tighten securely. Install accelerator pump inlet check ball (1/8") in pump well, and discharge check ball (3/8") in discharge passage.

Air Horn - Slide choke shaft and lever into air horn with choke lever pointing down and away from air horn, then slide choke valve down into slot in shaft. Hold choke valve closed, then position choke piston bracket and install new screws (do not tighten). Hold valve in a closed position and tap gently with a screwdriver to center and locate the valve. Tighten attaching screws securely, then stake in place by squeezing with pliers. Install fast idle lever and secure with lockwasher and nut. Check accelerator pump leather for cracks or wear and hardness. If necessary, install a new pump plunger. *NOTE - If a new pump plunger is installed, flex leather several times before installing in air horn.* Slide compression spring over plunger shaft, then slide plunger over hook and into position. Install a new air horn gasket, then install vacuum power piston in air horn. Lock in position by prick punching on retaining rim. Compress piston plunger to make sure no binding exists. If piston sticks or binds enough to cause rough operation, install a new piston assembly.



SERVICE PARTS: Gasket Set - Mopar No. 2084728 (WWC 3-188, 188A).
Repair Kit - Mopar No. 2084725 (WWC 3-188, 188A).

STROMBERG "WW" STUDEBAKER CARBURETORS

STUDEBAKER	Stromberg Carb. No.
V8 Engine (Early)	WW 6–123A
V8 Engine (Late)	WW 6–123B
V8 Engine (CCV) ①	WW 6–125 & 125A

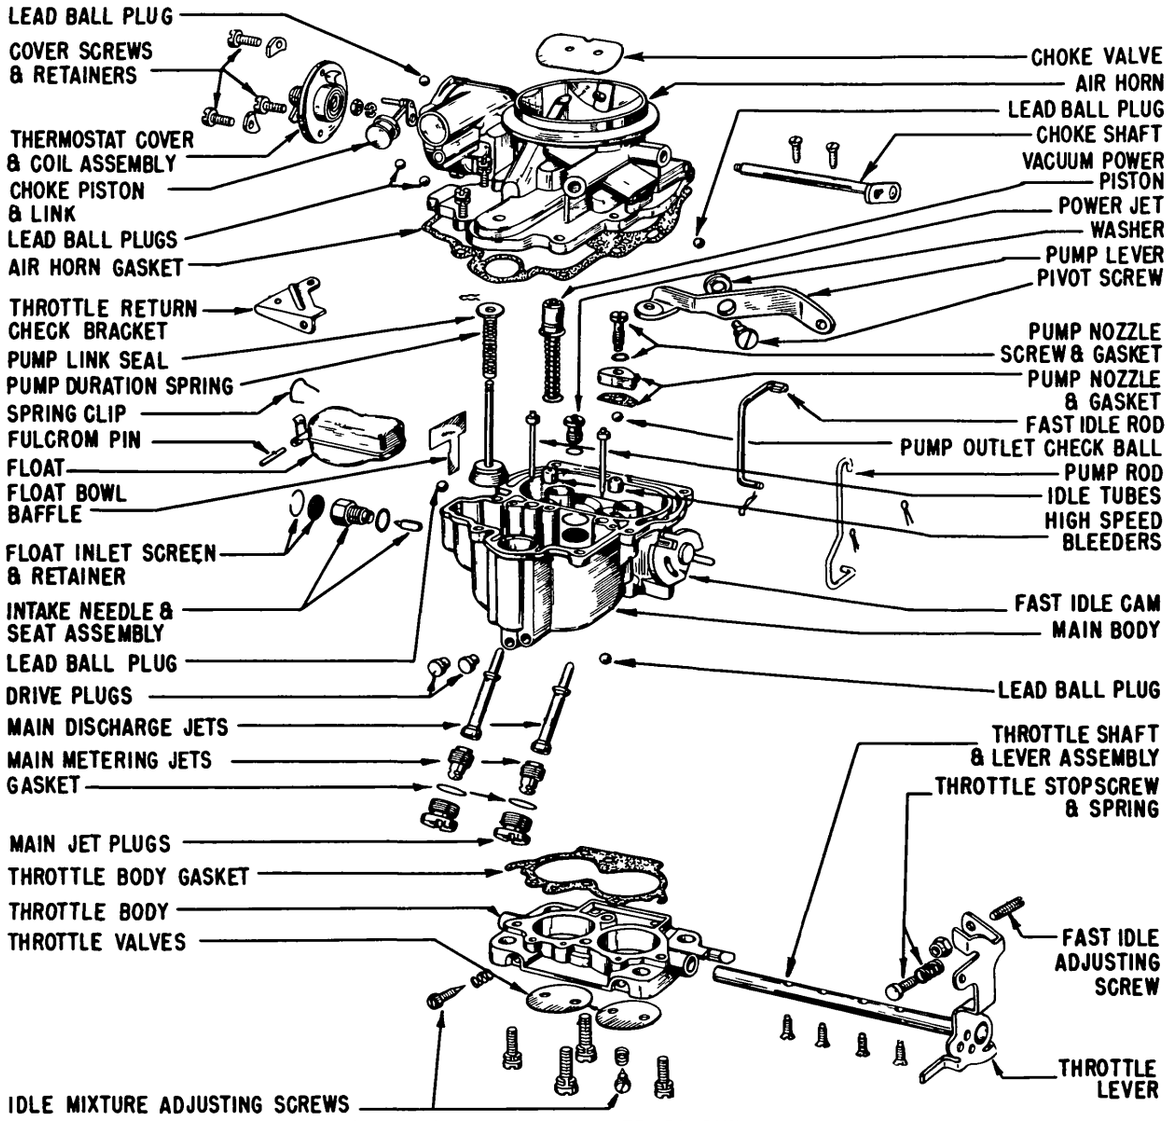
① – Closed Crankcase Ventilation.

DESCRIPTION: Dual downdraft type with straight air Horn (vertical air intake) and fast idle cam mounted on main body above throttle lever and linked to choke valve lever. Automatic choke housing mounted on air horn and linked directly to choke shaft. Carburetor contains conventional single float, idle system, main metering system, power system, accelerating system and automatic choke.

ADJUSTMENT: Make all adjustments exactly as detailed below.

Idl Setting: For initial setting, set idle adjusting screws (located in throttle body below float chamber) 1¼ turns out from a lightly seated position. Bring engine to normal operating temperature with carburetor air cleaner in place, choke fully open, and carburetor off fast idle.

Idle Speed – 550–600 RPM with selector lever in "N" on Flightomatic cars. Set idle speed by turning throttle stopscrew located on boss on throttle body until correct speed is obtained.



Idle Mixture – Turn both screws in equally until engine begins to run roughly from lean mixture. Then turn screws out until engine rolls from rich mixture. Now set screws about halfway between these positions where smoothest idle is obtained. Both screws must be turned equally. Recheck idle speed.

Accelerating Pump: No seasonal adjustment. Three holes provided in throttle lever for pump connector rod engagement.
C nter Hole – Normal operating conditions.
Upper Hole – Shorter stroke, less fuel discharge.
L wer Hole – Longer stroke, more fuel discharge.

Fl at Level: 3/16" from top of float to top of main body with air horn and gasket removed. Use Gauge J–7477. Top of float should just touch gauge. To adjust, bend float lip.

Fast Idle: With choke valve closed and high step of fast idle cam touching fast idle screw, adjust fast idle screw so .025" wire gauge can be inserted freely between throttle valve and throttle body on idle port side. *NOTE - This setting supersedes previous setting of .030".*

Unloader (Dechoke) Setting: To check setting, hold choke valve closed lightly. Open throttle valve to wide open position so throttle lever stop rests on throttle body stop. Choke valve should now be open enough to allow. .192" gauge of Tool J–7477 to be inserted between choke valve and inner wall of air horn. To adjust, bend throttle lever ear.

STROMBERG WW (STUDEBAKER) CARBURETOR

Automatic Choke: Centered at index. To change setting, loosen cover screws and rotate housing as required.

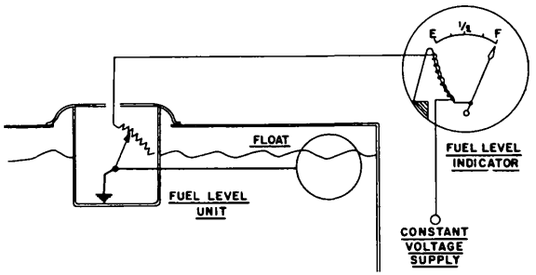
Throttle Return Check (Flightomatic Cars): Consists of a dashpot unit mounted on carburetor with dashpot plunger contacting throttle lever. Will prevent too-rapid closing of throttle and keep engine from stalling. *See "Throttle Linkage Adjustment" under CARBURETOR on car model page.*

OVERHAUL: *See 1959 Annual Data, Page 300, or later Manual edition.*

SERVICE PARTS: Gasket Set – Stromberg No. 381500 or Studebaker No. 1550308 (WW 6–123A & 125).
Repair Kits – Stromberg No. RK–274 or Studebaker No. 1550307 (WW 6–123A); Stromberg No. RK–278 or Studebaker No. 1552221 (WW 6–125).

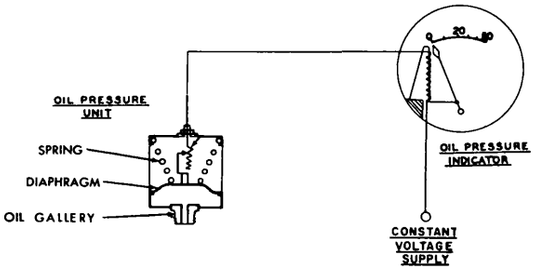
CHRYSLER CORP.
ELECTRIC TYPE

►CHANGES, CAUTIONS, CORRECTIONS



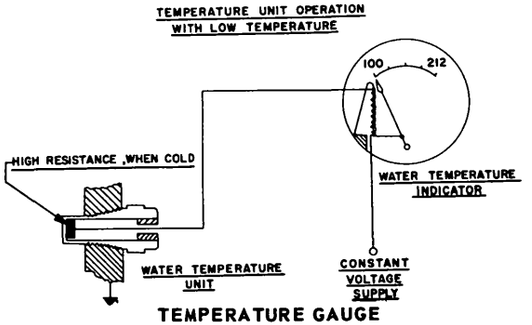
►*1960-61 INACCURATE TEMPERATURE INDICATOR READING CORRECTION (AIR COND. CARS):* May be caused by temperature indicator sending unit grounding on air conditioning compressor. To correct, install special Air Conditioned Car Temperature Indicator Sending Unit, Part No. 2256302.

►*1960-61 INACCURATE FUEL GAUGE READING CORRECTION:* If dash unit, tank unit, and wiring are in good condition, trouble may be caused by high resistance between fuel tank and car body. To correct, install Fuel Tank Grounding Clip, Part No. 2258412, over rubber hose connector of fuel supply line at tank gauge unit. This clip installed in production on 1961 models.



►*1960 CHRYSLER GAUGE VOLTAGE REGULATOR PRODUCTION CHANGE & OIL PRESSURE GAUGE INSTALLATION CAUTION:* External type gauge voltage regulator mounted on speedometer case beginning Serial No. 03148732 with Prefixes 81, 82, 83, 84, 85, 87. New type oil pressure gauge without internal voltage regulator also used. In case of oil pressure gauge failure on later cars, early type gauge, Part No. 2258138, may be installed if short auxiliary wiring to external voltage regulator is removed and instrument panel wiring connected directly to oil pressure gauge.

►*1960 DE SOTO FUEL GAUGE RADIO CONDENSER CAUTION:* A .5 mfd. condenser is installed on fuel gauge on radio equipped cars to suppress rapid clicking noise in radio caused by gauge voltage regulator in fuel gauge. When installing condenser, ground negative side of condenser to fuel gauge and install positive lead at ignition terminal of gauge with a pal nut to allow gauge wiring connection to be installed properly.



DESCRIPTION: Thermal type, constant voltage units operated by variable resistance type sending units which are sensitive to fuel level, engine temperature, and engine oil pressure. Constant voltage is supplied by a Constant Voltage Regulator built into one of the dash units (except some Chrysler cars – see "Production Change" above) and connected in series to each gauge which provides the same regulator voltage to each gauge regardless of line voltage fluctuations. *See individual Car Model pages for gauge application, part numbers, and to determine which gauge has the internal voltage regulator.* The gauge with the internal constant voltage regulator also may be identified by three terminals marked "A" (output voltage from regulator), "I" (input voltage to regulator), and "S" (connection to gauge sending unit). Other gauges have only "A" and "S" terminals. *NOTE – On Chrysler and Imperial cars with Panel set Instrument lighting, there is an additional terminal on each gauge for lighting connection.*

GASOLINE GAUGE

OIL PRESSURE GAUGE

TEMPERATURE GAUGE

►*GAUGE TESTER NOTE:* A special Gauge Tester, Tool C-3826, is available for testing gauge dash and sending unit. Procedures for use of tester are detailed below.

►*TESTING CAUTION: DO NOT ground tank or engine sending unit or wire as dash unit will be damaged.*

ALL GAUGES: Trouble – High (against peg), no, or inaccurate reading after ignition switch turned on.

Cause – Defective constant voltage regulator, or open circuit on input side of regulator. Replace dash unit in which regulator is located or correct open circuit in wiring connections.

Testing – Check voltage output at "A" terminal of regulator. Voltage should fluctuate between 0 and 7.0 volts. A steady voltage reading of 12 volts indicates faulty regulator.

FUEL GAUGE: Trouble 1 – Higher or lower fuel level reading than actually exists.

Cause – Defective tank or dash unit. Replace as necessary.

Testing – Connect Tester C-3826 to disconnected tank unit wire and to ground at car body; or connect a known good tank unit to disconnected tank unit wire and to ground at car body. Move tester knob to "L" or tank unit to empty and turn on ignition. Dash gauge unit reading should be "E" to -3/32". With tester knob at "H" or tank unit moved to full, gauge reading should be "F" to +3/32". *NOTE - With the tester knob at "M", gauge reading should be Half-way ±1/16".* If dash unit readings are correct, replace tank unit. If dash unit readings are incorrect, replace dash unit.

Trouble 2: Fuel gauge erratic operation.

Cause – Loose or dirty connections, or faulty tank unit.

Testing – Clean and tighten all connections. Test sending unit (see Trouble 1 above). Make sure tank unit is grounded to tank and tank is grounded to frame. *See "Inaccurate Fuel Gauge Reading Correction" above for installation of grounding clip.*

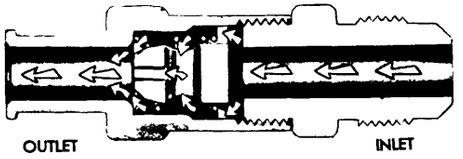
TEMPERATURE GAUGE: Trouble 1 – Higher or lower temperature reading than actual engine temperature.

Cause – Defective dash or engine units.

Testing – Connect Tester C-3826 to disconnected sending unit wire and to ground on engine; or connect a known good fuel tank sending unit to disconnected wire and ground. Turn on ignition switch and move tester knob to "L" or tank unit to empty. Dash gauge should read "C" ± 1/8". Move tester knob to "H" or tank unit to full. Dash unit should read "H" ± 1/8". *NOTE – With tester knob at "M", dash unit should read Half-way ±1/8".* If dash unit reads correctly, replace engine unit. If dash unit reads incorrectly, replace dash unit.

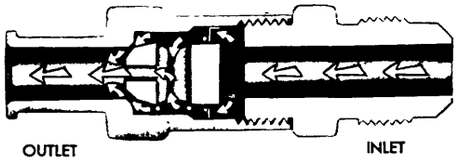
OIL PRESSURE GAUGE: Trouble – No or low oil pressure reading.

Cause – Faulty dash or sending unit or engine oiling system.



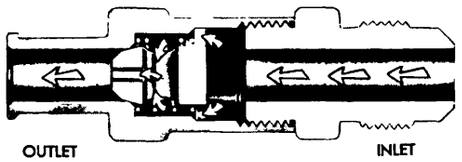
Testing – Make sure engine oil is at proper level and that engine oiling system is functioning properly *(see Car Model pages for correct oil pressure).* Connect Tester C-3826 to disconnected oil pressure engine sending unit wire and to ground on engine; or connect a known good fuel tank sending unit to disconnected wire and to ground. Move tester knob to "L" or tank unit to empty. Dash gauge unit should show no pressure. Move tester knob to "H" or tank unit to full. Dash unit should show high pressure. If dash unit operates correctly, replace engine unit. If dash unit not correct replace dash unit.

CLOSED CRANKCASE VENTILATION SYSTEMS (ALL CAR MODELS)



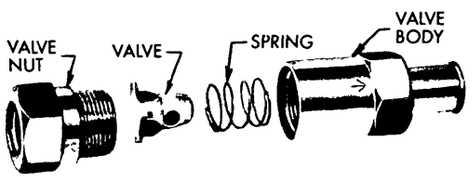
DESCRIPTION: Closed crankcase ventilation systems utilize vacuum in intake manifold to remove unburned gases from engine crankcase and return them to the combustion chambers to be burned. This unit which consists of a check valve, hose, and carburetor adapter or carburetor connection, replaces the conventional crankcase ventilator tube.

OPERATION: The crankcase vent valve assembly automatically meters flow of gases so that normal operation of engine is not disturbed. Under high vacuum conditions such as at idle or during deceleration, the valve is held closed and only small amounts of gases are allowed to pass through a metered orifice and into intake manifold. During periods of low vacuum in intake manifold, a spring holds the valve open and larger amounts of gases pass through to intake manifold. Fuel vapor is prevented from entering crankcase by the crankcase vent valve which is held closed by any reverse air flow.



SERVICING: See table below for servicing intervals. *NOTE - Indicated intervals are for normal operation. If car is operated under low temperature conditions; in "stop and go" service, or in dusty areas, ventilation system should be cleaned or serviced more frequently. A clogged system will result in erratic idle speed, stalling at low speed, or stumble on acceleration.* Remove ventilator hose from connections and blow out with air (replace hose if necessary). Remove crankcase vent valve and disassemble by unscrewing connector and removing check valve and spring. *NOTE - A "crimped type valve assembly is used on Lincoln, Pontiac & Tempest 4 Cyl. These valves cannot be disassembled and must be replaced.* Clean all parts in solvent or carburetor cleaner and blow dry with air. Clean out metering orifice using a suitable size drill to remove varnish and carbon accumulation. *CAUTION - Do not enlarge metering hole.* Inspect all parts for damage or excessive wear and replace if necessary. Install spring on valve until spring is properly seated in groove in valve, then place valve and spring in valve body and install connector. *CAUTION - Do not stretch or distort valve spring. If damaged, replace assembly.* Clean crankcase and intake manifold (or carburetor) connectors. Clean crankcase oil filler cap in solvent and blow dry with air. *NOTE - On Lincoln models, install new oil filler cap.* Reinstall ventilating system.

LOW VACUUM



INTERMEDIATE VACUUM

HIGH VACUUM

CRANKCASE VENT VALVE OPERATION

CRANKCASE VENT VALVE ASSY. (TYPICAL)

►*CADILLAC NOTE: It is rec mmend d that crankcas vent valve be removed and cl aned v ry 8,000 mil s by sloshing it in carburetor cleaner and blowing dry with air. Do not disassemble unless absolutely necessary. Clean out hose and connections with air. Us a drill to clean out metering orifice.*

①Maximum Servicing Intervals

Car	Mil ag
Buick	5,000 miles
Cadillac	③ 8,000 miles
Chevrolet Pass. Cars	10,000 miles
Chevrolet Trucks	10,000 miles
Chrysler, DeSoto, Dodge, Plymouth	10,000 miles
Comet	8,000 miles
Falcon	8,000 miles
Ford Pass. Cars	8,000 miles
Ford Trucks	8,000 miles
Lancer	10,000 miles
Lincoln	④ 6,000 miles
Mercury	10,000 miles
Oldsmobile	10,000 miles
Pontiac & Tempest (4 Cyl.)	②⑤ 12,000 miles
Pontiac Tempest (V8)	⑤ 12,000 miles
Rambler	10,000 miles
Studebaker	10,000 miles
Valiant	10,000 miles
Willys	⑥

① - If car is operated in cold temperature, "stop & go" service, or in dusty areas, clean system more frequently.
② - Vent valve cannot be disassembled, replace unit.
③ - See "Cadillac Note" above.
④ - Clean system every 6000 miles. Replace vent valve, which cannot be disassembled, every 12,000 miles.
⑤ -Every 12,000 miles or 12 months.
⑥ - At each tune-up, overhaul, or as required.

CHRYSLER CORP. DISTRIBUTORS

Chrysler (1961)
Dodge & Plymouth (1960-61)
Lancer (1961)
Valiant (1960-61)

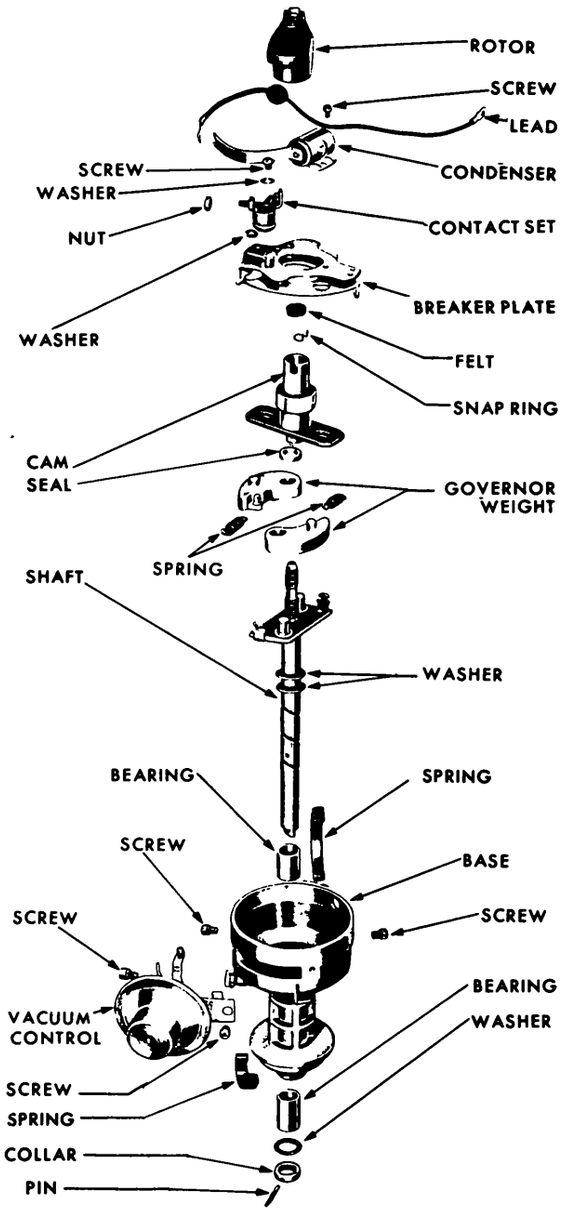
DESCRIPTION: Single breaker type distributor with a "pivoted" type breaker plate. The breaker plate assembly consists of a support plate which is attached rigidly to distributor housing and a movable breaker plate which is pivoted on support plate at a point under the condenser. Distributor primary lead is a continuous wire which enters housing through an insulating grommet.

DISASSEMBLY: Remove rotor, then remove clip attaching vacuum control unit to breaker advance arm and remove vacuum control unit from distributor housing. Remove primary lead terminal at terminal screw and remove primary lead wire and grommet as an assembly from distributor housing. Remove two screws and lockwashers attaching breaker plate assembly to housing and lift out the complete assembly including points and condenser. Remove oil wick from distributor cam, then remove wire clip from well in cam and remove cam, yoke and spacer. Clamp distributor in a vise (with soft jaws) and attach a dial indicator to body of distributor with indicator plunger resting against distributor shaft. Hook a spring scale over shaft and pull on a line with plunger of gauge. Apply a 5 lb. pull and check movement of distributor shaft. If side play exceeds .005", replace bushings and shaft. Remove distributor drive gear (six cylinder) or collar (V8) retaining pin and slide gear or collar off shaft. *NOTE - Support hub of gear or collar s pin can b driv n out without damaging parts.* Clean burrs from around pin hole and remove lower thrust washer. Push shaft up and remove through top of distributor, then remove upper thrust washers, shaft oiler and oiler wick.

BUSHING REPLACEMENT: Remove upper and lower bushings with Tool C-3744. *CAUTION - Do not drive bushings out f housing.* Before installing new bushings, soak in light engine oil for approximately 15 minutes. Position upper bushing with slot in bushing up and in line with oil hole in housing. Press bushing into housing with Tool C-3041 and adaptor (flat face of adaptor contacting bushing). When properly installed, upper end of bushing should be 1.613" from top of distributor housing (measured from bottom edge of straightedge to top of bushing. Invert distributor and install lower bushing flush with face of distributor base. *NOTE* - Insert a 3/32" rod through housing oiler hole to see if slot in bushing indexes with oiler hole in housing. If rod cannot be inserted through housing and bushing, drill a 1/8" hole through upper bushing by drilling through oil wick hole (remove burrs caused by drilling). Install burnishing tool, C-3041 and press burnisher through both bushings.

REASSEMBLY: Check operation of centrifugal weight and check weight springs for distortion. Lubricate governor weights and inspect all bearing surfaces and pivot pins for roughness, binding or excessive looseness. Install spacer on distributor shaft, then slide cam and yoke assembly on distributor shaft and engage weight lugs with slots in yoke. Install cam retaining spring clip, then lubricate and install upper thrust washers on shaft and slide shaft into distributor body. Position lower thrust washer and drive gear on lower end of shaft and install roll pin. *NOTE - Support hub of gear when installing pin so gear will not be damaged.* Install oiler wick and oiler, then install breaker plate assembly. Align condenser lead, breaker point spring, and primary lead, install attaching screws. Install felt wick in top of distributor cam. Attach vacuum control unit to breaker plate and install retainer clip and washer, then install vacuum unit attaching screws. Check breaker arm spring tension (see below) and adjust point gap. Lubricate felt pad in top of distributor cam with 3 to 5 drops of light engine oil and install rotor.

PERFORMANCE DATA: *See Car Model pages for Automatic & Vacuum Advance specifications.*



►*DISTRIBUTOR POINT GAP & DWELL NOTE:* Point gap and dwell must be within specifications at the same time (see Car Model pages for data). If this cannot be accomplished, either wrong points are installed or cam lobes are badly worn. Check dwell with engine idling at 475-500 RPM. *Dwell variation at speeds above 1500 RPM is not an indication of distributor wear.*

BREAKER ARM SPRING TENSION: Hook spring scale, Tool MTU-36 on breaker arm and pull in a straight line at a right angle to point surfaces. Take a reading as points start to separate. Spring tension should be 17-21.5 ozs. If not within limits, loosen screw holding end of point spring and slide end of spring in or out as necessary. Tighten screw and recheck spring tension.

LUBRICATION: Add 3 to 5 drops of SAE 10W oil to oiler on outside of distributor base and to felt wick under rotor in top of distributor cam. Wipe old grease from surface of breaker cam and apply a light film of new distributor cam grease. *CAUTION - Do not over-lubricate.*

VACUUM CONTROL UNIT: This unit cannot be disassembled or adjusted. If not within specifications, replace complete vacuum control unit.

HIGH TENSION CABLES: These cables have a non-metallic string type conductor for improved radio noise suppression. Do not jerk cables off spark plugs or out of distributor cap towers as cables may pull out of terminals or be damaged. Check cables for excessive resistance or open circuit. Replace cable if resistance is greater than 30,000 ohms or if terminal has pulled off.

CHRYSLER CORP. DISTRIBUTOR ASSY.

AUTOLITE ALTERNATOR & REGULATOR

Car Model	Alternator N.	R gulator N.	P larity
Checker	ALD-5001	VBT-6201A	Neg.
Willys	ALC-5001	Ⓒ VBS-6201A	Neg.

Ⓒ - With charge indicator light relay.

►CHANGES, CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTION: Reversed polarity or excessive voltage will result in extensive damage to alternator system. NOTE THE FOLLOWING TO PREVENT DAMAGE.*

Battery Installation - Alternator polarity (see above) determines which battery terminal is grounded. For negative polarity alternators, **negative** battery terminal must be grounded. *DO NOT REVERSE BATTERY LEADS or rectifiers will be damaged.*

Charging Battery - If a "Fast Charger" is used, both of the car's battery cables must be disconnected from battery. *DO NOT use a "Fast Charger" to provide starting voltage.*

Booster Battery (Used To Start Engine) - Booster battery **must** be connected with negative lead to negative terminal of battery and positive lead to positive terminal of battery. *DO NOT REVERSE BATTERY LEADS.*

DESCRIPTION: Main alternator components are the stator, rotor, slip ring end housing, drive end housing and rectifiers (diodes). Alternator voltage is controlled by varying the field current through a double contact voltage regulator unit. Because the rectifiers permit current flow in only one direction, no current can flow from battery to alternator and no circuit breaker (cutout relay) is needed. The self-limiting current characteristics of the alternator eliminate the need for a current regulator.

Stator - Consists of a laminated iron core with three phase windings electrically 120° apart wound in slots around inside circumference. A pair of leads are connected to each of the three points of the windings and one of each pair of leads connects to a negative rectifier and one to a positive rectifier.

R tor - Consists of a single field coil encased between two four-fingered overlapping iron sections assembled on a shaft. The two ends of field coil are connected to two slip rings insulated from each other and the shaft. Battery is connected to field coil through brushes and the slip rings.

Slip Ring End Housing - Supports rectifier heat sinks, pre-lubricated roller bearing for rotor shaft, brush holders and brushes, and field and output terminals.

Drive End Housing - Supports pre-lubricated ball bearing for rotor shaft. Through bolts hold entire assembly together.

Rectifiers - Six silicone diode rectifiers are pressed into heat sinks in slip ring end housing. Three rectifiers have negative polarity and their heat sink is grounded to end housing. The other three rectifiers have positive polarity and their heat sink is insulated from end housing and connected to alternator output terminal.

SPECIFICATIONS

Performance Data - Cold (70°F)

Alternator	Amperes	Volts	Alt. RPM
ALD-5001	38 min.	14.2	Ⓒ4200
ALC-5001	42 min.	14.2	Ⓒ4200

Ⓒ - 1750 Engine RPM.

Rotation - Clockwise at drive end.

Rated Output - 40 Amps. (ALD-5001), 45 Amps. (ALC-5001).

Field Coil Draw - 2.34-2.42 amps. (ALD-5001), 2.32-2.43 amps. (ALC-5001) at 10.0 volts and 70°F.

Capacitor Capacity - .1 mfd.

TROUBLE SHOOTING & DIAGNOSIS

ALTERNATOR DOES NOT CHARGE: Drive belt loose. Brushes or slip rings worn. Brushes sticking. Field or charging circuits open. Rectifiers open. Stator windings open.

LOW OR UNSTEADY CHARGING RATE: Drive belt loose. High resistance in charging circuit, battery terminals or engine-to-body ground strap. Stator windings open.

LOW OUTPUT & LOW BATTERY: High resistance in charging circuit. Regulator setting too low. Rectifier shorted or open. Stator winding grounded.

EXCESSIVE CHARGING RATE: Regulator setting too high or contacts stuck. Regulator base not grounded. Regulator winding open. Rectifier open.

REGULATOR CONTACTS OXIDIZED: Regulator setting too high or air gap incorrect. Rotor field coil winding shorted.

REGULATOR CONTACTS BURNED: Regulator setting too high. Rotor field coil winding shorted.

REGULATOR COIL WINDING BURNED: Regulator setting too high.

ALTERNATOR NOISY: Alternator mountings loose. Bearings worn. Drive belt worn. Interference between rotor fan and stator leads or rectifiers. Rotor or rotor fan damaged. Rectifier open or shorted. Stator winding open or shorted.

TESTING

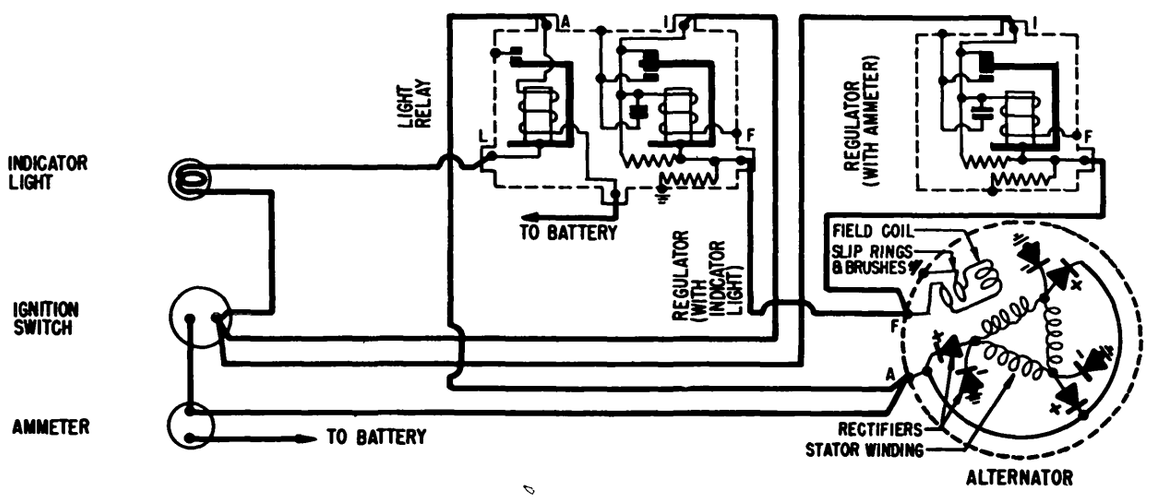
►*CAUTION: 1) Do not ground fi ld circuit b tween alt rnator and voltage regulator asr gulator will b damaged.*

2) Do not ground alternator output t rminal or alt rnator and circuit will be damaged (no circuit break r used and battery applied to output t rminal at all tim s).

3) Do not operate alternator on op n circuit with fi ld winding energized.

4) Do not polarize alternator as it is not r quir d and doing so will damage entire system.

5) Before making test connections, ignition switch must be off and battery ground cabl disconn ct d from battery.



ALTERNATOR IN CAR: With battery fully charged and engine at normal operating temperature, test circuits as follows:

Charging Circuit Resistance: 1) Connect an ammeter in series between alternator output terminal and charging circuit lead with lead disconnected from terminal. Connect a voltmeter across charging circuit (negative lead of voltmeter to positive terminal of battery and positive lead of voltmeter to alternator output terminal lead). Disconnect lead from regulator field terminal and from alternator field terminal. Connect a jumper wire between alternator field and output terminals. Connect battery ground cable and adjust engine speed and electrical load to obtain 10 amperes in charging circuit. Voltmeter reading should not exceed .3 volt. If more, inspect, clean, and tighten all connections in charging circuit.

2) With same conditions as above, connect voltmeter from negative (grounded) battery terminal to alternator frame, and then from alternator frame to regulator base. With 10 amperes in charging circuit, voltage reading in either case should not exceed .04 volt. If more, correct high resistance ground connections.

Current Output: Leave ammeter and jumper wire connected as in "Charging Circuit Resistance" above. Connect voltmeter with negative lead to ground at alternator frame and positive lead to alternator output terminal. Connect a carbon pile rheostat across battery and a tachometer to engine. Adjust engine to 1750 RPM and rheostat to obtain 14.2 volts on voltmeter. Current output shown on test ammeter should be within specifi-

CONTINUED ON NEXT PAGE

AUTOLITE ALTERNATOR & REGULATOR INTERNAL WIRING DIAGRAM

AUTOLITE ALTERNATOR & REGULATOR (Continued)

cations (see Performance Data above). A slightly low reading may mean an open rectifier and a considerably lower reading may mean a shorted rectifier,

ALTERNATOR OFF CAR: Field Coil Draw (Testing For Shorted Rotor) - Connect an ammeter and a rheostat in series between outer slip ring and battery. Connect other battery terminal to inner slip ring. Connect a voltmeter lead to each slip ring. With rheostat, adjust voltage to 10 volts and read field current draw on ammeter. If higher than specifications (see above) rotor field coil winding is shorted.

Rotor Test (For Grounds): Make test with a 110-volt test bulb with one probe on a slip ring and other probe on rotor core. If bulb lights, rotor winding is grounded.

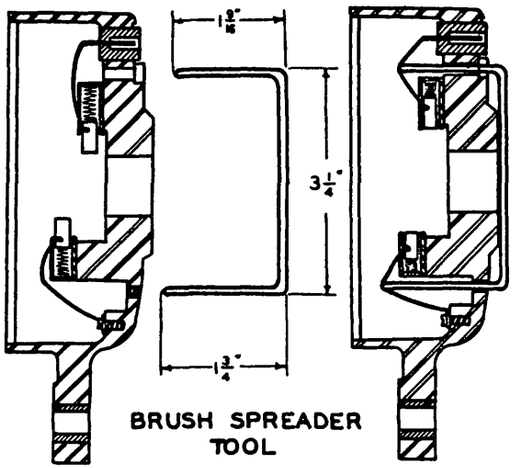
Stator Test: Test for shorted windings with an internal-external growler. Test for grounds with a 110-volt test bulb and test probes. *Make both tests with stator leads disconnected from rectifiers.*

Rectifier (Diode) Test: *Make initial test without disconnecting stator leads from rectifiers. This will eliminate need for complete disassembly. To find which rectifier is bad, stator leads must be disconnected and each rectifier tested individually.* Use a No. 57 test bulb in series with a 12-volt battery and test probes. Touch one test probe to rectifier heat sink and other probe to a rectifier lead in same heat sink. Reverse the probes. If lamp lights in **one** direction, rectifier is good. If lamp does **not** light in either direction, rectifier is open. If lamp lights in **both** directions, rectifier is shorted.

►*RECTIFIER TESTING TOOL NOTE: Diode Testing Tool C-3829 is available for testing rectifiers without disconnecting stator leads.*

OVERHAUL

►*TOOL NOTE:* Tools listed in following procedures are Miller Manufacturing Co. tools. Similar tools are also available from Draf Tool Co. as follows:



Tool Name	Draf No.	Miller No.
Drive End Bearing Installer	VA-603	C-3769
Roller Bearing Remover	VA-604	C-3770
Roller Bearing Installer	VA-605	C-3770
Housing Support	VA-606	C-3770
Rectifier Remover Support	VA-607	C-3771
Rectifier Remover	VA-608	C-3771
Rectifier Installer	VA-609	C-3772

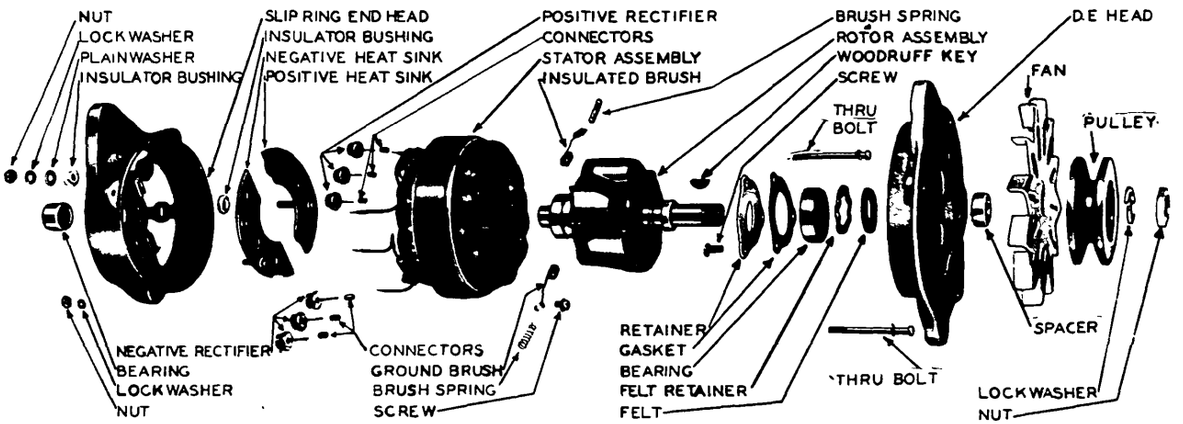
DISASSEMBLY: Remove through bolts, tap end housings lightly with soft hammer to separate them from stator, and remove drive end housing and rotor assembly. Disconnect positive and negative rectifier heat sink studs from end housing and remove stator. If brushes are worn to 5/16" or less, replace them. Grip insulated brush at brass terminal and pull it from field terminal insulated bushing. Remove ground brush lead attaching screw. *Do not lose brush springs when removing brushes from holders.* Clamp rotor in a vise (with protective jaws), remove pulley with puller or arbor press, and remove fan and woodruff key from shaft. Remove shaft from drive end housing and bearing assembly with a puller which grips under bearing retainer plate. *CAUTION - Do not support housing and press on rotor shaft as end housing and retainer screws will be damaged.* Remove screws from retainer plate and press drive end bearing from housing with Tool C-3769. Remove roller bearing from slip ring end housing with Tool C-3770.

Rectifier Replacement: *NOTE - Positive rectifiers have red marks, negative rectifiers have black marks. Positive heat sink has larger studs. All rectifiers are replaced in same manner.* Cut rectifier wire as near crimped sleeve connector as possible. Support heat sink on Support Tool C-3771 and press rectifier out of heat sink with Remover Tool C-3772. *CAUTION - Do not hammer on tool or rectifier will be damaged. Use a press only.* To install rectifier, support heat sink with Support Tool C-3771 and press rectifier into sink with Installer Tool C-3772. Strip insulation on stator leads about ¼" and connect them to rectifiers by crimping connector sleeves. *CAUTION - DO NOT solder connections as heat will damage rectifiers.*

REASSEMBLY: *NOTE - Bearings are pre-lubricated and no further lubrication is required.* 1) Install needle roller bearing in slip ring end housing so enclosed end of bearing is flush with outer surface of housing. Use same tools used for removal. Install felt washer and retainer into drive end housing and press ball bearing into housing (use a block of wood so pressure is exerted on bearing outer race only). Install retainer plate and gasket on end housing. With snap ring and retainer on rotor shaft, press housing on shaft with Tool C-3769 which fits over shaft and against bearing center race. Bearing must be against snap ring retainer. Install spacer, woodruff key, fan and pulley and pulley nut

2) Install brush springs and brushes. Ground brush is fastened to end housing with a screw. Insulated brush has blade terminal which is pushed into slot in field terminal insulator bushing and a tab on blade terminal snaps into insulator bushing. Install both rectifier heat sinks into end housing and install insulator bushings, washers and nuts. Push stator into housing by hand. Install drive end housing and rotor assembly into slip ring end housing and stator assembly using brush spreader tool as shown in illustration. *CAUTION - Make sure through bolt holes line up as no locator pins are used.* Install through bolts. Remove brush spreader tool and see that brush leads do not drag on rotor and that rotor turns freely when rotated by hand.

BRUSH SPREADER TOOL



VOLTAGE REGULATOR

DESCRIPTION: Regulator - Field control type. Temperature compensated, vibrating type voltage regulator with two sets of contacts using a common armature. Regulator operates on either upper or lower contacts (both sets never in operation at same time) depending on load and battery requirements as follows:

Upper Contact Operation (Low Speed & High Load) - Armature travel opens and closes upper contacts, cutting regulator resistance in and out of field circuit, and limiting alternator field current.

Lower Contact Operation (High Speed & Low Load) - Armature travel opens and closes lower contacts, grounding the regulator field terminal and bypassing alternator field coil (contacts closed), or cutting resistance in field (contacts open), and limiting field current.

CONTINUED ON NEXT PAGE

AUTOLITE ALTERNATOR ASSEMBLY - TYPICAL (EXPLODED)

AUTOLITE ALTERNATOR & REGULATOR (C ntinu d)

Indicator Light Relay: On cars with a charge indicator light in place of an ammeter a relay is used to operate the light. Relay has a single heavy winding in series with charging circuit with a moveable contact on an armature and a grounded stationary contact. Relay contacts are in series with indicator light which is connected to battery through ignition switch. With ignition switch on, light is grounded through contacts & lights up. When alternator charges, current flow through relay winding pulls armature down, opening the contacts and making light go out as long as alternator is charging.

CHECKING & ADJUSTING (ON CAR): Regulator - Disconnect alternator output terminal and install an ammeter between lead and terminal. Connect a voltmeter positive lead to regulator "BAT" terminal and negative lead to alternator frame. Adjust engine speed to 750 RPM and adjust load so there is a 10 ampere charge rate. Operate for 15 minutes to stabilize temperature. Note voltmeter reading. Cycle system by stopping and restarting engine and increase engine speed to 1500 RPM. Turn off all lights and accessories. Voltage should increase and amperage decrease. Voltage difference between readings of both tests should be .1-.3 volt. If greater or less, remove cover and move stationary contact support up or down (loosen support screw). Raising support will increase voltage. Replace cover, operate engine at 750 RPM and note voltage reading which should be as in table below. To adjust, bend lower spring hanger. *CAUTION - Do not short circuit between spring hanger and base or spring. Use an insulated bending tool.*

►*AMBIENT TEMPERATURE NOTE: The ambient temperature is the temperature registered on a reliable thermometer positioned 2" from regulator cover.*

Voltage Setting - Ambient Temp.

Temp. (°F)	Voltage	Temp. (°F)	Voltage
50°	14.1-14.5	110°	13.7-14.1
80°	13.9-14.3	140°	13.5-13.9

Indicator Light Relay: Disconnect field lead from both alternator and regulator. Connect an ammeter between disconnected alternator output terminal lead and alternator output terminal. Connect a carbon pile rheostat from output terminal lead to alternator field terminal. *NOTE - If dash indicator light cannot be seen during this test, use a 12-volt test lamp with a No. 57 bulb between regulator "L" and "B" terminals.* With rheostat resistance turned in, bring engine speed to 800 RPM and slowly turn resistance out of circuit until indicator light goes out. Ammeter reading should be as indicated below. To adjust, bend lower armature spring hanger. Increasing spring tension raises setting.

Relay Opens - 2.0-2.5 amperes.

Relay Closes - 1.5 amperes minimum.

ADJUSTMENTS (OFF CAR): *NOTE - Regulator must be reinstalled and final "On Car Adjustments" (see above) made after following "Off Car" adjustments completed.*

Regulator Lower Contact Gap: .010" measured between lower moveable contact and lower stationary contact with upper contacts closed. To adjust, bend upper stationary contact arm.

Regulator Air Gap (Upper C ntacts): .034-.038". Check air gap with test lamp (No. 57 bulb) in series with battery between regulator field terminal and regulator base. Insert a .034" wire gauge between armature and magnet core on contact side of brass stop rivet. Press armature down against gauge. Lower moveable contact should barely touch lower stationary contact and lamp should light. Insert a .038" wire gauge in same position. Light should go out. To adjust, loosen stationary bracket attaching screw and move bracket up or down.

Indicator Relay Air Gap: .015-.020" measured with flat gauge between armature and magnet core. To adjust, bend stationary contact arm up or down.

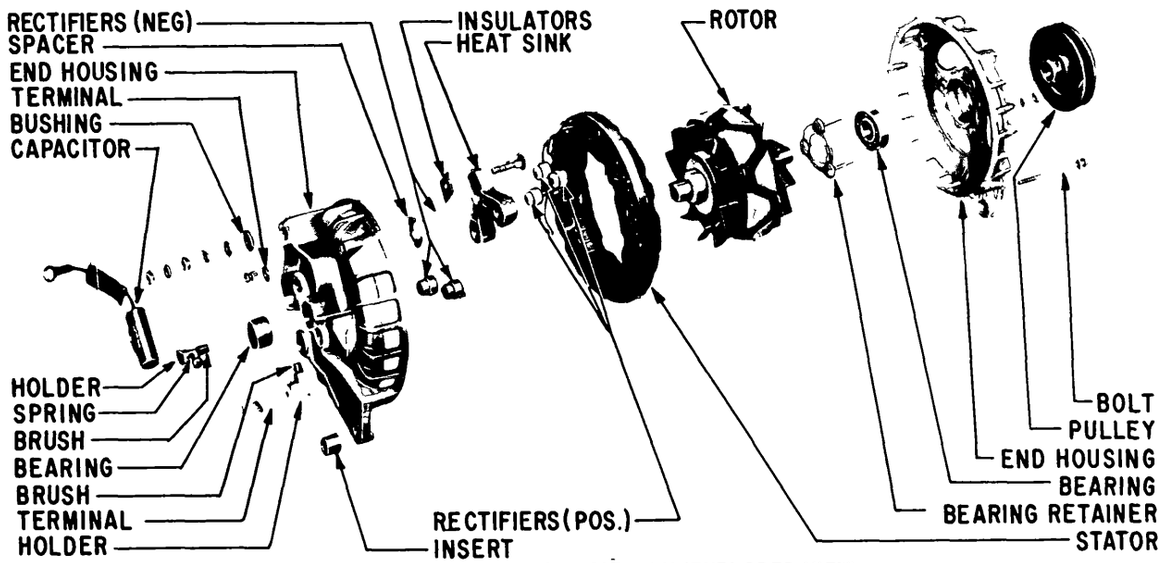
② - Use Part No. 2095000 for service replacement.

►CHANGES, CAUTIONS, CORRECTIONS

►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTION: Reversed polarity or excessive voltage will result in extensive damage to alternator system. NOTE THE FOLLOWING TO PREVENT DAMAGE.*

Battery Installation - Negative battery terminal must be connected to GROUND. Positive terminal must be connected to starter lead. *DO NOT REVERSE BATTERY LEADS.*

Charging Battery - If a "Fast Charger" is used, both of the car's battery cables must be disconnected from battery. *DO NOT use a "Fast Charger" to provide starting voltage.*



Booster Battery (Used To Start Engine) - Booster battery must be connected with negative lead to negative (ground) terminal of battery and positive lead to positive terminal of battery. *DO NOT REVERSE BATTERY LEADS.*

►*EXCESSIVE AMMETER FLUCTUATION CORRECTION:* For tests and voltage regulator modification necessary, see *"Voltage Regulator"* below.

►*ALTERNATOR OUTPUT TERMINAL GROUNDING & INSULATOR CAUTION:* Output terminal of alternator must not be grounded under any circumstances (will severely damage alternator and regulator). To prevent accidental grounding of terminal, make sure that Output Terminal Insulator, Part No. 2258754, is installed on "BAT" terminal of alternator.

DESCRIPTION: Main alternator components are the two end housings, stator, rotor, and rectifiers. Housings are vented at both ends and around the circumference and held together by three through bolts. The rotor consists of a field coil encased between two six-fingered, overlapping sections which are the pole pieces, and produces a 12 pole magnetic field. Ends of the field coil are connected to slip rings and the battery is connected to field windings through brushes and the slip rings. The rotor shaft is supported at drive end by a ball bearing and at the opposite end by a roller bearing. Both bearings are pre-lubricated. Three silicon diode rectifiers having negative polarity are pressed into the end housing, and three similar diodes having positive polarity are pressed into a die cast aluminum sink. Alternator output is controlled by a voltage regulator (current regulator and cutout relay are not required).

CHRYSLER ALTERNATOR ASSEMBLY (EXPLODED VIEW)

CHRYSLER CORP. ALTERNATOR & REGULATOR (Cont.)

SPECIFICATIONS

Performance Data (Cold - 70°)

Alternator	Amperes	Volts	Eng. RPM
2095060	35.0	15.0	1250
2095100	40.0	15.0	1250

Rotation - Clockwise at drive end.

Rated Output - 35 Amps. (2095060), 40 Amps. (2095100).

Field Coil Draw - 2.38 Amps. (min.) to 2.75 Amps. (max.) at 12 volts, with alternator rotor turned manually. 2.97 Amps. (min.) to 3.43 Amps. (max.) at 15 volts with alternator operating at 750 RPM at 70°F.

Rectifier Resistance - 4-10 ohms in forward direction. Infinity in reverse direction.

Capacitor Capacity - .158 microfarad, minimum (internally installed), .5 microfarad (externally installed).

Fuse : 7½ ampere fuse in line between regulator "IGN" terminal and ignition resistor (Regulator No. 1889960), or two fusible wires inside regulator cover (Regulator No. 2095700). *See "Fusible Wire Replacement Note" under VOLTAGE REGULATOR below.*

TROUBLE SHOOTING & DIAGNOSIS

ALTERNATOR DOES NOT CHARGE: Blown fuse or fusible wire. Drive belt loose. Brushes or slip rings worn. Brushes sticking. Field or charging circuits open. Rectifiers open. Stator windings open.

LOW OR UNSTEADY CHARGING RATE: Drive belt loose. High resistance in charging circuit, battery terminals or engine-to-body ground strap. Stator windings open.

LOW OUTPUT & LOW BATTERY: High resistance in charging circuit. Regulator setting too low. Rectifier shorted or open. Stator winding grounded.

EXCESSIVE CHARGING RATE: Regulator setting too high or contacts stuck. Regulator base not grounded. Regulator winding open. Rectifier open.

REGULATOR CONTACTS OXIDIZED: Regulator setting too high or air gap incorrect. Rotor field coil winding shorted.

REGULATOR CONTACTS BURNED: Regulator setting too high. Rotor field coil winding shorted.

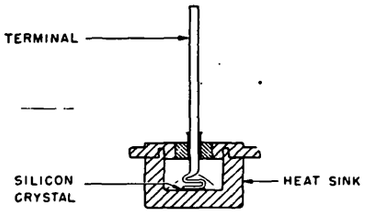
REGULATOR COIL WINDING BURNED: Regulator setting too high.

ALTERNATOR NOISY: Alternator mountings loose. Bearings worn. Drive belt worn. Interference between rotor fan and stator leads or rectifiers. Rotor or rotor fan damaged. Rectifier open or shorted. Stator winding open or shorted.

TESTING

ALTERNATOR IN CAR: With battery fully charged and engine at normal operating temperature, test circuits as follows:

►*CAUTION: Do not ground field circuit between alternator and voltage regulator as regulator will be damaged.*



Charging Circuit Resistance: Disconnect lead at alternator output terminal and connect a 0-50 ampere scale D.C. ammeter in series between output terminal and output lead (lead disconnected from terminal). Connect positive lead of test voltmeter to output lead and connect negative voltmeter lead to battery positive terminal. Operate engine to obtain 10 amps. from alternator. *NOTE - The voltmeter reading should not exceed .2 volt.* If a higher voltage drop is indicated, inspect, clean and tighten all connections in charging circuit.

Current Output: Disconnect battery ground and disconnect alternator output lead at terminal on alternator. Connect a 0-75 ampere scale D.C. ammeter in series between alternator output terminal and output lead. Connect positive lead of test voltmeter to output lead and connect negative lead of test voltmeter to ground. Disconnect field lead at alternator and at regulator, then connect a jumper wire from alternator field terminal to alternator output terminal. Connect engine tachometer and connect battery ground cable. Connect a battery-starter tester (with variable carbon pile) to battery terminals. Operate engine at 1250 RPM, then adjust carbon pile to obtain a reading of 15 volts on test voltmeter. Current output as indicated on test ammeter should be within specifications (see Performance Data above). If output is slightly less than specified, it may be an indication of possible "open" rectifier or other alternator internal condition. If output is considerably lower, it may be an indication of a possible shorted rectifier.

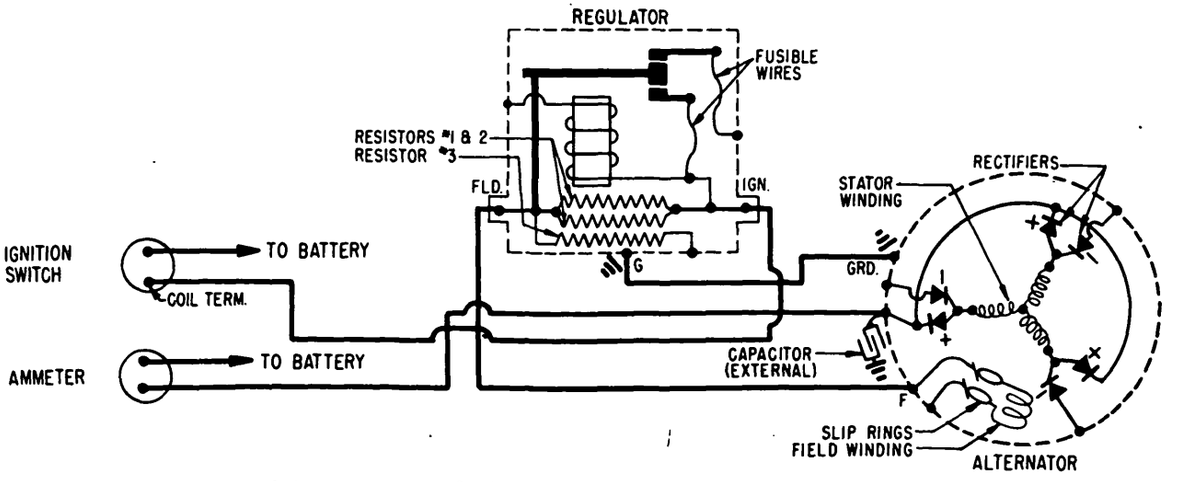
Field Coil Draw: With ammeter connected in circuit as for "Current Output" above, stop engine and note the reverse current reading on ammeter, and battery voltage reading on voltmeter. The rotor field coil should draw 2.38 to 2.75 amperes at 12 volts. A low field coil draw is an indication of high resistance in field coil circuit which may be caused by brushes, slip ring, or field coil connections. A high rotor field coil draw indicates a possible shorted coil.

ALTERNATOR ON BENCH: Field Coil Draw - Connect a source of 12 volt D.C. current and a test ammeter in series to field terminal and to ground. Slowly rotate alternator rotor by hand. The test ammeter reading should be 2.38 to 2.75 amperes at 12 volts.

Rectifier (Diode) Test: Rectifiers may be tested with a test lamp or with Tester Tool C-3829 as follows: *NOTE - The usual cause of an open or blown rectifier is a defective capacitor or a battery installed with reversed polarity. If battery is installed correctly and rectifiers are open, test capacitor capacity.*

TYPICAL RECTIFIER (DIODE)

Test Lamp Method - Disassemble alternator and separate wires at "Y" connector of stator. Use a test lamp with a No. 67 (4 cp.) bulb and a 12-volt battery. Test each rectifier in turn as follows: Touch outer case of rectifier with one probe and wire in center of rectifier with other probe. Reverse the probes, moving the probe from outer case to rectifier wire and the probe at rectifier wire to outer case. If lamp lights in **one** direction, the rectifier is good. If lamp **does not** light in either direction, the rectifier is open. If lamp lights in **both** directions, the rectifier is shorted.



Tester Tool C-3829 Method - Remove brushes and alternator through bolts and separate rectifier end housing and stator from drive end housing and rotor.

Positive Rectifiers - With stator assembly on an insulated surface, connect tool test lead clip to alternator "BAT" (output) terminal and plug tool into 110-volt A.C. power supply. Touch probe to **bare wire connection** of each rectifier. *CAUTION* - DO NOT break sealing around rectifier lead wire or on inner end of rectifier (will accelerate corrosion).

Negative Rectifiers - Connect tool test lead clip to rectifier end housing and touch bare wire connection of each rectifier with probe.

Test Results - Good rectifiers will produce a reading of 2 amperes or more and will be approximately the

CONTINUED ON NEXT PAGE

CHRYSLER CORP. ALTERNATOR & REGULATOR INTERNAL WIRING DIAGRAM

CHRYSLER CORP. ALTERNATOR & REGULATOR (C nt.)

same for the three rectifiers tested If two rectifiers are good and one is shorted, the reading on the good rectifiers will be low and the shorted one will be zero (with bad rectifier disconnected, reading on other two will be satisfactory) If one rectifier is open, its reading will be approximately 1 ampere and the other two rectifiers will show a satisfactory reading Positive and negative rectifiers will read on opposite side of scale on tool

►*RECTIFIER RESISTANCE NOTE.* A rectifier should have 4-10 ohms resistance in forward direction and infinite resistance in reverse direction Replace rectifiers with more than 10 ohms resistance in forward direction

Stator Test: Test stator for grounds with a 110-volt test lamp *Insulate stator from rectifier end housing.* With one probe of test lamp on stator pole frame, touch each of the stator leads with other probe If lamp lights, stator windings are grounded To test windings for continuity, touch one lamp probe to **all three** stator leads at "Y" connection and other probe to each of three stator leads (disconnected from rectifiers) If lamp does **not** light at each of the three rectifier leads, stator winding is open

OVERHAUL

►*AIR CONDITIONED CAR PULLEY REMOVAL NOTE:* Double sheave pulley on air conditioned cars is smaller in diameter and requires use of modified puller blocks SP-3002 (part of Puller C-3615)

►*ALTERNATOR BEARING LUBRICATION & REPLACEMENT CAUTION:* Alternator front and rear bearings are lubricated for life If bearings become dry, install new bearings *DO NOT attempt to lubricate NOTE* - When replacing front bearing, use only Part No 2095653 which has a protective shield and install bearing with shielded side toward rotor

►*RECTIFIER (DIODE) INSTALLATION CAUTION & TOOL MODIFICATION NOTE* Design of rectifier has been changed which requires a modification to Rectifier Installing Tool C-3772 to prevent damage to rectifier seal or core To modify Increase diameter of hole in driving end of tool from 3/8" to 515" (33/64") and increase depth to 1¼" *DO NOT use smaller diameter (unmodified) tool on later design rectifiers*

DISASSEMBLY: Remove insulated brush holder retaining screw, flat washer, nylon washer, and field terminal and carefully lift plastic brusn holder (with spring and brush assembly) from end housing Remove retaining screw from ground brush holder, then lift clip, spring and brush assembly from end housing Remove through bolts and pry between stator and drive end housing with a thin blade screwdriver *CAUTION - Stator is laminated, do not burr stator or end housing* Carefully separate drive end housing, pulley and rotor assembly from stator and rectifier housing assembly Remove three nuts and washers and while supporting the end frame, tap rotor shaft with a plastic hammer and separate rotor and end housing To remove drive end bearing from rotor shaft, use Tool C-3615 and adapters C-3375 *CAUTION - Make sure lower end of adapters are equally spaced under the bearing and that tool sleeve is bottomed on bearing* Remove DC output terminal nuts and washers, terminal screw (and inside capacitor, if so equipped) If necessary, heat sink and insulator can be removed To remove rectifiers from heat sink or end housing, cut rectifier wire at point of crimp, then support rectifier housing on Tool C-3771 *NOTE - This tool is cutaway and slotted to fit over wires and around bosses in housing.* Make sure that bore of tool completely surrounds rectifier, then press rectifier out of housing with Tool SP-3380 To remove roller bearing in end housing, support housing with Tool SP-3383, then press bearing out with Tool C-3770

REASSEMBLY: Support heat sink or rectifier end housing on circular plate, Tool SP-3377 Check rectifier identification to make sure correct rectifier is being used *NOTE - Identifying part numbers are stamped on case of rectifier Rectifiers are also identified by paint marks Red for positive and black for negative* Start new rectifier in casting squarely and press in with Tool C-3772 (see note) Crimp rectifier wires to wires disconnected at removal Repeat as necessary for other rectifiers in either the end housing or heat sink Support end housing on Tool SP-3383 so that notch in support tool will clear raised section of heat sink and press bearing into position with Tool SP-3381 *NOTE - Bearings are prelubricated and additional lubrication is not required* Insert drive end bearing in drive end housing and install bearing plate, washer and nuts to hold bearing in position Position bearing and drive end housing on rotor shaft and while supporting base of rotor shaft, press bearing and housing in position on rotor shaft with arbor press and Tool C-3769 *CAUTION - Make sure bearing is installed squarely Bearing must be pressed on shaft until it contacts shoulder on shaft* Install pulley on rotor shaft (support rotor so that all pressing force is on pulley hub and rotor shaft), then press into position with an arbor press *CAUTION - Do not use a force greater than 6,800 lbs* Pulley should just contact bearing inner race Install the heat sink and insulator, then install output terminal screw, insulating washers, lockwashers, and nuts *NOTE - Some alternators have the capacitor mounted internally On these units, the capacitor is mounted on top of the heat sink insulator and is held in position with the terminal screw* Make sure heat sink and insulator are in position and tighten the locknut Position the stator on rectifier end housing *CAUTION - Make sure all of the rectifier connectors and phase leads do not interfere with rotor fans and that the capacitor (internal) lead has clearance* Position rotor assembly in rectifier end housing and align the through bolt holes in stator, rectifier end housing and drive end housing Enter stator shaft in rectifier end housing, compress stator and both end housings manually and install through bolts, washers, and nuts Install insulated brush and terminal attaching screw, then install ground brush and attaching screw Rotate pulley slowly to be sure that fans do not hit rectifier and stator connectors

VOLTAGE REGULATOR

CHRYSLER	Chrysler No.
Imperial & 300F	1889960
VALIANT	
Early Cars	① 1889960
Later Cars	② 2095700

① - With "In-Line" fuse
② - With fusible wire in regulator

►*EXCESSIVE AMMETER FLUCTUATION CORRECTION:* This condition usually indicated by excessive ammeter pointer flutter, headlight flicker and heater blower motor speed variations at steady engine speeds, and may be caused by high resistance in field circuit to alternator or voltage regulator improperly set For proper diagnosis and correction, proceed as follows Run engine at various steady speeds with heavy electrical load (headlights and accessories on) to determine degree of fluctuation Stop engine, disconnect lead at "IGN" terminal of regulator and install a jumper wire from "IGN" terminal to positive terminal of battery Operate engine at 1250 RPM and observe flutter

1) If ammeter is normal, trouble is corrosion or other high resistance in field circuit connectors Clean and tighten all connections *NOTE* - On cars with 7½ ampere fuse in circuit, clean fuse and holder terminals and tape fuse holder to prevent dirt and moisture entry
2) If jumper wire did not correct the trouble or if ammeter fluctuation is excessive regardless of engine speed or electrical load, remove voltage regulator from car and solder a piece of copper wire between 38 ohm resistor terminal connected to "IGN" terminal of regulator and regulator base *CAUTION* - Use only rosin core solder and be sure regulator base is heated enough for proper metal fusion
3) Install regulator and adjust according to procedures and specifications below

►*REGULATOR 2095700 FUSIBLE WIRE REPLACEMENT NOTE·* To replace fusible wire, proceed as follows Cut blown wire from connection at rivet in regulator base (do not unsolder as voltage coil wire may be damaged), and unwind wire from regulator contact bracket Use rosin core solder only, tin one end of Fusible Wire No 2275242 and hold wire in recess in rivet against old fuse wire Put a drop of solder on wires When cool, pull fusible wire up and wrap around contact bracket and solder wire to bracket to be sure of a good connection

DESCRIPTION: Field control type Temperature compensated, vibrating type voltage regulator with two sets of contacts using a common armature On Regulator 2095700, upper stationary contact bracket is connected to "IGN" terminal by a fusible wire, and lower stationary contact bracket connected to ground by another fusible wire (Regulator 1889960 has 7½ ampere fuse in line between "IGN" terminal and ignition resistor instead of fusible wires) Regulator operates on either upper or lower contacts (both sets never in operation at same time) depending on load and battery requirements as follows

Upper Contact Operation (Low Speed & High Load) - Armature travel opens and closes upper contacts, cutting regulator resistance in and out of field circuit, and limiting alternator field current

CONTINUED ON NEXT PAGE

CHRYSLER CORP. ALTERNATOR & REGULATOR (C nt.)

L w r Contact Operation (High Speed & Low Load). Armature travel opens and closes lower contacts, grounding the regulator field terminal and bypassing alternator field coil (contacts closed), or cutting resistance in field (contacts open), and limiting field current.

CHECKING REGULATOR: Connect an ammeter in series with alternator output terminal (BAT) and the wire disconnected from alternator DC output terminal. Connect a DC voltmeter positive lead to alternator output terminal and ground the voltmeter negative lead to alternator frame or regulator base. Start engine and adjust engine speed to 1250 RPM. *NOTE - No reading on ammeter indicates blown fuse or fusible wire in regulator.* Turn on lights and electrical accessories to create enough electrical load that 15 minutes operation will stabilize the regulator temperature. Adjust electrical load so that there will be 15 amperes flowing in circuit with a fully charged battery. Voltmeter reading should be as indicated in the following table for the ambient temperature in which the regulator is operating.

►*AMBIENT TEMPERATURE NOTE: The ambient temperature is the temperature registered on a reliable thermometer positioned 2" from regulator cover.*

Voltage Setting - Ambient Temp.

Temp. (°F)	©Voltage	Temp. (°F)	©Voltage
0°	14.0-14.6	95°	13.6-14.2
25°	13.9-14.5	118°	13.5-14.1
48°	13.8-14.4	140°	13.4-14.0
70°	13.7-14.3		

© - There will be a slightly higher voltage at higher engine speeds, however, this must not exceed .7 volts at any temperature range.

ADJUSTMENT: Voltag - Adjust voltage by bending lower spring hanger of regulator **d wn** to increase voltage, up to decrease voltage. *CAUTION - Do not short circuit between spring hanger and base or spring. Use an insulated bending tool.*

Armature Air Gap: .048-.052". Check air gap with test lamp connected between ignition and field terminals on regulator. Insert a .048" wire gauge between armature and magnet core at hanger side of nylon stops. Press armature plate down. Upper contacts should open and test lamp should go dim. Insert a .052" wire gauge in the same position and depress armature. Upper contacts should remain closed and test lamp should remain bright. To adjust, bend upper contact support (1889960), loosen contact bracket attaching screw and adjust contact bracket (2095700).

Lower Contact Clearance: .015"±.001" with armature pressed down so armature rests on nylon stop. To adjust, bend lower contact arm. *NOTE - Press down on armature and not on contact spring.*

DELCO-REMY ALTERNATOR (EXTERNAL RECTIFIER) & REGULATOR

► CAUTIONS

►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTION: Reversed polarity or excessive voltage will result in extensive damage to alternator system. NOTE THE FOLLOWING TO PREVENT DAMAGE.*

Batt ry Installati n - Alternator polarity determines which battery terminal is grounded. For negative polarity alternators, **negative** battery terminal must be grounded. *DO NOT REVERSE BATTERY LEADS or rectifier assembly will be damaged.*

Charging Battery - If a "Fast Charger" is used, both of the car battery cables must be disconnected from battery. *DO NOT use a "Fast Charger" to provide starting voltage.*

Boost r Batt ry (Used T Start Engine) - Booster battery must be connected with negative lead to negative terminal of battery and positive lead to positive terminal of battery. *DO NOT REVERSE BATTERY LEADS.*

DESCRIPTION: Main alternator components are the stator, rotor, brushes, slip rings, slip ring end housing and drive end housing. Rectifier assembly is an externally mounted dry plate type which is connected to the three output terminals of the alternator. Alternator voltage and field circuit is controlled by a voltage regulator unit (see "Voltage Regulator" below for further description). *NOTE - Alternators may be either "A" circuit or "B" circuit types. Data below applies to "A" circuit types only.*

Stat r - Consists of an iron core with three phase windings electrically 120° apart wound in slots around inside circumference and forming the alternator frame. Stator leads are connected to terminal posts in slip ring end housing and these leads are connected to the external rectifier assembly by additional leads.

Rotor - Consists of a single field coil encased between two six-fingered overlapping iron sections assembled on a shaft. Some field coils contain a main field winding and a reverse high resistance shunt winding connected in parallel to the main winding to insure positive voltage control at high speeds. Other field coils have a single main winding only. Field coil leads are connected to three slip rings (two rings for main winding, one ring for reverse winding) which are insulated from each other and from the shaft. Battery is connected to field coil through brushes and the slip rings. *NOTE - Some alternators have a "double" rotor which has two main field windings and two reverse field windings.*

Slip Ring End Housing - Supports rotor shaft rear ball bearing, brush holders and brushes, and all terminals for lead connections.

Drive End Housing - Supports rotor shaft front ball bearing, pulley fan, and pulley. Through bolts hold entire assembly together.

Rectifier - Dry plate, three phase, full wave, bridge type, selenium rectifier mounted separately from alternator and connected to it by three leads from stator phase windings. Two output terminals are mounted on rectifier to connect to car wiring.

TESTING & TROUBLE SHOOTING

►*CAUTION: 1) Do not ground alternator output terminal or alternator and circuit will be damaged.*
2) Do not polarize alternator as it is not required and doing so will damage entire system.
3) Before making test connections, ignition switch must be off.

Current Output Test: With alternator, rectifier, regulator, and battery connected in the usual manner, check current output with an ammeter. *See "Specifications" above. NOTE* - Specifications apply to alternator when operating with full field current determined only by the resistance of main field winding.

Rectifier Test: Clean gently between rectifier plates to remove dirt, using care not to damage painted surfaces. Test as follows: Connect an ammeter and a .1 ohm fixed resistor (75 ampere capacity) in series across output side of rectifier. Connect a battery and carbon pile rheostat with all resistance turned in across two of the input terminals. Adjust rheostat to test voltage shown in "Voltage & Current Specification Table" below and note the current reading. *NOTE - Mak checks quickly (within 15 seconds) to avoid overheating rectifier.* Repeat test for each of six tests (A through F) as shown in "Test Connection Table", below, reversing ammeter connections to obtain current reading. Replace rectifier if current reading not within specifications. *CAUTION - DO NOT apply more voltage than specified to input terminals as excessive current draw resulting from higher voltag will burn out rectifier.*

►*RECTIFIER TERMINAL NUMBERING NOTE:* In the following table, rectifier input terminals are numbered

CONTINUED ON NEXT PAGE

DELCO-REMY ALTERNATOR (EXTERNAL RECTIFIER) & REGULATOR (Cont.)

from left to right with rectifier viewed with positive output terminal at upper left.

Test Connection Table

Test	Post. Lead to Terminal	Neg. Lead to Terminal
A	No. 1	No. 2
B	No. 2	No. 1
C	No. 1	No. 3
D	No. 3	No. 1
E	No. 2	No. 3
F	No. 3	No. 2

Voltage & Current Specification Table

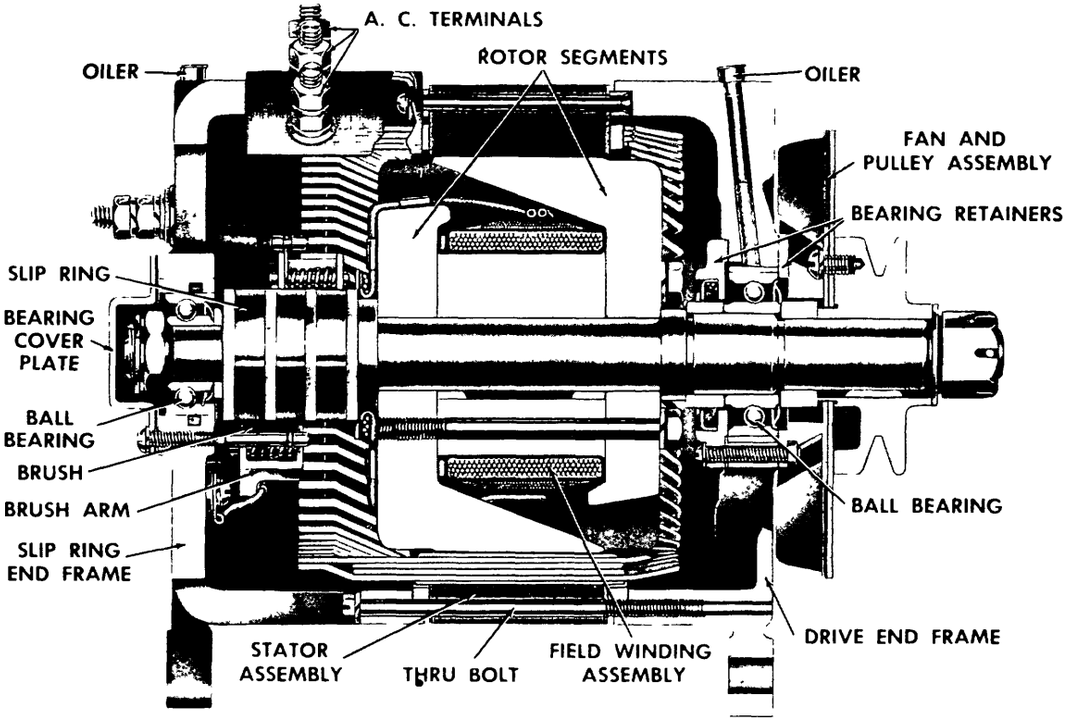
Rectifier	Test Volts	Min. Current	Max. Variation
1924332	5.75	29.5 amps.	6 amps.
1926291	5.0	16.0 amps.	3.5 amps.
1930086	5.75	29.5 amps.	6 amps.
1930522	11.5	30.5 amps.	5 amps.
1932630	5.75	19.8 amps.	8 amps.
1934404	5.75	24.0 amps.	6.5 amps.

HIGH CHARGING RATE TO FULLY CHARGED BATTERY: Voltage regulator setting too high or regulator faulty. Overheated battery. Alternator field circuit grounded in alternator, regulator, or wiring.

Checking - If battery not overheated, operate alternator at idle speed or a speed to give 30 amperes charge, whichever is higher, and disconnect lead from regulator "F" terminal. If output drops, regulator is faulty. If output remains high, disconnect field circuit at alternator. If output drops, wiring is grounded. If output remains high, field circuit is grounded in alternator.

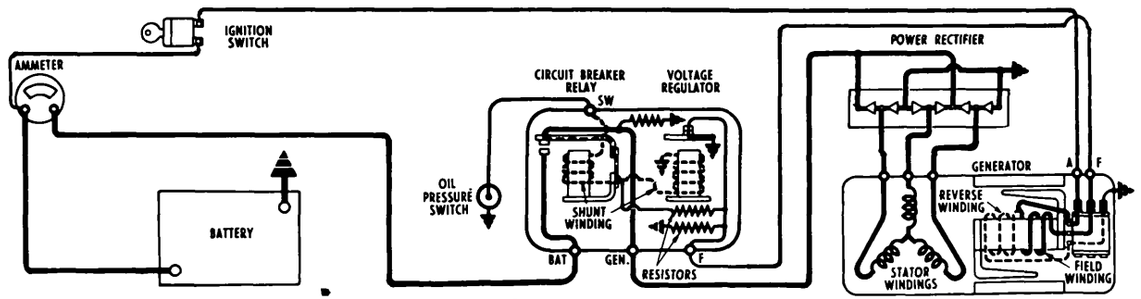
►*REVERSE WINDING NOTE:* If reverse field winding is open, high charging rate to fully charged battery will be present at high speeds even though all other parts of the system function properly.

LOW CHARGING RATE & LOW BATTERY: Wiring damaged or has high resistance. Faulty battery. Drive belt loose. Alternator or regulator faulty.



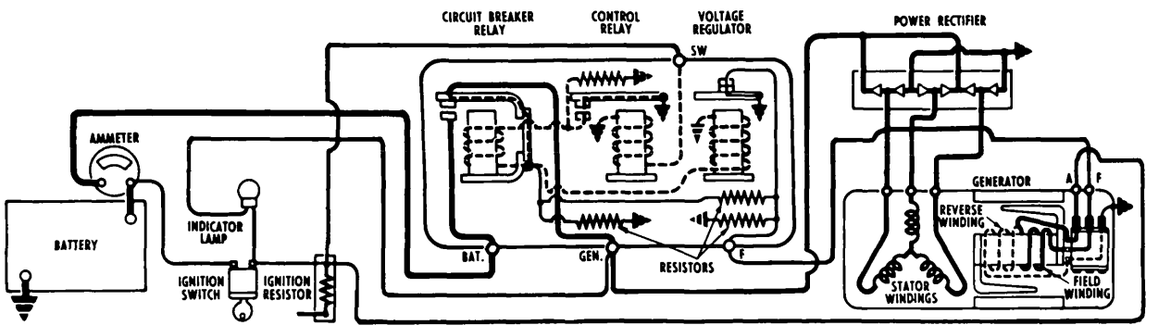
Checking - If wiring, battery, and drive belt are satisfactory, operate alternator at idle speed or a speed to give 30 amperes charge, whichever is higher, turn on a 30 ampere load and momentarily ground "F" terminal of regulator. If output does not increase to approximately 30 amperes, alternator is faulty. If output increases with "F" terminal of regulator grounded, regulator setting is too low or points are oxidized.

LOW BATTERY & NO CHARGING RATE: Wiring damaged or has high resistance. Battery faulty. Rectifier faulty. Alternator or regulator faulty.



Checking - If wiring and battery are satisfactory, proceed as follows: 1) Operate alternator at idle speed or a speed to give 30 amperes charge, whichever is higher, and measure output voltage at rectifier. If voltage sufficient to charge battery, alternator and rectifier are good.

2) Oil Pressure Switch Control Type Circuit - Check oil pressure switch by connecting a jumper wire from



CONTINUED ON NEXT PAGE

TYPICAL DELCO-REMY ALTERNATOR (SECTIONAL VIEW)

DELCO-REMY ALTERNATOR & 2-UNIT REGULATOR WIRING DIAGRAM

DELCO-REMY ALTERNATOR & 3-UNIT REGULATOR WIRING DIAGRAM

DELCO-REMY ALTERNATOR (EXTERNAL RECTIFIER) & REGULATOR (Cont.)

"SW" terminal of regulator to ground If alternator charges, replace oil pressure switch If oil pressure switch good, circuit breaker relay in regulator is faulty

3) R gulat r C ntr l R lay Type Circuit - If control relay contacts are closed but circuit breaker relay contacts are open circuit breaker relay winding is open If control relay contacts do not close, control relay winding is open If both control relay and circuit breaker relay contacts are closed, there is an open series circuit in regulator

4) Check field current draw by disconnecting rectifier from alternator, operating alternator at idle speed and connecting a low reading ammeter in series with the field circuit at regulator "F" terminal If field current less than specified (see "Specifications" above), ground regulator "F" terminal and recheck If field current remains low, alternator field circuit is faulty If field current increases to specifications, regulator has an open field circuit or oxidized contact points

5) If field current normal, check stator winding voltages at alternator output terminals with rectifier disconnected from alternator If voltages vary more than 2 volt, stator windings are shorted If stator windings are satisfactory, reconnect rectifier and recheck If voltages vary more than 1 volt with a charge rate of 30 amperes, rectifier is faulty (see "Rectifier Test" above) If voltages vary less than 1 volt with rectifier connected, regulator has a low voltage setting

EXCESSIVE REGULATOR CONTACT POINT ARCING: Regulator resistors open Alternator main field winding shorted

OVERHAUL

Disass mbly: Remove through bolts and separate end housings from stator Remove rotor from stator Use a gear puller or arbor press to remove bearings from end housings or rotor shaft For rotor disassembly, see "Field Coil Replacement" below

B arings: Replace bearings if worn or defective

Brush s: Brushes should be a free fit in holders Replace brushes if worn to less than ½ original length (compare with new brushes) Check brush spring tension (see "Specifications" above) and bend spring as required

Slip Rings· If rough or out-of-round, slip rings can be trued in a lathe **if outside diameter is never reduced below 1 560'**. If slip rings cannot be trued to maintain minimum diameter, replace as follows Remove glass twine between slip ring assembly and rotor segment and unsolder leads Pull slip ring assembly from shaft with a gear puller *Note position of leads in relation to tab to which connected DO NOT shorten leads* Clean shaft and rotor segment surfaces in contact with slip rings of varnish to assure proper fit of new assembly Press new assembly on shaft using keyway as a guide Solder field leads using rosin flux wrap several layers of glass or cotton twine between tabs and rotor, and coat twine with glyptol or varnish Turn slip rings in a lathe to 1 625" diameter and polish smooth with No 00 sandpaper

Stat r: Use a 110-volt test lamp and check for circuit between each stator terminal and frame If lamp lights, stator winding is grounded Check circuit between each two stator terminals If lamp does not light, stator winding is open To test for short circuited stator, see step **5)** under LOW BATTERY & NO CHARGING RATE above

Rotor: Use a 110-volt test lamp and check rotor field windings for ground by connecting test lamp between each slip ring and rotor shaft or segments If lamp lights, reverse or main field winding is grounded Check for open field winding by connecting test lamp between each two slip rings If lamp does not light when connected to any two slip rings, a field winding is open To check for shorted field windings, check field current draw (see "Specifications" above) by connecting voltmeter to both slip rings If rotor has also a reverse field winding, connect voltmeter as follows Number slip rings with other ring as No 1, middle ring No 2, and ring nearest rotor segment No 3 To check main field, connect rings No 2 & 3 To check reverse field, connect rings No 1 & 3 If current draw is more than specified, a winding is shorted *CAUTION - To insure accurate measurement, connect voltage source directly to slip rings*

Field Coil Replacement - Disassemble rotor assembly by removing slip ring assembly, pressing rotor shaft out with an arbor press, and removing through bolts holding rotor segments together Note relative position of parts for reassembly *CAUTION - Use a soft hammer only if necessary to tap parts loose* Wash all metal parts in caustic solution to remove varnish At reassembly, be sure that rubber washer fits **around** rotor core After reassembly, dip rotor assembly in a modified phenolic varnish and bake to prevent movement of winding in any direction

Reassembly· Reverse disassembly procedure, installing all parts in proper order Hold brushes away from slip rings to prevent damage when installing rotor When pressing fan and pulley on shaft, support shaft, not end housing to prevent brush damage

VOLTAGE REGULATOR

DESCRIPTION: Two and three unit types used **Two unit type** has a voltage regulator of conventional design and a circuit breaker relay to control the D C current between the rectifier and battery Circuit breaker relay is operated by D C voltage from rectifier when engine oil pressure switch completes circuit to ground **Three unit types** have same type voltage regulator and circuit breaker relay as two unit type, and in addition, a circuit breaker control relay which closes and opens the ground circuit of circuit breaker relay when ignition switch is turned on or off

SPECIFICATIONS

Voltage Regulator

Normal Setting - 13 8-14 8 volts at 125°F ambient temperature

Air Gap - 075" with armature pressed down until contacts just touch

Circuit Breaker Relay

Closing Voltage - 7 5-10 5 volts (1119159 160), 7 5-9 5 volts (Others)

C ntact Gap - 027" (1119159, 160), 032" (Others) with armature against upper armature stop

Air Gap - 013" (1119159 160), 017" (Others) with armature pressed down until contacts just touch

Contr l Relay

Closing Voltage - 7 5-10 5 volts

C ntact Gap - 025" with armature against upper armature stop

Air Gap - 035" with armature pressed down until contacts just touch

TESTING & TROUBLE SHOOTING: *See "Testing & Trouble Shooting" above*

ADJUSTMENT

►*ADJUSTMENT CAUTIONS* **1)** Before checking or adjusting, bring regulator to operating temperature of 125°F by connecting a ¼ ohm resistance in series with battery and operating regulator for 15 minutes with cover in place and no other load than ignition until regulator heated and temperature stabilized

2) Voltage regulator checks must be made at alternator speed of 3000 RPM or at maximum operating speed of alternator, whichever is lower

3) Alternator must be cycled after each electrical adjustment and before each check reading is made as follows Connect a 25 ohm, 25 watt rheostat in series with field circuit Reduce voltage below 4 volts by setting variable resistance at maximum, opening circuit to "IGN" or "SW" terminal of regulator by disconnecting lead or turning off ignition, and reconnecting circuit or restarting engine and bringing voltage up by decreasing resistance

ELECTRICAL CHECKS & ADJUSTMENTS: Voltage Regulator - *See 'Delco-Remy 1119000, 1119100, 1119200, 1972000 Series Single Contact Regulators in this section*

Control Relay: Adjust closing voltage as follows With "BAT" and "SW" terminal leads disconnected, connect a jumper wire between "GEN" and "SW" terminals, and a voltmeter between "SW" terminal and ground Connect a 25 phm, 25 watt variable resistor in field circuit at "F" terminal with all resistance turned in With alternator at idle speed, decrease resistance until contacts close and note voltage reading Adjust by turning spring adjusting screw Increase spring tension to increase setting Remove jumper lead and reconnect "SW" lead to terminal

Circuit Breaker Relay: Disconnect lead from regulator "BAT" terminal **On Oil Pressure Switch control,** connect a jumper between "SW" terminal and ground and a voltmeter between "SW" and "GEN" terminals **On Control Relay control,** connect a voltmeter between "GEN" terminal and regulator base **On all types** connect a 12-volt lamp between "BAT" terminal and regulator base With a 25 ohm, 25 watt variable resistor in field circuit at "F" terminal and alternator at idle speed slowly decrease resistance until lamp lights and note voltage Adjust by turning spring adjusting screw Increase spring tension to increase setting

MECHANICAL ADJUSTMENTS: Make adjustments as follows

Air Gap· With armature pressed down until contacts just close, measure gap between armature and core *See Specifications* Adjust as follows

Voltage Regulator - Loosen upper contact mounting screws and raise or lower contact as required

Circuit Breaker Relay - Loosen adjusting screws on back of relay and raise or lower armature as required

Contr l Relay - Bend lower contact support

Contact Gap: Check with armature against upper armature stop and adjust by bending upper armature stop *See Specifications*

DELCO-REMY ALTERNATOR (INTERNAL RECTIFIER) & TRANSISTORIZED REGULATOR

►CHANGES, CAUTIONS, CORRECTIONS

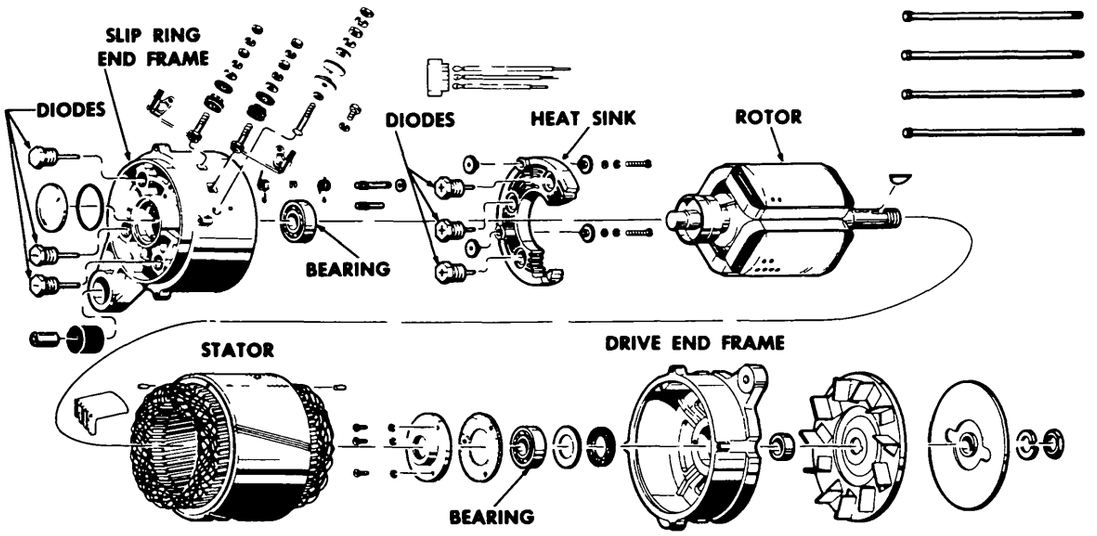
►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTION Reversed polarity or excessive voltage will result in extensive damage to alternator system NOTE THE FOLLOWING TO PREVENT DAMAGE*

Battery Installation - Alternator polarity determines which battery terminal is grounded For negative polarity alternators, **negative** battery terminal must be grounded *DO NOT REVERSE BATTERY LEADS or rectifiers will be damaged*

Charging Battery - If a "Fast Charger" is used, both car battery cables must be disconnected from battery *DO NOT use a 'Fast Charger" to provide starting voltage*

Booster Battery (used To Start Engine) - Booster battery **must** be connected with negative lead to negative terminal of battery and positive lead to positive terminal of battery *DO NOT REVERSE BATTERY LEADS*

DESCRIPTION· Main alternator components are the stator, rotor, slip ring end housing, drive end housing and rectifiers (diodes) Rectifiers are mounted in slip ring end housing Alternator voltage and output is controlled by a transistorized voltage regulator unit and a separate field relay unit on some applications (see "Voltage Regulator" below for further description) *NOTE - Alternators may be either "A" circuit or "B' circuit types Data below applies only to "A' circuit negative ground types*



Stator - Consists of a laminated iron core with three phase windings electrically 120° apart wound in slots around inside circumference of core Outer surface of core forms the alternator frame One end of each stator winding is connected to a pair of rectifiers in the slip ring end housing The other ends of the stator windings are connected together

Rotor - Two types used **1)** Consists of four field windings wound on a four pole rotor and shaft **2)** Consists of a single field coil encased between two six-fingered overlapping iron sections assembled on a shaft **On all r tors,** the ends of the field coils are connected to two slip rings insulated from each other and the shaft Battery is connected to field coils through two brushes and the slip rings

Slip Ring End Housing - Supports rectifiers, ball bearing for rotor shaft, brush holders and brushes, and field and output terminals *NOTE - Some alternators have three A C terminals in addition to output ('BAT') terminal so a transformer may be connected to step up A C voltage*

Drive End Housing - Supports ball bearing for rotor shaft Through bolts hold entire assembly together

Rectifiers (Diodes) - Three rectifiers with "—" case mark and right hand threads have negative polarity and are mounted in the slip ring end housing and grounded through the end housing The other three rectifiers are marked "+" on case, have left hand threads and have positive polarity They are mounted in a nylon heat sink which is mounted in but insulated from the slip ring end housing The positive rectifiers are connected through the heat sink to alternator output terminal A negative and a positive rectifier are connected to each of the three stator windings *NOTE - Rectifier lead has opposite polarity to polarity of the rectifier case*

DELCO-REMY ALTERNATOR (WITH INTERNAL RECTIFIERS)

SPECIFICATIONS

Performance Data - Cold (70°F)

Alternator	Amperes	Volts	RPM
1117070, 077, 078	①58	14 0	2500

TESTING & TROUBLE SHOOTING

►*CAUTION* **1)** *Do not ground alternator output terminal or alternator and circuit will be damaged*

2) *Do not polarize alternator as it is not required and doing so will damage entire system*

3) *Before making test connections, ignition switch must be off*

Current Output Test: On 4-terminal r gulat rs, connect an ammeter in circuit at alternator "BAT" terminal, a voltmeter from alternator "BAT" terminal to ground connect regulator "BAT" and "F2" leads together and disconnect and ground regulator "F1" lead Connect a carbon pile rheostat across battery to prevent high voltage **On 3-terminal regulators,** connect ammeter, voltmeter and carbon pile rheostat as in 4-terminal type above Disconnect "F2" and "BAT" leads from regulator "BAT" terminal but leave the leads connected to each other Disconnect and ground regulator "F" (alternator "F1") lead **On all units,** slowly increase alternator speed and check for rated output *See Specifications CAUTION - Alternator voltage must not exceed recommended voltage regulator setting*

BATTERY UNDERCHARGED· Drive belt loose Battery faulty Field relay faulty High circuit resistance Alternator faulty Regulator contact points oxidized Regulator transistor open Regulator diode shorted Voltage regulator setting too low

Checking - **1)** Check field relay as follows Connect a voltmeter from alternator "F2" terminal to ground Turn on ignition switch Voltmeter will indicate battery voltage if relay contacts are closed If no reading obtained contacts are open and relay is faulty

2) Check alternator output (see "Current Output Test" above) If battery is good, all circuit connections are satisfactory, field relay operates correctly and alternator is satisfactory other regulator trouble is indicated Proceed as follows

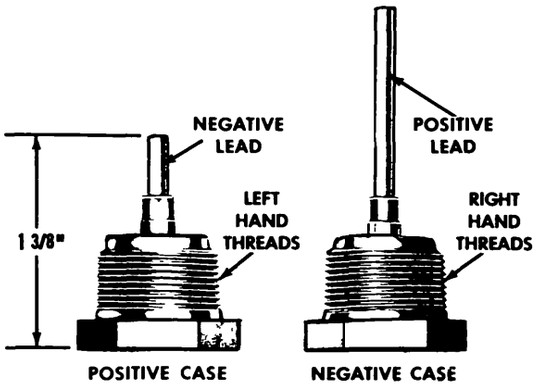
3) With all leads disconnected from regulator, connect negative terminal of a 12 volt battery to regulator base From positive terminal of battery connect an ammeter and a 2 6 ohm 50-75 watt resistor in series with regulator "F" (3-terminal type) "F1" (4-terminal type) terminal Ammeter reading less than 4 1 amperes

CONTINUED ON NEXT PAGE

DELCO-REMY ALTERNATOR (INTERNAL RECTIFIER) & TRANSISTORIZED REGULATOR (C ntinued)

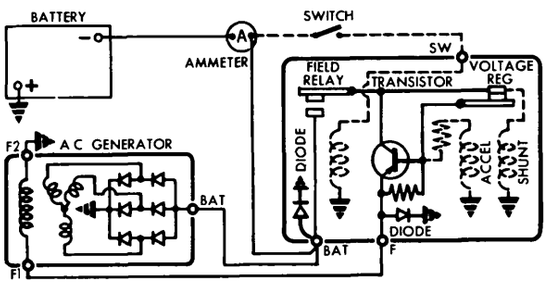
indicates high resistance in voltage regulator contacts or in transistor. Ground base terminal of transistor with a jumper wire. *NOTE - Base terminal is the soldered connection inside regulator common to the two wire-wound resistors.* If ammeter reading increases to 4.1 amperes or more, voltage regulator contact circuit has high resistance. If current does not increase to 4.1 amperes, transistor has high resistance and must be replaced. *See "Voltage Regulator" below for transistor replacement.*

4) If regulator contacts and transistor are satisfactory, check for shorted diode as follows: Disconnect all leads from regulator. **On 4-terminal types,** connect ohmmeter positive lead to "F2" terminal and negative lead to "F1" terminal. **On 3-terminal types,** connect ohmmeter positive lead to "BAT" terminal and negative lead to "F" terminal. If there is no resistance reading, diode is shorted and must be replaced. *CAUTION - It is very important to determine ohmmeter polarity before making this test or regulator will be damaged.*



BATTERY OVERCHARGED: Battery faulty. Alternator field circuit grounded. High charging circuit resistance. Regulator transistor shorted. Regulator diode open (resulting in shorted transistor). Voltage regulator setting too high.

Checking - 1) If battery in good condition, check for grounded alternator field circuit. *NOTE - Alternator must be disassembled to make this test. See "Overhaul" below for procedure.*



2) Check for high circuit resistance as follows: Connect an ammeter in circuit at alternator "BAT" terminal and a voltmeter from alternator "BAT" terminal to ground. Connect a carbon pile rheostat across battery. Connect another voltmeter from regulator "BAT" terminal to battery positive post. Slowly increase alternator speed to obtain alternator rated output. *CAUTION - Alternator voltage must not exceed recommended voltage regulator setting.* Maximum voltage drop should not exceed .3 volt.

3) Check for shorted transistor as follows: With all leads disconnected from regulator, connect an ohmmeter positive lead to transistor base (junction point common to the two wire-wound resistors) and ohmmeter positive lead to regulator "F1" (4-terminal type), "F" (3-terminal type) terminal. Note ohmmeter reading. Place ohmmeter negative lead on regulator base (ground) and note reading. Then leave ohmmeter negative lead at ground and move positive lead to "F1" or "F" terminal and note reading. *NOTE - Hold voltage regulator contacts open during all three checks.* A zero reading for any of the three checks indicates a shorted transistor. *CAUTION - Ohmmeter polarity must be determined before making above tests.*

4) If shorted transistor is found in above test, check alternator field for short (see "Overhaul" below), and check regulator diode for open condition as follows: Reverse ohmmeter connections used for checking for shorted diode (see **4** under BATTERY UNDERCHARGED above). Diode is open if reading is approximately 20-60 ohms.

DIODE (RECTIFIER) IDENTIFICATION

ALTERNATOR & REGULATOR WIRING DIAGRAM

►*VOLTAGE SETTING TAILORING NOTE:* If no circuit defects are found during all of the above tests and battery remains constantly over, or undercharged, voltage regulator setting may be raised or lowered .3 volt to compensate for various operating conditions.

OVERHAUL

Disassembly: Remove through bolts and remove drive end housing and rotor assembly from stator and slip ring end housing assembly. Separate rotor and drive end housing by removing bearing retainer plate screws, pulley nut, pulley, fan, and woodruff key. Bearings may be removed from shaft by pressing shaft from bearings supporting **inner race** of bearing only to prevent damage. Separate slip ring end housing and stator assembly by removing three A.C. terminal leads (if equipped) and prying both parts apart slowly, using a screwdriver to pry apart nylon stator winding-to-rectifier connector.

Rectifier Checking: *CAUTION - Use ohmmeter with 1½-volt cell and a scale on which 300 ohm value is at or near mid-scale and can be accurately read. Ohmmeter polarity MUST be determined before checks are made. DO NOT use 110-volt test lamp or other high voltage. Observe the following procedures exactly.* Check rectifiers for **sh rts** as follows: On **negativ** rectifiers, connect ohmmeter negative lead to rectifier case, and positive ohmmeter lead to rectifier lead. For **p sitive** rectifiers, reverse ohmmeter connections. Ohmmeter readings may vary among rectifiers, but a reading below 300 ohms indicates a shorted rectifier. To check for **p n circuit** on **negative** rectifiers, connect ohmmeter negative lead to rectifier lead, and ohmmeter positive lead to rectifier case. **Reverse** connections for **positiv** rectifiers. If ohmmeter indicates an infinite resistance, rectifier is open.

Rectifier Replacement - *Observe the following whil replacing rectifiers:* When cutting rectifier leads, leave ½" of lead on each side of rectifier lead to match new rectifier. Coat new rectifier threads lightly with silicone grease or light engine oil before installing. Torque new rectifier to 200 inch-lbs. Do not bend rectifier lead. Use only 60% tin, 40% lead solder, or other solder with 360°F or above melting point. Negative rectifiers have right hand threads, positive rectifiers have left hand threads. Replace as follows:

Negative Rectifiers - Clip leads on each side of rectifier lead and replace rectifier, observing cautions listed above.

Positive Rectifiers - Clip lead midway between each pair of negative and positive rectifiers. Remove nylon stator terminal holder from housing and leads from holder. Remove heat sink and "BAT" terminal attaching screws and remove heat sink from end housing. Replace rectifier, observing cautions listed above.

Rotor: Use a 110-volt test lamp and check as follows: for grounded coils, connect test lamp from either slip ring to rotor shaft or to laminations. If lamp lights, field is grounded. For open circuit, connect test lamp to each slip ring. If lamp does not light, field circuit is open. For short circuit, check field current draw by connecting a battery and ammeter in series with the two slip rings. Current draw should be as specified. *S Specifications.* If reading higher than specified, field windings are shorted. Replace rotor assembly or field winding as necessary.

Stator: Use a 110-volt test lamp and check as follows: For grounded windings, connect test lamp from any stator terminal to stator frame. If lamp lights, windings are grounded. For open circuit, connect test lamp successively between each pair of stator terminals. If lamp does not light, windings are open. A short circuit in stator may be assumed if all other electrical checks are normal and alternator does not produce rated output.

Slip Rings: If slip rings rough or out-of-round, true in a lathe. Remove no more than .001" (4-coil rotor type), .002" (single field rotor type) maximum diameter from slip rings. To replace slip rings, pull old assembly from shaft after leads unsoldered. Press new assembly on shaft using a sleeve over shaft so pressure applied to slip ring inner collar only. Use only pure tin solder when making connections. New slip rings **must** be trued in a lathe and polished.

Brushes: Replace brushes if worn to less than ½ original length (compare with new brushes). Check brush spring tension *(see Specifications)* and replace springs if necessary.

Reassembly: Reverse disassembly and note the following: **B arings** - Fill each bearing lubricant reservoir **half full** with Delco-Remy Lubricant No. 3 (No. 1948791) and pack bearings with same lubricant. Make sure sealed

CONTINUED ON NEXT PAGE

DELCO-REMY ALTERNATOR (INTERNAL RECTIFIER) & TRANSISTORIZED REGULATOR (Continued)

side of slip ring end housing bearing is installed away from grease reservoir and open side toward reservoir

Brushes - Lift brushes from slip rings when installing rotor to prevent brush and slip ring damage

TRANSISTORIZED VOLTAGE REGULATOR

DESCRIPTION: Transistorized type with diode Transistor works with a conventional type voltage regulator unit to limit alternator voltage to pre-set value The diode reduces arcing at voltage regulator contacts by dissipating energy created in alternator field windings when voltage regulator contacts separate The two types of transistorized regulators are used.

4-Terminal Type - Used in circuits with an ammeter Assembly contains a conventional vibrating type voltage regulator and a field relay Terminals are marked "BAT", "F1", "F2", "SW"

3-Terminal Type - Used in circuits with either an ammeter or charge indicator light Assembly contains a conventional vibrating type voltage regulator and an indicator light relay Terminals are marked "L", "F", "BAT" When an ammeter is used instead of a charge indicator light, the indicator light relay is not used and no connection is made at the "L" terminal On all charging system circuits using this type regulator, an additional separately mounted field relay is used to energize alternator field circuit

SPECIFICATIONS

Voltage Regulator
(Regulator No. 9000552, 562, 563, 554)

Normal Setting - 13 0-13 6 volts, adjust to 13 4 volts (9000552, 563, 554) 13 9-14 6 volts, adjust within range regardless of temperature (9000562)

Air Gap - 075" (9000552, 563, 554), 070" (9000562) with armature pressed down to point where contacts just touch

Field Relay (Integral)
(Regulator No. 9000552, 562, 563)

Closing Voltage - 5 0-9 5 volts
Air Gap - 014" with points just touching
Contact Gap - 027"

Field Relay (Separate)
(Relay No. 1116895)

Closing Voltage - 7 0-9 0 volts
Sealing Voltage - 11 volts maximum
Air Gap - 010" with contacts just touching
Contact Gap - 015- 025"

Indicator Light Relay
(Regulator No. 9000554)

Voltage Setting - Contacts should close 2 volts lower than voltage regulator setting

Air Gap - 075" with armature pressed down to point where contacts just touch

TESTING & TROUBLE SHOOTING: *See "Testing & Trouble Shooting" above*

CHECKING & ADJUSTMENT

►*ADJUSTMENT CAUTIONS* **1) 4-Terminal Type** - *DO NOT short across "F1" and "F2" terminals of either alternator or regulator*

2) 3-Terminal Type - *DO NOT short across "F" and "BAT" regulator terminals, or across "F1" and "F2" alternator terminals*

3) *DO NOT attempt to polarize alternator*

4) Before checking or adjusting, bring regulator to operating temperature of 125°F by connecting a ¼ ohm resistor in series with battery and operating alternator at 3000 RPM for 15 minutes with 3-10 amperes output, with regulator cover in place, until regulator heated and stabilized After warm-up completed, cycle alternator by stopping and restarting alternator

4-Terminal Regulator

Voltage Regulator Air Gap - Push armature down against a wire gauge until contacts just touch Adjust upper contact support for proper gap with contacts aligned *See Specifications*

Voltage Setting - Bring regulator to ambient temperature as described under "Adjustment Cautions" above Connect an ammeter in circuit at alternator "BAT" terminal and a voltmeter from regulator "BAT" terminal to regulator base (ground) With alternator operating at 3000 RPM and charging at 3-10 amperes, cycle alternator, bring back to 3000 RPM and 3-10 amperes charge and note voltmeter reading and regulator temperature If not within range shown in "Setting Table" below, adjust armature spring tension by turning adjusting screw as required Cycle alternator, bring back to 3000 RPM and 3-10 amperes charge and note reading Make final adjustment as required *CAUTION - Always make final setting by turning adjusting screw clockwise to hold spring holder against screw head*

Voltage Setting Table

Temperature (°F)	Setting Range
145°	12 7-13 3 volts
125°	13 0-13 6 volts
105°	13 3-13 9 volts
85°	13 6-14 2 volts
65°	13 9-14 5 volts
45°	14 2-14 8 volts
25°	14 5-15 1 volts

►*VOLTAGE SETTING TAILORING NOTE* If battery consistently over- or undercharged after voltage regulator properly set and all other checks indicate no circuit defects, voltage regulator setting may be raised or lowered 3 volt to compensate for various underhood temperatures and other operating conditions Allow reasonable length of time to check performance Proper setting is obtained when battery remains fully charged with minimum use of water

Field Relay Air Gap - Measure air gap with armature pressed down to point where contacts just touch *See Specifications NOTE - If point opening and closing voltage within specifications, relay will operate satisfactorily even if air gap not exactly within specifications*

Contact Gap - Check with feeler gauge *See Specifications* To adjust, bend flat contact support spring

Closing Voltage - *Make this check after setting voltage regulator and before unit cools* Connect a 50 ohm variable resistor in circuit from ignition switch and "SW" terminal of regulator Connect a voltmeter from "SW" terminal to regulator base (ground) With all resistance turned into circuit, turn on ignition switch and slowly decrease resistance until relay contacts close and note voltage If not as specified, adjust by bending armature spring post as required *See Specifications*

3-Terminal Regulator

Voltage Regulator Air Gap - Push armature down against a wire gauge until contacts just touch Adjust upper contact support for proper gap with contacts aligned *See Specifications*

Voltage Setting - Make connections as follows Connect an ammeter in circuit at "BAT" alternator terminal, and a voltmeter from regulator "BAT" terminal to regulator base (ground) *Adjustment procedures and cautions are the same as for "4-Terminal Regulator" above*

Indicator Light Relay Air Gap - With armature pressed down to point where contacts just touch, measure air gap with a wire gauge Adjust upper contact support for proper gap with contacts aligned *See Specifications*

Closing Voltage - *Make this check after setting voltage regulator and before unit cools* Disconnect alternator "F2" lead from regulator "BAT" terminal and connect a 50 ohm variable resistor in circuit from regulator "BAT" terminal to separately mounted field relay Connect a voltmeter from regulator "BAT" terminal to regulator base (ground) *CAUTION - Do not operate alternator with resistor in circuit* With all resistance turned out of circuit, turn on ignition switch *NOTE - Battery must have sufficient charge to cause contacts to open when resistance out of circuit* Slowly increase resistance and note voltage when contacts close Closing voltage should be 2 volts lower than voltage regulator setting *See Specifications*

Field Relay (Separately Mounted Type): Air Gap - With upper contacts pushed down until contacts just touch, adjust gap between armature and core by bending lower contact support *See Specifications*

Contact Gap - With armature against upper armature stop, measure contact gap with a feeler gauge, and bend upper armature stop to adjust *See Specifications*

Closing Voltage - Connect a variable resistor in circuit from field relay to indicator light, and a voltmeter from same relay terminal to relay base (ground) With all resistance turned into circuit, turn on ignition switch and slowly decrease resistance until relay points close and note voltage *See Specifications* To adjust, bend armature spring post

Sealing Voltage - After contact points have closed in "Closing Voltage" check above, continue to decrease resistance until armature seals to core and note voltage *See Specifications* To adjust, decrease air gap slightly by bending lower contact support *Readjust contact gap if air gap changed*

UNIT REPLACEMENT

Transistor Replacement - Remove two attaching screws on underside of regulator and unsolder connections inside regulator, directly above transistor *CAUTION - Hold soldering time as short as possible as transistors are easily damaged by excessive heat*

Diode Replacement. *NOTE - Diode mounted on underside of regulator on some early types, and inside regulator near voltage regulator unit on later types* Unsolder both diode connections and replace with new diode *CAUTION - Hold soldering time as short as possible as diodes are easily damaged by excessive heat*

LEECE-NEVILLE ALTERNATOR & REGULATOR

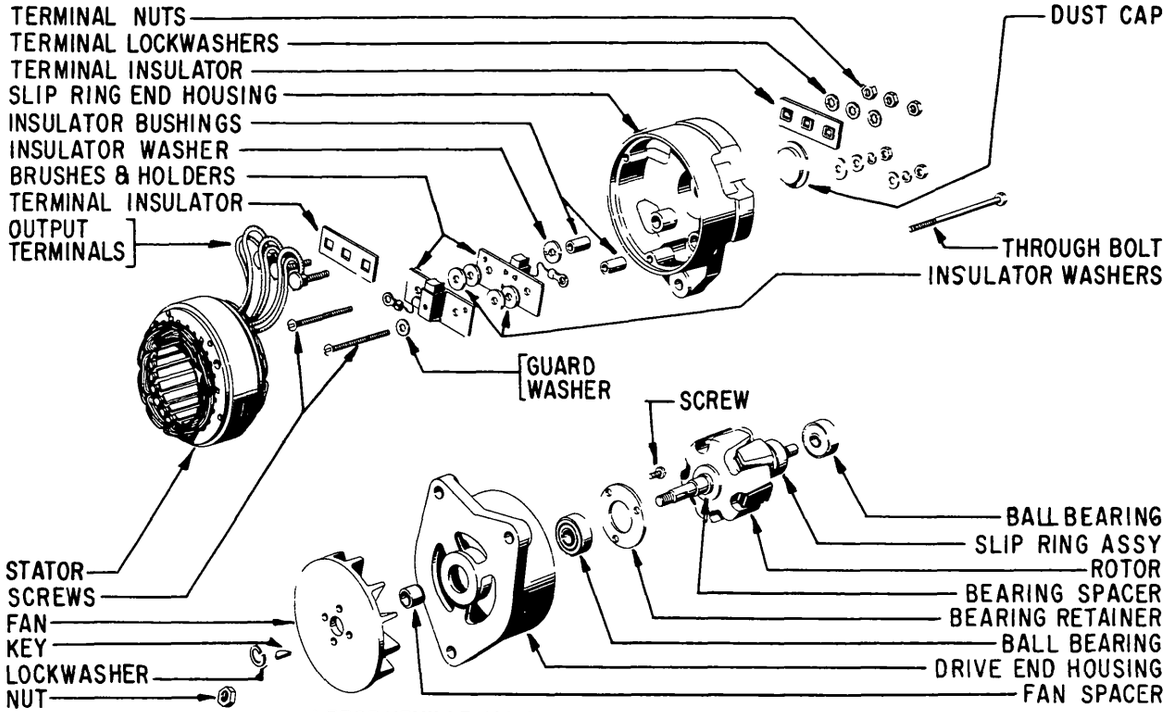
③ - Identification Nos COTF-10300-E, C1TF-10300-C,K
④ - Identification Nos C1TF-10300-F, J, M
⑤ - Also 50 Amp H D
⑥ - May also be marked B9FA-10300-B
⑦ - External Rectifier No C0011068-CA (Rambler No 3149242)

►CHANGES, CAUTIONS, CORRECTIONS



►*BATTERY INSTALLATION, BATTERY CHARGING, OR USING A BOOSTER BATTERY TO START ENGINE CAUTION Reversed polarity or excessive voltage will result in extensive damage to alternator system NOTE THE FOLLOWING TO PREVENT DAMAGE*

Battery Installation - Alternator polarity determines which battery terminal is grounded For negative polarity alternators, **negative** battery terminal must be grounded *DO NOT REVERSE BATTERY LEADS or rectifiers will be damaged*

Charging Battery - If a "Fast Charger" is used, both of the car's battery cables must be disconnected from battery *DO NOT use a "Fast Charger" to provide starting voltag*

Booster Battery (Used To Start Engine) - Booster battery **must** be connected with negative lead to negative terminal of battery and positive lead to positive terminal of battery *DO NOT REVERSE BATTERY LEADS*

DESCRIPTION: Main alternator components are the stator, rotor, brushes, slip rings, slip ring end housing and drive end housing Rectifiers consist of an externally mounted dry plate type on some models or are incorporated in slip ring end housing on other models Alternator voltage and output is controlled by a voltage regulator unit (see "Voltage Regulator" below for further description)

LEECE-NEVILLE ALTERNATOR ASSEMBLY (TYPICAL)

Stator - Consists of an iron core with three phase windings electrically 120° apart wound in slots around inside circumference Stator leads are connected to terminal posts in slip ring end housing These leads are connected to the external rectifier assembly or to internal rectifiers by additional leads

Rotor - Consists of a single field coil encased between two six-fingered overlapping iron sections assembled on a shaft The two ends of field coil are connected to two slip rings insulated from each other and the shaft Battery is connected to field coil through brushes and the slip rings

Slip Ring End Housing - Supports rectifier heat sink (if equipped), rotor shaft rear ball bearing, brush holders and brushes, and all terminals for lead connections

Drive End Housing - Supports rotor shaft front ball bearing, pulley fan, and pulley Through bolts hold entire assembly together

Rectifier (External Type) - Assembly is a dry plate, three phase full wave bridge type, selenium rectifier mounted separately from alternator and connected to it by three leads from stator phase windings Two output terminals are mounted on rectifier to connect to car wiring

Rectifier (Internal Type) - Six silicone diode rectifiers are screwed into a metal heat sink mounted in slip ring end housing and insulated from it Three rectifiers have negative polarity and are connected to ground through negative output terminal The other three rectifiers have positive polarity and are connected to alternator positive output terminal

►*CHARGE INDICATOR LIGHT RECTIFIER NOTE* On some Ford Light Duty trucks a modification to accommodate the charge indicator light consists in operating the load relay of the voltage regulator from a pair of rectifiers connected across one phase of the stator winding

TESTING

►*CAUTION 1) Do not ground field circuit between alternator and voltage regulator as regulator will be damaged 2) Do not ground alternator output terminal or alternator and circuit will be damaged 3) Do not operate alternator on open circuit with field winding energized*

CONTINUED ON NEXT PAGE

LEECE-NEVILLE ALTERNATOR & REGULATOR (Cont.)

4) Do not polarize alternator as it is not required and doing so will damage entire system.
5) Before making test connections, ignition switch must must be off.

ALTERNATOR IN CAR: With battery fully charged and engine at normal operating temperature, test circuits as follows:

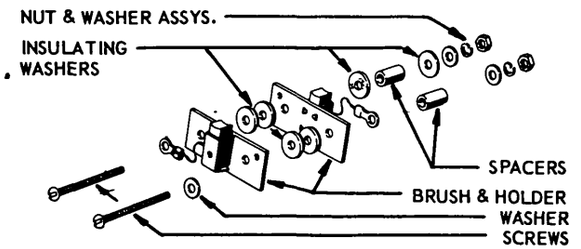
Current Output: Disconnect alternator "F" and "G" leads from regulator and connect leads together. Connect an ammeter positive lead to these two leads, start engine and connect ammeter negative lead to battery positive terminal. Operate engine at proper speed *(see "Performance Data" above)* and note ammeter reading. Current output should reach or exceed specifications *(see "Performance Data" above)*.

►*ALTERNATOR TESTER NOTE:* When using an Alternator Tester for an output test, the maximum voltage variation between phases should not exceed 1.5 volts (no load), .3 volt (load).

Field Coil Draw: Disconnect "F" lead from alternator and connect an ammeter negative lead to "F" terminal and positive ammeter lead to battery positive terminal. Current draw should be as in specifications. If current draw is low or zero, field has high resistance or is open. If current draw is high field is shorted or open.

ALTERNATOR OFF CAR: Stator Test - *NOTE - This test may be made on alternators with external rectifier with alternator in car if stator leads to rectifier assembly are disconnected. On internal rectifier alternators, remove stator from slip ring end housing.* Use a 110 or 220-volt test lamp and test probes. With one test probe on alternator end housing or stator core, touch other probe to each phase terminal in turn. If lamp lights, stator is grounded. Check stator windings for continuity with an ohmmeter and test probes at two of the winding leads in turn. Each phase should show a low resistance. If resistance is high, stator windings are open or shorted.

Rotor Test: Test rotor with a 110-volt test lamp. There should be no ground between either slip ring or shaft. There should be no ground between rotor core and slip rings.



Rectifier (External Type) Service: Clean rectifier assembly frequently by blowing compressed air through plates to remove dirt. With rectifier removed, use a bottle brush or rag between plates. *CAUTION - DO NOT force brush or rag between plates. DO NOT use solvent. Clean rectifier DRY.* To test rectifier, connect a 25 ampere load across output terminals with an ammeter in circuit. Touch test probes from a 12-volt battery to two of the three terminals in turn. Ammeter readings should be equal for all three checks. A different reading in any one test indicates a faulty rectifier. *CAUTION - DO NOT apply voltage to direct current output terminals of rectifier.*

Rectifier (Internal Type) Test: *NOTE - Resistance of silicon rectifiers will vary due to temperature, type of ohmmeter, battery voltage used in test equipment, and other factors.* Remove slip ring end housing from stator assembly. Proceed as follows:

Method 1 - Connect ohmmeter leads to the two alternator output terminals. Reverse the leads. Resistance should be 3.3-20 ohms in one direction and infinite in the other direction.

Method 2 - With positive probe of ohmmeter on alternator negative output terminal, touch each of stator winding terminals with other probe. Resistance should be 5-45 ohms. Reverse the probes. Resistance should be infinite. Now place negative probe on alternator positive output terminal and touch each of stator winding terminals with other probe. Resistance should be 5-45 ohms. Reverse the probes. Resistance should be infinite.

Rectifier Mount Ground Test (Internal Type Rectifiers): Use a 110-volt test lamp and check from each output terminal screw to ground. If ground exists, check top, center, and bottom rectifier assembly-to-housing mounts, and both output terminals.

BRUSH & HOLDER ASSEMBLY (EXPLODED)

OVERHAUL

►*OVERHAUL NOTE: Alternator need be disassembled only so far as necessary for testing or needed repairs. Bearings need be removed only if loose or if lubricant lost. On 100 Amp. alternator, repair rotor assembly (except for slip rings, bearing, or coil) only if proper machining and balancing equipment available.*

DISASSEMBLY: 30, 50, 60 Ampere Alternators - Remove fan and pulley assembly with a gear puller. Remove key and fan spacer. Remove splash shields and pry out bearing dust cap. Insert a brush clip on brush holders to retract brushes. Remove nuts, washers and insulator from the three stator phase terminals. Remove through bolts and pull slip ring end housing from rotor shaft with a gear puller. Remove stator from housing (tap with soft hammer if necessary to loosen). Remove rectifier assembly mounting screws and remove assembly from housing. With arbor press or gear puller, press rotor from drive end housing. Tap or press bearings out of each housing. Remove brush holder assemblies.

Slip Ring Replacement - While removing old slip rings, place new slip rings in a warm area to prevent cracking when installing. Unsolder coil wires from slip rings. Pull rings from shaft with gear puller or use arbor press. Press new slip ring assembly on shaft with slots in line with hole in shaft for coil wires and until outer face of outer slip ring is 9/16" from end of shaft. Concentricity of slip ring faces with bearing surface of shaft must be within .002". Cut rings on a lathe to correct.

Rectifier Cell Replacement (Internal Type) - *CAUTION - Disturb as few connections as possible. Metal-to-metal surface of cell and terminal connections have a special treatment to prevent corrosion and electrolysis. Same treatment must be applied to any worn or replacement cell.* Unsolder cell lead, bend down lock tab on inner bracket and remove cell with a wrench. *CAUTION - If spacer between inner and outer rectifier mounting bracket comes out, it must be clean and on both sides before re-installation.* Install new cell. Tighten to 20-25 inch-lbs., bend lock tab up. Solder lead to cell. *DO NOT OVERHEAT OR CELL WILL BE DAMAGED.*

100 Amper Alternator: 1) Remove pulley, both brush holder assemblies from brush end housing and nuts, washers and insulators from stator winding terminals. Remove brush end housing dust cap, housing bolts and alternator top support. Loosen brush end housing with a soft hammer and remove housing and stator assembly from shaft (use gear puller if bearing is tight). Remove stator from housing. Pull drive end housing from shaft with a gear puller. Remove retainer and bearing from drive end housing.

2) Unsolder both field leads from slip rings and press off slip rings with parallel bars. *CAUTION - Use care not to crack slip rings during removal. If cracked, they must be replaced.* Remove bearing and bearing retainer from slip ring end of shaft (save wood wedge from lead slot under bearing). Remove drive end shaft nut and tap off drive end rotor half with a soft hammer. Remove key. Press other half of rotor from shaft with an arbor press (use a brass rod on end of shaft to protect and lengthen it). Remove rotor coil from hub. *CAUTION - Keep rotor halves together to maintain proper balance.*

REASSEMBLY: 30, 50. 60 Amper Alternators - Press bearings into slip ring and drive end housings (apply pressure to outer race only). Press drive end housing and bearing assembly on rotor shaft with shaft on flat plate of arbor press (use pipe so pressure exerted on bearing inner race only). Install brush holder assemblies as shown in illustration. Install a holder clip to retract brushes. Install stator over rotor and insert through bolts through drive end housing and stator. Install rectifier assembly in slip ring end housing. Install slip ring housing and rectifier assembly over stator and rotor assembly and press on slip ring end housing with an arbor press. Tighten through bolts. Install stator terminal insulator, washers, and nuts. Remove brush retainer clip. There should be 1/16" clearance between alternator fan fins and drive end housing. Install pulley and tighten to 40 ft. lbs. Test assembly for free turning.

100 Ampere Alternator: 1) Press slip ring rotor half (with wire clip) on shaft as far as snap ring and press hub on shaft. Install coil with leads under wire clip. Install key, press drive end rotor half on shaft and install and tighten locknut. Paint rotor with red oxide or red Glyptol varnish to secure coil. Place coil leads in slot in shaft, press slip ring bearing on shaft (press on inner race only), place wood wedge in slot and install snap ring and insulating washer. Press slip rings on shaft one at a time with tapered side toward bearing and wire cutout aligned with slot in shaft. Solder coil leads to slip rings.

2) Press drive end bearing into housing (press on outer race only) and install bearing retainer. With slip ring end of shaft on press plate, press drive end housing assembly on shaft (use pipe so pressure exerted on bearing inner race only). Install stator over rotor and drive end housing so dowel pin in housing mates with stator hole. Install insulator over stator leads and press slip ring end housing on shaft (mate dowel pin in housing with hole in stator). Install alternator top support. Install insulator, bushings, washers and terminal nuts on terminals. Install brush holder assemblies.

CONTINUED ON NEXT PAGE

LEECE-NEVILLE ALTERNATOR & REGULATOR (C nt.)

Clearance between alternator fan fins and housing should be 1/16". Torque pulley nut to 40 ft. lbs.

VOLTAGE REGULATOR

FORD CARS & TRUCKS

Regulator - Ford Nos. -	Alternator
B8C-10505-A	B8TZ-10346-A, E
B8Q-10505-A	B8TZ-10346-G, F
PB8M-10316-A	C1TF-10346-B,C,D
B8C-10505-B	①B8TZ-10346-C,D

RAMBLER

Regulator - Lec-Neville Nos. -	Alternator
R0013456-RA②	A0015428-GA
R0013533-RA③⑩	A0012036-AA

① - When used as 50 Amp. use Regulator No. B8Q-10505-A.
② - Rambler No. 3156485. ③ - Rambler No. 3159383.
⑩ - Two Unit type.

DESCRIPTION: Two and three unit types used (see above). Three unit type has load relay, voltage regulator and current regulator. Two unit type used on some alternators with internal rectifiers has load relay and voltage regulator only. Data and specifications below apply to both types except for current regulator data which is not applicable to two unit type. Voltage regulator is a double contact type of conventional design. Current regulator is also of conventional design. Both units perform the same functions as on a DC current generator-regulator system. Load relay has a single core winding and a single set of contacts. Relay is controlled by ignition switch (except Ford Trucks, see below) which, by energizing core winding, closes relay contacts, energizes alternator field circuit, and connects the "G" and "B" terminals of regulator together (completes alternator charging circuits to battery).

►*FORD LIGHT DUTY TRUCK NOTE:* On trucks with charge indicator light, load relay is operated through a pair of rectifiers connected across one phase of stator windings instead of through ignition switch.

SPECIFICATIONS

Load Relay

Closing Voltage - 5.6-6.4 volts (Ford), 6.0-6.4 volts (Rambler).
Contact Gap - .018-.020" with contacts open.
Air Gap - .018-.020" with contacts closed.
Hinge Gap - .005-.007" with contacts closed.

Voltage Regulator

Voltage Setting (Method 1) - 13.5-14.3 volts.
Voltage Setting (Method 2) - 13.6-13.8 volts (upper contacts); 13.7-13.9 volts (lower contacts); 14.0-14.2 volts (transfer voltage).
Contact Gap - .018-.020" with lower contacts closed.
Air Gap - .035-.043" with lower contacts closed.
Hinge Gap - .018-.020" with lower contacts closed.

Current Regulator

Setting - 28-32 amps. (30 Amp.), 48-52 amps. (50 Amp.), 58-62 amps. (60 Amp.), 98-102 amps. (100 Amp.).
Contact Gap - .018-.020" with contacts open.
Air Gap - .032-.038" with contacts open.
Hinge Gap - .005-.007" with contacts open.

ADJUSTMENT

CHECKING & ADJUSTING (ON CAR): *NOTE - Regulator is "Temperature Compensated" type. Make following checks and adjustments after regulator heated and stabilized (after 30 minutes operation with 10 ampere load).*

Load Relay: Connect a 250 ohm, 25 watt rheostat from battery positive post to "IGN" terminal of regulator, and a voltmeter positive lead to regulator "IGN" terminal with negative lead grounded. Turn full resistance into circuit and slowly decrease resistance until relay points close. Closing voltage should be as specified. To adjust, bend armature spring lower hanger down to increase voltage, up to decrease voltage.

Voltage Regulator: Method No. 1 (Fixed Resistance Method) - Connect voltmeter positive lead to regulator "G" terminal and negative lead to battery negative post. Connect ammeter positive lead to "B" terminal of regulator (disconnect battery lead from regulator) and negative lead to battery negative post with 1½ ohm resistor in line between battery and ammeter. Start engine and slowly increase speed to 1600 RPM. Steady voltmeter reading should be as specified. Retest by stopping engine, momentarily turning off ignition and restarting engine. To adjust, bend armature spring lower hanger down to increase setting, up to decrease setting.

Method No. 2 - *CAUTION - Before setting each voltage in following test sequence, alternator must be stopped and ignition switch turned off.* Connect an ammeter in series with battery lead to regulator and a voltmeter between "B" and "G" regulator terminals. Connect a set of earphones (not less than 1000 ohms resistance) to "F" and "G" regulator terminals. Proceed as follows:

1) Start engine and slowly increase speed. Listen (with earphones) for start of vibration of regulator contacts and note voltage reading. Regulator is operating on upper contacts. If voltage not as specified, bend armature spring lower hanger down to increase, up to decrease.
2) Slowly increase speed past vibration on upper contacts and note voltage when vibration stops. Vibration stops immediately before regulator operates on lower contacts. This maximum voltage is "Transfer Voltage" and must be as specified. Adjust as in 1) above.
3) Increase speed slowly past "transfer voltage" point and note start of vibration on lower contacts. If not as specified, adjust air gap by loosening contact block lock screw and turning carrier block cam adjusting screw.

Current Regulator: Method 1 - With test leads connected as in "Voltage Regulator Method No. 1 (Fixed Resistance)" test above, connect a carbon pile rheostat across the 1½ ohm fixed resistor. With engine at 1600 RPM slowly decrease resistance of carbon pile rheostat until voltmeter reads 12 volts. Ammeter will now indicate specified setting for current regulator. To adjust, bend armature spring lower hanger down to increase setting, up to decrease setting. Retest voltage regulator setting with all test equipment removed except the voltmeter and with battery in circuit.

Method 2 - Connect a battery starter variable resistance load tester across battery. With alternator turning at 2000 RPM increase resistance. Current regulator should vibrate and hold line current to specifications. To adjust, bend armature spring lower hanger up or down as necessary. Retest voltage regulator setting (upper contacts) with only voltmeter connected and battery in circuit.

ADJUSTMENT (OFF CAR): The following adjustments are made on load relay, voltage regulator, and current regulator in the same manner.

Hinge Gap: Set gap between yoke and armature lower hinge spring by loosening and tightening armature lock screw. *See Specifications.*

Air Gap: Gap between armature or armature stop and core is set by holding armature towards core and adjusting stationary contact adjusting screw. *See Specifications.*

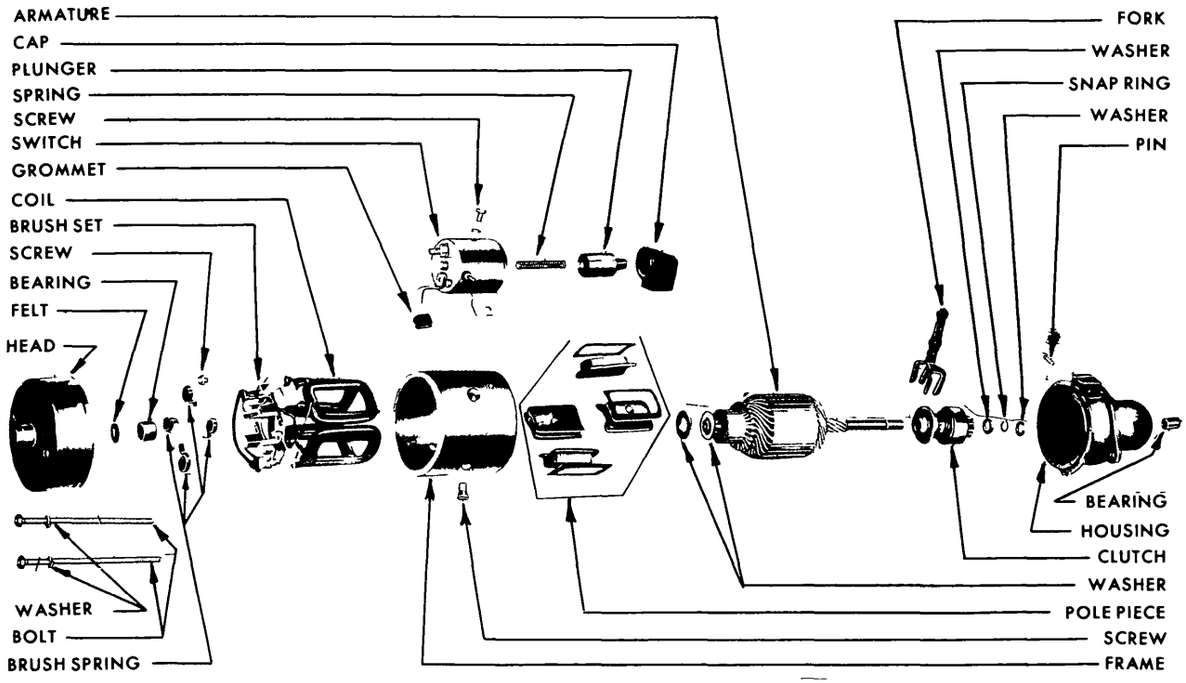
Contact Gap: Set gap by adjusting contact carrier or armature stop. *See Specifications.*

Armature Travel: Adjust armature to float within travel limits by bending armature hinge springs (armature spring removed). *NOTE* - On load relay, be sure to solder jumper wire to contact plate.

CHRYSLER CORP. STARTERS

Car Model	Chrysler Part No.
Chrysler & DeSoto (1960-61)	1889200
Dodge & Plymouth 361" Eng. (1961)	1889200
Dodge & Plymouth 318" Eng. (1961)	1889100

DESCRIPTION: 12 volt, four-pole type with solenoid pinion shift (overrunning clutch). Brushes and springs are mounted in a separate removable brush holder plate assembly.



SPECIFICATIONS: **Rotation** - Counterclockwise at commutator end.
Brush Spring Tension - 32-48 ozs.
Drive Endplay - .005" minimum.
Pinion to Housing Clearance - 1/8"±1/32" measured between pinion and pinion stop (with armature endplay removed).
Performance Data: *See Car Model pages.*

REPLACEMENT: Brushes & Springs - *NOTE - Brushes that are worn to ¼" or less or are oil soaked, should be replaced.* With commutator end head, brushes and brush holder removed, unsolder the two leads at ground brush terminal and the two insulated brush leads at field coil terminal (adjacent to hole in front face of field frame which is used in locating brush holder ring assembly). *CAUTION - Use care in removing and installing ground brushes so that shunt wire is not broken.* To remove brush springs, spread retainer tabs apart slightly on brush holder ring. If new springs are installed pinch the retainer tabs together, if necessary, to hold springs securely. Measure brush spring tension with starting motor completely assembled except for end head. Measure spring tension with spring scale hooked under spring near the end. Pull scale straight back while holding brush against commutator. Take a reading just as spring end loses contact with the brush. Spring tension should be 32-48 ounces.

►*TESTING & OVERHAUL NOTE: All testing and service procedures are the same as for conventional starters except as noted below.*

TESTING: Field Coils - With commutator end head, brushes and brush holder ring removed, disconnect field lead wires at solenoid connector and separate field leads to make sure they do not touch solenoid connector. Remove wire attaching ground terminal to field frame and pull brush leads, shunt wire and terminal assembly aside so there will be no contact.
1) Touch one prod of test lamp to series field coil lead, and the other prod to field frame. Lamp should **not** light.
2) Touch one prod to shunt field coil lead and other prod to field frame. If lamp lights in either of the two above tests, field coils are grounded and each coil should be tested separately after unsoldering the connecting wires.
3) Test two insulated brush holders for proper insulation from ring assembly by touching one test light prod to brush holder and the other to the ring. The lamp should not light. If lamp lights, the insulated brush holders are grounded and the brush ring assembly must be replaced.

OVERHAUL: Disassembly - Remove through bolts at commutator end and pull head from frame. Remove thrust washers from armature shaft, then lift brush holder spring and remove brushes. Remove brush holder plate. Disconnect field coil leads at solenoid connector, then remove solenoid attaching screws and remove solenoid and boot assembly. Drive out overrunning clutch shift fork pivot pin at upper side of pinion housing, then remove drive end pinion housing and spacer washer. Note position of shifter fork on starter drive and remove shifter fork. Slide overrunning clutch pinion gear toward commutator end of armature. Drive stop retainer toward pinion gear to expose snap ring and remove snap ring. Remove overrunning clutch drive from armature shaft. *NOTE - If it is necessary to remove field coils, remove ground brush terminal attaching screw and raise brushes with terminal and shunt wires up and away from field frame.* Remove pole shoe screws with special impact screwdriver, Tool C-3475.

CHRYSLER CORP. STARTER MOTOR (EXPLODED)

Cleaning: Wipe field frame, coil assembly and armature with a clean cloth only. To clean drive unit, use a brush moistened in solvent. DO NOT immerse starter parts in cleaning solvent.

Reassembly: Lubricate armature shaft and splines with SAE 10-W oil or 30-W rust preventive oil, then install starter drive, stop collar (retainer), lock ring and spacer washer. *NOTE - Small diameter end of spacer washer should be in contact with lock ring inside collar.* Install shifting fork over starter drive spring retainer washer with narrow leg of fork toward commutator. *CAUTION - If fork is not properly positioned, it will restrict starter gear travel, causing a lockup in the clutch.* Install drive end pinion housing on armature shaft, indexing shifter fork with slot in housing, then install shifter fork pivot pin. Install solenoid and boot assembly on field frame and tighten screws to 60-70 inch pounds. Install pinion housing and armature assembly into field frame so slot in housing indexes with locating tab projecting from solenoid base. *NOTE - Make sure shifting fork lever is inserted in solenoid plunger link.* Connect field coil leads at solenoid connector, then connect ground brushes and shunt wire terminal to field frame. Install brush holder ring assembly, indexing tang on ring in hole in field frame. Install brushes in brush holders. *CAUTION - Make sure field coil lead wires are properly enclosed behind brush holder ring and do not interfere with brush operation.* Position thrust washer on end of armature shaft and install commutator end head. Install through bolts and tighten to 40-50 inch pounds.

ADJUSTMENT: Starter Drive Gear - Place starter assembly in a vise with soft jaws, then push in on forward end of solenoid plunger link (not shifting fork lever) until plunger bottoms. Measure clearance between end of pinion and pinion stop with plunger seated and pinion pushed toward commutator end. Clearance should be 1/8"±1/32". Adjust for proper clearance by loosening solenoid attaching screws and moving solenoid in slotted holes in base. *NOTE - In some cases it may be necessary to remove starter end head and bend the end of the solenoid connector slightly to obtain proper adjustment.*

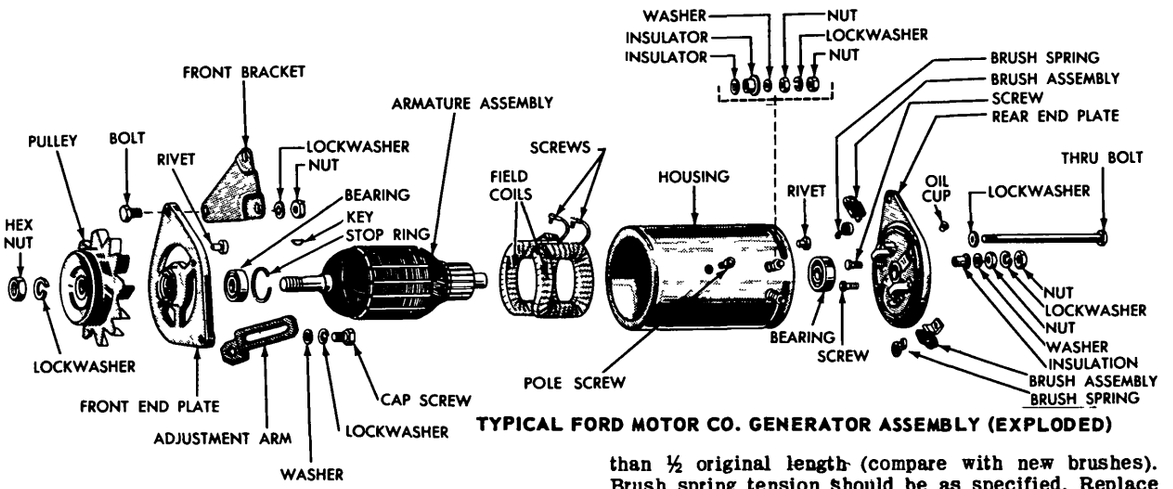
SOLENOID SWITCH: Test Specifications -
Pull-In Coil - 20.0-22.2 Amps. at 6.0 Volts at 70°F.
Hold-In Coil - 11.2-12.4 Amps. at 6.0 Volts at 70°F.

FORD MOTOR CO. GENERATORS

DESCRIPTION: Two pole, two brush, shunt generators of conventional design. Generators are force-draft air cooled by a fan built into drive pulley which rotates with armature shaft. Generators are of "B" circuit type with generator field grounded internally in the generator. *See illustration.*

LUBRICATION: Oiler for commutator endplate bronze bushing should be filled with a few drops of light oil every 5000 miles. Ball bearings are permanently lubricated.

►*GROUND POLARITY NOTE: Test connections given below are for negative grounded systems. If system is positive grounded, reverse test lead connections.*



►*CHARGING CIRCUIT FUSE CAUTION:* Some regulators may have a charging circuit fuse clipped to "BAT" terminal of starter relay (fuse may be bypassed on some cars). Check for blown fuse and cause of fuse failure when diagnosing generator, regulator, or battery failure. When making test connections for current output test, bypass fuse by disconnecting lead to fuse and attaching lead directly to circuit breaker at starter relay.

TESTING: Current Output - Connect an ammeter in series with regulator "BAT" terminal and lead to "BAT" terminal. Connect a voltmeter from regulator "ARM" terminal to ground. With engine idling, connect generator "FLD" and "ARM" terminals together with a jumper wire. Slowly increase generator speed to indicated RPM and note voltmeter and ammeter readings. *See Car Model pages for specifications.* Generator should reach or exceed maximum output.

Charging Circuit Resistance: Connect an ammeter between regulator "BAT" terminal and lead to "BAT" terminal. Connect voltmeter positive lead to "ARM" terminal of generator and voltmeter negative lead to battery positive post (or "BAT" terminal of starter relay). Connect generator "ARM" and "FLD" terminals with a jumper wire. Start engine, turn on light and accessories, and adjust engine RPM to give ammeter reading of 20 amperes. Maximum voltage drop should not exceed .8 volt.

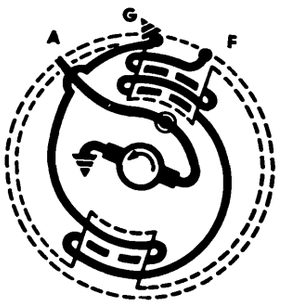
Ground Circuit Resistance: Leave ammeter and jumper wire connected as in "Charging Circuit Resistance" test above. Connect voltmeter positive lead to starter motor rear endplate capscrew, and negative lead to generator frame. Start engine, turn on lights and accessories, and adjust engine RPM to give ammeter reading of 20 amperes. Maximum voltage drop should not exceed .1 volt.

OVERHAUL: Disassembly - Remove through bolts and remove commutator endplate. *NOTE - Hook brushes away from commutator to prevent damage and loss of parts.* Remove armature and drive endplate assembly from frame. Remove pulley, drive endplate, and key from armature shaft. Pull or press commutator end ball bearing from armature shaft. *NOTE - Remove bearing only if necessary as bearing will be distorted when removed from shaft and must be replaced.* On drive endplate, remove snap ring and press bearing from endplate.

TYPICAL FORD MOTOR CO. GENERATOR ASSEMBLY (EXPLODED)

Inspection - Wash all parts except armature, field coils, and bearings in solvent and wipe other parts with a clean cloth. Inspect parts for wear, roughness, scoring, worn insulation, evidence of burning, etc. Replace parts as necessary.

Armature: Check armature shaft for wear or scoring and replace armature if necessary. Check armature windings for short on a growler. With a test lamp, check armature for short circuit to shaft and for open circuit between segments. If commutator rough, scored, or out-of-round, reface as required, removing no more than 3/64" maximum from diameter of commutator. Undercut mica and polish commutator with No. 00 sandpaper.



Field Windings: Let field coil ground wire hang freely (disconnect from frame) and check field windings with a test lamp for open circuit from ground wire to "FLD" terminal. Test field for ground with frame with a test lamp. Test field current draw as follows: Connect an ammeter from "FLD" terminal to battery positive post. Connect battery negative (ground) post to generator frame. Field current draw should be as specified. *See Car Model pages for specifications. NOTE - If field current draw checked with generator in vehicle, disconnect "FLD" lead at generator or regulator and do not use a jumper from battery to generator frame.* Check "FLD" terminal for ground with frame. When replacing field coils, Pole Screw Remover and Installer, No. 10044, with generator clamped in a vise or arbor press, is recommended to prevent damage and to assure proper fit of parts.

Brushes: Brushes must be free in holders and free from excess dirt and oil. Replace brushes if worn to less than ½ original length (compare with new brushes). Brush spring tension should be as specified. Replace brush springs if not within limits. *See Car Model pages for specifications.* Check insulated brush holder for ground with endplate. If ground exists, replace endplate.

Bearings: If commutator endplate bronze bushing is worn or scored, replace bushing or endplate as required. Replace ball bearings if worn, scored, loose, or if lubricant lost. *NOTE - Commutator end ball bearing will be distorted if removed from shaft and must be replaced. Drive rear bearing on shaft with a fibre mallet with socket or spacer against inner race of bearing.*

Reassembly: Reverse disassembly procedures, assembling all parts in proper order (see illustration). Make sure drive end bearing snap ring is in position against bearing in drive endplate.

POLARIZING GENERATOR: *Before operating, generator must be polarized as follows:* Disconnect field lead form "FLD" terminal of regulator and MOMENTARILY touch this disconnected wire to "BAT" terminal of regulator. *Do not use a jumper wire or regulator points will be burned instantly.*

FORD MOTOR CO. GENERATOR INTERNAL WIRING

AUTOLITE 6 & 12-VOLT "A" CIRCUIT REGULATORS

►CAUTIONS

►*GENERATOR REPOLARIZING:* Whenever regulator or generator leads are disconnected for ANY reason, the generator must be repolarized as follows: After generator and regulator leads are reconnected, connect jumper wire between "GEN" and "BAT" terminals momentarily to allow a quick current surge through generator windings. This will prevent damage to equipment caused by reversed polarity (vibration, arcing, and burning of contact relay points).

►*NORMALIZING THE REGULATOR:* Before checking regulator, bring it up to normal operating temperature as follows: Operate generator at speed of 1500 RPM, adjust charging rate to 10 amperes (connect .25 ohm resistor in charging line or use variable resistance connected across battery). Continue operation for 15 minutes to "normalize" the regulator or bring it up to operating temperature (temperature can be checked by placing an accurate thermometer 2" from cover).

DESCRIPTION: These regulators are similar in design to previous types with two resistors.

CHECKING & ADJUSTING: *See "Autolite 12-Volt Regulators" in 1956 Annual Data or "Autolite 6 & 12-Volt Regulators" in latest Manual edition.*

Voltage Setting: After regulator normalized (see above), and with generator charging at 10 amps., note voltmeter reading and regulator temperature. If voltage setting not within range shown in Voltage Regulator Setting specifications below, adjust regulator.

Adjustment - Decrease generator speed to slow idle, remove regulator cover, adjust voltage regulator by bending armature spring lower hanger down (increase spring tension) to increase voltage setting, or up (decrease tension) to lower voltage setting. After each adjustment, check setting by first cycling regulator (decrease speed until cutout relay contacts open), then rechecking voltmeter reading and temperature with 10 ampere charging rate.

VOLTAGE REGULATOR SETTINGS

Model	Voltage Setting Table
VBO-4201E-4A	No. 1
VBO-4202A	No. 1
VBO-4601C	No. 3

VBO Voltage Regulator Settings

Table No. 1

Temp.	① Volts
50°F	14.7
80°F	14.5
110°F	14.3
140°F	14.1

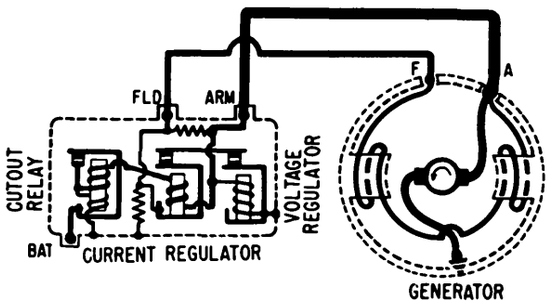


Table No. 3

Temp.	②Volts
50°F	7.3
80°F	7.2
110°F	7.1
140°F	7.0

① - Plus or minus .3 volt. ② - Plus or minus .2 volt.

Current Setting: Normalize regulator (see above). Current regulator setting should then agree with "Test A" specifications in Current Regulator Setting table below. For "Test B", operate generator at 2000 RPM, and add sufficient load to cause current regulator to operate (turn on lights and accessories, add additional load such as a lamp bank or carbon pile, or use a variable resistance across battery) with voltage of 6.7-6.9 volts (6 volt types), 13.6-13.8 volts (12 volt types). Continue to operate the generator for 15 minutes to normalize the current regulator by bringing it up to operating temperature (temperature can be checked by placing an accurate thermometer 2" from regulator cover). At end of the total 30 minute operation, current setting should agree with "Test B" specifications in Current Regulator Setting table below. If charging rate not within range shown in "Test B" column, adjust current regulator.

Adjustment - When amperage not within limits, adjust by removing regulator cover and bending armature spring lower hanger down (increase spring tension) to increase amperage setting, or up (decrease tension) to lower amperage setting. After each adjustment, stop and restart engine, then bring engine up to speed and take reading with cover on regulator.

VBO-4200 & 4600 REGULATORS

Current Regulator Setting

Model	Regulator Nominal Setting	Setting

AUTOLITE 6 & 12-VOLT "B" CIRCUIT REGULATORS

► CAUTIONS

►*GENERATOR POLARIZING CAUTION* When regulator or generator leads are disconnected for any reason, then generator must be repolarized as follows With all wiring properly attached to both regulator and generator, disconnect generator field lead from its terminal on the regulator and momentarily touch it to the BAT terminal on regulator Re-attach field lead to field terminal on regulator This procedure will establish the correct polarity and prevent damage to the equipment

►*NORMALIZING THE REGULATOR* Before checking regulator, bring it to normal operating temperature as follows Operate generator at a speed of 1500 RPM, adjust charging rate to 10 amperes (6 volt), 7 amperes (12 volt) by connecting a 25 ohm resistor in charging line or by using a variable resistance connected across battery Continue operation for 15 minutes to "normalize" the regulator or bring it up to operating temperature (temperature can be checked by placing an accurate thermometer 2" from cover)

DESCRIPTION: "Temperature Compensated" three unit type regulator assembly The charging system is a "B" circuit in which the generator field is grounded at generator ground brush and insulated in the voltage regulator from ground Field control resistors are inserted between field and armature circuits to control generator output *CAUTION - This type regulator must be used only with generators having internally grounded fields*

CHECKING & ADJUSTING: *See "Autolite 12-Volt Regulators" in 1956 Annual Data or "Autolite 6 & 12-Volt Regulators" in latest Manual edition.*

Voltage Setting: After regulator normalized (see above), and with generator charging at 10 amps (6 Volt), 7 amps (12 Volt), or with a 25 ohm resistor between regulator and battery, note voltmeter reading and regulator temperature If voltage not within range shown in Voltage Regulator Setting specifications below, adjust regulator *See "Autolite 12-Volt Regulators" in 1956 Annual Data or "Autolite 6 & 12-Volt Regulators" in latest Manual edition.*

DELCO-REMY 6 & 12-VOLT "SINGLE CONTACT" REGULATORS

►*1972000 REGULATOR NOTE:* These regulators checked and adjusted the same as 1119000 Series regulators. Specifications are listed below.

DESCRIPTION: "Single Contact" type similar in design to previous models. Air gap adjustment on some regulators is made by turning a nylon nut located at top of regulator unit. Point contact gap setting is made in same manner as for previous models. All voltage regulators and some current regulators are "temperature compensated" as indicated below.

CHECKING & ADJUSTMENT: Make all checks and adjustments in following sequence Voltage Regulation, Cutout Relay Operation, and Current Regulation AFTER regulator has been brought up to normal operating temperature as directed below. Generator must be repolarized each time leads are reconnected and before operating

►*GENERATOR REPOLARIZING* After generator and regulator leads reconnected, connect jumper lead between regulator "GEN" and "BAT" terminals momentarily to allow a quick current surge through generator winding This will prevent damage to equipment caused by reversed polarity (vibration, arcing, and burning of relay contact points)

VOLTAGE REGULATOR

►*NORMALIZING THE REGULATOR* Before checking voltage setting, bring regulator to operating temperature as follows Connect 1/4 ohm resistance in series with battery, see that regulator cover in place, operate regulator for 15 minutes continuously with no other load than ignition (*NOTE*–If variable resistor used in place of fixed 1/4 ohm resistor, set resistor for 1-10 ampere charging rate)

Air Gap: 075" (except 1119004), 063" (1119004) with contacts just touching Adjust by loosening upper contact mounting screws and raising or lowering contact bracket (models without nylon adjusting nut), by turning nylon adjusting nut (models with nylon nut) *NOTE - On models without nylon adjusting nut, align contacts and tighten bracket mounting screws.*

Voltage Setting: With regulator "Normalized" (see above), setting can be checked using either "Fixed Resistance" or "Variable Resistance" method as indicated below.

Fixed 1/4 Ohm Resistance Method

1) Connect 1/4 ohm fixed resistor (not less than 25 watts) in charging circuit at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "BAT" terminal and ground

2) Cycle the generator using either of the following methods **(A)** Move voltmeter lead from regulator "BAT" terminal to "GEN" terminal Reduce generator speed until voltmeter reading is 4 volts, then move voltmeter lead back to "BAT" terminal **(B)** Connect variable resistance in field circuit(in line between generator and regulator "F" terminals), turn out all resistance, operate generator at 3500 RPM and turn in resistance until generator voltage reduced to 12 volts then turn out all resistance and remove variable resistor

3)–Operate generator at 3500 RPM (cars & trucks), note voltmeter reading with regulator cover in place This is the voltage setting (see data below). Adjust by turning adjusting screw at voltage regulator armature spring lower bracket clockwise to increase setting, or counter-clockwise to decrease setting.

Variable Resistance Method

1)–Connect variable resistance (not less than 25 watts) and ammeter in charging circuit at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "BAT" terminal & ground

2)–Cycle the generator (use either method outlined in step 2 of Fixed 1/4 Ohm Resistance Method above).

3)–Check and adjust voltage setting as outlined in step 3 of Fixed 1/4 Ohm Resistance Method above

① - With no load on BAT terminal, add 5 amp. load at P-terminal. Voltage regulator to operate 2-3 volts lower. Check operating voltage with no current flow at P-terminal of regulator.

② - With ¼ ohm resistance in series with battery, add 5 amp. load at P-terminal Voltage regulator to operate 1-2 volts lower. Check operating voltage with no current flow at P-terminal of regulator.

③ - Paralleling voltage regulator setting must drop 4- 6 volts per 30 ampere battery load

④ - With no load on BAT terminal, add 5 amp. load at P-terminal Voltage regulator to operate 2-3 volts lower.

Voltage Setting Specifications

Setting - As indicated in table below with regulator at a specific ambient temperature When a voltage range only is given, set regulator within that range at 125°F ambient temperature Regulator settings can be "tailored" to keep battery in satisfactory state under particular operating conditions as directed below

►*AMBIENT TEMPERATURE NOTE:* "Ambient Temperature" is the temperature of the air surrounding the regulator approximately 1/4" from regulator cover when regulator is at operating temperature ("Normalizing" procedure given above will result in an approximate ambient temperature of 125°F) and can be measured by placing a thermometer 1/4" from regulator cover See table below for specific regulator settings at various ambient temperatures.

Ambient Temperature Voltage Tables (Volts)

Ambient Temp.	Table No. 1	Table No. 3	Table No. 4
165°F	13.1-13.9	13.1-13.9	6.5-6.9
145°F	13.5-14.3	13.5-14.3	6.7-7.1
125°F	13.9-14.7	13.8-14.7	6.9-7.3
105°F	14.2-15.0	14.0-14.9	7.0-7.5
85° F	14.4-15.4	14.2-15.2	7.1-7.6
65° F	14.7-15.7	14.4-15.4	7.2-7.7

"Tailoring" Voltage Regulator Setting

If battery is consistently undercharged or overcharged (using too much water), adjust voltage regulator within range specified for the ambient temperature in which the regulator is operating, as directed above. ***CAUTION - Regulator setting above 14.8 volts (at 125°F) may cause damage to lights and other voltage sensitive equipment and should be avoided.***

1)–Battery uses too much water. If voltage regulator setting **above** normal range listed above, reduce setting to within upper portion of normal range and check battery condition over a period of time. If voltage regulator setting **within** normal range listed above, reduce voltage setting 0.1 or 0.2 volts and check battery condition over period of time. This should be continued until battery remains charged with minimum use of water.

2)–Battery is consistently undercharged–If voltage regulator setting is **below** normal range listed above, increase setting to within lower portion of normal range and check battery condition over a period of time. If voltage regulator setting is **within** normal range listed above, increase voltage setting 0.1 volt and check battery condition over period of time. This should be continued until battery remains charged with minimum use of water.

CUTOUT RELAY

►*ADJUSTMENT CAUTION Disconnect battery lead before making Air Gap and Contact Gap adjustments.*

CONTINUED ON NEXT PAGE

DELCO-REMY 6 & 12-VOLT "SINGLE CONTACT" REGULATORS (C ntinued)

Air Gap: 020" (Exc 1119261), 023" (1119261), with contacts just touching To check, press down on armature until points just close (use finger pressure on armature directly above contacts), measure gap between armature and center of core. To adjust, loosen two screws at armature hinge on back of relay, raise or lower armature as necessary. *CAUTION - On relays with two sets f contacts, make sure both sets close simultaneously.*

C ntact Gap. .020" with armature up against upper stop *(CAUTION*–Gap must be same for both sets of contacts to insure simultaneous closing). Use feeler gauge to check gap. To adjust, bend upper armature stop up or down as necessary.

Cut-in (Cl sing) V ltag : 6-Volt 5 9-6.7 volts (except 1119281), 5 9-6 5 volts (1119281), **12-Volt** 11.8-13.5 volts (except 1119004), 11 5-13.0 volts (1119004). To check with regulator properly connected to generator and battery, connect voltmeter between regulator "GEN" terminal and ground Use either of the following methods to check cut-in voltage

1) Slowly increase generator speed and note voltmeter reading at instant contacts close, then decrease generator speed and make certain that relay contacts open See item (3) for adjustment

2) Connect a variable resistor in the field circuit between regulator "F" terminal and generator "F" terminal (use 25 ohm-25 watt resistor) Operate generator at medium speed with all resistance turned in, slowly turn out resistance and note voltmeter reading at instant relay contacts close Slowly turn in resistance and make certain that relay contacts open Adjust as follows

3)–Turn adjusting screw under armature spring (adjacent to contacts) in or clockwise to increase cut-in voltage, out or counter-clockwise to decrease cut-in voltage

Cut-Out (Op ning) Amp rage: (1119261) Relay opens at 1-4 amperes, reverse current at 12.5 volts.

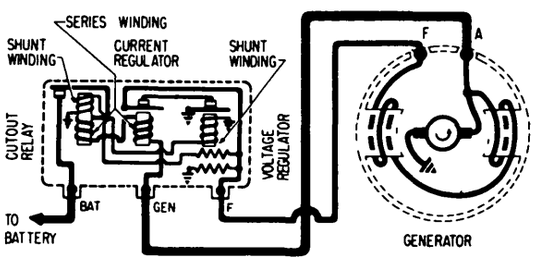
CURRENT REGULATOR

►*CHECKING & ADJUSTMENT CAUTION* Temperature Compensated Current Regulators should be checked by the "Load Method" which provides for bringing the regulator up to operating temperature Regulators which are not temperature compensated can be checked by the "Jumper Lead" Method

Air Gap 075" with contacts just touching Check and adjust air gap in same manner as Voltage Regulator (above)

Curr nt S tting Use correct method for each type as listed below *CAUTION–Do not attempt to short out voltage r gulator by inserting screwdriver through hol in base (will short out both voltage and curr nt regulators and cause generator to operate without control).*

Load M th d
(F r T mperature Compensat d R gulat rs)



1)–Connect ammeter in charging circuit at regulator "BAT" terminal (in series with battery)

2)–Turn on all accessory load (lights, radio, etc.) and connect additional load (carbon pile rheostat or bank of lights) to reduce voltage to approximately 1.0 volt below voltage regulator setting.

3)–Operate generator at 3500 RPM (cars & trucks) for 15 minutes with regulator cover in place. This will bring regulator up to operating temperature.

4)–Cycle the generator by using either of the following methods **(A)** Connect voltmeter between regulator "GEN" terminal and ground, reduce generator speed until voltmeter reading is 2 volts (6 volt systems), 4 volts (12 volt systems), then increase generator speed to 3500 RPM **(B)** Connect variable resistance in field circuit (in line between regulator and generator "F" terminals), operate generator at 3500 RPM with all resistance turned out, turn in resistance until generator voltage reduced to 6 volts (6 volt systems), 12 volts (12 volt systems), then turn out all resistance.

5)–Operate generator at 3500 RPM and note ammeter reading which is the current setting. Adjust by turning the adjusting screw at the current regulator armature spring lower bracket clockwise to increase setting, or counter-clockwise to decrease setting.

DELCO-REMY 12-VOLT REGULATORS
WIRING DIAGRAM

Jumper Lead Method
(For Non-Temperature Compensated Regulators)

1)–Connect ammeter in charging circuit at regulator "BAT" terminal (in series with battery).

2)–Connect short jumper lead across voltage regulator points (from upper contact bracket to armature).

3)–Turn on all lights and accessories or connect additional load (see step 3 under Load Method above) to cause current regulator to operate.

4)–Operate generator at 3500 RPM (cars & trucks) and note ammeter reading which is the current setting. Adjust as directed in step (5) under Load Method above.

DELCO-REMY "1119600 SERIES" "DOUBLE CONTACT" REGULATORS

►*DOUBLE CONTACT REGULATOR CAUTION: These r gulators do not operate in same manner as previous double contact regulators (1119100 Series).*

►*REGULATOR TESTING & SERVICE CAUTION: When t sting generator and this type regulator, observe the following precautions:*

1 - DO NOT GROUND GENERATOR FIELD WITH REGULATOR CONNECTED TO GENERATOR - This will cause **upper set** of contacts in Voltage Regulatorto burn up immediately.

2 - DO NOT FILE REGULATOR CONTACTS - All contacts of the Double Contact Voltage Regulator are soft alloy and should be cleaned with crocus cloth or other fine abrasive and washed with carbon tetrachloride.

DESCRIPTION: These regulators differ from previous "Double Contact" Voltage Regulator units in that operation of the "upper" and "lower" contacts on the voltage regulator have been reversed and additional resistance is included for better regulation.

OPERATION: The Voltage Regulator has an additional set of "Upper Contacts" connected directly across the generator field (which shorts out generator field circuit). The "Lower Contacts" are connected in series with the generator field. The Voltage Regulator operates either on "Upper Contacts" or "Lower Contacts" (both sets are never in operation at the same time), depending on load and battery requirements, as follows:

Lower Contact Operation (Low Speed & High Load-

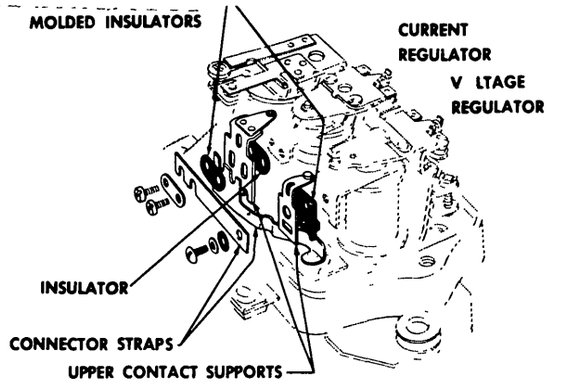
205°	13.3-14.1		12.6-13.4

℃ - Ambient temperature taken within ¼" of cover.

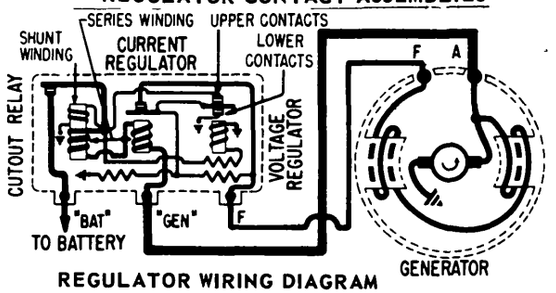
℗ - Operating voltage will be .1-.3 volts l wer on lower contacts.

High G n rator Fi ld R quir m nt) - Regulator armature travel opens and closes lower contacts (vibrating action) cutting regulator resistance in and out of field circuit. This operation is same as on regulators with a single set of contacts.



Upper Contact Operation (High Speed & Low Load - Low Generator Field Requirement) - Under these conditions, upper contact operation is not sufficient to control generator voltage. Regulator armature travel opens and closes upper contacts (vibrating action), shorting the field out (contacts closed) or cutting the regulator resistance in the field circuit (contacts open). This action provides additional regulation.

CHECKING & ADJUSTING: *See Regulator Cautions above.* Cutout Relay and Current Regulator are checked in same manner as for other 1119000 Series 12-Volt Regulators. *See "Delco-Remy 1119000 Series Regulators".*



►*CHECKING & ADJUSTING CAUTION: "Temperature Compensated" Current Regulators used on some units (see table below). It is necessary that these regulators be adjusted to the setting specified for the "ambient temperature" of the unit. See table below.*

Voltage Regulator (Double Contact Type): Battery should be fully charged so that charging rate limited to 1-10 amperes (if charging rate above 10 amperes, connect ¼ ohm resistor in series with battery). Connect voltmeter from regulator "BAT" terminal to ground. Connect a 25 ohm (25 Watt) variable resistance in generator field circuit (between regulator "F" terminal and field lead normally connected to this terminal). *CAUTION* - Resistor should have an "open" position at the full resistance end to assist in cycling the generator.

Operation on Upper Contacts - With variable resistance turned out (minimum resistance), operate generator at medium speed, or a higher speed, so voltage regulator is operating on upper set of contacts. *Continue to operate 15 minutes to establish operating temperature* (with regulator cover in place). Cycle generator by turning variable resistance to "open" position momenttarily, then slowly decrease (turn out all) resistance. Regulator should again be operating on upper set of contacts. Note voltmeter reading and the ambient temperature (temperature of air surrounding regulator ¼" from its cover). Operating voltage should be as indicated in ambient temperature table (13.8-14.6 volts at 125°F).

REGULATOR CONTACT ASSEMBLIES

REGULATOR WIRING DIAGRAM

Operation on Lower Contacts - Increase resistance slowly until voltage regulator begins to operate on lower contacts. Lower set of contacts should operate .1-.3 volts lower than upper contacts.

Adjustment of Voltage Setting - (Upp r set of Contacts) - Turn adjusting screw clockwise to increase voltage and counterclockwise to decrease voltage. *CAUTION* - If adjusting screw is turned down beyond range, spring support may not return when screw is backed off. In this case, turn screw counterclockwise until there is

ℂ - Ampere Range for "Non-Temperature Compensated" types. Specification Table number (see below) for "Temperature Compensated" types.

DELCO-REMY "1119600 SERIES" "DOUBLE CONTACT" REGULATORS (C ntinu d)

ample clearance between screw head and spring support Then bend spring support up carefully until it touches screw head. Final setting of unit should be made by increasing spring tension. If setting is too high, adjust unit below required value, then raise to exact value by increasing spring tension. After each adjustment, replace regulator cover, recycle generator

L w r S t of Contacts - Adjust for difference in voltage (.1-.3 volts lower) between operation of upper set of contacts and the lower set by increasing or decreasing air gap between armature and center of core. Increase voltage by increasing air gap or decrease voltage by decreasing air gap. Loosen armature screw slightly, than insert screw-driver in slot of bracket and move armature up or down as necessary. Lower points should just be touching when air gap is checked. Recheck voltage setting for both sets of contacts.

Air Gap - 067" **Contact Gap** - 016"

Cutout R lay: Closing Voltag - 11 8-13 0 volts

Current Regulator Setting: *NOTE* - Current regulator must be brought up to normal operating temperature before checking current setting. On "Temperature Compensated" current regulators (see table below), the "ambient temperature" must be determined and the regulator set to the current value indicated in "Current Setting - Ambient Temperature" table *See "Delco-Remy 1119000 Series Regulators"*

LINCOLN CONTINENTAL "DOUBLE CONTACT" REGULATORS

►*REGULATOR TESTING & SERVICING CAUTION:* To test a Ford double-contact regulator, remove field wire from regulator and connect to armature terminal either directly or through jumper wire connection from test equipment (in use) to save irreparable damage to regulator

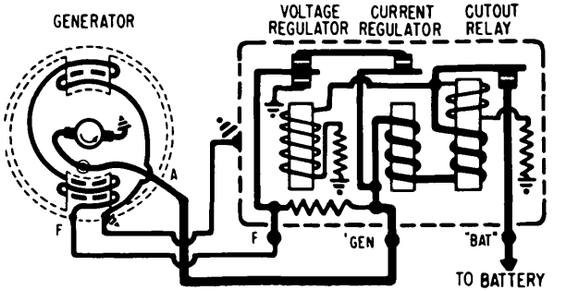
►*REGULATOR SERVICING NOTE:* Disconnect battery ground from battery before connecting or disconnecting regulator wiring harness or attaching instrument test leads, as accidental flashing of harness across terminals of regulator will damage regulator.

DESCRIPTION: Three-unit regulator with cut-out relay, current and voltage regulator, similar to previous three-unit type regulators except for voltage regulation control

OPERATION: Voltage Regulator has an additional set of "upper contacts" connected directly across generator field (which shorts out generator field current). "Lower contacts" are connected in series with generator field.

Lower Contact Operati n (Low Speed & High Load - High Generator Fi ld Requirement) - Regulator armature travel opens and closes lower contacts (vibrating action) cutting regulator resistance in and out of field circuit. This operation is same as on regulators with single set of contacts

Upper Contact Operati n (High Speed & Low Load - Low Generator Fi ld Requirement) - Under these conditions, upper contact operation is not sufficient to control generator voltage. Regulator armature travel opens and closes upper contacts (vibrating action), shorting the field out (contacts closed) or cutting the regulator resistance in the field (contacts open). This action provides additional regulation.



DIAGNOSIS & TESTS: *See Regulator Cautions above. NOTE - Make "Generator Output", "Charging Circuit" & "Ground Circuit" resistance tests, before making alternations to voltage regulator settings.*

Generator Output Test: *NOTE* - With Volt-Ampere Tester, turn control knob to "Direct" position. With Volt-Ampere Model VAT-6 Tester, turn control knob to No. 1 position. Proceed as follows·

1) Turn voltmeter selector switch to 16 VOLTS, and disconnect BAT wire from generator regulator terminal and connect negative ammeter test lead to generator regulator BAT wire.

2) Connect positive ammeter test lead to generator regulator BAT terminal, and disconnect generator field wire from regulator FIELD terminal and connect it to regulator ARM terminal. **Turn off all lights & equipment.**

3) Connect positive voltmeter test lead to ARM terminal of regulator and negative lead to ground. Start engine and gradually increase speed. *CAUTION - DO NOT exceed 1500 RPM, as high voltage will damag ignition system.*

GENERATOR & REGULATOR WIRING DIAGRAM

4) Read both ammeter and voltmeter for maximum output. When reading less than 40 amperes or erratic, check for slipping belt drive, low brush spring tension, broken field or armature wires or dirty commutator.

5) When ammeter does not show a reading but voltmeter indicates a reading above 16 volts, the cutout relay is not closing or wire leading from armature to regulator is open.

6) When both ammeter and voltmeter show a low or no reading, polarize generator and repeat test. If both meters still show a low or no reading, generator is defective.

Charging Circuit Resistance Test: Measure amount of resistance between armature terminal of generator and positive battery terminal, as follows:

1) Set tester knob as in "Output Test" above.
2) Turn voltmeter selector switch to 4 VOLTS, and adjust corrector so pointer reads Zero on left side of scale.

3) Disconnect BAT wire at regulator and connect negative ammeter test lead to BAT wire. Disconnect generator field wire at regulator FIELD terminal and connect to ARM terminal.

4) Connect positive ammeter test lead to generator regulator BAT terminal, and connect positive voltmeter lead to ARM terminal of generator and negative

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL "DOUBLE CONTACT" REGULATORS (Continued)

voltmeter test lead to starter relay battery terminal 5) Adjust engine RPM so ammeter reads exactly 20 amperes Voltmeter should read not more than 8 volt

6) Excessive reading indicates high current resistance Check all wiring and connections from generator armature terminal to positive battery terminal and inspect cutout relay points

Generator Ground Circuit Test: Make tester connections the same as Steps 1 through 3 in "Charging Circuit Resistance Test" above, and proceed as follows

1) Connect positive ammeter test lead to regulator BAT terminal, and positive voltmeter test lead to starting motor rear end plate capscrew Connect negative voltmeter test lead to generator frame

2) Adjust engine RPM until ammeter reads exactly 20 amperes Read voltmeter A reading of more than 1 volt indicates excessive circuit resistance Inspect ground cable and connections between battery and engine and inspect grounding of generator *NOTE* - Loose mounting bolts or painted or rusted surfaces between generator and engine, cause high resistance

Regulator Ground Circuit Test: Proceed as follows 1) With Volt-Ampere Tester, turn control knob to "Direct" position With Volt-Ampere Model VAT-6 Tester, turn control knob to No 2 position.

2) Turn voltmeter selector switch to 4 VOLTS position, and disconnect BAT wire from regulator and connect negative ammeter test lead to BAT wire

3) Connect positive ammeter test lead to regulator BAT terminal, and connect negative voltmeter test lead to generator frame and positive voltmeter lead to regulator base **Turn off all lights and equipment.**

4) Watch voltmeter while slowly increasing engine RPM from idle to 1500 RPM Voltmeter should not read in excess of 1 volt, and should preferably stay at ZERO Poor generator and regulator ground contact is indicated when reading exceeds 1 volt Check ground wire between generator and regulator and engine to body ground strap

Regulator Cutout Relay Test: *NOTE* - Battery must be in good condition and charging circuit resistance within specifications With Volt-Ampere Tester, turn control knob to "Direct" position With Volt-Ampere Model VAT-6 Tester, turn control knob to No 2 Position Proceed as follows

1) Turn voltmeter selector switch to 16 VOLTS position, and disconnect generator field wire from regulator FIELD terminal and connect it to regulator ARM terminal

2) Disconnect BAT wire from regulator and connect negative ammeter test lead to regulator BAT wire Connect positive ammeter test lead to regulator BAT terminal

3) Connect positive voltmeter test lead to ARM terminal of regulator and negative voltmeter test lead to regulator base

4) Slowly increase engine RPM and note voltage at which cutout relay points close Closing voltage is indicated by a slight dropping of the needle, at the same time, deflection of test ammeter needle will be noticed Closing voltage must be 12 3-13 0 volts Repeat operation to be sure cutout relay operates each time

5) Test amount of current necessary to open cutout relay points by increasing engine RPM until generator charges approximately 10 amperes, then slowly decrease engine RPM and observe ammeter reading *NOTE - It may be necessary to reduce engine idle speed to allow relay points to open* Cutout relay points must open at 8 amperes reverse current (discharge direction). When Cutout relay does not open or close at specified settings, remove regulator cover and inspect and adjust, see below

Regulator Voltage Regulation Test: With Volt-Ampere Model VAT-6 Tester, turn control knob to No 3 (1/ ohm) position, and proceed as follows

1) Turn voltmeter selector switch to 16 VOLTS position and connect positive voltmeter test lead to ARM terminal of regulator and negative voltmeter test lead to regulator base

2) Attach regulator temperature gauge to regulator cover, then run engine at fast idle for 15-20 minutes (if cold) or until regulator temperature gauge reading is steady for 5 minutes

3) Accelerate engine to 2000 RPM Voltage regulator should be operating on lower set of contacts Record voltmeter reading

4) Reduce engine s peed gradually until voltmeter needle jumps up or down the scale Regulator should now be operating on upper set of contacts - maintain this speed and record voltmeter reading If second reading is 14 7-15 3 volts at 75°F and the difference between the two readings is not more than 3 volt limiter is adjusted correctly If difference between readings is more than 3 volt, adjust voltage regulation If second reading is not within specifications, bend spring hanger to increase or decrease spring tension as required and repeat test procedure *NOTE* - Voltmeter may not jump up or down scale when operation is transferred from lower to upper contacts This is a satisfactory condition, provided unit is operating within specifications

Regulator Current Regulation Test: *NOTE* - This test can only be made with load placed on generator causing current regulator to operate

1) With Volt-Ampere Tester, turn control knob to "Fixed Load" (1½ ohm) position With Volt-Ampere Model VAT-6 Tester, turn control knob to No 3 (¼ ohm) position.

2) Disconnect BAT terminal wire from regulator and connect positive ammeter test lead to regulator BAT terminal Connect negative ammeter test lead to regulator base

3) Start engine and increase speed to 2000 RPM Turn control knob slowly toward the "Variable" position until highest possible ammeter reading is obtained If setting is not within 38-42 Amperes at 75°F, regulator cover must be removed and spring tension of current regulator adjusted to obtain the specified setting

ADJUSTMENTS: Cutout Relay - Bend spring support upward to cause cutout relay to close at higher voltage or downward for lower voltage *CAUTION - DO NOT BEND ARMATURE STOP or otherwise change point gap*

Current Regulation - Bend spring support upward to increase current output, downward to decrease output *DO NOT BEND ARMATURE STOP or oth rwise change point gap*

Voltage Regulation - Bend spring hanger up or down to increase or decrease operating voltage of voltage regulator If further adjustment is necessary proceed as follows.

1) Disconnect negative (ground) terminal from battery and remove regulator from car and remove regulator cover

2) Place a 040" feeler gauge between armature core and armature, and turn upper contact screw in or out to obtain 040" air gap

3) Place 037" feeler gauge between armature core and armature, and turn lower contact screw in or out to obtain a 037" air gap between armature core and the armature Hold contact points together by pressing downward on screwdriver while making this adjustment

FORD MOTOR CO. "SINGLE CONTACT" 12-VOLT REGULATORS

►CAUTIONS

►*GENERATOR POLARIZING: (NOTE* - Polarization is not necessary except when generator has been rebuilt or if new pole shoes have been installed). To polarize a generator on the car, disconnect the field wire and the battery wire from the regulator and momentarily connect the two wires together (engine not running). *CAUTION - Do not polarize generator by any method that applies battery voltage to field terminal of regulator.*

►*NORMALIZING THE REGULATOR:* **On the Car**–Clip special thermometer T56L-10505-A on regulator cover (see Note below). Operate engine with generator charging at 10 ampere rate for 30 minutes or until regulator temperature is stabilized

On the Bench–Procedure is same as on the car except that a small fan should be mounted 12-15" from the regulator so as to circulate air over the regulator cover while it is being warmed up.

Thermometer T56L-10505-A Note–This thermometer is calibrated in 10°F. increments and has additional Voltage scales indicating the correct voltage regulator setting for each temperature reading (both 6 volt and 12 volt scales provided).

►*AMBIENT TEMPERATURE NOTE:* Ambient temperature is the temperature taken adjacent to the regulator, using Thermometer T56L-10505-A.

DESCRIPTION: These 12 volt regulators are the same design as previous 12 volt units.

CHECKING & ADJUSTMENT: *CAUTION*–Regulators are temperature-compensated and must be brought up to normal operating temperature before checks are made. This normal temperature is that existing adjacent to the regulator cover after 1/2 hour of operation in the car or after the regulator has been heated until the temperature is stabilized (standard normal temperature is 70-80°F.

►*TEST METER CONNECTIONS:* If special Test Sets used, make all connections in accordance with manufacturer's instructions. If individual meters used, make connections as follows: Connect test ammeter and 1½ ohm fixed resistor in series in charging line at regulator "BAT" terminal, from regulator terminal to ground (Ford). *CAUTION - Disconnect battery cable.* On other cars, connect test ammeter and 1½ ohm fixed resistor in series in charging line at regulator "BAT" terminal in series with battery. Connect voltmeter between regulator "ARM" terminal and ground (regulator base or battery grounded terminal). Connect a 50 ohm variable field rheostat (2 amp. rating) in generator field circuit (disconnect field lead at regulator "FIELD" terminal, connect rheostat between this lead and regulator "FIELD" terminal).

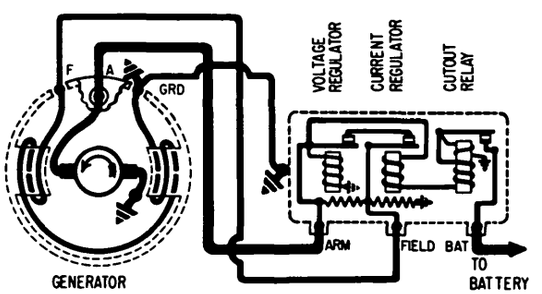
CUTOUT RELAY

Cut-In (Closing) Voltage: After regulator normalized and with test meters connected (see above), check cut-in voltage as follows:

Comet, Falcon, Ford - With field resistance completely turned in the field circuit, operate engine at 1500 RPM, slowly turn resistance out of field circuit and note voltmeter reading when relay contacts close (pointer will drop back slightly). Repeat this check several times by turning resistance in and out of field circuit.

Mercury - With all the resistance turned out of the field circuit, slowly increase generator speed and note voltmeter reading at instant relay contacts close (pointer will drop back slightly). Repeat this check several times by decreasing generator speed until contacts open and then increasing speed until contacts close. If closing voltage not correct as shown in setting table below, adjustment is required.

Adjustment - Bend adjusting arm under armature spring (to left of relay contacts) upward to increase cut-in voltage, or downward to decrease cut-in voltage. Replace regulator cover and recheck the setting.



Cut-In (Closing) Voltage Setting

12.0-2.8 volts (25 & 30 Amp.), 12.4-13.2 volts (35 & 40 Amp.).

Cut-out (Opening) Discharge Current: This can be checked after checking cut-in voltage by increasing generator speed (or turning out field resistance) until charging current is approximately 10 amperes, then slowly decrease generator speed (or turn in field resistance) until maximum **discharge** current indicated on ammeter (ammeter will return to zero as contacts open).

Cut-Out (Opening) Discharge Current

6-9 amps. (25 & 30 Amp.), 8 amps. (35 & 40 Amp.), reverse current.

12-VOLT REGULATOR WIRING DIAGRAM

VOLTAGE REGULATOR

Voltage Setting: After Cutout Relay checked (above), cycle regulator by decreasing generator speed until cutout relay contacts open and then increase speed to 1500 RPM. Clip special thermometer on regulator cover to establish regulator ambient temperature and corresponding voltage setting (see Voltage Regulator Settings for various ambient temperatures below). Turn resistance completely out of field circuit (charging rate should be approximately 10 amperes). Note voltmeter reading. This is the voltage setting and should agree with setting listed below.

Final Test (Ford) - Remove all test leads except voltmeter leads and install "BAT" and "F" wires on regulator. Run engine at 1500 RPM (under battery load) and note voltmeter reading (voltage will rise to regulated value after a few moments operation).

Adjustment–Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase voltage setting, or downward to decrease voltage setting. Replace regulator cover and recheck the setting after each adjustment.

Voltage Setting

14.6-15.4 volts, with ambient air temperature of 75°F, *See table below.*

Ford Voltage Regulator Settings (Ambient Temperature Correction)

Ambient Temp. (°F)	All Exc. Auto-Lite 40 Amp. (Volts)	Aut-Lit 40 Amp. (Volts)
25°	15.1-15.9	14.3-15.2
35°	15.0-15.8	14.3-15.2
45°	14.9-15.7	14.3-15.1
55°	14.8-15.6	14.3-15.0
65°	14.7-15.5	14.3-14.9
75°	14.6-15.4	14.2-14.9
85°	14.5-15.3	14.1-14.8
95°	14.3-15.1	14.1-14.7
105°	14.2-15.0	14.0-14.7
115°	14.1-14.9	14.0-14.6
125°	13.9-14.7	13.9-14.5
135°	13.8-14.6	13.8-14.4
145°	13.6-14.4	13.8-14.4

CURRENT REGULATOR

Current Setting: This check requires that a load be added, or that the generator voltage be dropped to approximately 13 volts, to cause current regulator to operate. It is recommended that a heavy duty variable resistance (carbon pile) be connected across the 1-1/2 ohm fixed resistor in the charging line (connect resistance from ammeter lead terminal of fixed resistor to ground–see Test Meter Connections above). After Voltage Regulator checked (above), and with all resistance turned out of the field circuit, operate generator at 1500 RPM (Comet, Falcon, Ford), 2000 RPM (Mercury), **decrease the resistance until voltage drops to approximately 13 volts and ammeter reading is at maximum. This ammeter reading is the current setting. If not correct (see table below), adjust as follows:**

Adjustment–Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase current setting, or downward to decrease current setting. Replace regulator cover and recheck setting.

Current Setting

25 Amp. Regulator - 23-27 amperes (all models).
30 Amp. Regulator - 28-32 amperes (all models).
35 Amp. Regulator - 33-37 amperes (all models).
40 Amp. Regulator - 38-42 amperes (all models).

BENDIX POWER BRAKE UNIT "HYDRAULIC (DISC) REACTION"

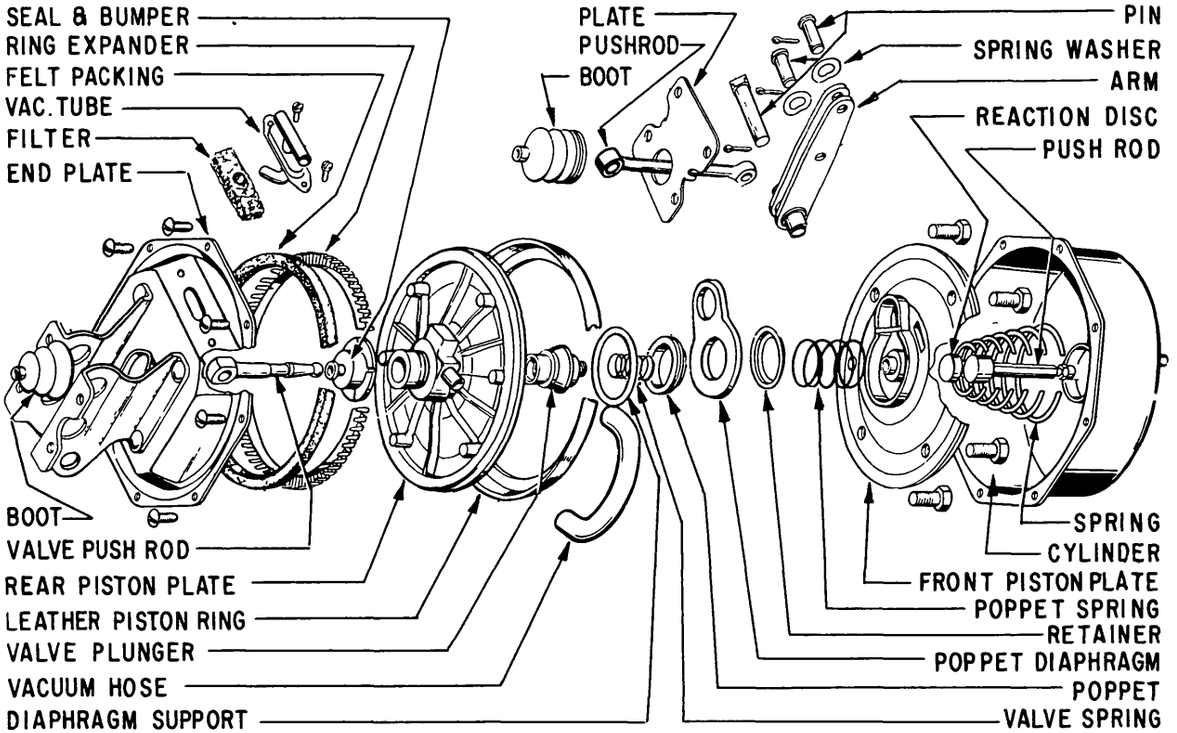
Cadillac, All Series (1961) ①
Chevrolet Pass. Cars (1961) ①
Ford Pass. Cars (1961) ②
Lancer (1961)
Lincoln Continental (1961)
Mercury (1961) ②
Oldsmobile (Except F-85) (1961) ①
Pontiac (Except Tempest) (1961) ①
Studebaker (Except Hawk) (1961) ③
Thunderbird (1961) ②
Valiant (1961)

① - "Moraine Power Unit (Hydraulic Diaphragm Reaction Type)" also used.
② - Early Cars. Later Cars use "Midland-Ross Diaphragm Type".
③ - "Hydrovac Piston Type" also used.

DESCRIPTION: Similar in design to units used on previous models. A plastic type piston plate is used on some models. Service procedures for this type plate are different than for die-cast plate.

OPERATION: *See "Bendix Power Brake Unit Hydraulic (Disc) Reaction Type" in 1959 Final Data or later Manual edition.*

REMOVAL & INSTALLATION: *See "Bendix Power Brake Unit Hydraulic (Disc) Reaction Type" in 1959 Final Data or later Manual edition and note the following:*



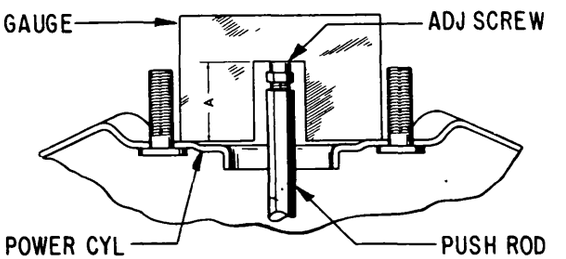
Master Cylinder: *NOTE - Master cylinder can be removed from all cars without removing power brake assembly from car.* Disconnect hydraulic brake line from master cylinder and remove nuts and bolts securing master cylinder to power brake unit. *CAUTION - Keep area around pushrod clean.*

OVERHAUL: *See "Bendix Power Brake Unit Hydraulic (Disc) Reaction Type" in 1959 Final Data or later Manual edition and note the following:*

Vacuum Power Piston (Plastic Type): Disassembly - Remove piston felt and expander ring from piston assembly, then lift rod seal and bumper boot from rear piston plate and slide off eye end of operating rod. Remove capscrews from front piston plate, separate front and rear piston plates, and remove leather packing. Remove poppet spring, valve, return spring retainer, poppet diaphragms, poppet, poppet spacer, and plunger and rod assembly. *NOTE - Do not separate valve operating rod from valve plunger unless replacement of valve rod or plunger is necessary.* If valve rod or plunger must be replaced, hold assembly with valve plunger down and inject alcohol into cavity around valve rod to wet rubber lock in valve plunger, then drive or pry valve plunger off valve rod. Use care not to damage plunger if it is to be reused. Remove rubber reaction disc from front piston plate if necessary.

CAUTION - When cleaning, use only alcohol on parts containing rubber or plastic.

Reassembly - Position plunger and rod assembly into rear piston plate, and install rod seal and bumper boot. Position spacer washer into cavity inside rear piston plate, then assemble poppet through poppet diaphragm, and install poppet spring retainer on end of poppet. Position leather packing on rear piston plate, then install poppet spring and valve return spring on plunger and poppet reaction plate. Position and align front piston plate against rear piston plate, and secure in position with capscrews. Soak piston felt in shock absorber fluid, then insert felt in expander ring, and position expander and felt in groove around rear piston plate with expander teeth up.



BENDIX "HYDRAULIC (DISC) REACTION" POWER BRAKE UNIT

Pushrod Adjustment (All Cars): *NOTE - The self-locking screw on end of pushrod is set to correct height on original assembly and adjustment is not required unless hydraulic pushrod has been replaced, or if adjustment has been changed. If necessary, adjust as follows:* With piston assembly free in cylinder and firmly seated in a released position, hold pushrod seated against reaction disc and centered in spring of master cylinder. Use Gauge indicated in table below or measure distance from mounting face of power cylinder to end of pushrod adjustment screw (see table for correct dimension). Rotate adjusting screw as necessary to obtain correct adjustment.

Pushrod Adjustment

PUSHROD ADJUSTMENT

MIDLAND-ROSS DIAPHRAGM TYPE POWER BRAKE UNIT

F rd Pass. Cars (1961) ©
M rcury (1961) ©
Thunderbird (1961) ©

© - Later Cars For Early Cars, see *"Bendix Power Brake Unit (Hydraulic Disc Reaction Type)" in this section*

►CHANGES, CAUTIONS, CORRECTIONS

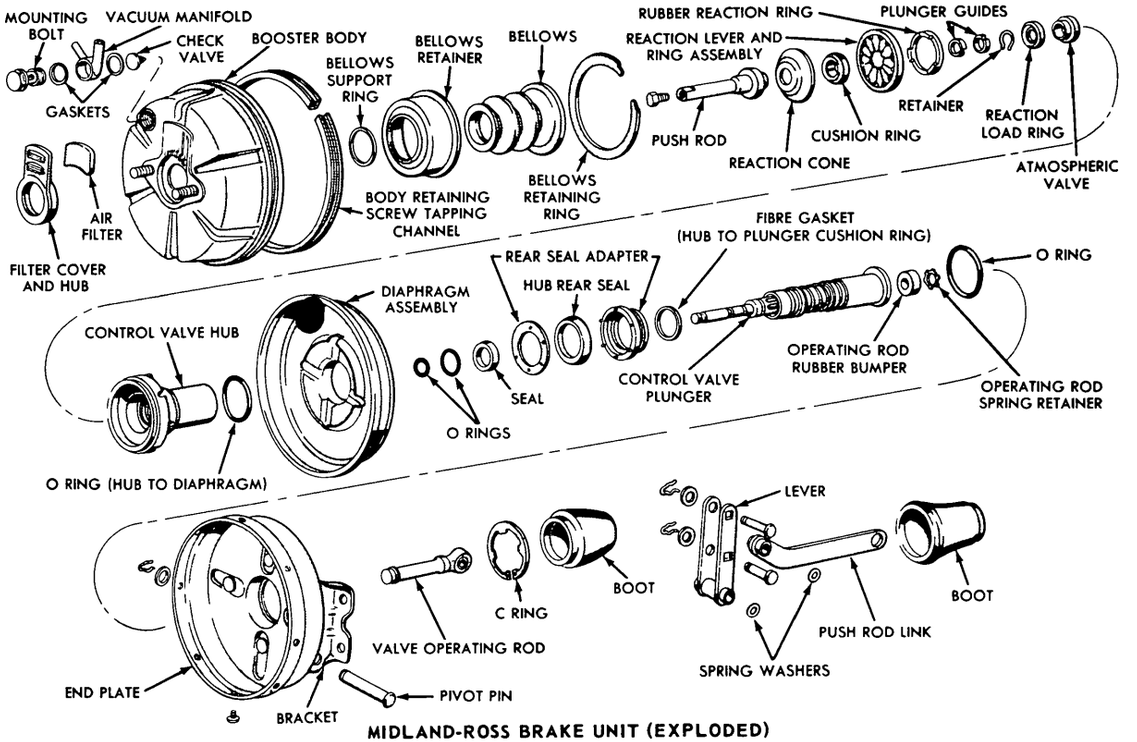
►*1961 VACUUM LEAK AT VACUUM INLET FITTING CORRECTION* To correct, use an additional gasket under fitting mounting bolt and torque bolt to 8-10 inch lbs *CAUTION - DO NOT exceed this torque or manifold will break*

DESCRIPTION: Self-contained vacuum actuated, diaphragm type power booster mounted on firewall Booster diaphragm is vacuum balanced (equal vacuum on both sides of diaphragm when in released position) Actuating control piston is mechanically linked to brake pedal linkage by an actuating rod, and conventional type hydraulic master cylinder is mounted on forward end of booster unit

LUBRICATION: At 4000 mile intervals lubricate mechanical linkage lightly with SAE 10W engine oil

TROUBLE SHOOTING: *NOTE - Following data is for troubles originating in booster assembly only For other troubles, see "Hydraulic Brake Trouble Shooting" in Brak Section of Manual*

Brak s Drag: Valve plunger stuck



Brakes Grab: Sticking actuating valve assembly

Brakes S lf-Apply Wh n Engine Started: Leak in rear housing Diaphragm out of locating radii in housings, allowing atmospheric pressure into rear chamber Atmospheric valve unseated or stuck

Hard Pedal· Pedal linkage sticking Vacuum check valve faulty or stuck in closed position Vacuum hose collapsed or leaking Vacuum fitting plugged Vacuum chamber or bellows assembly leaking Diaphragm assembly out of place in housing locating radii Automatic transmission throttle valve vacuum line connection or fitting leaking

REMOVAL & INSTALLATION: On inside of car, remove pushrod link-to-brake pedal pivot retaining pin retainer clip, then disconnect link from pedal Disconnect stop light switch wires and hydraulic pipe from master cylinder *NOTE - To avoid bleeding brake system at installation, master cylinder may be disconnected from booster unit at this time without removing hydraulic line* Disconnect manifold and transmission vacuum throttle valve vacuum hoses from booster unit Remove booster bracket-to-dash panel retaining nuts, then pull booster and bracket off studs while sliding pushrod link out of dash panel hole To install, reverse removal procedure and bleed brake system if hydraulic line was disconnected

DISASSEMBLY· **Rem val of External Parts** - Remove master cylinder, air filter cover and hub, and air filter from booster body Remove vacuum manifold, gaskets, and vacuum check valve from booster body Disconnect valve operating rod from lever (remove retaining clip and pivot pin). Remove the brackets from end plate, and rubber boot from valve operating rod

MIDLAND-ROSS BRAKE UNIT (EXPLODED)

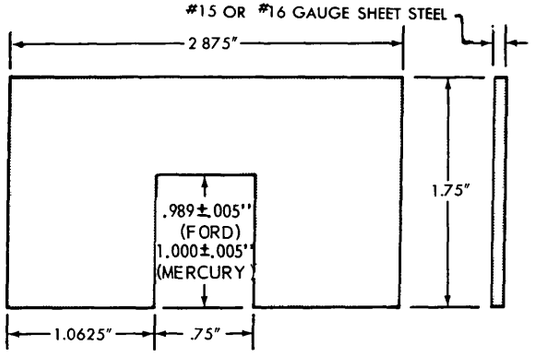
Removal of Bellows, Control Valve & Diaphragm Assemblies: Remove "C" ring holding rear seal adapter assembly to end plate Scribe mark booster body and end plate for reassembly, then remove retaining screws, rap end plate with a soft hammer, and separate end plate and booster body Push lip of bellows into vacuum chamber, then remove bellows, control valve, and diaphragm as an assembly Remove outer "O" ring from control valve hub

Disassembly of Bellows, Pushrod, & Control Valve Assemblies: Remove large bellows retaining ring, bellows, bellows retainer, and support ring from diaphragm and and valve assembly Remove retainer and support ring from bellows Remove pushrod assembly, reaction lever and ring assembly, and rubber reaction ring from control valve hub Remove both plastic plunger guides from control valve plunger, then remove retainer holding reaction load ring and atmospheric valve on control valve hub Slide reaction load ring and atmospheric valve from control valve hub Slide plunger and rear seal adapter from rear of control valve hub, then remove hub outer "O" ring from front side of diaphragm

Disassembly of Control Valve Plunger: Remove hub rear seal adapter from valve plunger and remove seal from adapter Remove "O" rings, seal, and fibre gaskets from plunger Pull valve operating rod from valve plunger assembly *CAUTION - Do not r move op rating rod from plunger unless valve or plunger is to be replaced If parts are separat d, new rubber bumper and spring washer must be installed on operating rod to retain it properly in the valve*

CLEANING & INSPECTION· Clean all metal parts in solvent Clean rubber parts in alcohol only Just before reassembly, re-wash all metal parts coming in contact with hydraulic brake fluid in clean alcohol Blow dirt and cleaning solvent from recesses and passages with compressed air Use all parts furnished in repair kit and discard all old rubber parts Replace any parts that are worn or damaged If inside of booster body is rusted or corroded, polish with steel wool or emery cloth If booster body scored, it should be replaced

REASSEMBLY: Assembly of Control Valve Plunger - If operating rod and plunger were separated, install new rubber bumper and spring retainer on rod, then push rod firmly into plunger until rod bottoms Install fibre gaskets, plunger seal and "O" rings on plunger assembly Install valve hub rear seal in adapter with sealing lip of seal toward rear of valve Slide adapter assembly onto plunger with small diameter end of hub to rear



Assembly of Control Valve, Pushrod, & Bellows Assemblies: Install control valve hub outer "O" ring, then install plunger and seal adapter and hub on diaphragm (hold hub on front side of diaphragm, insert plunger assembly into hub from rear side of diaphragm) Install atmospheric valve, and reaction load ring on plunger and hub, compress valve spring, and install load ring retainer in groove of plunger Install both plastic plunger guides in plunger grooves Install rubber reaction ring in valve hub so ring locating knob indexes in notch in hub with ring tips toward front

CONTINUED ON NEXT PAGE

MIDLAND-ROSS DIAPHRAGM TYPE POWER BRAKE UNIT (C nt.)

Assemble reaction lever and ring and install assembly in valve hub. Install reaction cone and cushion ring on pushrod and install pushrod assembly on valve hub so plunger indexes in rod. Assemble bellows, retainer, and support ring (ring should be on middle fold of bellows). Place bellows assembly on diaphragm and secure with retaining ring (ring must be fully seated).

Installation of Bellows, Control Valve & Diaphragm Assemblies: Move booster body retaining screw tapping channel just enough for a new surface for self-tapping attaching screws. Install diaphragm, control valve parts, and bellows as an assembly in booster body. *CAUTION - Lip of diaphragm must be evenly positioned on retaining radius of booster body.* Pull front lip of bellows through body and place it around outer groove of body. Install "O" ring in front of end plate and install plate on body.

PUSH ROD GAUGE TOOL

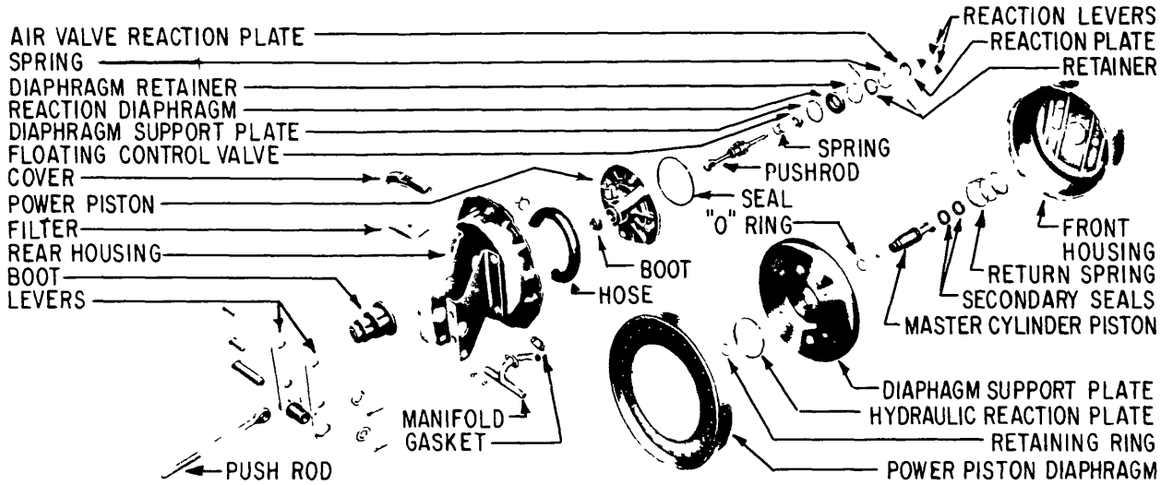
Align scribe marks, compress assemblies, and install self-tapping attaching screws. Install large "C" ring on rear seal adapter at rear of end plate. *NOTE - Perform pushrod adjustment (see below) before completing reassembly.*

Installing External Parts: Install valve operating rod rubber boot. Install mounting brackets on end plate. Connect lever to mounting bracket, then connect valve operating rod and pushrod link to lever. Install vacuum check valve, vacuum manifold, both gaskets, and tighten mounting bolt to 8-10 inch lbs. Install air filter, filter cover and hub, and master cylinder on booster body. Torque master cylinder attaching bolts to 10-13 ft. lbs.

PUSHROD ADJUSTMENT: Place a gauge made to the dimensions shown in illustration against master cylinder mounting surface of booster body. Pushrod adjusting screw should just touch inner edge of slot in gauge. If gauge not used, distance from master cylinder mounting surface on booster body to end of pushrod adjusting screw should be 1.000"±.005" (Ford & T-Bird), .989" ±.005" (Mercury).

MORAINE POWER BRAKE UNIT "HYDRAULIC (DIAPHRAGM) REACTION" TYPE

Buick (Except Special) (1961)
Cadillac, All Series (1961) ℂ
Chevrolet Pass. Cars, All Series (1961) ℂ
Oldsmobile (Except F-85) (1961) ℂ
Pontiac (Except Tempest) (1961) ℂ
Rambler, All Series (1961)



ℂ - "Bendix Power Unit Hydraulic (Disc) Reaction Type" also used.

DESCRIPTION: Design is similar to previous models except for the use of selective shims between power cylinder and brake master cylinder. On Buick models, an additional reaction disc is used between master cylinder piston reaction plate and reaction levers.

OPERATION: As brake pedal is depressed, the operating rod moves air valve forward until its seat contacts floating control valve, sealing off atmospheric pressure. Further movement carries floating valve away from seat on power piston and opens the area forward of diaphragm to vacuum source while air valve remains closed. As air is exhausted forward of diaphragm, atmospheric pressure on opposite side moves diaphragm and piston assembly forward. As diaphragm and piston assembly moves forward, the master cylinder piston is depressed into master cylinder. As pressure builds up in master cylinder, the hydraulic piston reaction plate moves away from its stop and presses against the reaction levers. These levers in turn swing around their pivots and push the valve reaction plate back against the floating control valve snubbers. In this manner, approximately 40% of the load on master cylinder piston is transferred through air valve and operating rod to the brake pedal.

REMOVAL: Power Brake & Master Cylinder - Disconnect hydraulic line from master cylinder and vacuum line from power unit, then disconnect pushrod from brake pedal. Remove nuts attaching power unit to firewall and remove unit.

Master Cylinder: *NOTE - Master cylinder can be removed from power unit without removing power unit from car.* Remove hydraulic connection from master cylinder (cover opening and pipe to prevent dirt entering). Remove master cylinder attaching nuts and remove master cylinder from vacuum unit. *NOTE - Master cylinder piston assembly will remain attached to vacuum unit. If necessary to replace piston, it will be necessary to disassemble vacuum unit.*

MORAINE BRAKE POWER UNIT ASSEMBLY

►*DISASSEMBLY & OVERHAUL CAUTION: Use care to prevent damage to parts. Do not allow oil or grease to come in contact with diaphragm or other rubber parts.*

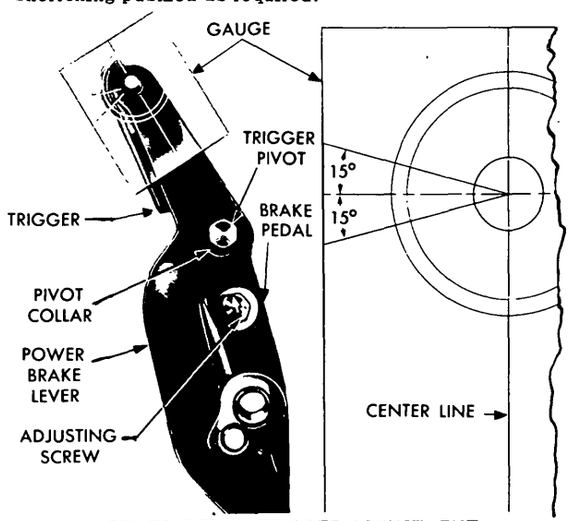
OVERHAUL: *See "Moraine Power Brake (Hydraulic Diaphragm Reaction) Type" in 1959 Final Data or later Manual edition and note the following:*

Disassembly: If necessary to remove power cylinder from master cylinder be careful not to damage selective shims found between these two parts. If shims are damaged, replace with new shims of the same thickness.

Gauging Master Cylinder Piston: *NOTE - It is necessary to gauge piston if front or rear housing, power piston assembly, master cylinder piston, or master cylinder assembly is replaced with a new part.* To check master cylinder piston, remove front housing from master cylinder (DO NOT remove selective shims from studs). *CAUTION - Be sure parts are not displaced from bore of master cylinder.* Place Gauge J-8531 so that it stands perpendicular to front housing next to two lower studs, and bridges over end of master cylinder piston. Piston should be flush with gauge plus or minus .010". If there is excess clearance under legs of gauge, add shims (gasket material) over front housing studs as required to take up clearance. If there is excessive clearance at center of gauge, remove shims. When all shims are removed, and piston end is still lower than gauge, check for deformed parts and replace as required. Install front housing on master cylinder and tighten nuts to 20 ft. lbs. *NOTE - The dimension of Gauge J-8531 provides a measurement of 1.833-1.844" from end of master cylinder piston to master cylinder surface on power cylinder.* If more than five .010" shims are required for correct adjustment, recheck assembly of vacuum piston.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "OVAL PISTON" TYPE

Chrysler & Imperial (1961)
DeSoto (1961)
Dodge & Dodge Dart (1961)
Plymouth (1961)



►*NOTE: "Bellows Type" Power Unit also used.*

►CHANGES, CAUTIONS, CORRECTIONS

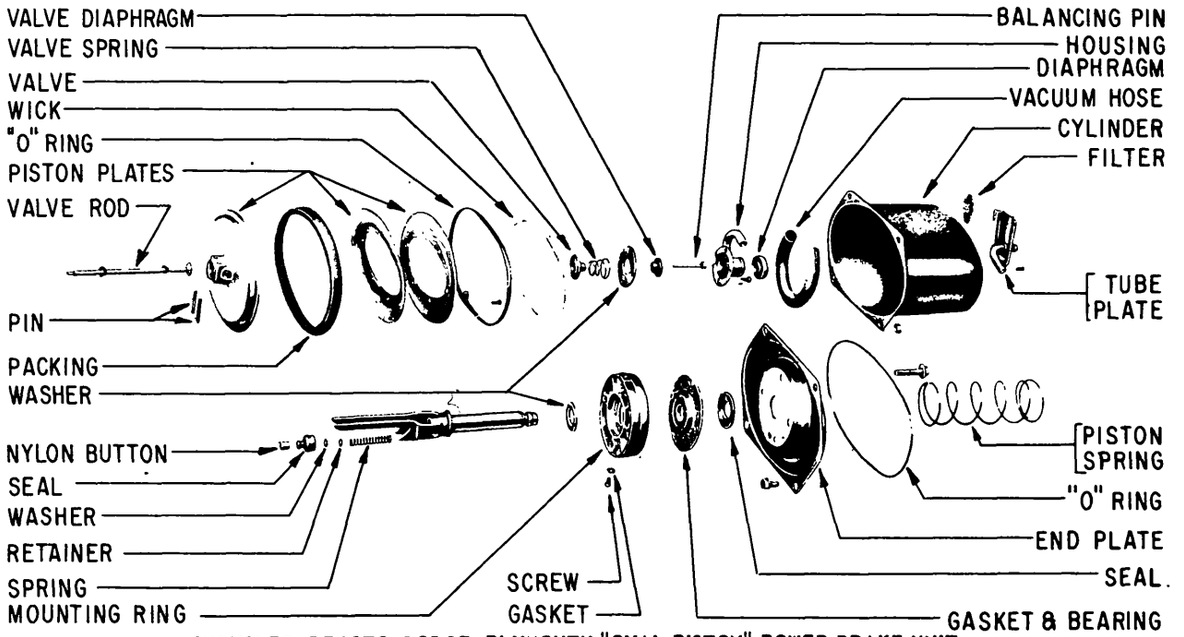
►*1960-61 LACK OF ASSIST ON INITIAL STOP DURING COLD WEATHER CORRECTION:* May be caused by rubber seal in check valve in vacuum hose sticking, or by kinked or collapsed vacuum hose. To correct, replace vacuum hose if necessary, and install improved type Check Valve, Part No. 1944089 (color coded Red and White). *CAUTION - Use only check valves with this color code.* Make sure brake pedal and linkage adjustments are correct.

DESCRIPTION: Oval air-vacuum unit of same design used previously.

ADJUSTMENTS: Pedal Freeplay Adjustment - Remove vacuum hose and depress brake pedal several times to release all vacuum. Insert blade of screwdriver between rubber collar of power brake trigger pivot and rear side of elongated hole in power brake lever, forcing them apart. *NOTE - If brake pedal and lever not wedged apart, a false freeplay setting (which includes booster valv travel) will be measured at pad end of pedal.* Check freeplay with linkage in this position by pushing lightly at pedal pad. Freeplay travel should be 1/16-1/8". If not within limits, adjust by lengthening or shortening pushrod as required.

BRAKE PEDAL TRIGGER ADJUSTMENT

Freeplay Measurement (Alternate Method) - Remove master cylinder pushrod end pin. With light finger pressure, move pushrod forward until contact made with master cylinder piston. Attempt to insert pushrod end through power lever and pushrod end hole. If pushrod must be pulled back to allow passage of pin, freeplay is present. If pushrod must be pushed further into master cylinder to allow passage of pin, no freeplay is present and adjustment must be made at pushrod.



Pedal Linkage Adjustment - If pedal pressure releases slowly, adjust by rotating adjusting screw on trigger (accessible through slot in left side of brake pedal bracket) **counterclockwise.** A time delay (noted during a fast brake application) can usually be corrected by turning screw **clockwise.** *NOTE - Rotation of adjustment screw should be limited to 90° on either side of vertical position (arrow up).*

LUBRICATION: Periodically place a few drops of SAE 10W engine oil on brake lever pin bushings. No other lubrication required.

TROUBLE SHOOTING: *See "Chrysler, Dodge (Oval Piston) Type Power Unit" in 1959 Final Data or later Manual edition.*

TESTING: *See "Chrysler, Dodge (Oval Piston) Type Power Unit" in 1959 Final Data or later Manual edition.*

REMOVAL & INSTALLATION: *See "Chrysler, Dodge (Oval Piston) Type Power Unit" in 1959 Final Data or later Manual edition and note the followina:*

CHRYSLER, DESOTO, DODGE, PLYMOUTH "OVAL PISTON" POWER BRAKE UNIT

Pedal Trigger Adjustment - *NOTE - This bench adjustment must be made before reinstallation of linkage on car.* With adjusting screw in position, wedge brake pedal pivot to rear side of hole in power brake lever until adjusting screw collar is compressed and metal-to-metal contact exists. With Gauge Tool C-3508 over brake lever pin, align centerline of gauge with the centerline of the pedal. Turn the adjusting screw so the outer curved surface of trigger arm coincides with inner circle on gauge within the 15° arc lines. Distance from center of brake lever pin to inner circle must be .640"±.005". Remove wedge between power brake lever and brake pedal and press pedal so outer curved surface of trigger arm coincides with outer circle of gauge within the 15° arc lines. Radius of circle should be .730". If trigger arm curvature does not fall within the two circles, bend trigger arm as necessary or install new pedal and trigger and adjust as described.

OVERHAUL: *See "Chrysler, Dodge (Oval Piston) Type Power Unit" in 1959 Final Data or later Manual edition.*

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "BELLOWS" TYPE

Chrysler & Imperial (1961)
DeSoto (1961)
Dodge & Dodge Dart (1961)
Plymouth (1961)

►*NOTE: "Chrysler, DeSoto, Dodge, Plymouth (Oval Piston) Type" Power Unit also used.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1960-61 LACK OF ASSIST ON INITIAL STOP DURING COLD WEATHER CORRECTION:* May be caused by rubber seal in check valve in vacuum hose sticking, or kinked or collapsed vacuum hose. To correct, replace vacuum hose if necessary, and install improved type Check Valve, Part No. 1944089 (color coded Red and White). *CAUTION - Use only check valves with this color code.* Make sure brake pedal and linkage adjustments are correct.

DESCRIPTION: Same design as used on previous models.

ADJUSTMENT: *See "Chrysler, DeSoto, Plymouth (Bellows Type) Power Unit" in 1959 Final Data or later Manual edition and note the following:*

Pedal Freeplay Adjustment: Pedal freeplay should be 1/16-1/8". Adjustment procedure remains unchanged.

REMOVAL, OVERHAUL, & INSTALLATION: *See "Chrysler, DeSoto, Plymouth (Bellows Type) Power Unit" in 1959 Final Data or later Manual edition.*

BENDIX HYDRAULIC SINGLE ANCHOR

Buick (1961)
Buick Special (1961)
Lancer (1961)
Oldsmobile (1961)
Oldsmobile F-85 (1961)
Pontiac (1961)
Pontiac Tempest (1961)
Rambler American, Series 6101 (1961) ①
Rambler V8, Series 6120, 6180 (1961) ①
Valiant (1961)
Willys FC-170 (1961) ②

① - For models with Automatic Brake Adjusters, *see "Bendix Automatic Adjuster Hydraulic Brakes" in this section.* ② - With Dual Rear Wheels

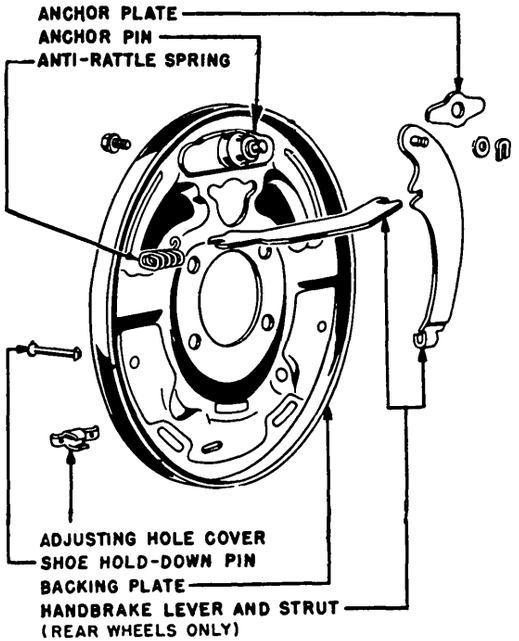
►CHANGES, CAUTIONS, CORRECTIONS

►*1961 BUICK BRAKE DRUM REPLACEMENT NOTE* Replacement brake drums have a blue lacquer coating for protection Remove coating with methyl chloroform before installing new drums

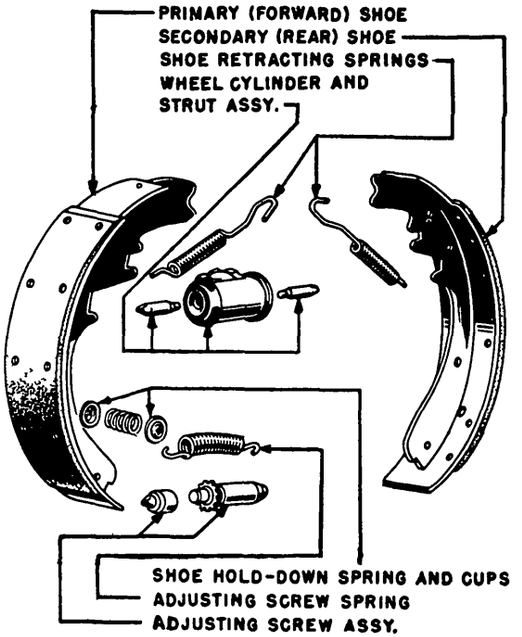
DESCRIPTION: Single anchor, without eccentric, hydraulic type of same design used previously Fixed anchor pins are used on all models except Pontiac Front Wheels Fixed anchor pins are not adjustable and "Major Brake Adjustment" is not required

ADJUSTMENTS: Before attempting any adjustments, car should be placed on stands with all wheels free Brake pedal should operate freely and there should be no bind in brake lever or cables

Brake Pedal Adjustment: This adjustment should conform with recommendations before any other adjustment is made



Buick & Buick Special - *NOTE - Brake pedal height cannot be adjusted on either manual or power brake cars* A non-adjustable pushrod connects directly to brake pedal External brake pedal return spring is not used and pedal return depends entirely on a spring within the cylinder Make sure pedal returns completely when released slowly If pedal does not return freely, check all pivot points for binding or lack of lubrication



Lancer - No adjustment provided Freeplay controlled by stop built into master cylinder

Oldsmobile - Two adjustments required **Pedal Height** - Measurement should be as listed below To adjust, loosen locknut and adjust stopscrew located on underside of brake pedal support **Pedal Freeplay** - Push master cylinder pushrod until it contacts hydraulic piston, then turn pushrod until clevis pin can freely be installed into brake pedal Shorten pushrod one full turn for proper freeplay Tighten locknut and connect pushrod to brake pedal *NOTE - If pedal height is changed, adjust stop light switch*

Pedal Height - 8"±1/8" from top of brake pedal pad to floor pan (carpet turned back)

Oldsmobile F-85 - Two adjustments required **Pedal Height** - This measurement should be 6½"±1/8" from top of brake pedal pad to floor pan (carpet turned back) To adjust, loosen locknut and adjust stop bracket on underside of brake pedal bracket **Pedal Freeplay** - Freeplay should be 3/16" To adjust, *see "Oldsmobile" above*

BENDIX HYDRAULIC SINGLE ANCHOR BRAKE ASSEMBLY

Pontiac & Pontiac Tempest - Adjust pedal stop bracket to provide 6-6¼" (Pontiac), 4½" (Tempest) pedal pad to floor mat When pedal height changed, adjust stop light switch *CAUTION* - Do not lower pedal more than specifications

Rambler - Pedal freeplay should be ¼-½" Adjust by rotating pushrod eccentric bolt *NOTE - Compensating port in master cylinder should be wid open when brake pedal is in fully released position*

Valiant - No adjustment provided Freeplay controlled by stop built into master cylinder

Willys - Pedal freeplay should be at least ½" Adjust by rotating pushrod eccentric bolt *CAUTION - Compensating port in master cylinder should b wide open when pedal is in fully released position*

Minor Wear Adjustment: Check and adjust brake pedal clearance (see Brake Pedal Adjustment), release hand brake lever, and see that cables are free and are not holding brake shoes against drum At each wheel, expand brake shoes by turning adjusting screw up until wheel can just be turned by hand, adjust hand brake (cars where hand brake adjusted with shoes "expanded", see Hand Brake Adjustment), then back off adjusting screw the number of notches or "clicks" as shown in table below Check wheel for freedom of drag If drag noted, tap backing plate to assist centralization of shoes, then recheck If drag still exists, anchor pin adjustment may be in order See Major adjustment

Lancer	10-12 Notches
Oldsmobile	16 Notches
Oldsmobile F-85	15 Notches
Pontiac	12 Notches
PontiacTempest	10 Notches (Front), 12 Notches (Rear)
Rambler	ℂ 8 Notches
Valiant	10-12 Notches
Willys	Until Free

ℂ - 10 notches with new lining

Major Adjustment (Cars with Adjustable Type Anchor Pins): *NOTE - Major adjustment not required on cars with fixed anchor pins.* Make this adjustment when new or relined shoes are installed or when minor adjustment is not satisfactory. Jack up all four wheels, loosen or disconnect parking brake cables at equalizer or intermediate lever, then remove adjusting hole covers on backing plate and inspection hole covers on drum (remove wheels for access). Check pedal clearance (see Brake Pedal Adjustment). Adjust each wheel brake as specified by car manufacturer (see below). *NOTE - If hand brake cables not disconnected or loosened, shoes may be held in on position by cable.*

Pontiac (Front Wheels) - *NOTE - Pontiac rear wheels do not require a major adjustment as the anchors are "fixed" to backing plate.* Insert a .015" feeler gauge between lining and drum 1½" from adjusting screw end of secondary (rear) lining and expand shoes with adjusting screw until feeler gauge cannot be withdrawn. Back off adjusting screw until only a slight drag is felt on feeler gauge. *NOTE - This insures that shoes are against anchor pin and primary shoe is against drum.* Withdraw feeler gauge and insert it between lining and drum about 1½" from anchor pin end of secondary lining. This should give a slightly heavier drag (than near the adjustment screw). Adjust anchor pin to provide adjustment. Tighten anchor pin locknut to 60-90 ft. lbs. Complete adjustment as shown in minor adjustment above, and hand brake adjustment below.

Hand (Parking) Brake Adjustment: *CAUTION - Brake shoes must be expanded on some cars when adjusting hand brake cables.* Adjust each car as follows:

Buick – *NOTE – Make Parking Brake Adjustment when rear cables disconnected, or if cables are stretched, or whenever service brake pedal has good reserve but parking brake pedal depresses more than 8 ratchet clicks.* Make Minor Adjustment (see above). With parking brake assembly fully released, there should be 3/8" distance from rear face of parking brake idler lever to end of its slot in the frame. Adjust front cable clevis to correct. Depress parking brake pedal **exactly 2 ratchet clicks.** Tighten rear cable adjusting nut to obtain a heavy two-hand drag at rear wheels. Release parking brake lever and check rear wheels for free rotation in either direction.

Buick Special - Make "Minor Wear Adjustment" above. Pull out parking brake lever exactly 8 ratchet clicks. Hold threaded end of intermediate parking brake cable (to prevent twisting of cable) and tighten adjusting nut until left rear wheel can just be turned backward using both hands. Release parking brake lever and pull out exactly 3 ratchet clicks. Both rear wheels must turn freely in either direction.

Lancer - Make "Minor Wear Adjustment" above. Release parking brake foot lever completely. Loosen cable adjusting and lock nuts and adjust length of front cable so front cable has approximately 1/8" free-play. Tighten adjusting and lock nuts and check brake pedal and release handle for free operation.

Oldsmobile (1961) - Release parking brake and make "Minor Wear Adjustment" above if brake pedal-to-floor board clearance is less than 1¾" (Power Brakes), 4" (Standard Brakes). Adjust rear cables by first tightening equalizer adjusting nut until a heavy drag is felt at rear brakes, then loosen equalizer adjusting nut 10 turns and tighten locknut.

Oldsmobile F-85 - Make "Minor Wear Adjustment" above if total service brake pedal travel exceeds 4". Adjust rear cables by first tightening equalizer adjusting nut until a heavy drag is felt at rear brakes, then loosen equalizer adjusting nut 9 turns and tighten locknut.

Pontiac - Apply hand brake at first notch and check equalization. Loosen adjusting screw of tightest brake if not equal. If more than a few notches are required, loosen clamp screws on spreader and pull downward on the tight side of cable. This should equalize cable. Tighten spreader clamp screws while parking brake lever is still in applied position. When lever fully released wheels should turn freely with cable pulled down by gripping cable midway between conduit and and guide on frame. When adjusting rear end of front cable for close adjustment for tension, be sure to turn clevis on or off cable end but do not twist cable. Coarse adjustment is secured by selecting the correct hole in spreader.

Pontiac Tempest - Make "Minor Wear Adjustment" above. Loosen locknut (front nut) on rear cable equalizer and turn adjusting nut (rear nut) for proper tension on rear cables. *CAUTION - Do not twist cable.* Tighten locknut to 60-120 inch-lbs. torque. Release parking brake fully and make sure there is no drag on rear wheels.

Rambler (Hand Operated Type) - Pull handle back to give 3½" clearance between handle and mounting bracket. Tighten cable at equalizer until brakes are fully applied. Release brake and check for drag.

Rambler (Foot Operated Type) - With lever in fully released position adjust rear cable at equalizer so wheels will turn without drag.

Valiant (1961) - Make "Minor Wear Adjustment" above. Release brake foot lever completely. Loosen cable adjusting and locknuts and adjust length of front cable so front cable has approximately 1/8" freeplay. Tighten adjusting and locknuts and check brake pedal and release handle for free operation.

Willys (Transmission Mounted Type) - Release fully the parking brake handle. Make sure cable and linkage do not bind. Rotate drum so a pair of access holes in drum expose shoe adjusting screw wheels in brake. Rotate adjusting wheels until shoes are snug against drum then back off each wheel 7 notches for proper clearance.

MASTER CYLINDER REMOVAL & FILLING: *NOTE - Procedures below apply for standard brakes. For removal with Power Unit, see Power Brake Unit pages in this section.*

Buick - Remove connector from stop light switch and disconnect brake pipe from master cylinder. Remove locknut, shoulder bolt, and spring washer connecting brake pedal to master cylinder pushrod. Remove master cylinder-to-dash panel bolts and remove master cylinder.

Filling - Fluid should be ½-1" below lip of filler opening.

BENDIX HYDRAULIC (Cont.)

Buick Special - Remove stop light switch connector and disconnect brake pipe from master cylinder. Remove retainer pin, washer, and clevis pin holding brake pedal to master cylinder pushrod. Remove master cylinder-to-dash panel bolts and remove master cylinder.
Filling - Fluid should be ½-1" below lip of filler opening.

Lancer - Remove brake pedal return spring and disconnect pushrod from brake pedal. Disconnect brake pipe and stop light switch leads from master cylinder. Remove master cylinder-to-dash panel attaching bolts and slide master cylinder straight out from dash panel.
Filling - Fluid should be even with top edge of master cylinder.

Oldsmobile - Disconnect brake pipe from master cylinder. On Synchro-mesh cars, install gauge pin in frame side rail holes to hold clutch linkage in position and disconnect clutch linkage from clutch pedal bellcrank and remove bellcrank. Remove master cylinder attaching nuts and remove cylinder.
Filling - Fluid should be ½" below bottom of filler opening.

Oldsmobile F-85 - Disconnect brake pipe from master cylinder, remove attaching nuts and remove cylinder. *NOTE* - Unnecessary to disconnect pushrod and clevis.
Filling - Fluid should be ½" below filler cap.

Pontiac & Pontiac Tempest - Disconnect brake pedal return spring. Disconnect master cylinder pushrod from brake pedal by removing cotter pin and clevis pin from clevis. Disconnect brake pipe from master cylinder, remove master cylinder-to-cowl attaching bolts and remove cylinder.
Filling - Fluid should be 1" below top of filler opening.

Rambler – Disconnect pipe from master cylinder, remove attaching bolts, and remove master cylinder.
Filling – Maintain fluid to within ½" of top of filler opening.

Valiant - Remove brake pedal return spring and disconnect pushrod from brake pedal. Disconnect brake pipe and stop light switch leads from master cylinder. Remove master cylinder-to-dash panel attaching bolts and slide master cylinder straight out from dash panel.
Filling - Fluid should be even with top edge of master cylinder.

Willys - Master Cylinder location under instrument panel in front of steering column. Access hold for filling provided on instrument panel to right of speedometer.
Filling - Fluid should be ½" below top of filler hole.

BENDIX AUTOMATIC ADJUSTER HYDRAULIC BRAKES

Ford Pass. Cars (1961)
Lincoln Continental (1961)
Mercury (1961)
Rambler American, Series 6101 (1961) ①
Rambler V8, Series 6120, 6180 (1961) ①
Thunderbird (1961)
① – "Bendix Hydraulic Single Anchor (Without Eccentric)" also used.

► *EXCESSIVE REVERSE "CLUNK" OR BRAKE CHATTER CORRECTION:* Make sure brake backing plate attaching bolts are tightened to correct specifications. Front Brake: 80–100 ft. lbs. (Upper) 20–30 ft. lbs. (Lower). Rear Brake: 30–35 ft. lbs.

► *1961 FORD & MERCURY BRAKE NOISE OR SQUEAL CORRECTION & PRODUCTION CHANGE:* On early cars (before Sept. 16, 1960 for Mercury; before Dec. 19, 1960 for Ford) install higher tension brake shoe lower hold–down springs. Springs, Part No. TDAA–2068–A, identified by black paint, are used on later production cars.

► *1960–61 MERCURY PREMATURE BRAKE BACKING PLATE WEAR CORRECTION:* Remove any sharp or rough edge on brake shoe rim.

► *1961 THUNDERBIRD BRAKE PEDAL PIVOT PIN RATTLE CORRECTION:* Install split nylon bushings, Part No. C1VV–2461–B, preloaded with a Lubriplate coated wave washer, Part No. 356468–S13W.

► *1961 THUNDERBIRD FRONT BRAKE "HONK" CORRECTION:* Condition may occur just before car comes to a full stop. Correct by installing new front brake carrier assemblies, Part No. C1SS–2010–H (Right), No. C1SS–2011–H (Left).

DESCRIPTION: Similar in design to previous Bendix Single Anchor (Without Eccentric) brakes and incorporating an automatic adjuster to maintain proper lining to drum clearance. The automatic adjuster uses movement of rear (secondary) shoe during a reverse brake application to turn brake adjusting screw a small amount after a predetermined amount of wear on front and rear linings. The adjuster consists of a steel cable with a hook and anchor fitting permanently attached, a cable guide, adjusting lever, adjusting screw, pivot nut, socket and spring.

OPERATION: When lining has worn enough to require adjustment (approximately .0005" on each shoe), secondary shoe on which adjuster is mounted moves far enough from shoe anchor during a **revers** application to cause cable to lift adjuster lever into engagement with the next tooth in the adjusting screw. When brake is released, secondary shoe returns to the anchor. Movement of the adjusting screw is 1/24th of a revolution each time it is moved by the adjuster. In forward braking, adjusting parts move with secondary shoe as a unit, and there is no lifting of the lever to engage a new tooth in adjusting screw.

ADJUSTMENTS: Make adjustments with drums cool and contracted. If car raised on frame hoist, disconnect parking brake cables. *NOTE – Anchor pins ar fix d in backing plate and no major adjustm nt is required.*

Pedal Freeplay: Ford, Lincoln, M rcury, Thund rbird – Pedal freeplay is not adjustable.
Rambler – Rotate brake pedal–to–pushrod eccentric bolt to obtain ¼–½" pedal freeplay. Adjust for maximum pedal height on power brake equipped cars.

Initial Adjustment After Ov rhaul: F rd, Linc ln, Mercury, Thunderbird – Raise car and disconnect parking brake cables. Remove access hole cover plate from backing plate and turn adjusting screw upward with Tool 2018 or screwdriver to expand shoes against drum until a slight drag is felt. Remove brake drum. Hold adjusting lever away from adjusting screw and back off adjusting screw ¾–turn with fingers. *NOTE–*

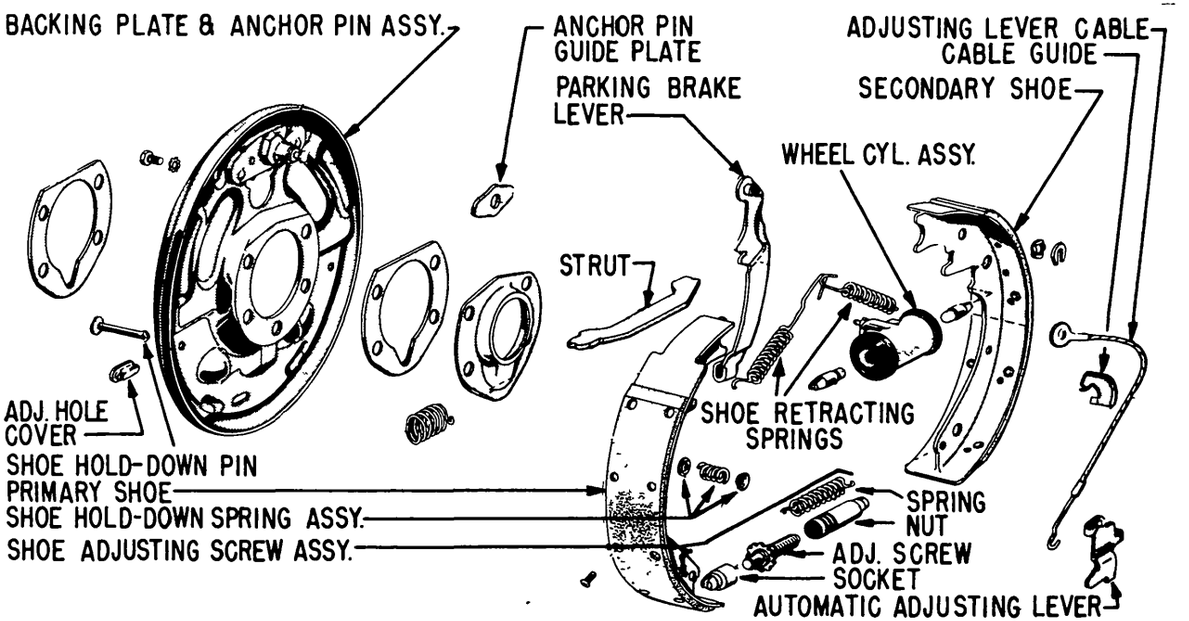
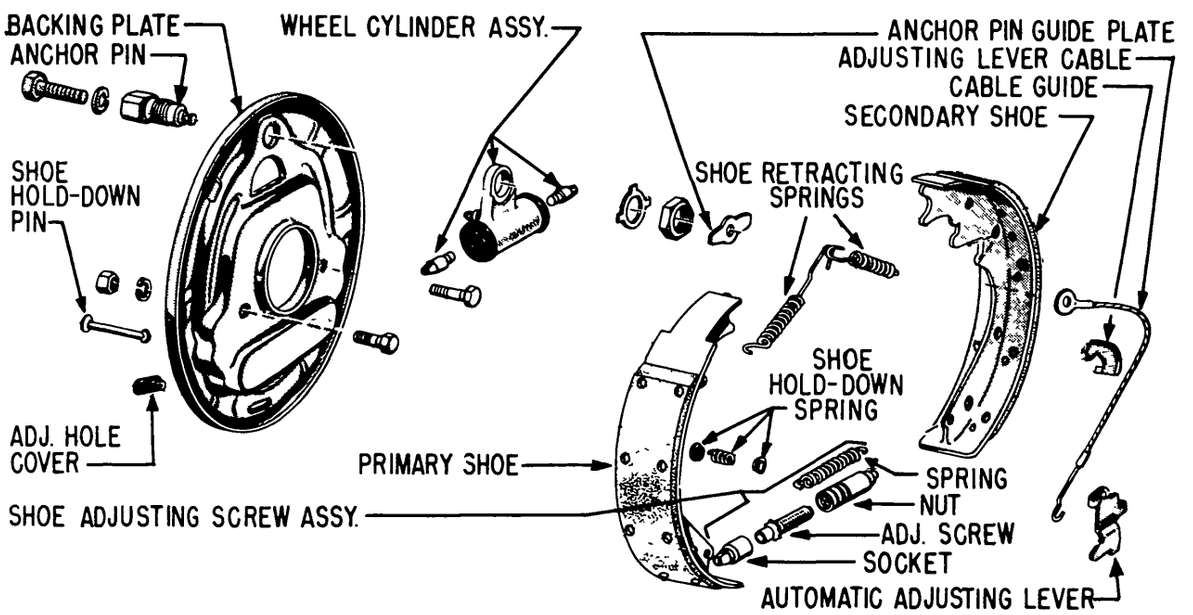
BENDIX AUTOMATIC ADJUSTER HYDRAULIC BRAKES (C nt.)

If scr w cannot b turned with fingers, screw must be freed or adjusting l v r will not turn screw. If brake drum cannot be removed, hold adjusting lever away from adjusting screw while backing adjusting screw off until wheel turns freely, then back off one more stroke.

Rambl r – Lengthen adjusting screw to expose 3/8" of adjusting screw threads, then install drum. Drive car cautiously in reverse, making 7 or 8 brake applications before road testing.



BENDIX AUTOMATIC ADJUSTER ASSEMBLY



Parking Brak Adjustm nt: Ford & Thunderbird - With parking brake cables fully released, loosen locknut on equalizer rod and turn adjusting nut several turns forward. Turn locknut forward against equalizer until cables are just tight enough to remove slack. *CAUTION Excessive tight ning of cables may pull brake shoes off anchors.* Tighten both nuts against equalizer. Remove all slack from cable between parking brake pedal and equalizer lever without moving equalizer lever.

Linc ln – Fully release parking brake and raise car. Loosen cable at equalizer lever, then depress parking brake pedal 1¾" from normal released position. Adjust cable until there is a slight drag at rear wheels. Tighten equalizer rod locknut. Release brake and make sure brake shoes return to fully released position. Depress parking brake pedal 2". Car should be held satisfactorily under normal conditions.

Mercury – Release parking brake pedal, raise car, then loosen parking brake cable at equalizer lever. Depress parking brake pedal 1¾" from fully released position. Adjust front and rear cables until a slight drag is felt when turning rear wheels. *NOTE – The adjustment should be evenly divided between the two cables to maintain proper equalizer lever action.* Equalizer lever will be properly positioned when distance from rear cable clevis pin on equalizer bar to rear face of crossmember (to which parking brake bracket is attached) is 5½", with parking brake pedal fully released. Tighten locknut on equalizer rod, then release parking brake and check to make sure that shoes return to fully released position. Depress parking brake pedal 2". Under normal conditions, this should hold car satisfactorily.

FORD, LINCOLN & MERCURY REAR BRAKE ASSEMBLY

FORD & MERCURY FRONT BRAKE ASSEMBLY (LINCOLN SIMILAR)

Rambl r (Hand Op rat d Typ) - Pull handle back to give 3½" clearance between handle and mounting bracket. Tighten cable at equalizer until brakes are fully applied.

Rambl r (F t Op rated Typ) - With lever in fully re-

CONTINUED ON NEXT PAGE

BENDIX AUTOMATIC ADJUSTER HYDRAULIC BRAKES (C nt.)

leased position adjust rear cable at equalizer so wheels will turn without drag.

Automatic Adjuster: Removal - Disengage adjusting lever from adjusting screw by pulling backward on lever. Move outboard side of adjusting screw upward and back up pivot nut as far as possible. Pull adjusting lever, cable and adjusting spring down toward rear to unhook pivot hook from large hole in secondary shoe. *CAUTION - DO NOT pry pivot hook out of hole.* Remove anchor springs and unhook cable anchor. Remove shoe guide plate. Remove cable guide from secondary shoe and remove shoe hold-down springs, shoes, adjusting screws, pivot nut and socket.

Installation - Install brake shoes on backing plate with hold-down spring pin, springs and cups. Install parking brake link and spring. Connect parking brake cable. Install shoe guide plate on anchor pin. Place cable anchor over anchor pin with crimped side toward backing plate. Install primary and secondary shoe to anchor springs. *CAUTION - Be sure that cable end is not cocked or binding on anchor pin.* Install cable guide on secondary shoe web with flanged hole fitted in hole in web. Thread cable through guide groove, not between guide and shoe web. Turn adjusting screw in to limit of threads then back off ½ turn. *CAUTION - Place left hand screw on right side of car, right hand screw on left side of car.* Install adjusting socket on screw, place assembly between shoe ends with adjusting screw nearest secondary shoe. Hook cable hook into hole in adjusting lever from backing plate side. Place pivot hook into large hole in secondary shoe web. Place hooked end of adjuster spring into large hole in primary shoe web and loop end of spring to adjuster lever. Check action of adjuster by pulling cable toward secondary shoe to lift lever past tooth. Spring will pull lever to original position (when cable released) advancing screw one tooth (1/24 revolution). Lever should contact adjusting wheel 3/16±1/32" above centerline of screw. Cable length should be 11 1/8±1/64". Cable guide groove should be parallel with shoe web and body of guide should be flat against web. Pivot hook surfaces should be square with body of lever. Adjusting screw must be seated properly in shoe web. Replace damaged or incorrect parts. Follow adjustment procedures given above.

MASTER CYLINDER: Removal (F rd, Linc ln, M rcury, Thunderbird) – Disconnect speed control linkage at exterior arm (remove cotter pin). Disconnect rubber boot, brake line, and stop light switch wires from master cylinder and stop light switch. Remove master cylinder attaching bolts and remove master cylinder.

Filling – Maintain fluid to within 3/8" (Ford & Thunderbird), ¼" (Lincoln & Mercury) of top of master cylinder.

Removal (Rambler) – Disconnect pipe from master cylinder, remove attaching bolts, and remove master cylinder.

Filling – Maintain fluid to within ½" of top of filler opening.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brak Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brak Trouble Shooting" in Brake Section of Manual.*

Willys, All Models (1961) ①

① – For FC–170 with Dual Rear Wheels, *see "Bendix Hydraulic Single Anchor (Without Eccentric)" brakes.*

►*WILLYS FORWARD CONTROL MASTER CYLINDER NOTE:* Master cylinder mounted on inside front panel of cab, just underneath instrument panel. Access to filler plug is through hole cover on panel to right of speedometer.

DESCRIPTION: "Self-Centering" hydraulic type with non-adjustable anchor ramps for each shoe. An eccentric adjusting cam is used for brake shoe adjustment.

ADJUSTMENT: Before making adjustments, jack up all four wheels, check brake pedal clearance or free travel (see below), fully release hand brake and make certain that rear wheels are free, then adjust each wheel as follows:

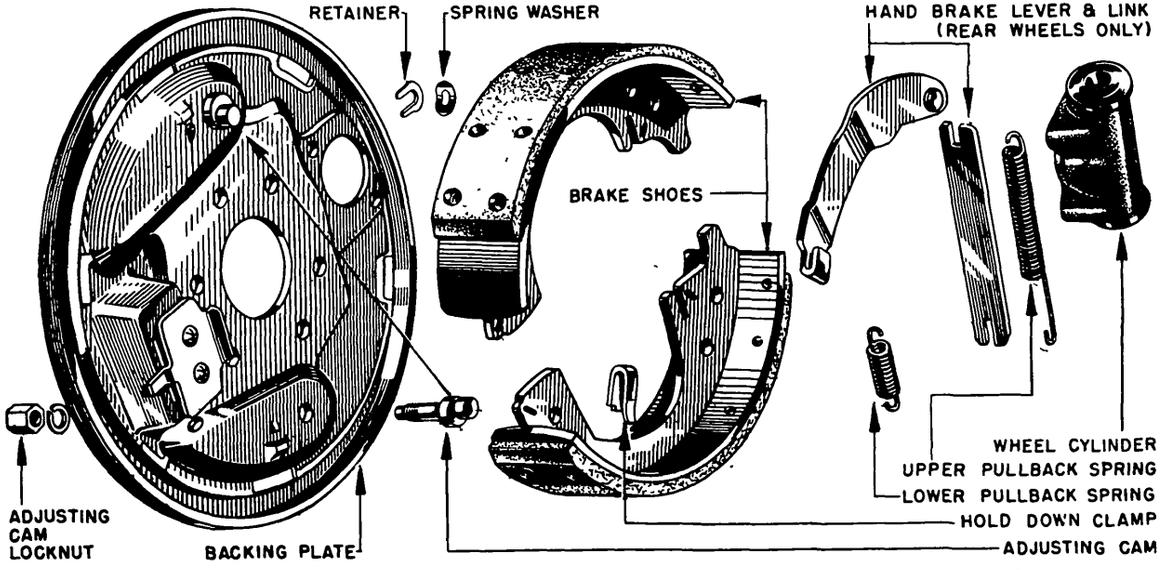
Brake Shoe Adjustment (For Wear or New Linings):

►*CAUTION: Brake shoes must be "centralized" by several hard brake applications before adjusting.*

Eccentric Adjustment - Adjust eccentric for each brake shoe by turning eccentric up and out until brake shoe firmly applied and wheel is locked, then back eccentric off until wheel just rotates freely without drag. Shoe clearance will then be approximately .010".

Anchor Lip Adjustment - Pressure required to pull shoe outward from support plate should be 15 lbs. Measure with spring scale hooked in end of shoe. Adjust by bending anchor lip slightly toward brake support plate to obtain this 15 lb. coil spring pressure to hold shoes on support plate ledges.

Hand Brake Adjustment: Remove all slack from rear wheel brake cables as follows:



Willys (Vehicles with cabl c nnect d t rear wh l service brakes) -Pull hand lever "on" three notches, loosen front nut on connecting link between intermediate lever on frame crossmember and rear cable equalizer, tighten rear nut on link until slight drag noted at each rear wheel, then tighten front nut to lock adjustment. Release hand lever and check for freedom of drag.

Willys (Vehicles using propeller shaft mounted parking brakes). Fully release hand brake lever, check linkage for freedom from bind. Rotate brake drum so one pair of three sets of holes are over adjusting screws. Use tool or screwdriver to rotate each adjusting screw away from drive shaft until shoes are snug against drum, then back off each screw 7 notches for running clearance.

Willys (Vehicles with Operator Adjustabl Hand Brak Lever – 1) Adjusting knob on hand brake lever handle compensates for lining wear or for unusual holding conditions. With lever in "off" position, turn adjusting knob clockwise while applying and releasing handle every ¼–turn of knob until definite "snap over center" action takes place. *CAUTION – Over adjustm nt causes hard hand lever action but d s n t incr ase brake efficiency. For major adjustm nt pr c d as follows:*

CONTINUED ON NEXT PAGE

BENDIX (LOCKHEED) SELF-CENTERING

BENDIX (LOCKHEED) SELF-CENTERING REAR BRAKE (FRONT SIMILAR EXCEPT HAND BRAKE PARTS OMITTED)

BENDIX (LOCKHEED) SELF-CENTERING (Cont.)

2) With adjusting knob turned fully counterclockwise, place handle in "on" position. Tighten parking brake cables at equalizer adjusting nut until slight drag is felt at rear wheels. Tighten locknut. Release control handle. Rear wheels should be free. Turn adjusting knob clockwise for desired tension.

Brake Pedal Adjustment: Adjust master cylinder pushrod by loosening locknut and turning rod for following pedal travel with master cylinder piston and pushrod back against stop:

Brake Pedal Free Play – ½" (All Models).

MASTER CYLINDER: Fluid Level – Maintain fluid level to ½" below top of filler opening.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

Studebaker, All Models (1961)
① – For cars with automatic brake adjusters, see *"Wagner Automatic Adjuster Hydraulic Brakes" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 STUDEBAKER EXCESSIVE BRAKE PEDAL SHAFT ENDPLAY CORRECTION & PRODUCTION CHANGE (Auto. Trans. Cars):* On cars before Serial No. 61S–24202 and 61V–19554, install plain washer, Part No. 532035, between bracket bushing and hairpin lock on end of shaft not having a washer. Cars after above serial numbers have this washer.

DESCRIPTION: Hydraulic, self-centering and self-energizing type with Bendix type brake shoe assemblies.

Self-centering Device - The upper anchor pin end of each brake shoe rests against a wedge-shaped anchor block which is mounted on fixed brake anchor pin (shoes do not contact anchor pin directly) so that the shoes are free to move radially. The wide edge of the anchor block is toward the top. When the brakes are applied, the lining surface pressure tends to force the shoe to adjust its position on the block and center itself in the drum. This centering action takes place on light, or heavy brake application and is continuous with drum expansion. The anchor plate aids in keeping the shoes properly aligned at the self-centering block.

ADJUSTMENTS: Place car on stands so that all four wheels are free. Check master cylinder and see that fluid level is ½" below top of cylinder. Place parking brake handle in fully released position. Adjust as follows:

Rambler Brake Pedal Free Travel Adjustment: Adjust the brake pedal play ¼" to ½" by rotating the master cylinder piston pushrod to brake pedal attaching eccentric bolt.

Studebaker Brake Pedal Free Travel Adjustment: Turn adjustable pedal stop on pedal bracket to obtain ¼–3/8" pedal free travel (measured from brake pedal pad) before pressure stroke starts.

Brake Shoe Adjustment: Remove adjusting hole cover from backing plate, insert screwdriver or special adjusting tool through adjusting hole and turn adjusting screw to expand shoes until drum is just locked (pivot tool on edge of slot, move handle upward to expand shoes). Then back off the adjusting screw 8 notches (used lining), 10 notches (new lining), or more if necessary until drum is free of any drag. Replace adjusting hole cover, adjust parking brake.

PARKING BRAKE ADJUSTMENT: Rambler (Hand Operated Type) - Pull handle back to give 3½" clearance between handle and mounting bracket. Tighten cable at equalizer until brakes are fully applied.

Rambler (Foot Operated Type) - With lever in fully released position, adjust rear cable at equalizer so wheels will turn without drag.

Studebaker - Set control handle four notches from fully released position. Adjust rear wheel cables at equalizer on frame side rail by backing off front nut until all slack is removed from cables and a heavy drag noted when rotating rear wheels by hand. Tighten front adjusting nut. Release control handle fully and see that wheels are free of any drag.

WAGNER (LOCKHEED) SELF-CENTERING BRAKES (C ntinued)

BRAKE SHOE REMOVAL & INSTALLATION:

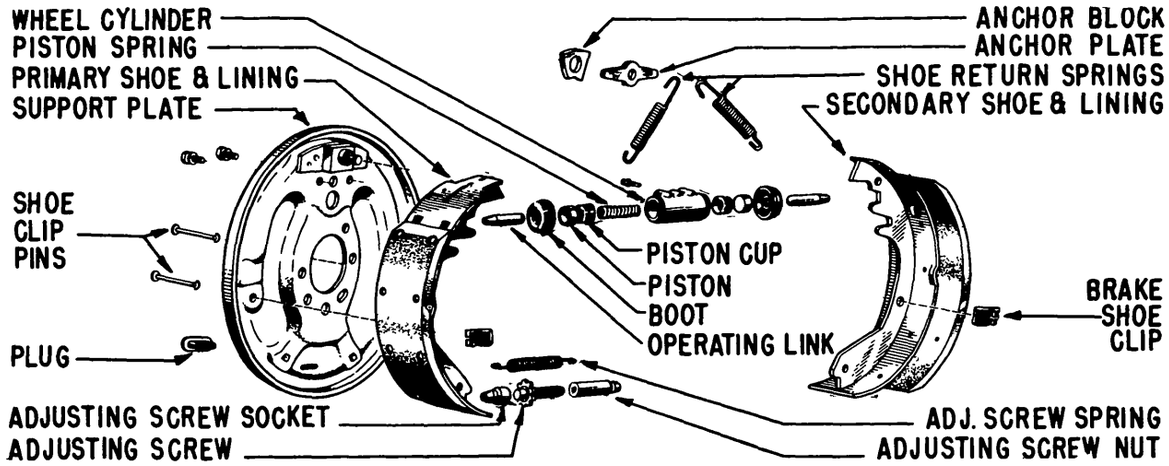
R moval: Install wheel cylinder clamp to prevent hydraulic system leakage. Unhook the two shoe return springs at anchor. On rear brakes, swing the hand brake lever on the secondary shoe toward the axle to slacken cable. Lift cable from lever slot. Compress and remove hold-down spring clip on each shoe. Spread shoes and lift off brake support plate. On rear brakes, remove parking brake link and anti-rattle spring. Separate shoes by removing star wheel adjusting assembly and spring. On rear brakes, pull clip from parking brake lever mounted on secondary shoe and remove lever from shoe. Anchor plate and anchor block may now be lifted from anchor pin.

Installation: Reverse removal procedure. *NOTE* - On Studebaker Taxi and all 8 cylinder models, the parking brake lever is mounted on inner side of rear shoe. On Studebaker 6 cylinder models and all Rambler models, the parking brake lever is mounted on outside of shoe.

WHEEL CYLINDER: Removal & Disassembly - Disconnect flexible hose from cylinder. Remove screws attaching cylinder to backing plate. Remove cylinder.

Assembly & Installation: Assemble cylinders as shown in illustrations. Reverse removal procedure to install.

MASTER CYLINDER: Removal (Rambler) – Disconnect pipe from master cylinder, remove attaching bolts, and remove master cylinder.



Filling – Maintain fluid to within ½" of top of filler opening.

Removal (Studebaker) – Disconnect pushrod from brake pedal, remove shoulder bolt from pushrod, and nylon bushings from pushrod. Disconnect stop light switch wire and hydraulic line. Remove attaching bolts and remove master cylinder.

Filling – Maintain fluid to within ½" of top of cylinder.

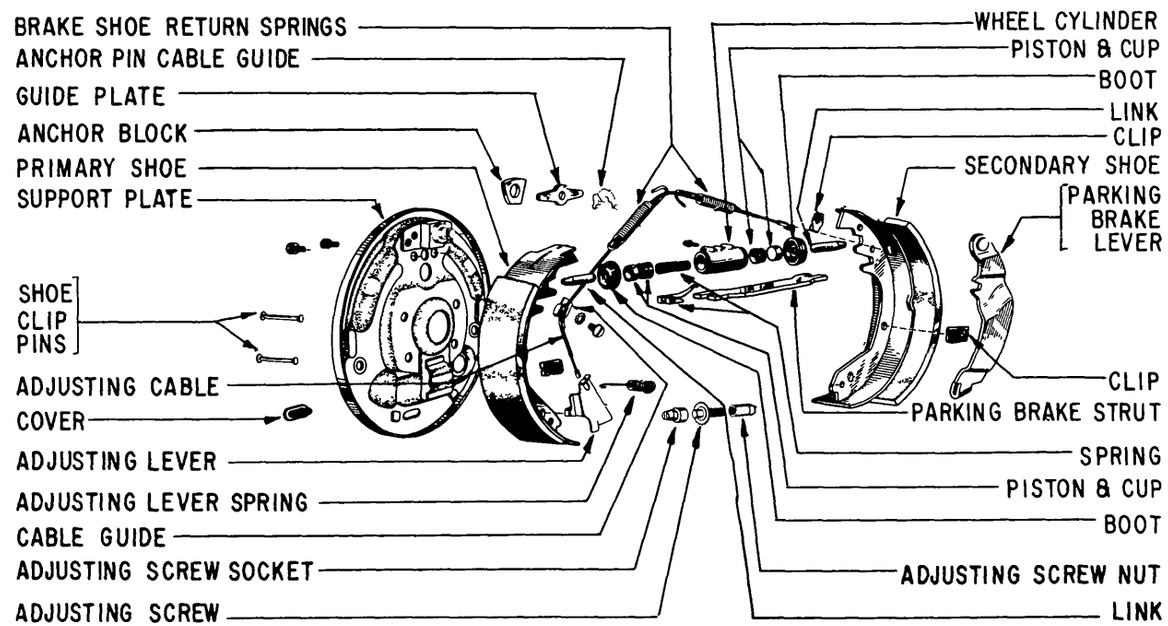
BLEEDING BRAKE SYSTEM & OVERHAULING OF MASTER CYLINDER & WHEEL CYLINDERS: *See "Hydraulic Brake Servicing" in Brake Section of Manual and note the following:* CAUTION - To bleed power brakes, engine must be stopped and no vacuum in power brake system. *NOTE* - On Studebaker equipped with power brake and/or hill holder, these units must be bled before the rest of the system.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

WAGNER (LOCKHEED) SELF-CENTERING FRONT BRAKE ASSEMBLY

WAGNER AUTOMATIC ADJUSTER HYDRAULIC BRAKES

Rambler 6 Cyl., Series 6110 (1961)



DESCRIPTION: Hydraulic, self-centering and self-energizing type with Bendix type brake shoe assemblies similar in design to Wagner (Lockheed) Self-Centering Brakes and incorporating an automatic adjuster to maintain proper lining to drum clearance. The automatic adjuster uses movement of the front (primary) shoe during brake applications to turn brake adjusting star wheel a small amount as determined by lining wear. The adjuster consists of an adjusting lever, cable guide and an adjusting cable.

OPERATION: After lining wears enough to require adjustment, the adjusting cable will lift adjusting lever into position to engage with next tooth of star wheel when the brakes are applied. When brake is released, shoes return to the brake shoe anchor. This action will repeat on subsequent brake applications, if necessary, until shoe-to-lining clearance is reduced to a point where shoe movement is not enough to cause cable to lift lever to next tooth. The automatic adjuster is located on the front shoe (primary), and the adjusting action, when required, occurs when applying brakes in either forward or reverse motion.

ADJUSTMENT: Place car on stands so that all four wheels are free. Check master cylinder and see that fluid is ½" below top of cylinder. Place parking brake handle in fully released position, then adjust as follows:

Brake Pedal Free Travel Adjustment: ¼" to ½" free travel required. To adjust, rotate master cylinder pushrod-to-brake pedal attaching eccentric bolt.

CONTINUED ON NEXT PAGE

WAGNER AUTOMATIC ADJUSTER BRAKE ASSEMBLY (REAR SHOWN - FRONT SIMILAR)

WAGNER AUTOMATIC ADJUSTER HYDRAULIC BRAKES (C nt.)

Brake Sh Adjustment: Adjustment not normally required, however, if a manual adjustment is necessary (after installation of new lining or shoes), proceed as follows Remove access hole cover and use a screwdriver to rotate star wheel. To tighten, rotate backing plate side of star wheel toward axle. To back off star wheel, it may be necessary to insert a second tool, past the star wheel, to force automatic adjusting lever off of star wheel. Back off star wheel to eliminate drag.

Parking Brake (Foot Operated Lever): With lever in fully released position, adjust rear cable at equalizer so wheels will turn without drag

BRAKE SHOE REPLACEMENT: *See "Wagner (Lockheed) Self–C ntering" and note the following:*

Automatic Adjuster Installation: With shoes installed on backing plate, install anchor block on anchor pin with convex side facing primary shoe (arrow on block should point in direction of forward drum rotation), then install shoe guide plate. Install **red** secondary shoe return spring with long hook end flat against shoe guide plate. Install **blue** primary spring **last** with short hook end flat against shoe table when hooked on tab of primary shoe. Slip anchor pin cable guide down in slot on anchor pin and install adjuster guide on primary shoe (do not tighten guide screw). Install adjuster lever into larger hole near end of primary shoe and connect adjuster lever spring between small hole in secondary shoe and slot in lever. Thread adjusting cable through shoe hold–down springs and over cable guide on anchor pin, hooking eye end of cable over secondary shoe return spring hook. Route cable around cable guide and swivel lever upward and engage barrel fitting end of cable in lever slide. With brake released, push primary shoe cable guide out to pull cable taut until bottom edge of adjusting lever is engaging star wheel tooth and parallel to star wheel shank. Tighten cable guide screw and test action by pulling cable.

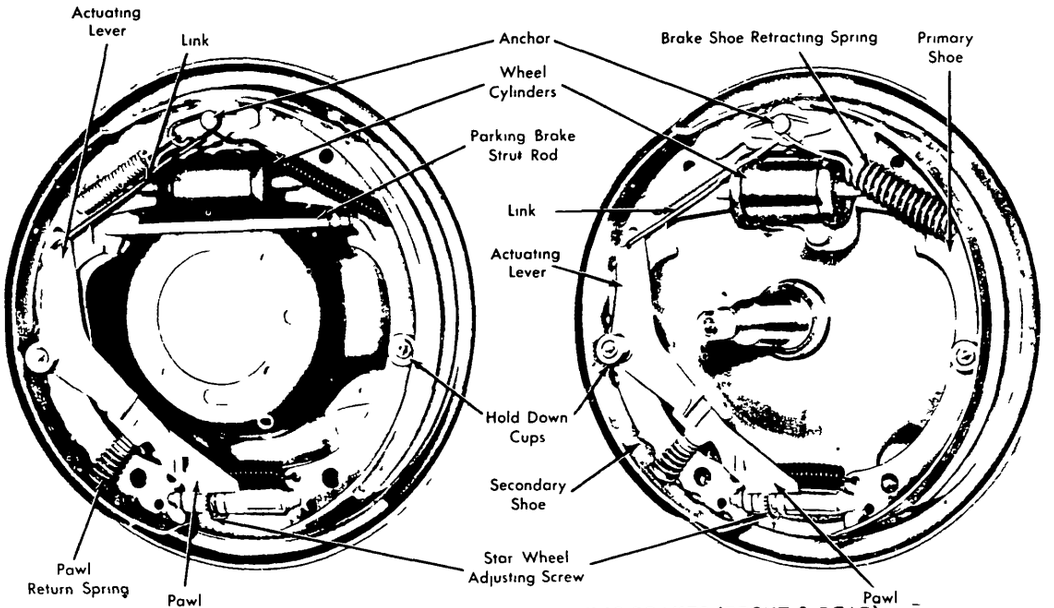
TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

CADILLAC (BENDIX-MORAINE) AUTOMATIC ADJUSTER BRAKES

Cadillac, All Series (1961)



►CHANGES, CAUTIONS, CORRECTIONS

► *1961 CADILLAC BRAKE PEDAL INCOMPLETE RETURN CORRECTION:* On some cars before Engine No. 036024, condition may be caused by Cruise Control cut–off switch arm contacting its mounting bracket. If switch is properly adjusted and interference still exists, grind off edge of switch mounting bracket so there is at least 1/16" clearance between edge of switch arm and mounting bracket when brake pedal is fully raised (including slack and freeplay from pedal weight and linkage).

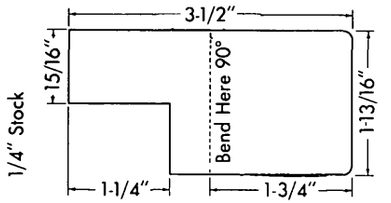
► *1961 CADILLAC FRONT BRAKE BACKING PLATE BOLT TORQUE & CAUTION:* Steering knuckle and arm–to–backing plate bolt and nut should be tightened to 60 ft. lbs. If necessary to re–torque, back off nut, then tighten to 60 ft. lbs. DO NOT overtighten as stripped threads will result. DO NOT use a standard bolt and nut in place of these special parts.

DESCRIPTION: Hydraulic single anchor type brake (without eccentric) with Bendix type shoes. Brake shoe anchor pins are fixed in backing plate and require no adjustment. Moraine automatic adjusting mechanism consists of a link, actuating lever, pawl, and pawl return spring.

OPERATION (AUTOMATIC ADJUSTER): The adjusters operate only when brakes are applied as car is moving in reverse As the brake drums move rearward, the wrap around action of the brake shoes forces upper end of primary shoe against anchor pin and the secondary shoe away from anchor pin The link which holds top of actuating lever stationary, forces actuating lever to pivot on secondary shoe This pivoting action forces pawl downward against end of a tooth on the star wheel adjusting screw. If lining-to-drum clearances are correct, the downward movement will stop before star wheel is turned If clearances are too wide, the secondary shoe will move outward and the pawl will move downward far enough to turn star wheel one notch and take up the adjustment

CADILLAC AUTOMATIC ADJUSTER HYDRAULIC BRAKES (FRONT & REAR)

ADJUSTMENTS: Brake Shoe Adjustment – *NOTE – Adjustment should be required only after shoe relining or replacement, or when length of star wheel has been changed.* Remove adjusting hole cover in drum and rotate star wheel to expand shoes until drum can just be rotated forward with a two–foot bar between the wheel mounting studs. Reach through adjusting hole and disengage adjuster pawl from star wheel (use a hooked tool) and back off star wheel **exactly 40 n tches.** *CAUTION – This 40 notch adjustment must be maintained.* Drive car forward and reverse and apply brakes moderately 5 or 6 times in each direction for final adjustment.



Parking Brake: *TOOL NOTE – Make a gauge tool from ¼" flat steel stock as shown in illustration.* With service brakes properly adjusted, lubricate parking brake linkage and check for free movement of cables in con-

CONTINUED ON NEXT PAGE

CADILLAC "AUTOMATIC ADJUSTER" BRAKES (C ntinu d)

duit and equalizer. Check rear relay lever spring and replace if necessary. With parking brake mechanism in fully released position, insert 15/16" part of gauge tool in gap between relay lever and end of slot in frame. Adjust intermediate cable at front clevis until gauge is a slip fit. *NOTE – On cars with Engine Nos. 010963 to 014241 with reworked intermediate cable, end of gauge should be aligned with scribe mark on frame and this dimension should be used instead of rear end of frame slot.* Back off equalizer nut so relay lever can be moved forward to insert 1 13/16" end of gauge into frame slot. *NOTE – There must be slack in rear cables when 1 13/16" end of gauge is in place.* Tighten equalizer nut to obtain a near lock–up drag on rear wheels when wheels turned by hand in forward direction. Remove gauge. Parking brake pedal should now travel 2–2½" with approximately 50 lbs. pressure on pedal.

BRAKE SHOE REPLACEMENT: Removal – *CAUTION– Note position and color of brake assembly springs for reinstallation in exactly the same locations.* Disconnect parking brake cables at rear wheels. Disconnect primary and secondary brake shoe retracting springs, and remove shoe hold–down cups. springs, pins, and sleeve. Remove pawl return spring, pawl and actuating lever. Disengage shoes from wheel cylinder and rotate shoes until link disengages from shoe plate (front), or anchor (rear).

GAUGE TOOL

Installation: Tighten front backing plate bolt to 60 ft. lbs. *(see "Front Backing Plate Bolt Torque & Caution" above).* Tighten rear backing plate bolts to 35–45 ft. lbs. (Series 60, 62, 75), 65–75 ft. lbs. (Series CC). Position shoes and hook connecting spring between primary and secondary shoes. Install star wheel between shoes so star wheel will engage pawl. *CAUTION* – Star wheel with 1 groove on O.D. (left hand threads) must be on right side of car; wheel with 2 grooves (right hand threads) must be on left side of car. Small diameter thin thrust washer must be between the end socket of star wheel and the large diameter spring washer. Install actuating lever, pawl spring, and pawl. Install shoe hold–down pins, cups, and springs, then install retracting springs. Loosen star wheel enough to install drums. Make wheel bearing, service, and parking brake adjustments.

1961 HYDRAULIC BRAKE SPECIFICATIONS

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "THREE PLATFORM" TOTAL CONTACT BRAKES

Chrysler & Imperial (1961)
DeSoto (1961)
Dodge &Dodge Dart (1961)
Plymouth (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1959–61 BRAKE DRAG, PULL OR TOO FREQUENT BRAKE ADJUSTMENT CORRECTION:* This condition may result from burrs or sharp edges on brake shoe table loops and/or dust shield platforms. To correct, remove drums and brake shoe assemblies and remove any burrs or paint build-up on dust shield platforms. Lubricate all platforms with a thin film of MoPar "door ease" or Lubriplate. Carefully remove all sharp edges on shoe loop with a file or scraper. *CAUTION - Remove sufficient material to smooth loop edges only.* Reinstall brakes, retainers and return springs. Check brake shoe return spring tension by attaching a spring scale at toe of shoe and pull shoe away from wheel cylinder. Shoe should begin to move away from wheel cylinder pushrod at 45-55 lbs. If more than 55 lbs. is required to move shoe check for cause of drag. If less than 45 lbs. is required to move shoe, replace with new heavier load return springs, Part No. 2266881. *CAUTION– If th se h avi r springs used, th y must b installed on both right and left sid s of car at ith r front or r ar brak s, or on all four wh ls.*

►*HEAVY DUTY LINING NOTE:* Heavy duty lining is available for use on Police, Ambulance, High Performance, and other heavy duty vehicles for increased lining life and to prevent brake fade.

►*MASTER CYLINDER PUSHROD PRODUCTION CHANGE & REPLACEMENT NOTE:* 1/8" longer master cylinder pushrod used on later production cars with manual brakes. This pushrod will raise brake pedal height about 1". Only this pushrod will be furnished for replacement.

►*BRAKE LINING REPLACEMENT CAUTION:* Use only a lining set with same color identification as used on opposite wheel.

►*REAR WHEEL REMOVAL CAUTION:* **Do not apply service brakes to hold shoes against drum while using wheel puller.** To hold hub and drum from turning while using wheel puller, back off brake shoes from drum with adjusting cams. Apply hand brake and allow one rear wheel to remain on floor, or block wheel in suitable manner.

DESCRIPTION: These hydraulic brakes have three raised platforms (for each shoe) pressed into dust shield and three contact loops on each brake shoe so that shoe will ride on the platforms. An additional loop in brake shoe is for the attachment of return spring. The platforms act as guides to maintain proper shoe alignment and to reduce vibration and noise. Return spring is hooked in center of brake shoe eliminating need for flat guide springs. On front wheel brakes, two single piston cylinders (single action) are attached to support plate assembly, the upper cylinder actuating the front shoe and the lower cylinder actuating the rear shoe. On rear wheel brakes one double piston cylinder (double action) is attached to top of support plate assembly and actuates both brake shoes. An anchor pin in support plate assembly holds spring link in fixed position at one end. The other end of link is positioned by brake shoe adjusting cam, providing constant-loaded spring length. Side rattle and twisting of shoe is controlled by shoe retainer spring which maintains a constant pressure against platforms.

ADJUSTMENTS: Place car on stands, so that all four wheels are free. Check master cylinder and see that fluid level is not over ½" below top of cylinder. Place parking brake lever in fully released position.

Brake P dal Adjustm nt: *NOTE – Pedal freeplay adjustment not required on cars with manual brakes. The master cylinder has a fluted dust boot and retainer*

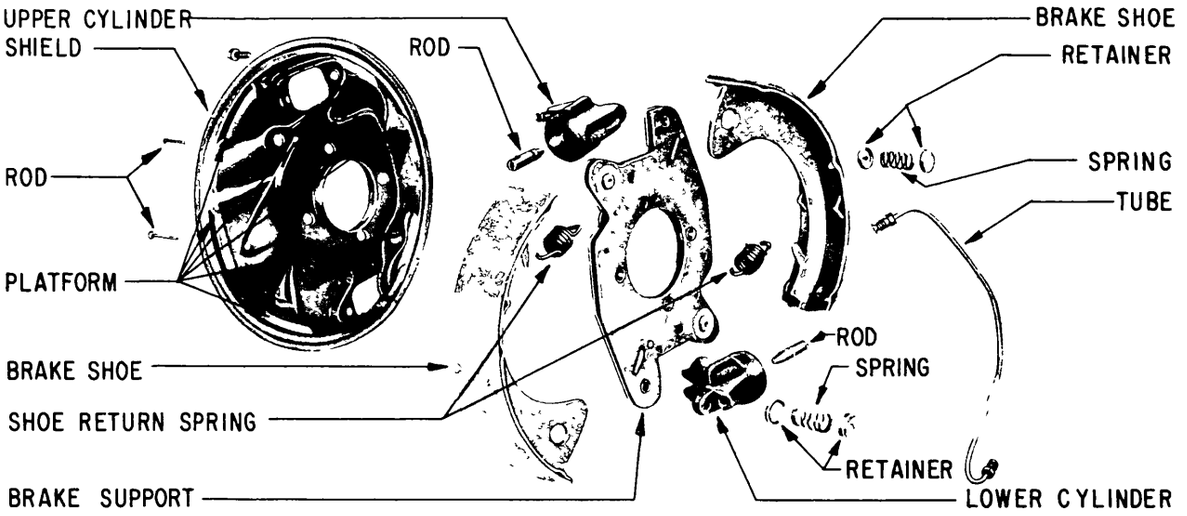
CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "THREE PLATFORM" TOTAL CONTACT BRAKES (Con..)

and th retainer acts as a master cylinder piston stop. There is no pedal stop and no pedal mounted pedal r turn spring. How ver, on later 1961 cars, a pedal r turn spring has been incorporated over master cylinder pushrod boot and held in place by a retainer ring in a groove in master cylinder pushrod. This pedal return spring and retainer may be installed on earlier cars if desir d.

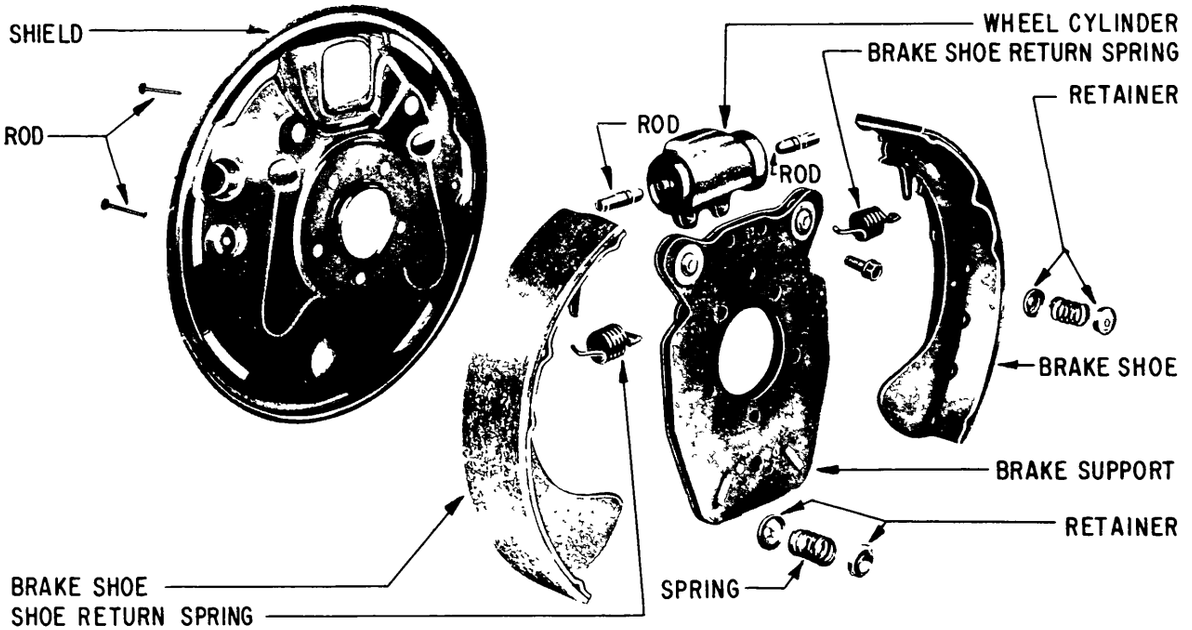
P w r Brak s – *For complete pedal freeplay and linkage adjustm nt, see Chrysler Corp. Oval Piston Type or Bellows Type Pow r Brake Units in this section.*

Front Wheel Adjustm nt: Turn each adjusting cam on both front shoes in the direction of FORWARD wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction (each cam a little at a time) until no drag is felt.



Rear Wh el Adjustment: Turn front shoe adjusting cam in direction of **f rward** wheel rotation and rear shoe adjusting cam in direction of **reverse** wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction until no drag is felt.

►*RELINED OR NEW SHOE ADJUSTMENT NOTE:* Apply brake pedal prior to adjusting brakes to properly center shoes in brake drum and to assist in adjustment.



Hand Brake Adjustm nt (External Type): Disconnect control cable at brake operating lever. With a feeler gauge between brake lining and brake drum at brake band anchor, adjust anchor screw to obtain .015–.020" clearance between lining and drum. Install lock wire through head of anchor screw and anchor bracket. Adjust lower half of band by tightening guide bolt until there is a slight drag, then release bolt until drum can be rotated freely by hand. Tighten guide bolt lock nut. Tighten adjusting bolt nut until there is a slight drag on drum, then back off until drum rotates freely. Tighten adjusting lock nut. Connect operating cable to lever. Pull cable through firewall and tighten "V" nut at parking brake pedal assembly until nut is finger tight, then tighten nut 3 additional turns. Parking brake should be free of any drag. If brake pedal depresses more than 3½" from fully released position, readjust the brake.

Hand Brake Adjustment (Internal Type): With adjusting screw cover plate removed, turn adjusting nut until slight drag is felt on drum, then back off adjusting nut at least one full notch or until drum is free. *NOTE – Two raised shoulders on adjusting nut must be seated in grooves on adjusting sleeve.* Tighten cable adjusting "V" nut at parking brake pedal assembly finger tight, then an additional 3 complete turns. Parking brake should be free of any drag. If brake pedal depresses more than 3½" from fully released position, readjust the brake.

BLEEDING BRAKE SYSTEM: Use compressed air refiller, Tool C-3496 attached to master cylinder to keep master cylinder filled. Back off adjusting cams all the way, then starting with right rear wheel cylinder, attach bleeder hose, Tool C-650 to valve, with other end in jar partially filled with brake fluid. Bleed intermittently, opening and closing valve (at wheel cylinder) until fluid runs out of bleeder hose in a solid stream without bubbles. Repeat this operation on left rear wheel, right front wheel and finally left front wheel. At front wheels (with two cylinders), bleed lower cylinder first to force air out of connecting line to upper cylinder, then bleed upper cylinder. Repeat bleeding operation if brake action indicates air still in lines. Readjust cams after completing bleeding operation.

THREE-PLATFORM TOTAL CONTACT BRAKE ASSEMBLY - FRONT WHEELS

THREE PLATFORM TOTAL CONTACT BRAKE ASSEMBLY - REAR WHEELS

BRAKE SHOE REPLACEMENT: Removal - 1) Remove wheel, hub and drum assembly using puller C-845 to remove drum assembly.

2) Insert wrench C-3462, in the inner support plate hole, with tool cam slot engaging the spring hook. Turn tool handle to disengage spring from spring link, and turn handle in opposite direction to release the spring. Remove both springs in this manner. *CAUTION* - Do

CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "THREE PLATFORM" TOTAL CONTACT BRAKES (Cont.)

not use brake spring pliers or damage to lining will result

3) Turn brake shoe guide spring retainer 1/4 turn and remove (the lip on end of spring is for correct positioning on outer support assembly) Slide shoes from support assembly

Installation: 1) Position brake shoe in support plate, (make sure that wheel cylinder pushrods properly engage toe end of shoes and that shoes are in alignment),

2) Check tension of springs by hooking a spring scale at toe end of shoe and pulling shoe away from wheel cylinder. Scale should read 45-55 lbs. to move shoe off wheel cylinder. If more than 55 lbs. is required to move shoe, check for cause of drag. If less than 45 lbs. is required to move shoe, replace with new return springs (*see "Brake Drag, Pull or Too Frequent Brake Adjustment" above*).

1961 BRAKE SIZE APPLICATION

Car Model	Brake Size
Chrysler Newport & Windsor (Exc. Station Wagon)	11"
Chrysler Newport & Windsor Station Wagon	12"
Chrysler New Yorker, 300G, & Imperial	12"
DeSoto & Dodge (Polara)	11"
Dodge Dart & Plymouth (Std. Cars)	11"
Dodge Dart & Plymouth (High Perf. Cars) Std.	11"
Dodge Dart & Plymouth (High Perf Cars) Optl.	12"
Dodge, Dodge Dart, & Plymouth (Police Cars)	12"

1961 PARKING BRAKE SPECIFICATIONS

Drum Diameter	Width	Lining Length	Thickness
6" ①	2"	16 68"	5/32"
7" ②	2"	③ 6.53"	5/32"

① - External Contracting type.
② - Internal Expanding type. ③ - Each shoe.

LINING REPLACEMENT: Drum diameter should not exceed 004" out of round at any point Grind lining to specified clearance of 010"- 024" below drum diameter

►*BRAKE BACKING PLATE & BRAKE SHOE LOOP NOTE* Platforms for each shoe must be uniform in height and flatness (use surface gauge to check) and mating loops on brake shoes must be uniform and smooth Replace backing plate when platform heights vary more than 010"

WHEEL CYLINDER & SUPPORT PLATE: Removal & Disassembly - 1) Disconnect flexible brake hose at wheel cylinder (upper cylinder on front), and remove wheel cylinder mounting screws and lockwashers at rear of brake shield

2) Remove support plate mounting bolts and remove support plate with wheel cylinders and connector tube attached

3) With assembly on bench, remove cylinder connector tube and wheel cylinders

Assembly & Installation: 1) Assemble wheel cylinders on support plate (Install connector tube on front assembly)

2) Position support plate on brake shield and install cylinder mounting screws and lockwashers, but do not tighten

3) Install support plate bolts, lockwashers and nuts Tighten to 35 ft lbs and cylinder mounting screws to 20 ft lbs

WHEEL CYLINDER OVERHAUL: Wheel cylinder pistons that are badly scored or corroded should be replaced Use new piston cups when reconditioning cylinders Cylinder walls that have light scratches, or show signs of corrosion, can usually be cleaned up with crocus cloth Cylinders that have deep scratches or scoring, may be honed using Tool C-3080 Diameter of cylinder bore should not be increased more than 002" If a cylinder does not clean up at 002" it should be replaced (*NOTE* - Black stains on cylinder walls are caused by piston cups and will do no harm)

MASTER CYLINDER: Removal – Remove pushrod clevis pin and disconnect pushrod from pedal. Disconnect brake pipe and stop light switch wires. Remove attaching bolts and remove master cylinder.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Manual*

Chevrolet Pass. Cars (1961)
Chevrolet Corvair Cars & Trucks (1961)
Chevrolet Corvette (1961)
Chevrolet Truck, Series 10, 20, 30 (1961) Front & Rear
Chevrolet Truck, Series 40, 50, 60 (1961) Front Only ①
① — For Rear Brakes, *see "Chevrolet Truck Twinplex" in this section.*

►CHANGES, CAUTIONS, CORRECTIONS

►*PASS. CAR & HALF-TON BRAKE SHOE GRINDING CAUTION:* If bench grinder used, grind shoes to .057-.087" smaller than drum size. If spindle grinder used, grind shoe to drum diameter.

►*BRAKE DRUM REPLACEMENT CAUTION:* Use suitable volatile non-toxic greaseless type solvent to clean oil from braking surface of drum before drum is installed.

►*METALLIC BRAKE LINING CAUTION:* This special purpose optional type lining may be used with the old standard drums provided surface of drum is smooth. Service adjustments are the same as for standard brakes except as noted in data below.

►*BRAKE SHOE ANCHOR PIN INSTALLATION CAUTION:* Tighten brake shoe anchor pins to torque indicated in table below.

Anchor Pin Tightening Torque

Car Model	Ft. Lbs.
Pass. Car (Except Corvair)	65
Corvair (Front)	60—85
Corvair (Rear)①	100—125
Truck, Series 10 (Front & Rear)	100—125
Truck, Series 20, 30 (Front & Rear)	150—175
Truck, Series 40, 50, 60 (Front)	150—175

①—Anchor pin is fixed on Corvair Truck Rear Brake.

DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric adjustment.

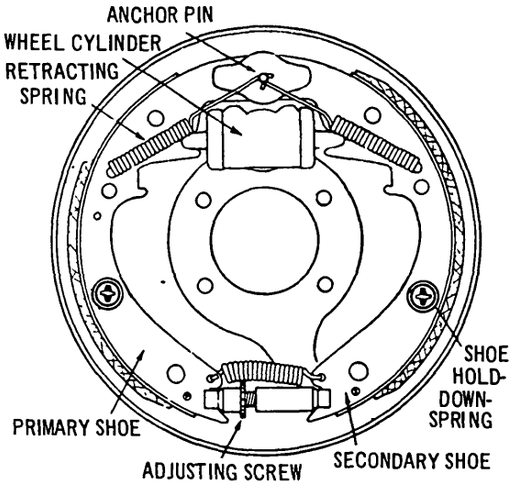
►*METALLIC LINING SERVICE NOTES:* When servicing the special purpose optional type lining it is important that the items below are followed:

Pull Back Spring Installation - Heat resistant type springs used as follows; PINK pull back springs must be used with front primary shoes and both rear shoes. YELLOW pull back springs must be used with front secondary shoes. Use GREEN hold down springs on all eight shoes. Paint on the springs will become blistered and burnt in operation but does **not** indicate that springs have been excessively hot.

Hold Down Spring Cup Installation - Install large hold down spring cup against web and small cup at outer end of hold down spring.

Drum Replacement - Blue heat discoloration is normal and drum should not be replaced if surface of drum is smooth.

ADJUSTMENT: Adjustments are made differently for wear (Minor Adjustment) and for new lining or shoe assemblies (Major Adjustment).



Brake Pedal Adjustment: Before adjustments made, make sure pedal returns to fully released position freely, with no binding, and that pedal retracting spring has not lost its tension.

Passenger Cars - 1/8"-3/8" pedal movement before contact of pushrod and main cylinder piston. To adjust, loosen check nut on clevis. Turn pushrod in proper direction to secure adjustment. Tighten check nut.

Corvair Trucks – With projection on head of pushrod pivot bolt toward front of truck, rotate bolt in either direction until 1/8" brake lever freeplay is obtained. Measure freeplay at bottom of pedal post underneath truck.

Trucks (With Eccentric Bolt Type Adjustment) - Rotate eccentric bolt (located at point master cylinder pushrod connects to brake pedal) to obtain a free pedal travel of 1/8" measured at center of pedal pad. *NOTE - Stop light switch should be adjusted to make electrical contact at approximately 13/16" pedal travel.*

Trucks (With Threaded Rod Type Adjustment) - Adjust pushrod so that pedal free travel measured at center of pedal pad is 1/8". *NOTE - Stop light switch should be adjusted to make electrical contact at approximately 13/16" pedal travel.*

FRONT BRAKE ASSEMBLY

Minor Adjustment (For Wear): Jack all wheels clear of floor. On passenger cars, loosen check nut at brake cable equalizer to remove tension from brake cable. On trucks, disassemble clevis of parking brake pull rod. On all cars and trucks, remove adjusting hole covers from flange plates. Expand brake shoes by turning adjusting screw with Tool J-4707 until a light uniform drag is felt on brake drum (move outer end of tool toward center of wheel to expand shoes). Now turn adjusting screw in opposite direction specified number of notches as listed in table below to relieve brake drag. Replace adjusting hole covers, reconnect and adjust parking brake.

CHEVROLET-BENDIX HYDRAULIC (C nt.)

Brak Sh Adjustm nt Sp cifications

Car Model	Notches
Pass. Cars (Except Corvair)	12
Corvair Cars & Sta. Wagon (Front & Rear)	12
Corvair Trucks	12 (Front), 15 (Rear)
½—Ton Truck	12
Other Trucks	7

►*MAJOR ADJUSTMENT NOTE: All brakes have "fixed" anchor pins and major brake adjustments are not required.*

HAND (PARKING) BRAKE: Passenger Cars and ½ & ¾ Ton Trucks adjusted differently. 1, 1½, 2 and some ¾ Ton Trucks have propeller shaft mounted parking brakes. *CAUTION* - Service brakes must be properly adjusted before making parking brake adjustment.

Adjustment (Chevrolet Pass. Cars): *NOTE - A spring loaded pedal return and a ratcheting mechanism to p rmit a second stroke of pedal, if necessary, is used. Parking brake application is assured even if rear service brakes are out of adjustment. Pedal returns to normal position after each stroke and will not indicate brake application. When parking brake is applied, the release handle will "pop out" about 2", indicating that brakes are applied. If more than two strokes are r quired to set brakes, check both service and parking brake adjustment.* Raise rear wheels and check location of idler lever with respect to swivel rod bracket on frame for correct front cable adjustment. To adjust front cable, disconnect equalizer and adjust check nuts on forward cable for correct clearance (clearance will be correct even after long periods of service). Depress parking brake pedal 6 notches from fully released position (release lever fully out) and adjust equalizer adjusting nuts for slight drag on both rear wheels. Tighten check nuts and release parking brake. No drag should be felt.

Adjustm nt (Corvair): Raise rear of car and pull parking brake lever up 4 notches from fully released position. Loosen forward check nut on equalizer and tighten the rear one until a heavy drag is felt at rear wheels. Tighten check nuts securely. Fully release parking brake and rotate rear wheels; no drag should be felt.

Adjustment (Corvette): Pull hand brake out 7 clicks of pawl (not notches). Loosen check nuts on cable ends, then turn forward check nuts against clevis plates until a moderate drag is felt when rotating brake drums. Tighten check nuts and set parking brake lever to 2 notches from full released position. No drag should be felt.

Adjustment (Trucks Without Propeller Shaft Parking Brake): With service brakes properly adjusted, raise rear wheels and apply parking brake lever 4 notches from a fully released position. Loosen jam nut on threaded rod at end of forward cable. *NOTE - If threaded rod length is insufficient to obtain adjustment, move primary lever to next supplemental adjusting hole toward rear of truck.* Tighten rear nut on threaded rod until a light drag is felt at rear wheels, then tighten jam nut and lower truck to floor. Test parking brake.

Adjustment (¾ & 1 Ton Trucks using propeller shaft mounted parking brakes): Adjust clevis on brake pull rod so distance from end of rod to center line of clevis pin hole is 1 7/16". Place the hand brake lever in fully released notch of ratchet sector. Loosen locknut on brake pull rod. Remove cotter pin from clevis pin holding brake rod to brake cam (leave loose). Set brake cam rest flat on upper brake band bracket. Back off adjusting nuts (at lower end of spring) and adjusting nut at top of adjusting bolt (bolt joins lower part of band to bracket). *(CAUTION* - Do not remove nuts, loosen only). Remove lock wire from anchor screw. Adjust anchor screw until there is .010-.015" clearance between lining and drum at anchor screw. Tighten adjusting bolt (bolt without spring) until there is .020" clearance between drum and lower end of brake band. Tighten locknut. Tighten adjusting nut at lower end of spring until there is .020" clearance between drum and upper end of brake band. Tighten locknut. Adjust brake pull rod so clevis pin can be installed while brake cam rests flat on upper brake band bracket. Install cotter pin in clevis pin of brake pull rod and tighten locknut on brake pull rod. Install lock wire on anchor screw. Recheck all points of facing for correct clearances.

Adjustment (1½ & 2 Ton Trucks): Propeller shaft mounted, shoe type. *See "Chevrolet Twinplex" for data.*

MASTER CYLINDER: Removal (Pass. Cars & C rvair Cars) – Disconnect hydraulic line from master cylinder. On Chrevolet, disconnect brake pedal arm from pushrod. On Corvair, remove pedal return spring. Remove master cylinder attaching bolts and remove master cylinder. *CORVAIR CAUTION – Use extreme care to prevent brake fluid contamination of interior of car.*

Removal (Corvair Trucks) – Disconnect hydraulic line from master cylinder and remove master cylinder from beneath truck.

Removal (Chevrolet Trucks) – Disconnect clutch and brake pedal return springs. Remove pushrod boots and brake pipes from master cylinder. Remove attaching bolts and remove master cylinder.

Filling (All Models) – Maintain fluid to within ½" below reservoir filler opening.

BLEEDING BRAKE SYSTEM: *S "Hydraulic Brak Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brak Trouble Shooting" in Brake Section of Manual.*

CHEVROLET TRUCK TWINPLEX

Chevrolet Trucks, Series 40, 50 60 (1961) Rear Only Ⓒ
Ⓒ – For Front Brakes, see *"Chevrolet-Bendix Hydraulic" in this section.*

DESCRIPTION: Two cylinder, four anchor type (each shoe anchored at each end and linked to wheel cylinder at each end). Brakes are radially self-centering.

ADJUSTMENT: Each shoe has one adjustment (adjusting screw at adjustable anchor end). Adjustment is same for both wear and for new or relined shoe clearance.

Brake Pedal Adjustment: *See "Chevrolet-Bendix Hydraulic" for data.*

Brake Shoe Adjustment: Jack up both rear wheels, remove adjusting hole covers from backing plates (two holes at each wheel–one for each shoe). Use tool J-4707 or screwdriver inserted through rear (lower shoe) adjusting hole and turn adjusting screw up (move outer end of tool toward center of wheel) until light brake drag is felt on wheel, then back off adjusting screw 3 notches for correct running clearance. Adjust upper shoe similarly by inserting tool through front adjusting hole.

Parking (Hand Brake) Adjustment: Parking brake is independent type mounted on propeller shaft at rear of transmission.

1½ & 2 Ton–Fully release brake lever. Loosen locknut on outer shoe adjusting screw then tighten to secure a clearance of .010" to .015" measured at point directly above screw. Tighten locknut. Loosen locknut on link between hand brake lever and shoe actuating lever. Tighten adjusting nut on link to secure a clearance of .010" to .015" between inner shoe and drum. Tighten locknut.

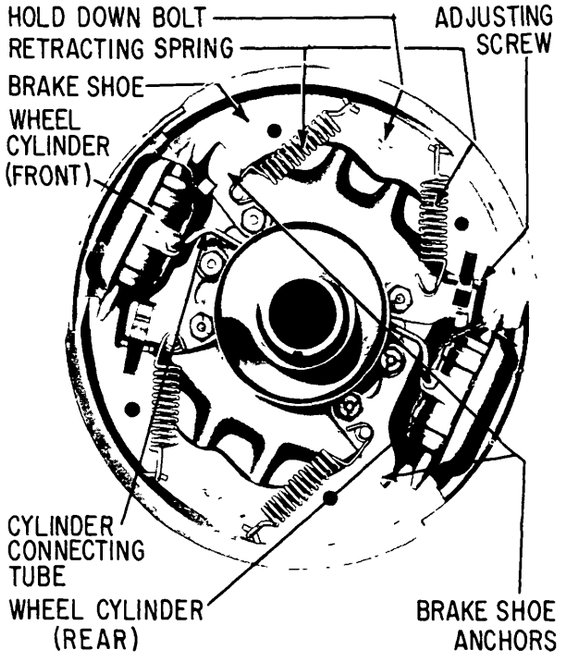
Tilt Cab Over–Center Lever Adjustment – With lever fully released, turn adjusting knob until cable link pivot is at bottom of guide slot. *Adjust parking brake as detailed above.* Turn lever adjusting knob as required to obtain over–center locking position.

MASTER CYLINDER: Removal & Filling – *See "Chevrolet-Bendix Hydraulic" in this section.*

BLEEDING BRAKE SYSTEM: Pressure or manual methods can be used.

Pressure Bleeding: 1) Back off adjusting screw all the way on upper shoes of both rear wheels. Fill master cylinder reservoir to top of filler plug opening. Connect pressure bleeder to master cylinder and open valve in bleeder tank line. *(NOTE*–Bleeder tank should be charged with 25-35 lbs. air pressure and kept at approximately this pressure during bleeding operation. End of bleeder tube must be in a bleeder jar or bottle and covered with fluid while performing bleeding operations). 2) Connect bleeder tube to bleeder valves in following sequence, open bleeder valve and bleed until all air bubbles disappear, then close bleeder valve. Sequence as follows:

a) Hydrovac slave cylinder (bleeder valve on end cap). *NOTE* - Will take approximately ½ pint of fluid.
b) Hydrovac valve (bleeder valve on top of control valve).
c) Right front wheel.
d) Left front wheel.
e) Right rear wheel, front cylinder.
f) Left rear wheel, front cylinder.



3) Adjust upper shoe on each rear wheel with pressure tank still connected. Push down hard on brake pedal several times to centralize shoes. Disconnect pressure tank and readjust all brake shoes..

4) Apply approximately 75 lbs. pressure on brake pedal and check pedal clearance from toe board to forward edge of pedal pad. Clearance should be a minimum of 5" with floor mat removed. If reserve less than 5", rebleed Hydrovac and rear brakes in sequence outlined above.

Manual Bleeding: 1) Install adapter and automatic filler J-713. Connect bleeder tube to Hydrovac bleeder valve (on end cap). Place end of tube in container having sufficient fluid to cover end of tube.

2) Open bleeder valve approximately ¾ of a turn, depress brake pedal a full stroke and allow it to return slowly, making sure end of tube is under surface of liquid in container. Continue operating pedal, refilling jar at master cylinder when necessary, until liquid emerging from bleeder tube is air bubble free. Close bleeder valve. Proceed to bleed system as outlined in steps 2) b) through f), 3) and 4) under "Pressure Bleeding" above, using automatic filler in place of pressure tank.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Manual.*

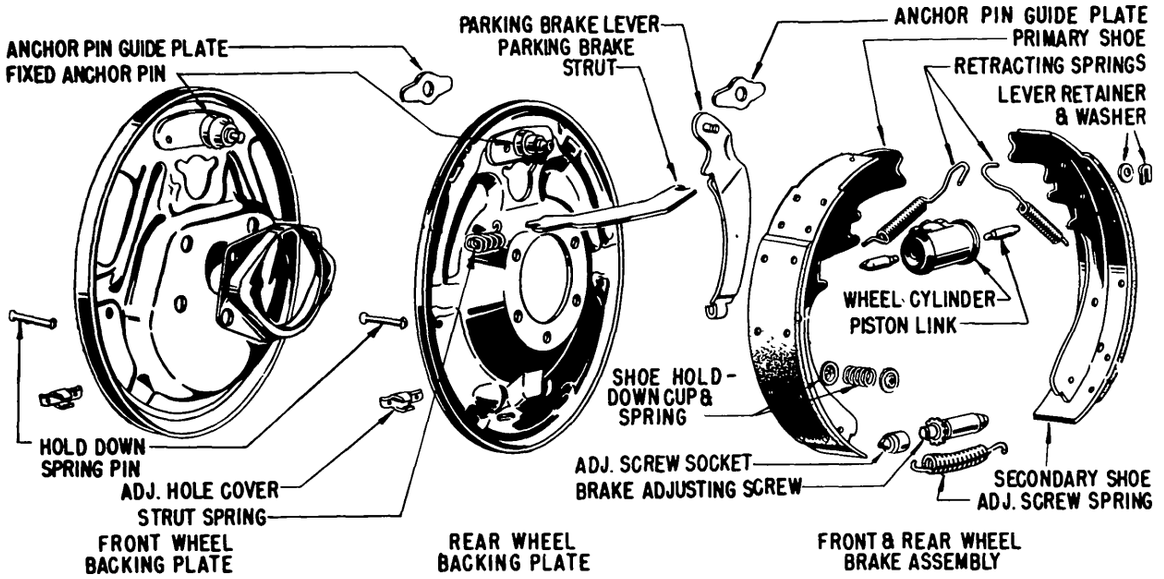
FORD BENDIX HYDRAULIC

Comet, All Models (1961)
Falcon, All Models (1961)
Econoline Trucks, All Models (1961)
Ford Trucks, F-100 (1961) Front & Rear
Ford Trucks, F-350, P-400 (1961) Rear Only ①
①—"Ford Truck Bendix Uni-Servo" type used on Front.

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 COMET & FALCON BRAKE PRODUCTION CHANGE & SERVICE NOTE:* Approximately February 8, 1961 the following changes in brake design were made:
Brake Shoes – Brake shoe web thickness increased from 3/16" to 7/32". Other corresponding parts of the brake have been changed to accommodate the thicker shoe web. *NOTE* –To prevent interference with rear wheel brake drum in some cases, grind 1/16" from end of brake retracting spring where loop is inserted in brake shoe.
Front Wheel Cylinders –Orificed metal baffle installed in cylinder with piston return spring between baffle and primary piston (no spring between baffle and secondary piston). Piston return spring is shorter. *CAUTION* - Do not hone this type cylinder. Also, use care when bleeding system so no air is trapped by orificed baffle.

►*1960-61 COMET & FALCON BRAKE SQUEAL CORRECTION:* On cars **without** brakes with thicker shoe webs *(see "Production Change" above)*, convert early type brakes to later type by installing thicker web shoes and new brake adjusting screw and socket assembly having wider notches to accommodate thicker web shoes. To correct squeal on all cars, there should be 2 insulators, No. C2DZ-2A482-A, installed inside socket at end of adjusting screw. Ribbed type socket with a flat base to the bore **must** be used. There must be 1/16"-1/8" clearance maintained between end of socket and near edge of adjusting screw star wheel when assembly installed in the brake (add or remove 1 insulator as necessary). *Apply lubriplate to adjusting screw threads only. DO NOT lubricate socket.*



DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric. Anchor pins are fixed and are not adjustable.

ADJUSTMENTS: Before making any adjustments, jack up all four wheels, check brake pedal clearance (see below), fully release hand brake lever and make certain that all wheels turn freely. Parking brake cables should be disconnected when car raised on frame hoist.

Brake Pedal Adjustment: Adjust as follows:
Comet, Falcon, Econoline – 1/4–7/16" (Falcon & Econoline), 5/16–7/16" (Comet) pedal freeplay. Loosen master cylinder pushrod–to–brake pedal eccentric bolt locknut and rotate bolt until freeplay is within specifications.
Ford Trucks – 3/16–3/8" pedal freeplay. On F Series, loosen locknut on eccentric bolt connecting master cylinder pushrod to brake pedal and rotate bolt as necessary. On P Series, turn hex head on master cylinder pushrod to obtain proper adjustment. Tighten locknut to 30–35 ft. lbs.

Parking Brake Adjustment: With service brakes properly adjusted, adjust parking brake as follows:
Comet & Falcon – Pull release handle 3 notches from fully released position. Turn front nut on equalizer several turns forward, then turn rear nut forward until cables prevent forward rotation of rear wheels. Tighten front nut against equalizer. Release the handle.
Econoline – Pull release handle 1 notch from fully released position. Turn front nut on equalizer forward several turns, then turn rear nut forward until there is a medium drag at rear wheels. Tighten front nut against equalizer. Release the handle.
Ford Trucks - With parking brake handle fully released, turn nut on front of equalizer several turns forward. Turn rear nut forward until cables are just tight enough to remove all slack. Tighten front nut against equalizer. *NOTE – For propeller shaft mounted parking brakes, see "Ford Truck Self-Centering" brakes in this section.*

Minor (Wear) Adjustment: Comet & Falcon – Remove adjusting hole cover and turn adjusting screw until there is a slight drag on the drum, then back off adjusting screw until wheel turns freely.
Econoline – Remove adjusting hole cover and turn adjusting screw until there is a moderate drag on the drum, then back off adjusting screw 10 notches to allow wheel to turn freely.
Ford Trucks – Remove adjusting hole cover and turn adjusting screw until the shoes drag against the brake drum, then back off adjusting screw 10–12 notches so wheel turns freely.

FORD TRUCK FRONT AND REAR BRAKE

MASTER CYLINDER: Removal (Comet & Falcon) – Disconnect rubber boot, brake lines, and stop light switch wires from master cylinder. Remove attaching bolts and remove master cylinder.

Filling – Maintain fluid to within 3/8" (Falcon), 1/4" (Comet) from top of reservoir.

Removal (Econoline) – Remove forward splash shield and disconnect brake pedal return spring. Remove pushrod eccentric bolt. Remove snap ring from brake pedal pivot pin. Remove brake pipe outlet fitting bolt and washers (outlet fitting will be disconnected from master cylinder). Remove mounting bolts and remove master cylinder (swing down and remove from brake pedal pivot pin).
Filling–Maintain fluid to within ½" of top of reservoir.

Removal (Ford Trucks) – *See "Ford Bendix Uni-Servo" brakes in this section.*
Filling – Maintain fluid to within ½" of top of filler neck.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

1961 COMET, FALCON & ECONOLINE HYDRAULIC BRAKE & LINING SPECIFICATIONS
►*FOR FORD TRUCK LINING SPECIFICATIONS, SEE "FORD TRUCK SELF-CENTERING" DATA.*

Car Model	Drum Diameter Front	Drum Diameter Rear	Wheel Cyl. Diameter Front	Wheel Cyl. Diameter Rear	Master Cyl. Diameter	Lining Width Front	Lining Width Rear	Lining Thickness
Falcon	9"	9"	1.062"	.8125"	1"	2.25"	1.50"	
Comet	9"	9"	1.062"	.8125"	1"	2.25"	1.50"	
Econoline	10"	10"	1.125"	.8125"	1"	2.50"	1.75"

FORD TRUCK SELF-CENTERING

F rd Trucks, F–500, 600; B–500, 600; P–500; C–550, 600 (1961) R ar Only ①

① – "Ford Bendix Uni–Servo" used on Front.

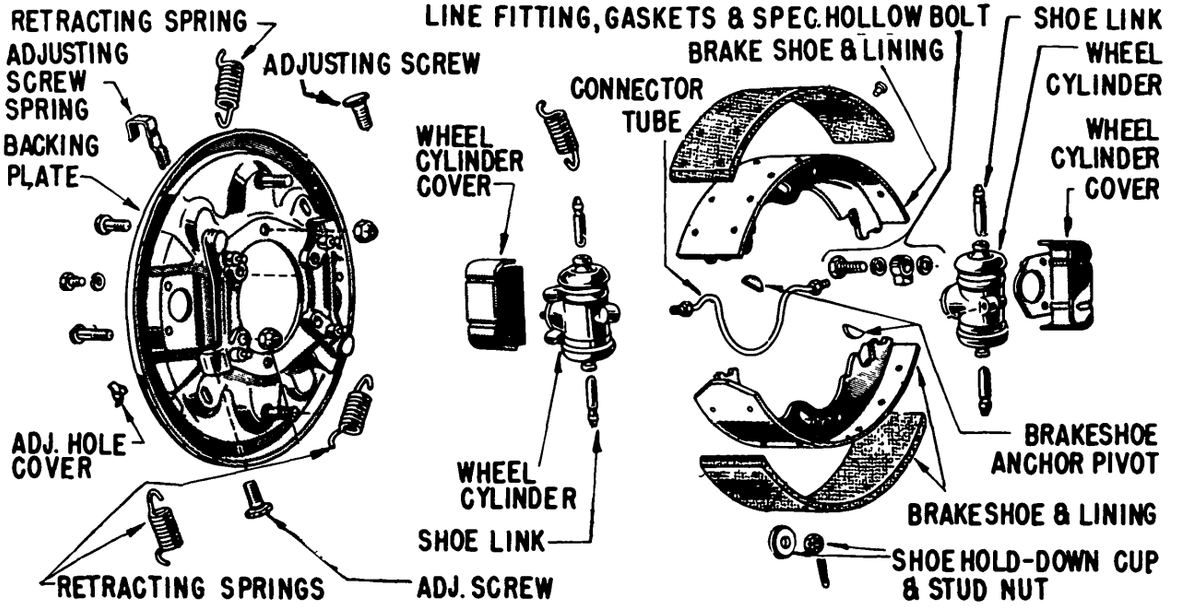
DESCRIPTION: Two cylinder, two shoe, four anchor type hydraulic brakes. Each shoe is anchored at each end and linked to wheel cylinder at each end so that all shoes are self–energizing for both forward and reverse motion. All shoes are radially self–centering.

ADJUSTMENT: W ar Adjustment – With wheels raised, remove adjusting slot covers. Turn rear (secondary shoe) adjusting screw until brake shoe drags against drum. Back off adjusting screw so drum rotates freely. Depress brake pedal to center the shoes, then back off adjusting screw one additional notch. Repeat procedure for primary shoe.

Brak P dal Adjustm nt: 3/16–3/8" pedal freeplay. On F, B & C Series, loosen locknut on eccentric bolt connecting master cylinder pushrod to brake pedal and rotate bolt as necessary. On P Series, turn hex head on master cylinder pushrod to obtain proper adjustment. Tighten locknut to 30–35 ft. lbs.

Parking Brak Adjustm nt: External Band Type – On cable controlled type, move parking brake lever to fully released position. On rod type linkage, set lever at first notch. Flat part of adjusting rod cam must rest on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, then adjust clevis rod as necessary. Install clevis pin and cotter pin. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise to obtain .010" clearance between brake lining and brake drum at anchor bracket. Loosen locknut on adjusting screw for lower half of brake band, adjust screw to obtain .010" clearance between lining and drum at lower half of band. Tighten locknut. Turn upper band adjusting nut for same .010" clearance. Be sure to install lock wire in anchor adjusting screw.

Int rnal Sh (9" Diam t r) Type – With parking brake lever fully released, remove linkage adjusting clevis pin. Lengthen adjusting link by turning clevis until shoes seat against drum with clevis pin installed. Remove clevis pin and shorten linkage to obtain .010" clearance between shoes and drum measured at all points around drum with clevis pin installed. Install clevis retaining cotter pin.



Internal Sh (12" Diameter) Type – Remove pin from adjusting rod clevis, loosen nuts on adjusting rod, and turn clevis so there is 1/4–3/8" free play on brake operating lever. Tighten clevis nuts and install clevis pin.

DISASSEMBLY: Make sure there is no vacuum or air pressure in system. Remove wheel and drum or hub and drum assembly. Proceed as follows:

1) Un qual Length Retracting Springs – Clamp boots against cylinder, note location of retracting springs and remove with Tool 2035–N. Remove brake shoe guide bolt lock wire, nut, washer, and bolt from both shoes, then remove shoes from carrier plate.

2) Equal Length Retracting Springs – Clamp boots against cylinder and remove retracting springs with Tool 2035–N. Remove brake shoe guide bolt cotter pin, nut, washer, and bolt from both shoes, then remove shoes from carrier plate.

FORD TRUCK SELF-CENTERING (C ntinued)

REASSEMBLY: 1) Unequal Length Retracting Springs – Position adjusting wheel, slide adjusting screw through anchor pin support and index adjusting wheel tab in slot on adjusting screw. Install and tighten adjusting wheel lock. Place brake shoes in anchor pin slot on support bracket and engage other end of shoe in cylinder link. Install shoe guide bolt, washer, and nut. Tighten nut finger tight, then back off 1 full turn and install lock wire. Install retracting springs with Tool 2035–N, making sure springs are installed in original locations.

2) Equal Length Retracting Springs – Thread adjusting screw and wheel into anchor pin support and install adjusting wheel lock. Thread adjusting wheel into support so shoe will rest against wheel end. Install brake shoe over both retracting spring anchor pins, insert ends in cylinder links and install shoe guide bolt, washer and nut. Tighten nut finger tight, then back off 1 full turn and install cotter pin. Install retracting springs with Tool 2035–N.

MASTER CYLINDER: R m val & Filling – *S "Ford Truck B ndix Uni–S rvo" brak s in this s ction.*

BLEEDING BRAKE SYSTEM: Bleed t p wheel cylinder **first,** then lower. If power unit used, unit must be bled before wheel cylinders, with engine off and no vacuum in power unit system. *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "H, draulic Brake Trouble Shooting" in Brake Section of Manual.*

FORD TRUCK BENDIX UNI-SERVO

Ford Trucks, F–250, P–350 (1961) Front & Rear
Ford Trucks, F–350, P–400 (1961) Front Only ①
Ford Trucks, F–500, 600; B–500, 600; P–500; C–550, 600 (1961) Front Only ②

①–"Ford Bendix Hydraulic" type used on Rear.
②–"Ford Truck Self–Centering" type used on Rear.

DESCRIPTION: Bendix "Uni-Servo" single anchor, hydraulic type with single-acting wheel cylinder mounted on the backing plate and actuating the primary shoe through a strut (no direct connection to secondary shoe). Brake shoes are conventional Bendix type.

ADJUSTMENTS: Make adjustments with brake drums at normal temperature and with wheels either jacked up or contacting road (if wheels on road so they cannot be checked for drag, make this check by striking drum with a hammer–sound will be deadened if shoes contacting drum).

Minor Adjustment: Remove adjustment hole cover from brake carrier plate. Rotate adjusting screw, with a suitable tool, until shoe begins to drag, then back off shoe 10-12 notches until drum can be turned without drag.

Major Adjustment: Rotate drum until feeler slot is at lower end of Secondary (rear) shoe, then insert a 010" thick feeler gauge between brake shoe and drum Rotate drum and feeler gauge up along secondary shoe until feeler is wedged between secondary shoe and drum Turn adjusting screw (star wheel) to expand shoes until a heavy drag is felt against drum, then back off adjusting screw just enough to give clearance of 010" between shoe and drum at a point 1½" from each end of secondary shoe *NOTE - This clearance will give operating clearance for both primary and secondary shoes* When this clearance cannot be obtained, anchor pin must be adjusted

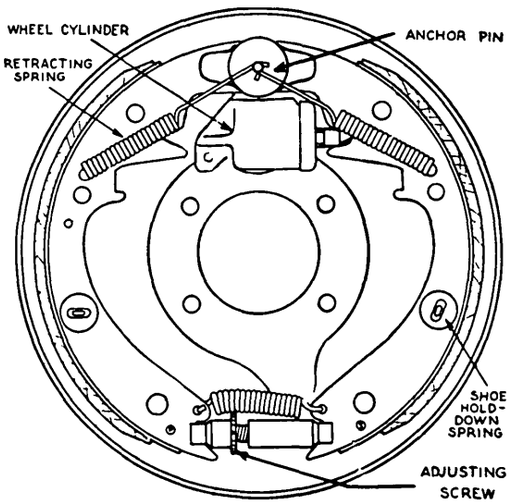
Anchor Pin Adjustment - Loosen anchor pin nut just enough so anchor pin can be moved up or down (by tapping with soft hammer) centering shoes in drum and providing the 010" operating clearance at above positions Tighten anchor pin nut to 80–100 ft lbs Check other brake assembly

Brake Pedal Adjustment: Brake pedal free travel should not be less than 3/16" nor more than 3/8" before push-rod touches master cylinder piston. Adjustable at master cylinder pushrod.

Parking Brake Adjustment (Rear Wheel): *See "Ford Bendix Hydraulic" in this section.*
Parking Brake Adjustment (Propeller Shaft): *See "Ford Truck Self–Centering" in this section.*

MASTER CYLINDER: Removal (F & B Series) – With all air pressure or vacuum removed from system, disconnect stop light switch wires and brake line from master cylinder. Force as much fluid as possible from master cylinder, then disconnect rubber boot from end of master cylinder, remove attaching bolts, and remove master cylinder.

Removal (C Series) – Procedure is same as for F & B Series with access to master cylinder under floor plate.



Removal (P Series) – Procedure is same as for F & B Series after turning front wheels all the way to the left and removing fender apron for access to master cylinder.

Filling (All Series) – Maintain fluid to within ½" of top of filler neck.

BRAKE SPECIFICATIONS: *Se "Brake Specification Table" in "Ford Truck Self–C ntering" data in this section.*

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brak Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brak Tr ubl Shooting" in Brake Section f Manual.*

BENDIX UNI-SERVO BRAKE ASSEMBLY

AUBURN

Car Model	Clutch No.
Dodge Dart & Plymouth, 6 Cyl.	100131-1
Willys 4 & 6 Cyl.	Ⓒ

Ⓒ - Two types used (heavier spring used on 6 Cyl. 2-wheel drive models). *NOTE* - Rockford clutches also used on these models.

DESCRIPTION: Single plate, dry disc type of same design as used on corresponding previous models.

►*WILLYS 4-CYLINDER 9¼" CLUTCH PRODUCTION CHANGE & CAUTION:* Clutch Pressure Plate No. 907821 (replaced No. 922071) with Engine Serial No. 3J-170142, 1T-89315 and 4J-284064. DO NOT use this assembly on any 9¼" assembly designed for L6-226 4x2 vehicles as interference between pressure plate assembly and clutch housing will result.

►*WILLYS L6-226 4x2 CLUTCH DISC PRODUCTION CHANGE & VIBRATION CORRECTION:* New Clutch Driven Plate No. 926917 used in production starting with Engine Serial No. S-16923 to reduce clutch vibration. Install this driven plate for replacement and vibration correction.

PEDAL ADJUSTMENT

Dodge Dart & Plymouth 6 Cyl.: Freeplay Adjustment - Adjust self-locking nut on fork rod to provide 5/32" free movement at fork-to-pushrod pin. This will provide correct 1-1¼" pedal freeplay.

Over-Center Spring Adjustment - Release clutch pedal rod from clutch pedal and depress clutch pedal to floor. Back off over-center spring adjusting nut until free of "C" link and then tighten nut until it just contacts "C" link. Turn nut 3 turns tighter with pedal still depressed. Reconnect clutch pedal to pedal rod and check pedal effort. There should be 25 lbs. effort required to produce a 5" pedal stroke (1-1¼" from floor) and 10-12 lbs. on return stroke. If effort required too high, tighten adjusting nut; if too low, loosen nut. Initial effort required to start pedal movement should be 5-7 lbs. If more than 7 lbs., screw in over-center spring stopscrew and rubber bumper (below and at right angle to "C" link and spring). If pedal hangs up at about 1" of travel, screw bumper out. Tighten locknut.

Willys Freeplay Adjustment: 4 Cyl. (Jeep & Jeep Dispatcher) - 1½" pedal freeplay. To adjust freeplay, loosen yoke locknut on cable between throwout lever and cross shaft lever and turn yoke as required.

4 Cyl. (Trks. and Sta. Wgn. Exc. FC-150) - 1" pedal freeplay. To adjust, loosen control rod locknut and screw adjusting nut (on threaded connection between clutch control lever and control tube lever) in or out. Retighten locknut.

6-226 Models (Exc. FC-170) - 1" pedal freeplay. To adjust, loosen locknuts on pedal adjusting rod. Turn nuts forward to increase or backward to decrease freeplay. Tighten both locknuts against trunnion (without changing adjustment).

FC-150 & FC-170 Models - ½" pedal freeplay. To adjust, change cable length so pedal has ½" free movement from fully engaged position before resistance is felt.

REMOVAL

Dodge Dart & Plymouth 6 Cyl.: Remove transmission. Pull out release bearing and sleeve. Mark cover and flywheel for reassembly. Loosen clutch attaching bolts in succession a few turns at a time to release spring tension. Remove clutch assembly.

Willys: Jeep & Jeep Dispatcher - Remove transmission or transmission and transfer case. Remove engine from chassis (labor will be saved if engine is removed without bell housing). Mark pressure plate and flywheel for reinstallation of clutch. Remove clutch cover screws (turn all screws out evenly to reduce spring pressure) and remove cover assembly and clutch disc from flywheel.

Forward Control Mdls - Remove transmission or transmission and transfer case. On FC-150 models, remove bell housing from engine. On FC-170 models, remove flywheel housing pan from bottom of housing. On all models, mark pressure plate and flywheel for reinstallation. Loosen attaching screws evenly (to release spring pressure and prevent distortion of bracket), then remove clutch assembly from flywheel.

Utility Models - On 6-226 models (with split bell housing), disconnect both front and rear propeller shafts and pull transmission to rear sufficiently to clear transmission main driveshaft from clutch, then remove bottom pan from bell housing. Mark both pressure plate and flywheel for reassembly. Loosen pressure plate to flywheel screws evenly in sequence a little at a time to prevent distortion of clutch bracket. Remove assembly from vehicle.

OVERHAUL: *See "Auburn Clutches" in 1959 Annual Data or later Manual edition and note the following:*

►*OVERHAUL TOOL NOTE: Use Tool C-585A (Dodge Dart & Plymouth, 6 Cyl.), C-585-C (Willys).*

Clutch Springs: Use correct springs (see table below). Replace all springs that are burned or do not meet specifications.

Clutch Spring Specifications

Model	No. & Color	Lbs. Pressure
Dodge Dart 6	3 Dark Blue	254-280 at 1 13/16"
Plymouth 6	3 Dark Blue	254-280 at 1 13/16"

DESCRIPTION: Single plate, dry disc type. Three release levers, mounted on bolts piloted in pressure plate and retained in clutch cover, actuate clutch struts which provide "knife-edge" action.

Semi-centrifugal Clutch Note - These clutches have three roller assemblies in grooves in pressure plate directly under the clutch cover. Centrifugal action on these rollers increases the pressure plate load as the engine speed increases.

►CHANGES, CAUTIONS, CORRECTIONS

►*STUDEBAKER 6 CYL. CLUTCH RELEASE SHAFT PRODUCTION CHANGE & CAUTION:* Longer release shaft Part No. 1553490 used in production with engine S-185257 or approximately Serial No. 61S-13563 for positive clutch operating shaft-to-ball stud engagement without use of ¼" spacer. Use Release Shaft 535692 on Models previous to this Serial No. and 1553490 after this Serial No.

BORG & BECK CLUTCH ASSEMBLY (TYPICAL)

►*STUDEBAKER LARK MODELS CLUTCH LINKAGE INTERFERENCE & ALIGNMENT CORRECTION:* Caused by interference between clutch pedal-to-bellcrank rod and edge of clearance hole in firewall. To correct, remove rod and lengthen rod and clevis assembly to 10¼" from center of clevis hole to pin hole in forward end of rod. Reinstall rod and adjust bellcrank-to-operating shaft rod to obtain free travel of ½-1" at pedal pad. Bend bellcrank as required for clearance.

►*STUDEBAKER LARK 6 MODELS INSUFFICIENT ENGAGEMENT OF CLUTCH OPERATING SHAFT & FLEXIBLE SUPPORT BRACKET BALL STUD CORRECTION:* A ¼" spacer Part No. 1693451 added between operating shaft bracket and frame bracket at Serial No. 61S-2281, for more positive shaft-to-ball stud engagement. To install spacer on earlier cars, remove flexible support bracket and ball stud assembly from bracket (discard bolts). Install a ¼" thick spacer between flexible bracket and frame with longer bolts G-181315 (¼"-28-1).

►*PONTIAC TEMPEST CLUTCH PILOT BEARING OIL SEAL NOTE:* New oil seal and felt used in later production with a crankshaft Part No. 542234 that has a deeper bore. When seal or felt replaced on later cars, bore of crankshaft should be 1/3 full of molybdenum disulphide grease, prior to installation of felt and seal. DO NOT use this seal and/or felt on earlier cars.

►*PONTIAC CLUTCH RELEASE FORK ASSY. PRODUCTION CHANGE:* New assembly with redesigned ball retainer spring used on later cars to improve clutch release operation.

►*PONTIAC TEMPEST CLUTCH PILOT BEARING RETAINER PACKAGE & CLUTCH RELEASE BEARING PACKAGE NOTE:* Retainer Pkg. Part No. 541359 & Bearing Pkg. Part No. 541939 released for correction of noise in clutch pedal bearing or release bearing areas.

►*PONTIAC TEMPEST "GRATING", "STICKY ACTION" OR "GRINDING" NOISE CORRECTION:* When this condition exists upon clutch release or engagement, correct by applying a light coat of high temperature grease (such as wheel bearing grease) to release fingers and contact surface of release bearing and area where fingers contact clutch cover.

REMOVAL: Chevrolet Truck - Remove transmission, see Transmission Section, then disconnect slave cylinder at clutch fork and remove bearing from fork. Press fork away from ball mounting (use screwdriver) or remove ball stud from rear of clutch housing. *NOTE - Pry retainer out of fork with small screwdriver.* Install Tool J-5824 to support assembly, loosen clutch attaching bolts gradually to release spring tension then remove tool and remove clutch assembly. *NOTE* - Mark clutch cover, flywheel and one pressure plate lug before removing clutch from flywheel.

Chrysler, DeSoto, Dodge & Lancer, Plymouth & Valiant - Remove transmission, see Transmission Section, then remove clutch housing pan and dust seal. Disconnect release fork rod at fork. Remove fork pull-back spring and detach fork from its pivot and remove fork, dust seal, seal and bearing. Mark flywheel, clutch cover and one pressure plate lug for reassembly and installation. Back off attaching bolts one turn at a time to release spring tension and remove assembly. *NOTE* - Keep disc facings free of grease, oil or dirt.

Pontiac - Disconnect starter lead at battery and remove propeller shaft and transmission; see Transmission Section. *CAUTION - DO NOT DAMAGE release bearing support.* Remove release bearing and fork pushrod. Remove pin and washer from clutch pedal pushrod at countershaft and disengage rod from shaft. Rotate shaft assembly to remove overcenter spring. Remove left hand pivot pin (threaded into countershaft) from shaft and move left end of shaft rearward withdrawing right end of shaft from bushing in flywheel housing. Remove starter and front flywheel housing shield. Remove flywheel housing bolts and pull housing off dowels then remove housing. Mark clutch cover and flywheel for reassembly, then loosen cover bolts gradually to release tension and remove all but top bolt. Move bottom of assembly out from flywheel and remove driven plate, then remove top bolt and clutch cover assembly.

Rambler - Remove transmission, see Transmission Section, then disconnect linkage and remove clutch housing and pan. Punch mark flywheel, clutch cover and pressure plate assembly (reassemble to same marks) and take out clutch fork. Remove clutch cover mounting screws uniformly to relieve spring tension and remove clutch assembly.

CONTINUED ON NEXT PAGE

BORG & BECK (C nt.)

Studebaker - Disconnect battery. On 6 Cyl. remove dipstick and tube and starter mounting capscrews (do not disconnect cables) and tie starter out of way. On V8 remove starter. On all models, remove clutch operating shaft. Remove transmission, see Transmission Section. Disconnect engine rear support from crossmember. Raise engine at oil pan and remove crossmember. On V8 remove clutch housing cover plate. Remove clutch housing.

NOTE - On 6 Cyl. remove dowel bolts first. Remove cover screws evenly to relieve pressure and remove clutch assembly and driven plate.

T mp st - Raise car and disconnect stabilizer bar at body frame rail. Disconnect exhaust pipe and front of torque tube from clutch housing. Support torque tube at front after lowering it enough to permit access to clutch assembly. Disconnect clutch rod from fork and accelerator linkage at pedal. Disconnect clutch linkage link from clutch housing stud. Remove clutch housing assembly with components intact. Remove clutch pressure plate and cover assembly and driven plate.

Valiant - Raise car and remove transmission, see Transmission Section. Remove clutch housing pan and disconnect clutch linkage and retracting spring at clutch fork. Remove clutch fork and release sleeve and bearing assembly. Mark cover and flywheel for reassembly and remove six cover attaching bolts. Remove cover and clutch plate.

ADJUSTMENTS: Ch vrolet Trucks - Two adjustments as follows:

Pedal T tal Trav l - *NOTE - Fill master cylinder to ½" below top of res rvoir.* Locate clutch pedal bumper to bring clutch pedal 5/8" higher (Model 60), even with brake pedal (Other models). Disconnect return spring, bottom cylinder pushrod and piston (push pushrod forward as far as possible). Pull clutch fork to rear until bearing touches levers and turn adjusting nut (behind pushrod fulcrum) until clearance between fulcrum pivot and clutch fork is 5/32" (use 5/32" diameter drill).

P dal Free Trav l Adjustment - Adjust pushrod eccentric bolt and adjustable pushrod so as to obtain free travel between master cylinder pushrod and piston. This will amount to 1/8" free travel measured at center line of pedal pad, just before pushrod contacts piston. *NOTE* - This adjustment insures piston uncovering port in reservoir.

Chrysler, D soto, D dg & Lancer, Plymouth & Valiant - Two adjustments as follows: *NOTE - Lancer & Valiant have non-adjustabl ov r-center spring.*

Pedal Freeplay Adjustment - Adjust self-locking nut on fork rod to provide 5/32" free movement at fork-to-pushrod connecting pin. This will provide correct 1-1¼" pedal freeplay.

Ov r-Cent r spring Adjustment - Release clutch pedal rod from clutch pedal and depress clutch pedal to floor. Back off over-center spring adjusting nut until free of "C" link and then tighten nut until it just contacts "C" link. Turn nut 3 turns tighter (9¼" clutch), 5 turns tighter (10", 10½", 11" clutch) with pedal still depressed. Reconnect clutch pedal to pedal rod and check pedal effort. There should be 25 lbs. effort to produce a 5" pedal stroke (1-1¼" from floor) and 10-12 lbs. on return stroke. If effort too high, tighten adjusting nut; if too low, loosen nut. Initial effort to start pedal moving should be 5-7 lbs. If more than 7 lbs., screw in over-center spring stopscrew and rubber bumper (below and at right angle to "C" link and spring). If pedal hangs up at about 1" of travel, screw bumper out. Tighten locknut.

Pontiac - Pedal Freeplay - To adjust, loosen adjusting nut locknut on clutch fork rod at clutch fork then turn adjusting nut to remove all freeplay (release bearing contacting the clutch pressure plate levers), then back off adjusting nut 3½ turns (5 turns with new driven plate) to provide correct free travel. Tighten locknut to 60-120 ft. lbs. and check pedal height.

Pedal Height Adjustment - Distance from under surface of pedal pad to floor mat should be 6-6¼". To adjust loosen pedal rod upper trunnion jam nuts and adjust.

Rambler - Pedal Freeplay Adjustment - Adjust at connecting link between throwout lever and release idler shaft assembly to obtain freeplay of ½-¾".

Studebaker - Pedal Freeplay Adjustment - Free travel ½-1". To adjust, loosen locknut on rod connecting clutch release shaft lever to clutch operating shaft lever. Turn opposite nut in or out as required. Tighten locknut.

►*HILL HOLDER NOTE:* Check setting whenever clutch pedal adjusted and adjust operating rod so Hill Holder releases at same time clutch is engaged.

Tempest - Pedal Freeplay Adjustment - Adjust self-locking nut on fork rod to provide 5/32" free movement at fork-to-pushrod connecting pin. This adjustment will provide necessary 1" free travel at pedal.

►*PONTIAC CLUTCH OVERHAUL NOTE:* Parts are not furnished and these clutches are serviced by replacement.

OVERHAUL: Mark all parts before dismantling clutch and reassemble in same position (necessary to maintain balance). Replace grooved, checked or warped pressure plates. Replace springs when pressure plate discolored from heat.

Disassembly: Place clutch on fixture or arbor press (support pressure plate under release levers), place block across cover resting on spring bosses, compress cover slightly, remove metal staking in adjusting nuts by running hacksaw blade through slot, remove nuts. Release pressure slowly, remove cover and springs. Remove release levers by grasping lever and eyebolt between thumb and forefinger, so that inner end of lever and upper end of eyebolt are pressed together, lift strut over ridge in end of lever (press lower end back against lug), lift lever and eyebolt out.

Reassembly: Place pressure plate on fixture or arbor press supporting plate under release lever lugs. Install lever, eyebolt and strut assemblies by reversing removal procedure. On semi-centrifugal models, install roller assemblies in pressure plate grooves. Install clutch springs on pressure plate. Install anti-rattle springs on release levers in cover. Place cover on pressure plate. Make certain that springs are seated in cover recesses and anti-rattle springs in place on release levers. Compress cover slowly and guide eyebolts through holes in cover. If assembly made in fixture, use clamps to clamp cover flange to plate at mounting holes. Install eyebolt nuts and turn nuts down flush with head of bolt. Compress and release clutch several times to seat all working parts. Then adjust release lever heights.

Clutch Springs: Note spring color and install in same relative position (groups of two different springs used on some clutch models). Springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

Clutch Spring Specifications

BORG & BECK (Cont.)

Release Lever Adjustment (With Borg-Warner Universal Fixtures UF-300, 400): Special lands must be installed on fixture under pressure plate lever lugs. Set adjusting arm on adjusting sleeve so that height of lower side arm above bottom of sleeve is correct for each model (see table below). Install indicating plate on levers. Adjust each lever so that it just contacts indicating plate or adjusting arm, lock lever adjusting nuts by peening nut against notches in eyebolt.

Release Lever Setting (Borg-Warner Fixtures UF-300 & UF-400)

Clutch Assembly No.	①Lever Height
926	2 3/16"
361360	2 1/4"
361407, 416, 436, 442, 449	2 5/32"
361468	2 5/16"
361483	2 9/32"
361494	2 9/16"
361505	2 3/16"

① - Using three 3J Lands and 3X Indicating Plate.

Release Lever Adjustment (Using Gauge Plate): Install clutch on flywheel in car, or on dummy flywheel on bench, with Borg & Beck Gauge Plate installed in place of regular driven member (*CAUTION* - Machined lands on gauge plate should be directly under release levers). Depress each lever several times to seat all parts, then place straightedge or sheet metal height gauge on gauge plate boss directly above release lever and adjust lever height until lever tip contacts lower edge of height gauge ("Flush" setting). *NOTE* - For "Lower" settings, gauge should have a cutout at the center equal to the setting so that lower edge of gauge will be below the top of the gauge plate boss.

(Using Borg & Beck Gauge Plate)

Clutch Model	Lever Height
8A7, & 5A7	3/16" Lower
9A7	1/16" Lower
10A7	Flush
10.5A8 (Exc. 1451)	Flush
11A9	5/32" Lower

① - Molded ② - Woven ③ - Replaces 3779872 (Early Cars).

DESCRIPTION: Single plate dry disc type with a diaphragm spring (replacing conventional clutch release springs and release levers). Diaphragm is shaped like a dished washer, with inner rim slotted to form 18 release fingers and is pivoted on inner and outer pivot rings mounted on 9 bolts in clutch cover. *NOTE* - Clutches used on 235" engine, 283" engine with 2-Bbl. Carb., and Corvair engine all have straight-finger clutches. All other models using this type clutch, have six of the fingers (18 total) bent upward with weights at outer ends to provide centrifugal action for increased clutch pressure at higher clutch speeds.

Pedal Adjustment (Std. Travel): Pass. Car - 1) Remove clip retaining swivel to clutch lever and shaft.
2) Adjust swivel to line up with dimple located on clutch lever and shaft assembly while holding fork pushrod rearward to remove all lash between release bearing and clutch diaphragm spring. Reinstall swivel. Pedal free travel will range from 1 1/4" to 1 5/8".
►*NOTE:* If pedal does not return to bumper stop or hangs up on floor pan, measure distance between lower edge of overcenter lever and flange of instrument panel brace. If this distance less than 1" ±1/8" for 235" & 283" engines or 1 1/4" ±1/8" for 348" engine, replace pedal assembly or overcenter lever.

Corvair Pass. Car - 1) Attach return spring to clutch lever control cable cross-shaft outboard lever lower hole. *NOTE* - Clutch fork pull rod must be disconnected from cross-shaft lever.
2) Adjust clevis swivel until outboard lever on clutch lever control cable cross shaft has a clearance of 1/8" to 3/4".
3) Hold pull rod to remove all slack at bearing and align swivel with upper hole of outboard lever, then back off swivel 3 complete turns and assemble swivel to lever and install clip.

Corvair Truck & Greenbrier - *NOTE* - Pedal should have at least 3/4" travel before release bearing engages diaphragm.
1) Disconnect rear clutch return spring. *CAUTION* - Front spring must be in operation to hold pedal bumper in contact with toe-board.
2) Remove retainer clip, clevis pin and washer from clutch control idler lever and remove rear cable clevis.
3) Let idler lever hang free to furnish guide for correct line of action of cable clevis.
4) Pull cable clevis rearward to remove all slack forward of this point, then pull clutch fork pull rod until all slack is taken up at clutch fork.
5) With cable clevis and pull rod in this position, adjust pull rod clevis to align holes in both clevises.
6) With pull rod clevis position established, unscrew clevis 3½ turns (lengthen rod 5/32"). Tighten jam nut.
7) Line up holes in cable clevis, pull rod clevis, and clutch fork pull rod idler lever and insert clevis pin and retainer clip. Install return spring.

Trucks - Adjust pushrod so as to obtain free travel between master cylinder pushrod and piston. This will amount to 1/8" free travel measured at center line of pedal pad, just before pushrod contacts piston. *NOTE* - This insures piston uncovering port in reservoir.

Pedal Adjustment (Total Trav l): Trucks - 1) Adjust clutch pedal bumper so clutch pedal pad (fully released) is even with brake pedal, then disconnect return spring.
2) Push slave cylinder pushrod forward as far as possible and pull clutch fork rearward until all slack is removed at throwout bearing, then turn adjusting nut behind slave cylinder pushrod fulcrum ("V" block) to obtain 5/32" clearance between fulcrum pivot and clutch fork (use shank of 5/32" drill).

Removal: Pass. Cars - Remove transmission. Remove clutch throwout bearing from fork, then remove clutch fork tension spring from fork. Remove clutch fork by forcing it forward and toward center of vehicle. Install Clutch Pilot Tool J-5824 to support clutch assembly. Loosen clutch attaching bolts one at a time until tension of spring is released. Remove tool, then remove clutch assembly from vehicle. When installing clutch, align "X" mark on cover and flywheel.

Corvair - *See "Engine" in Corvair Special Data.*

Trucks - Remove transmission, then disconnect slave cylinder at clutch fork and remove bearing from fork. Press fork away from ball mounting (use screwdriver), or remove ball stud from rear of clutch housing. *NOTE - Pry retainer out of fork with small screwdriver.* Install Tool J-5824 to support assembly. Loosen clutch attaching bolts gradually to release spring tension then remove tool and remove clutch assembly.

Bleeding System: (Trucks) - Same as for brake system. Bleed clutch hydraulic line at clutch slave cylinder bleed holes.

OVERHAUL: 1) Remove three drive strap-to-pressure plate bolts and retracting springs, then remove pressure plate from cover. *NOTE* - When disassembling, note position of grooves on edge of pressure plate and cover for reassembly to maintain balance.
2) Inspect spring, rings and cover for excessive wear or damage. If defect found, replace assembly.

LONG MODEL 8½

Clutch Cover Assy.

Model	Long No.	Ford No.
Comet & Falcon Std.	260013	CODD-7563-B

Clutch Disc

Model	Long No.	Ford No.
Comet & Falcon Std.	280122	C1DD-7550-E
Comet & Falcon H.D.	280124	C1DD-7550-C
Econoline	280124	C1UU-7550-A

►*COMET CLUTCH EQUALIZER BUSHING PRODUCTION CHANGE & SERVICE NOTE:* Later production uses one-piece plastic bushing, in place of two-piece bronze bushing, in equalizer bar. At time of initial installation of plastic bushing, the pivots and inside surfaces of bar at bushing contacts must be lubricated with a light coat of chassis lubricant. No lubrication fitting used with plastic bushings.

►*STORED CAR CLUTCH CAUTION:* Prop clutch pedal in depressed position to prevent clutch disc sticking to flywheel during prolonged storage.

►*FAULTY CLUTCH OPERATION DUE TO EXTRA FLOOR MAT:* Extra thickness of mats require the readjustment of both "Pedal Freeplay" and "Total Travel" to maintain proper clutch linkage travel, freeplay, and operation.

DESCRIPTION: Single plate, dry disc type. Three flat release levers extend through slots in cover and engage slots in pressure plate bosses. Pressure plate springs are installed between pressure plate and cover between the release levers.

PEDAL ADJUSTMENT

Comet & Falcon: Assist Spring Adjustment - Adjust retainer in link so distance from inside radius of spring hook to front face of link is 1 3/16"

Total Travel Adjustment - Move bumper and bracket as required to secure 6-6½" of travel. Make this adjustment prior to making Freeplay Adjustment.

Freeplay Adjustment - Loosen pedal-to-equalizer rod nuts and move equalizer bar as required to obtain 7/8-1 1/8" movement of pedal from fully released position until release fingers contact release bearing, then tighten nuts against trunnion without altering adjustment.

Econoline: Freeplay Adjustment - Loosen nut on turnbuckle on release rod and rotate turnbuckle to obtain freeplay or travel of 7/8-1 1/8 movement, measured from fully released position, until release fingers contact release bearing. Tighten nut. *NOTE* - When freeplay is correct, total travel will be correct.

OVERHAUL: *CAUTION - Parts are not furnished and manufacturer recommends that clutch not be disassembled.* Replace pressure plate and cover assembly if release levers do not operate freely or if lever heights are not equal. *See Release Lever Checking below.*

Release Lever Checking: Assemble pressure plate and cover assembly on flywheel with a .250" shim installed in place of regular driven member. Use depth gauge or dial indicator to measure height of inner end of each release lever. All levers must be equal within .031". If lever variation greater than .031" replace pressure plate and cover assembly.

►CHANGES, CAUTIONS, CORRECTIONS

►*BUICK "SPECIAL" CLUTCH LINKAGE BIND CORRECTION:* Lubricate all pivot points, then realign linkage as necessary to eliminate bind at any pivot point. Adjust equalizer perpendicular to engine to eliminate bind at equalizer levers.

►*352" MERCURY CLUTCH PEDAL-TO-IDLER ROD LENGTH CAUTION:* Use later type rod, 15.25", to insure adequate threads for jam nut on end of rod. Early rods were 14.56".

►*MERCURY CLUTCH SQUEAK CORRECTION:* When noise occurs only when depressing clutch pedal while engine running replace throw-out bearing. If noise occurs without engine running, lubricate driving lugs and edges of pressure plate with "Lithium" base grease. DO NOT over-lubricate.

DESCRIPTION: Single plate, dry disc type.

REMOVAL OF CLUTCH: Buick - Remove transmission, see Transmission Section, and remove throw-out bearing. Disconnect release rod from fork by removing clevis pin and unhooking fork boot from housing. Push inward on release fork to free it from ball stud in flywheel housing and remove fork. Mark clutch cover and flywheel so cover can be installed in original position

(for engine balance). Loosen each cover bolt a turn at a time to relieve clutch spring pressure. *NOTE - Spacers (¼" nuts) placed between levers and inner edge of cover will aid in removal and installation.* Support pressure plate and cover assembly while removing last bolts, then remove cover assembly and driven plate.

Ford Pass. - Remove transmission or slide back far enough to clear in-put shaft, see Transmission Section, then remove flywheel housing cover and release lever retracting spring. Slide release bearing and hub off release lever. Mark clutch cover and flywheel for reinstallation. Loosen six cover bolts uniformly to release spring tension. Remove cover and pressure plate through opening in flywheel housing.

Ford Truck - Remove retracting spring and pushrod at release lever. Remove slave cylinder attaching bolts. Remove transmission, see Transmission Section. Remove dust cover from clutch housing and remove release bearing and hub from lever. Mark pressure plate and cover assembly and flywheel for reinstallation in same position. Loosen cover bolts uniformly to release spring tension, then remove pressure plate and cover assembly and clutch disc through opening in bottom of clutch housing.

CONTINUED ON NEXT PAGE

LONG "CF" & "NC" (C nt.)

Oldsmobile - Remove transmission, see Transmission Section, then remove lower flywheel housing and release bearing. Mark flywheel and clutch cover for reinstallation. Loosen cover bolts uniformly two turns at a time to release spring tension and remove clutch cover assembly and driven disc.

PEDAL ADJUSTMENT: Buick - Release clevis pin from rear end of clutch release rod and rotate rod as required to obtain 3/16" movement at outer end of fork before throw-out bearing contacts release levers. This will give 7/8"-1" free play at pedal pad.

Ford & Mercury . If total pedal travel is less than 6 5/8" or more than 6 7/8", reposition pedal bumper and bracket until travel is within these limits. Adjust spring link to give assist spring length of 10" (between spring eye centers), with pedal fully released against bumpers. With engine idling, depress pedal to take up free travel and note reading from released position. Free travel should be 1 1/4-1 3/8" (Ford), 3/4-1" (Mercury). To adjust, turn adjusting nut on equalizer rod. Tighten locknut securely. Operate engine at 3000 RPM. Free travel should not be less than ½". Readjust equalizer rod if necessary. *Free travel must be set exactly.*

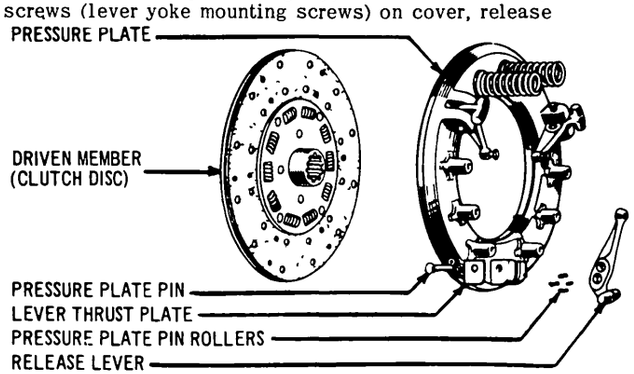
Oldsmobile - Disconnect lower clutch control rod from equalizer by removing wire clip. Adjust control rod in or out of trunnion nut to obtain 7/8"-1" free travel at clutch pedal. Check free travel at clutch pedal pad with lower clutch control rod connected to release yoke.

OVERHAUL: *NOTE - Car manufacturers (Buick, Ford, Mercury & Oldsmobile) do not recommend Clutch Cover & Pressure Plate Assembly overhaul. On these models, if lever height does not meet specifications shown in "Release Lever Setting" table or if levers do not operate freely without bind, replace the assembly.* Mark all parts for disassembly and reassemble in same relative positions.

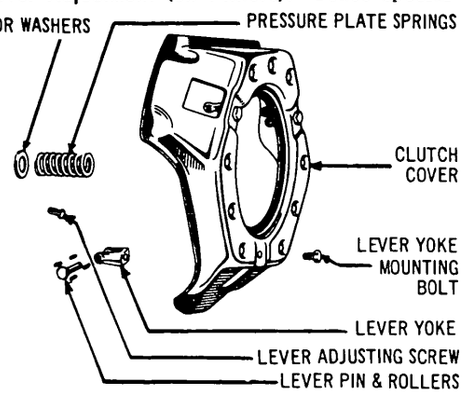
Clutch Fixture Note: Manufacturer recommends use of Borg-Warner Universal Clutch Fixture UF-300 or UF-400 for all servicing and rebuilding operations.

Disassembly: Place clutch on fixture (supporting pressure plate on special lands under lugs) or arbor press. Compress cover plate slightly, take out assembly screws (lever yoke mounting screws) on cover, release pressure on cover plate slowly, lift off plate. Note whether washers used on yokes under assembly screws (these washers must be reinstalled if old pressure plate used again). See special directions below on removing and reinstalling release levers.

Clutch Springs: Pressure springs should check with table below.



Clutch Spring Specifications



Cover Assembly	Spring Color & No.	Lbs. Pressure
L-5167	9-Tan	158-165 at 1 9/16"
L-5222	9-Buff (Bronze)	137-147 at 1.747"
260093	12-Purple	140-150 at 1.672"
260108	9-Buff (Bronze)	137-147 at 1.747"
260154	6-Aluminum	200-210 at 1.751"
260162	9-Pea Green	170-180 at 1.762"
262832	9-Orange	170-180 at 1 9/16"
266978	3-Pea Green	170-180 at 1.762"
	6-Brown & White	154-164 at 1.736"
267346	9-Buff (Bronze)	137-147 at 1.747"
267350	9-Pea Green	170-180 at 1.762"
267371	9-Buff (Bronze)	137-147 at 1.747"
268594	6-Aluminum	200-210 at 1.751"

Release Lever Assembly: Mount lever yoke on release lever, fasten by inserting flat-sided lever pin (flat side out or toward cover) and roller (place roller on flat side of pin). Insert lever in pressure plate lug, use roller pin sawed off to length of lever width as a guide and insert needle bearings, insert roller pin, pushing guide pin out, lock both lever pins with cotter pins. Thread release lever adjusting screws in ends of levers, turning screws down completely.

Assembly: Place pressure plate on fixture or arbor press. Assemble pressure springs, locator washers or insulator washers on plate, place washers on lever yokes (if washers used previously and old pressure plate being used). Place cover plate in position (lining up marks made before dismantling), compress cover slowly guiding lever weights through holes in cover and lining up yokes under cover plate holes. See that pressure springs are seated, insert cover screws in yokes, using lockwasher under screw head, tighten screws securely. Compress and release clutch several times (using weight on release levers) to seat all parts. Then adjust release lever heights.

Release Lever Adjustment (on Fixture): Place special lands on fixture under pressure plate lugs, assemble lever adjusting arm and sleeve setting bottom of adjusting arm correct distance as shown in table (all figures plus or minus 1/32") above bottom of sleeve and lock the adjusting arm with the thumbscrew. Swing arm over each release lever in turn, back off adjusting screw on top of lever until rounded screw head just contacts arm, lock screws by inverting clutch so that screw head is supported and stake or peen lever into adjusting screw slot. Do not disturb lever yoke screws when making this adjustment.

L NG CLUTCH ASSEMBLY (TYPICAL)

Release Lever Setting
(Borg-Warner Fixtur s UF-300 & UF-400)

Clutch Assembly	Lever H ight
L-5167	① 1 7/8"
L-5222	③
260093	⑤
260108	③
260154	
260162	⑤
262832	① 1 7/8"
266978	②③
267346	⑤
267350	②⑤
267371	④ 2 1/4"
268594	③⑥ 1 13/16"

① - With three 3J Lands and three 3D Rings.
② - No lever adjustment. Use new pressure plate to restore settings. Set levers parallel by tapping assembly screw on top cover.
③ - See "Ford" under Release Lever Checking & Adjustment (without Fixture) data below.
④ - With three 3J Lands, six 3K4 Height Sleeves, one 3X Indicating Plate and three bars (½" x ½" steel) bridging slots.
⑤ - Maximum Variation of Finger Height .031"
⑥ - With three 3J Lands and one 3D Ring.

Release Lever Checking & Adjustm nt (Without Fixtur): Check lever heights as follows (adjustment not recommended on Ford clutches).

Ford - Mount clutch assembly on spare flywheel with three .250" thick spacers (drill rod or precision washers may be used) in place of regular driven member (*NOTE* - Place spacer under each release lever). Use dial indicator to measure lever heights. All levers must be equal within .031". Replace pressure plate and cover assemoly if greater variation noted.

Oldsmobile (Exc. F-85) - Install special lever setting Gauge J-1084 on flywheel in place of driven member. Mount pressure plate assembly on flywheel tightening screws one or two turns at a time (to prevent distortion of cover). Lay short straightedge across center boss of the gauge as a guide for positioning levers. Bearing surfaces of all lever adjusting screws should be from .000-.062" below level of gauge center boss, and each lever should be within .015" of the other two levers. *NOTE* - If levers are not more than .025" out of plane, lightly tap release yoke mounting screw heads with 8 ounce hammer to bend pressure plate cover to bring levers within .015" of same plane. When levers are more than .031" out of plane, or do not lie within .000-.062" below center boss, adjust levers as directed under "Release Lever Adjustment (On Fixture)" above.

BUICK HYPOID

Series 44, 46, 47, 4800 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*REAR AXLE HOUSING CAUTION:* When housing replaced, readjust pinion nose angle, see *Propeller Shaft Alignment in this section.*

►*AXLE SHAFT INSTALLATION CAUTION:* Coat axle shaft lightly with rear axle lubricant (see "Rear Axle Lubrication Note") from sealing surface to six inches inboard before installation to prevent damage to lip of wheel seal. USE ONLY POSITIVE TRACTION LUBRICANT with a Positive Traction Differential.

►*REAR AXLE LUBRICANT NOTE:* Flushing and seasonal changes not recommended for either type axle. Maintain level at filler opening to ¼" below. Use Factory Hypoid Gear Lubricant in standard axle. Use Buick Special Lubricant No. 723-TL-1000 in Positive Traction axle.

DESCRIPTION: Hypoid gear, semi-floating type with drive from axle housing through one upper and two lower control arms. Power-Lock Differential (Plate Clutch Type) Optional.

►*AXLE IDENTIFICATION NOTE:* Ratio stamped on bottom of axle housing. An "X" inside a circle next to number indicates "Positive Traction" type differential. This type also identified by lubrication tag next to filler plug.

	Axl Ratios	
Mod l	Domestic	Export
4400 (Std.) Ⓒ.....	.....3.07 (14-43)	3.36 (14-47)
All Others	3.23 (13-42).....	3.36 (14-47)

Ⓒ - 3.23 (13-42) with Power Pack.

Axl Shaft R moval: Place stands under rear axle so wheels clear floor, then remove wheel and drum. Remove wheel bearing retainer plate-to-backing plate nuts (leave bolts in place to support backing plate). *NOTE - L ft sid wh l bolts hav left hand threads.* Use Puller J-6176 with Slide Hammer to pull axle assembly. Replace two backing plate nuts finger tight to hold plate in place.

Carri r Ass mbly R moval: Place jacks under rear axle housing and raise car. Mark rear universal joint for proper alignment for reassembly, then disconnect rear joint "U" bolts. Push rear propeller shaft forward and wire it to upper control arm bracket out of way. Remove axle shafts, see above, then back off two opposite carrier to axle housing nuts to last few threads and remove all other nuts. Place drain pan under carrier and pull carrier forward to drain lubricant. Place transmission jack under carrier and remove from housing.

Wheel Bearing Adjustment: None required.

BUICK HYPOID PINION ASSEMBLY

OVERHAUL: *See "Buick Hypoid" Rear Axle in 1956 Annual Data or later Manual edition and note the following:*

Differential Bearing Support Removal (With Tool J-6553): This tool should be used to pull bearing supports on 1960-61 models as follows: Retract pins in tool by turning expander screw in puller body counterclockwise, then insert puller body into bearing support until reference line on tool is flush with end of support and punch mark on tool is in general direction of hole in support. Expand tool a slight amount by turning expander screw clockwise until a slight drag on pins is felt, then move tool as required to engage pins with holes in support. Fully expand pins. Place tool sleeve over tool and install draw bolt, thrust washer, thrust bearing, and small washer, then thread draw bolt in tapped hole in puller body. Apply a reasonable amount of torque to draw bolt, then strike carrier pedestal with a solid hammer blow.

Wheel Bearing & Seal Replacement: Notch wheel bearing retaining rings in 3 or 4 places with a chisel to expand ring and slide ring off shaft. Press wheel bearing off with Remover J-6525 either in a press or with use of Ram and Yoke Assembly J-6180 and Adapter J-6258. Install new retainer plate. Press new bearing against shoulder with Installer J-6257 either in press or by using Ram and Yoke Assembly J-6180 and Holder J-6407 with Ring J-6407-2. Press new retaining ring against bearing in same manner. Remove old seal by inserting Puller J-6199 through seal and expanding it so it can be removed with a slide hammer. Coat outside diameter of seal with sealer, position seal over Installer J-9194 and drive seal straight into housing until installer bottoms against wheel bearing shoulder.

Drive Pinion & Bearing Removal: Install Holder J-8614-01 on pinion flange with two 5/16" - 18 x 2" bolts with flat washers. Remove pinion nut and washer. Use Puller J-8614-02 in Holder J-8614-01 to pull pinion flange. *NOTE - Hold pinion while flange is being removed to prevent falling out of carrier.* Remove pinion carefully to prevent damage to bearing races.

Pinion Bearing Preload Adjustment: Place original shim pack against head of pinion, and use bearing Replacer J-6377 and Holder J-6407 with Ring J-6407-2 in press to install bearing on pinion shaft. *NOTE - Original shims used only as a starting adjustment.* For starting pinion preload bearing adjustment, use original preload spacers. Place spacers on pinion, and hold pinion in carrier. Oil front bearing and place in position on pinion. Hold pinion in position and use Installer J-8913 to drive bearing into fully seated position. Install new "O" ring seal with sealing compound using Installer J-8913. Fill space between lips of oil seal with wheel bearing grease and apply thin coat of same grease to seal surface of pinion flange. Install pinion flange sufficiently to add washer and start nut. Hold flange with Holder J-8614-01 and torque nut to 80 ft. lbs. with wrench J-1313 on outer end of Handle J-6246 (this amounts to 250 ft. lbs. torque at nut). Rotate pinion 3-4 times to seat bearings. Preload should be 15-35 inch-lbs. including drag on new seal. When preload too low, reduce total spacer thickness .001" for each added 10 inch-lbs. preload needed; if too high, increase total pinion spacer thickness .001" for each 10 inch-lbs. to be subtracted. Spacers are furnished in pairs to supply thickness range from .400" to .470" by thousandths.

BUICK SPECIAL & OLDSMOBILE F-85 HYPOID

Buick Special Series 4000, 4100 (1961)
Oldsmobile F-85 (1961)

DESCRIPTION: Hypoid gear, semi-floating type, with drive from axle housing through two upper and two lower control arms. "Positive Traction" Differential Optional on Buick Special. *See "Power-Lock Differential ("Belleville" & Plate Clutch Type)".*

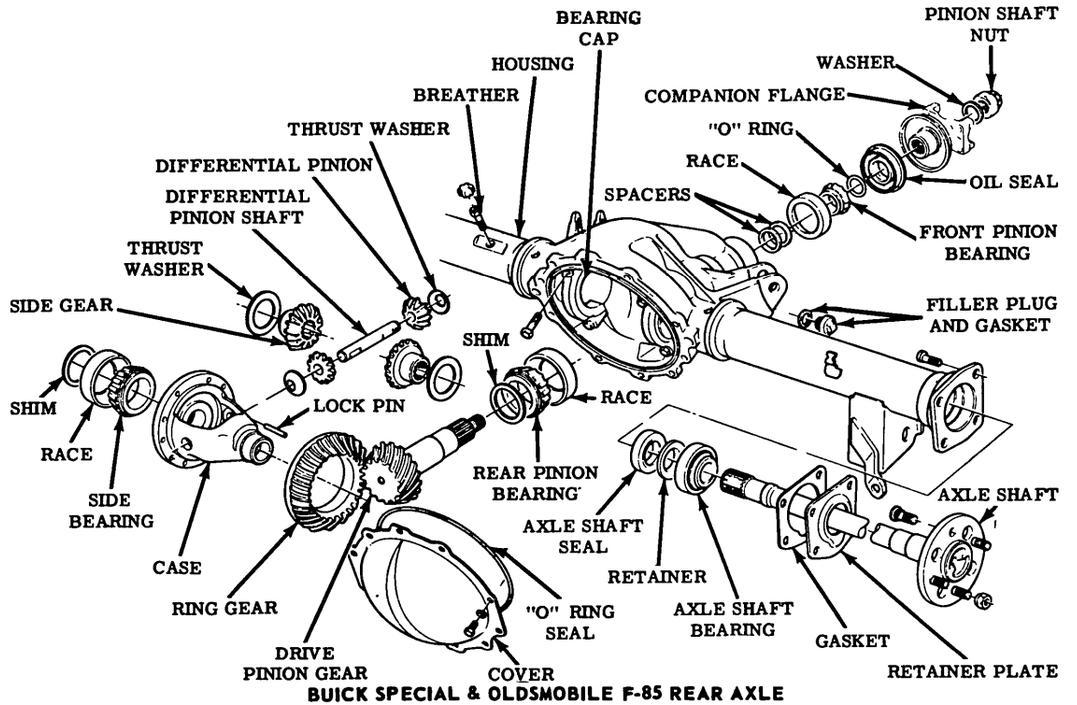
Axle Ratios

Model	Axle Ratios
Buick Special	3.08 (40-13); 3.36 (37-11)
Oldsmobile	3.08 (40-13); 3.23 (42-13); 3.36 (37-11)

Axle Shaft Removal: Remove wheel and brake drum. *NOTE - Left hand wheel bolts have left hand threads and nuts are marked "LF".* Remove four axle bearing retainer nuts. Attach Puller J-2619 and Adapter J-8617 and pull axle from housing. *CAUTION* - Support axle shaft carefully while pulling axle shaft out to prevent cutting seal lip. Left shaft is shorter than right shaft.

Wheel Bearing Adjustment: None.

OVERHAUL



Differential Case Assembly: Removal - Back out cover bolts and pry bottom of cover loose to drain lubricant and remove cover. Check and record ring gear to pinion gear backlash, see below, for reassembly to same clearance. Remove bearing cap bolts marked "R Top" and "L Top" for reassembly. Install four safety bolts 7/16"-14 x 4 1/4" through caps finger tight. Use two pry bars to pry out differential case, to rest on safety bolts. Support assembly with one hand and remove safety bolts. Keep right and left bearing outer races and shims in sets with marked caps.

Disassembly - Pull side bearings with Support J-8615 in center hole and Puller J-2241-A or hydraulic Puller J-9005. Remove ring gear from case. Use soft hammer if necessary but DO NOT pry ring gear from case. Drive spring pin from differential pinion axle and drive and drive axle from case and remove pinions, side gears and thrust washers.

Pinion Assembly: Removal - Check "Pinion Bearing Preload", and "Pinion Depth Setting", *see below,* to check for previous setting error or for reinstallation. Use Holder J-8614-01 and remove pinion nut and washer. Use Puller J-8614-02 and Holder J-8614-01 to pull pinion flange. Remove pinion assembly, tapping with soft hammer while guiding pinion by hand to prevent damage to outer bearing races.

Disassembly - When pinion bearing is to be replaced or pinion depth setting is to be changed, remove bearing with Remover J-8612 and Holder J-6407. Pry seal from carrier and remove front bearing. Drive out outer races (front and rear) if bearings are to be replaced.

Differential Case Assembly: Reassembly - Examine all wearing surfaces of parts for scoring or unusual wear. Clean all parts thoroughly and lubricate each part before assembly. Place side gear thrust washers over gear hubs and install gears in case in original positions. Add pinion (less washer) between side gears and rotate gears until pinion is directly opposite loading pening in case. Place other pinion between side gears so that axle holes are in line, then rotate gears to make sure holes in pinions will line up with holes

BUICK SPECIAL & OLDSMOBILE F-85 REAR AXLE

in case. When holes line up, rotate pinions back toward loading opening and slide thrust washers into place. Install pinion axle and drive spring pin through hole until flush with case. Check ring gear for nicks, burrs or scoring. New gear set will have matched numbers. With mating surfaces of case and ring gear clean and free of burrs, thread two 3/8"-24 x 2" studs in opposite holes and install gear on case. Torque bolts alternately in progressive steps to 60 ft. lbs. Install side bearing with Installer J-8606 and Drive Handle J-8092.

Side Bearing Preload Adjustment - *NOTE - Adjusting shims furnished in thicknesses ranging from .040" to .082" in two thousandths graduations.* Place differential case and bearing assembly in carrier. When new side bearings used, use original adjusting shims. When old bearings are used, select new right and left adjusting shims each .002" thicker than original shim. Slip right shim into position then drive left shim into position carefully and install bearing caps with four 7/16"-14 x 4 1/4" cyl. head bolts. Rotate differential case several turns to seat bearings. Check preload with inch pound torque wrench connected at ring gear attaching bolt. With wrench projecting straight out, preload should read 20-30 inch lbs. with new bearings, or 10-20 inch lbs. with used bearings. When preload is not within specifications, increase shim thickness .002" each side for 10 in. lbs. preload desired or decrease shim thickness same amount for each 10 inch pounds to be subtracted. When preload adjustment correct, pry out differential assembly, remove bearing caps and place out of way. *NOTE* - Keep outer races and adjusting shims with their respective caps for reinstallation.

Pinion Assembly: Reassembly - When rear bearing is replaced always replace outer race with Installer J-8608 and Driver Handle J-8092. When front bearing is replaced always replace front outer race using Installer J-8611 and Driver Handle J-8092. Place original shim on pinion as starting adjustment and install rear pinion bearing with Installer J-8609, in press.

Preload Adjustment - When new bearings are installed use original preload spacers. When old bearings are to be used, select a pair of preload spacers .002" less than original spacers. Install spacers on pinion, place pinion assembly in carrier. *NOTE - Spacers are furnished in thickness ranges from .400" to .470" by thousandths.* Oil front bearing, and place in position. Hold pinion fully forward and drive front bearing over pinion until seated using Installer J-8613. Install new "O" ring seal. Coat OD of new pinion oil seal with sealer and install seal with Installer J-8613. Coat lips of oil seal and seal surface of pinion flange with gear lube. Install flange with soft hammer until a few threads appear, then install washer and nut. Hold the flange with Holder J-8614-01 and torque nut to 200 ft. lbs. Rotate pinion to seat bearings. Check bearing preload using an inch pound torque wrench connected at pinion nut. Preload reading (including drag of new seal) should be 25-35 inch. lbs. with new bearings, 15-25 inch lbs. with reused bearings. When preload not within specifications, reduce total pinion spacer thickness .001" for each added 10 in. lbs. preload desired or increase total pinion spacer thickness .001" for each 10 in. lbs. preload to be subtracted.

Depth Adjustment - Pinions are marked on small end

CONTINUED ON NEXT PAGE

BUICK SPECIAL & OLDSMOBILE F-85 HYPOID (C ntinued)

of pinion tooth indicating in thousandths the amount pinion varies from a nominal setting. A plus (+) marking, indicates that rear face of pinion when pressed into carrier must be nominal distance from centerline of the side bearing pedestals plus the amount indicated on pinion tooth. A minus (—) marked pinion indicates, nominal setting minus amount indicated on pinion tooth. *CAUTION* - Preload must be correct before making depth adjustment.

Pinion Setting Gaug J-8619 - Consists of a master gauge and an indicator gauge upon which a dial indicator is mounted. Master gauge is used to "Zero" indicator gauge. *CAUTION - Gauge parts must be clean, parti cularly the center and discs of indicator gauge and centering hole and disc pads on master gauge.* Place large discs on indicator gauge and place contact button on stem of dial indicator, then mount dial indicator on indicator gauge. Place indicator gauge on master gauge so that spring loaded center is engaged in centering hole. Center indicator contact button on contact pad and lock thumb screw. Hold yoke down firmly, with both discs contacting horizontal and vertical pads on master gauge then set dial indicator at zero. *NOTE - Be sure bearing support bores are free of burrs and center of pinion is clean.* Rotate pinion to bring blank tooth between matching number and the pinion setting mark slightly counterclockwise to top center (at about 11 o'clock). This is the gauging tooth used in production, and should be used in service. Place indicator gauge in carrier and turn pinion so that indicator contact button has a good contact with gauging tooth of pinion. Press gauge yoke down firmly toward pinion and read indicator noting whether it is plus (+) or minus (—) as indicated by arrows on surface of yoke. This indicates the variation from nominal setting of the gauging face of this pinion. Recheck zero setting to be sure it was not changed in handling.

NOTE - When old set reused, maintain original setting. When new set used, dial indicator reading should be within .0015" of pinion setting marked on pinion. When pinion setting is not as specified proceed as follows: *NOTE : Pinion depth shims furnished in thicknesses ranging from .040" to .070" by thousandths.*

Remove pinion assembly and press off bearing, see disassembly. Remove shim from pinion, wipe dry and measure its thickness, with micrometer. Service shims are marked in thousandths but should be rechecked with with micrometer. Increase or decrease thickness of shim as required to obtain proper pinion setting. For example - If pinion marked "+8" and gauge reading is "+6", decrease thickness of shims by .002". If gauge reading is "+10", increase thickness by .002". *CAUTION - Check depth setting on any new pinion even if pinion has same setting as old pinion.* Whenever a depth setting is changed, change preload setting the same amount by changing spacer thickness. (If depth setting decreased .002", decrease preload spacer thickness .002"). Reinstall rear pinion bearing with new thickness shim, reinstall pinion and bearing assembly in carrier with new thickness preload spacers. Install pinion flange and nut and tighten to 200 ft. lbs. Recheck pinion setting with gauge. Pinion setting must be within .0015" of setting marked on NEW pinion or within .0015" of original setting, USED pinion (as checked before disassembly). Recheck pinion bearing preload. Preload must not exceed 35 inch lbs. including drag on lubricated new seal.

Differential Assembly: Backlash Adjustment - Install differential case and bearing assembly. Slip right shim into position at right bearing and drive left shim into position with soft hammer. Rotate differential assembly to seat bearings then mount dial indicator on housing with contact button on back face of ring gear tooth as near in line with ring gear rotation as possible. Lock pinion to carrier and check backlash, at three or four points around ring gear. Lash must not vary over .001" around ring gear. If variation in excess of .001" check for burrs or uneven bolting condition or distorted flange and correct as necessary. Gear lash at point of minimum lash should be .007" to .009" for NEW gears, adjust to .008". On original gear set, original gear lash must be maintained within ±.001". When backlash not within specifications, increase thickness of one shim and decrease thickness of other shim for same amount. Shift a .002" shim thickness for each .001" change in backlash desired. If backlash is .001" too much, decrease thickness of right shim .002" and increase left shim thickness by .002". If backlash .002" too little, increase thickness of right shim .004" and decrease thickness of left shim .004". When backlash correct, install bearing caps according to markings and torque cap bolts to 75 ft. lbs. Install new cover seal with heavy grease to retain it in groove, install cover and tighten bolts to 25 ft. lbs.

CHEVROLET HYPOID (PASS. CAR & ½-TON TRUCK)

Chev. Pass. Cars (1961)
Ch vrolet Corv tte (1961)
Chevrol t ½-Ton Truck (1961)

DESCRIPTION: Semi-floating, hypoid type with separate carrier and Hotchkiss drive. Power-Lock Differential optional.

►*PINION BEARING PRELOAD CAUTION:* Rear universal joint companion flange nut controls rear axle pinion bearing preload. Bearing preload must be adjusted whenever companion flange nut is loosened.

►*AXLE IDENTIFICATION NOTE:* Conventional axles have serial number on right front side of differential. Positraction axle is identified by serial number and letter "P" on front side of carrier and lubrication tag on filler plug.

Axle Shaft Rem val: Raise car and place jack stands under axle housing. Remove tire, wheel and brake drum assembly. Remove four nuts and lockwashers from bearing retainer bolts (on inside of axle flange). Attach Axle Puller J-5748, with slide hammer, to flange and remove axle shaft and bearing assembly. Be careful not to disturb backing plate. *NOTE* - If bearing retainer and parking brake strut interfere, raise strut slightly with screwdriver to obtain clearance.

Carrier Removal: Remove rear wheels, brake drums and gasket. Remove bearing retainer bolts (on inside of axle flange) and use Tool J-5748 to remove axle shaft and bearing assembly so that axle clears differential side gears. Separate rear universal joint, lower propeller shaft, then drain rear axle lubricant and remove differential carrier nuts and lift out carrier assembly.

OVERHAUL: *See "Chevrolet Hypoid (Hotchkiss Drive)" in 1956 Annual Data or later manual edition and note the following:*

Rear Wheel Bearing Removal & Installation: Install Tool J-5741 between axle flange and bearing with land of plates against bearing and inside the retainer. Install bolts in plates. *NOTE - It will be necessary to remove retainer plate attaching bolts to allow installation of tool between retainer and bearing.* Press bearing from shaft with press plate parting line resting on press bed. *NOTE - This operation may damage bearing retainer so that it may not be replaced.* Install new bearing with Tool J-6661, pressing it on until bearing bottoms on shaft against shoulder. *NOTE - New bearing retainer must be on shaft before bearing is installed.* Install new axle shaft bearing retainer ring on shaft and use Tool J-6661 in arbor press to seat ring against bearing.

Axle Ratios: As follows:

Model	Axle Ratios ① Gear Rati
283" 3-Speed Trans.	3.36-1
Overdrive	3.70-1
Powerglide	3.08-1
Turboglide	3.36-1

② - Positraction available in 3.36, 4.11 & 4.56-1 ratios.
③ - Positraction available 3.70, 4.11 & 4.56-1 ratios.
⑨ - Positraction not available with Auto. Trans.

CADILLAC HYPOID

Cadillac (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*REAR AXLE SERVICE CAUTION:* Manufacturer recommends that all service on Standard or Controlled Differential Assembly other than oil seal or universal joint yoke replacement (and necessary pinion bearing preload adjustment) be handled by replacement of complete assembly. *No disassembly or adjustment of these units should be attempted in the field.*

►*REAR AXLE IDENTIFICATION MARKS:* Gear ratio of axle is indicated by a letter stamped on bottom side of carrier on flange adjacent to rear axle housing. A Controlled Differential is identified by letter "G" following axle ratio Code Letter. *See Axle Ratios.*

►*PINION BEARING ADJUSTMENT CAUTION:* Pinion bearing adjustment (preload) controlled by rear universal yoke nut which compresses spacer or sleeve between pinion bearings.

►*CAUTION:* Loosening or removal of the pinion shaft nut (for oil seal or yoke replacement) will disturb pinion bearing preload so that the detailed procedure, given below, must be followed to avoid overloading bearings or collapsing bearing spacers.

DESCRIPTION: Hypoid gear with torque arm drive (coil spring rear suspension, except commercial) of same design used on previous models.

Axle Ratios

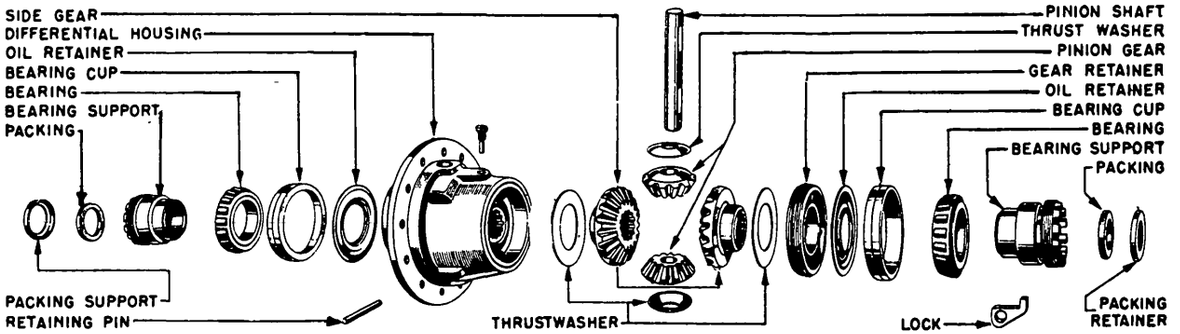
Model	Ratio	©Code Letter
60,62 Series (Less AC)	2.94-1	T
60, 62 Series (AC)	3.21-1	W
75 Series	3.36-1	X
Comm.	3.77-1	Y

© - Letter "G" following Code letter indicates Controlled Differential.

Axle Shaft & Bearing (Exc. Comm. Chassis): Removal - Raise car and remove wheel and brake drum. Remove four bearing retainer and backing plate nuts and use Puller J-8131 and Slide Hammer J-2619 to pull axle shaft. Groove spacer with chisel and hammer, but do not split spacer. Drive chisel into spacer until spacer can be slipped off shaft. Assemble rear axle shaft and bearing assembly to "U" shaped piece of Bearing Plate and Pin Assembly J-2986-1 and place on press. Assemble Bearing Holding Tool J-2986-3 around bearing and dowels (to keep bearing from exploding while under arbor press load) and press shaft through bearing. **Reassembly** - Install new bearing on shaft so bearing seal is toward flange end of axle shaft. Place assembly through ring of Installer Tool J-6257 and position in press. Press bearing up to but not quite touching shoulder. Remove shaft from tool and assemble new spacer on shaft and reinstall assembly on tool. Press shaft through spacer until spacer just touches bearing. Install oil ring seal on bearing.

Installation - Lubricate wheel bearing bore in housing. Place new "O" ring seal on wheel bearing and install axle shaft (shorter shaft on left side), but do not damage seal. Install backing plate and bearing retainer, retainer nuts, brake drum and wheel.

Rear Axle Oil Seal (Comm. Chassis): Replacement - New oil seal must be installed whenever old seal removed. Fashion a plate with oblong center hole so it fits behind seal and remove seal with slide hammer. Coat surface of sealing lip with lubricant and outside diameter of seal with non-hardening gasket sealer before installation. Press seal squarely into its bore and onto its seat.



Differential Carrier: Removal - Disconnect rear universal joint at pinion yoke. Remove rear axle lubricant with suction gun. Remove axle shafts, see above, and remove carrier to axle housing nuts and washers. Remove entire assembly with gasket.

Installation - *NOTE* - If carrier was removed because of failure, inspect axle housing and rear wheel bearings for metal chips and thoroughly clean as required. Reverse removal procedure and note the following: On Controlled Differential carrier be sure internal splines of differential side gears are aligned by inserting axle shaft splines in each side approximately 4" until they bottom on differential pinion shaft.

Pinion Oil Seal & Yoke: Removal - Raise rear of car and remove both rear wheels and brake drums to eliminate drag when measuring torque readings. Use suction gun to remove approximately 1½ pints of lubricant. Disconnect rear universal joint from pinion yoke. Use a 50 inch pound torque wrench and Socket J-2571-1 with Adapter J-2571-2 to measure inch pounds required to rotate shaft (2 full turns). Record torque reading. Mark pinion shaft and yoke with punch mark for reinstallation. Install Holding Tool J-6544 on yoke, and install Socket J-2571-1 on pinion nut through hole in holding tool and remove nut using 3/4" drive socket wrench. Remove yoke from pinion shaft with Tool J-6295-01. Pry out old seal and remove staking marks on shaft threads.

Installation - Coat outer edge of seal with non-hardening gasket sealer and lubricate sealing lip with rear axle lubricant. Position seal in carrier and place Seal Installer J-8436 against seal and secure with pinion nut and washer. Install Socket J-2571-1 on pinion nut and press seal into carrier by tightening nut with socket wrench. Remove socket tool, pinion nut and washer, and seal installer. Install yoke on pinion shaft splines with punch marks up. Install pinion nut, holding flange of yoke with Pinion Yoke Holding Tool J-6544. Tighten pinion nut until proper preload is attained. Preload is attained when inch pounds torque required to rotate pinion shaft is 2 to 5 lbs. greater than the torque required to rotate shaft prior to seal and yoke removal above. *NOTE - It is necessary to remove Yoke Holding Tool J-6544 to install 50 inch pound torque wrench.* Tighten nut approximately ½ turn and check torque. Repeat this operation until proper torque is obtained but do not overtighten or back off nut to reduce preload. Maximum allowable torque on an assembly with over 1,000 miles is 15 inch lbs. (used seal) or 20 inch lbs. (new seal). The torque of a new assembly is 50 inch lbs.

Rear Axle Backlash: To measure rear axle assembly backlash, raise car on hoist and fasten one end of piece of bar stock to yoke on pinion shaft and the other end to frame side rail by means of a "C" clamp, to prevent rotation of drive shaft. Apply brake cable at one wheel to hold wheel stationary, and measure movement of outer circumference of opposite tire tread. A stiff wire pointer fastened to fender of car will aid in this measurement. Maximum backlash at tire tread should not exceed ½".

CADILLAC REAR AXLE ASSEMBLY

CHEVROLET TRUCK HYPOID

Chevrolet Truck ¾-Ton (1961)①
Chevrolet Truck 1, 1½, 2-Ton (1961)②

① - Torque-arm drive. ② - Hotchkiss drive.

DESCRIPTION: Full-floating, hypoid gear type, with "straddle" mounted pinion shaft (rear end of pinion shaft is supported in carrier housing on a roller bearing). ¾-ton, 1-ton, 1½-ton & Std. Duty 2-ton trucks have double row ball bearing on pinion shaft assembly. Heavy Duty 2-ton trucks have two tapered roller bearings (one-piece outer race) on pinion shaft. The ring gear thrust pad has been eliminated from the ¾ & 1-ton trucks. ¾ & 1-ton trucks have flange type axle shafts bolted to wheel hub. Other trucks have a splined type axle shaft with splines fitted into splines in wheel hub.

Axle Ratio Identification ①

Ratio	Identification
4.57 (32-7) Std.	MH (C20), MK(K20)
4.57 (32-7) Optl. (H.D.,3,4-Speed)	MJ(C20)
5.14 (36-7) Std.	ML(P20),PA(C30),PC(P30)
5.14 (36-7) Optl.(H.M.,H.D. 3,4-Speed)	MN(P20)
5.14 (36-7) Optl.②	PB(C3602,03,09,12),PK(P30)
6.17 (37-7) Std.	PD(C40),PE(C,L,S50;S62,64)
7.20 (36-5) Std.	PF(C,L60;S67)
7.20 (36-5) Optl.	PF(S62,64);PH(C.L.,S60)

① - Stamped as prefix to Unit No. on Carrier Housing.
② - Dual Wheels.

Axle Shaft Removal (Series 20,30): Remove eight capscrews and lockwashers in axle shaft flange, install two ½"x13" screws in special threaded holes in flange (between regular mounting screw holes), turn these screws up evenly to loosen the shaft, withdraw shaft from housing, remove and discard gasket. *Use new gasket when installing shaft.*

►*CAUTION:* Thoroughly clean all lubricant from axle shaft flange and end of wheel hub before installing axle shaft. *Grease at this point will cause loosening of axle shaft flange capscrews.*

►*AXLE SHAFT NOTE:* Shafts unequal length (right shaft longer than left). Install in correct position.

Axle Shaft Removal (Series 40,50,60): Remove hubcap, then thread Tool J-1436-1 into hole in axle shaft and use slide hammer to remove shaft.

NOTE - When reinstalling axle shaft, tap flange splines into engagement with wheel hub splines (if necessary, rotate wheel slightly to align splines on shaft with both wheel hub and differential side gear splines), use new hub gasket.

►*AXLE SHAFT NOTE:* Some models have different length axle shafts. Install longer shaft on right side.

Wheel Bearing Adjustment: Remove wheels and axle shafts see above, bend back lip of lock in locknut notch, remove locknut and adjusting nut lock. Tighten inner adjusting nut to 50-65 ft. lbs. (Series 20 & 30), 75-100 ft. lbs. (Series 40,50,60), with special wrench J-2222 (Series 20 & 30), J-870 (Series 40), J-5670(Series 50 & 60) while turning hub, then back off nut 1/8 turn. Check hub for free turning, install adjusting nut lock with tangs aligned with adjusting nut slots, bend tang into adjusting nut slot. Install outer locknut and tighten securely, then bend lock tang down into notch in locknut.

DIFFERENTIAL CARRIER: Removal - Drain lubricant, remove axle housing cover and axle shafts, see axle shaft removal above. Remove two trunnion bearing "U" bolts from rear yoke and split rear universal joint (hold bearings on trunnion with tape). Remove bolts and lockwashers holding carrier to axle housing, support carrier on floor jack and roll from under car.

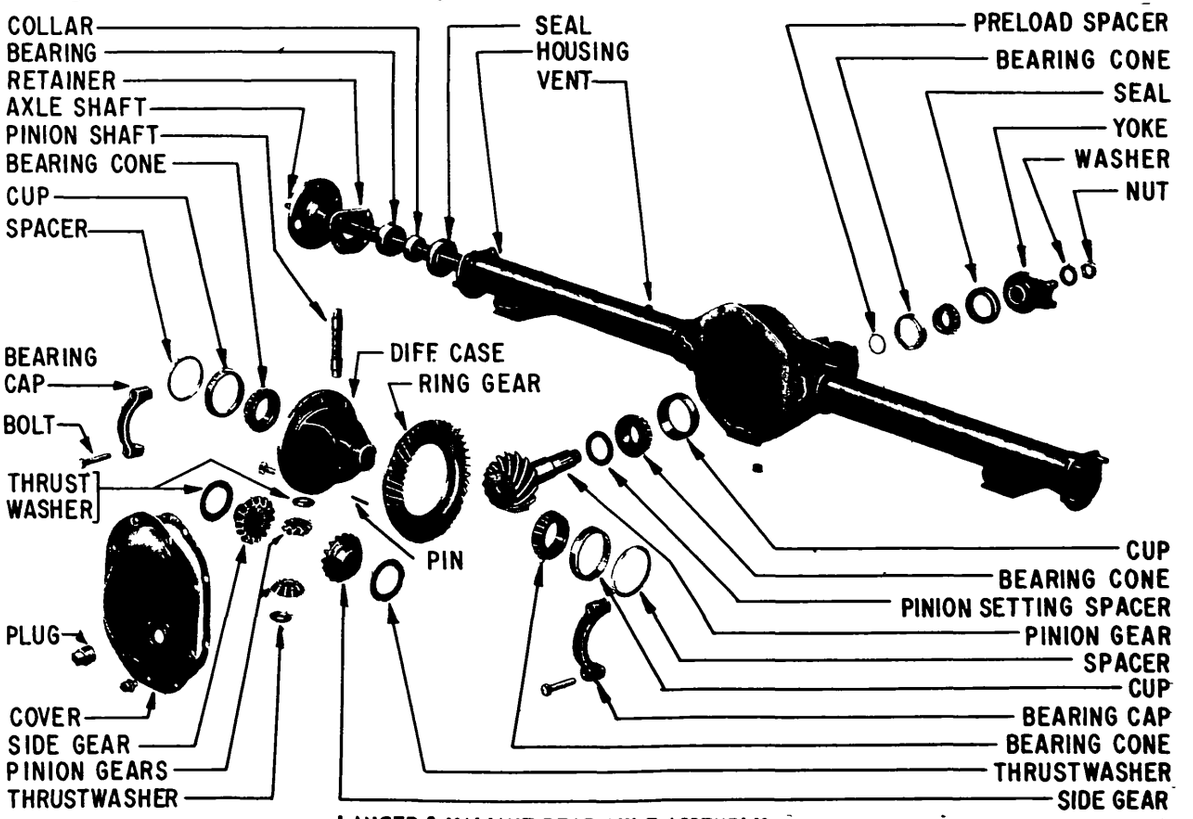
OVERHAUL: *See "Chevrolet Truck Hypoid" in 1960 Annual Data or later Manual edition and note the following.* **On ¾-Ton & 1-Ton,** the bearing spacer has been eliminated and a double row ball bearing used in place of tapered rollers. Same tool used to remove bearing. Replace double row bearing with a press and 2" pipe of suitable length, pressing against inner race. **On 1½-ton & 2-ton,** press oil seal into retainer with seal lip toward pinion bearing, until it is a minimum of .12" below top of seal bore. This compresses and spreads felt packing to assure proper sealing around pinion drive flange.

LANCER & VALIANT HYPOID

Dodge Lancer (1961)
Valiant (1961)

DESCRIPTION: Semi-floating, hypoid gear type with differential carrier integral with rear axle housing.

Axle Ratios



Trans.	Standard Ratio	Optional Ratio
Synchro-mesh	3.55-1 (39-11)	3.23-1 (42-13)
TorqueFlite	3.23-1 (42-13)	3.55-1 (39-11)

Axle Shaft Removal: Remove wheel and drum. Disconnect brake line at wheel cylinder. Work through axle shaft flange to remove retainer nuts and use Puller C-3725 to pull axle shaft and rear brake assembly. Carefully remove brake assembly from axle shaft without damaging seal contact area. Remove seal from housing. Use same tool to remove bearing from axle shaft (when necessary to replace bearing). Removal damages bearing.

Rear Axle Assembly Removal: Raise car and support body at front of rear wheels. Block brake pedal up. Remove rear wheels and disconnect hydraulic flex line. Disconnect parking brake cable at transmission and propeller shaft at yoke. Remove spring clips (U bolts) and shock absorbers. Remove assembly from beneath car.

OVERHAUL: *See "Valiant Hypoid" in 1960 Annual Data, Page 356, or later Manual edition.*

Pinion Bearing Preload: Service procedure remains the same with change in specification only. *NOTE* - Wrench should be moving with nose of carrier up to obtain accurate reading of 15-25 inch pounds (New bearings), 0-13 inch pounds (used bearings) without seal.

LANCER & VALIANT REAR AXLE ASSEMBLY

CHRYSLER CORP. HYPOID

Chrysler, Imperial, DeSoto, Dodge, Plymouth (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*CHRYSLER BEARING NOISE (37-65 MPH) CAUTION:* DO NOT disassemble rear axle carrier, for humming or whining noise, until after checking the following items for source of noise. 1) Side grille bar whistle. 2) Tire tread noise. 3) Front wheel bearings. 4) Propeller shaft center bearing. 5) Axle shaft endplay or noisy bearings.

►*REAR AXLE HOUSING PRODUCTION & DRAIN PROCEDURE CHANGE:* Drain plug eliminated on later cars. Use suction gun and hose to remove lubricant.

►*CHRYSLER REAR AXLE LUBRICANT LEVEL CHECKING CAUTION:* Accurate level of lubricant can only be determined when weight of car is on wheels (on floor or on wheel type hoist).

►*REAR SPRING "U" BOLT TORQUE SPECIFICATION CHANGE:* Torque specification reduced to 50 lbs., superseding all previous specifications, to reduce possibility of damage to axle shaft bearings.

DESCRIPTION: Design is same as used on previous models. "Sure-Grip" Diff. optional. *See "Power-Lock Diff. ("Belleville" & Plate Clutch Type)".*

►*DIFFERENTIAL TYPE & RATIO IDENTIFICATION:* Ratio stamped on identification pad on carrier housing. "Sure-Grip" differential identified by letter "S" stamped on this pad or by a metal tag marked "Use Sure-Grip Lube", attached to carrier housing bolt.

Axle Ratios: Used as follows: *NOTE* - Both conventional and "Sure-Grip" differentials used with same ratio.

Dodge, Dart & Plymouth Ratios

Model ①	Standard Ratio	Optional Ratio
6 Cyl. SM	3.54-1 (39-11)	②3.90-1 (39-10)

CHRYSLER CORP. HYPOID REAR AXLE ASSEMBLY

AXLE SHAFT REPLACEMENT & ENDPLAY ADJUSTMENT: Loosen brake shoe cams and remove rear hub and drum assemblies with Puller, Tool C-845. *(NOTE - Do not attempt to remove brake drums by hammering on end of axle drive shaft as damage to bearings and thrust block will result).* Disconnect brake line at each cylinder and remove brake support plates and dust shields as assemblies. Remove axle shaft keys and install Tool C-745 to protect outer axle seal. Remove shim pack between brake backing plate and axle housing flange. Pull axle shaft with Puller C-499. Remove shaft bearings with Puller C-293-13, inner oil seals with Puller C-637, and brake dust shield outer seal with Driver C-3565. Clean all parts and inspect for wear or distortion. To install, reverse removal procedure, then adjust axle shaft endplay (see below).

Endplay Adjustment: Install shims totaling .040" at one end of axle housing (shims are available in .005", .010", .0125", .015", .030" thicknesses). Lubricate bearing and install the axle shaft, bearing and cup, then using Tool C-413, drive bearing cup into axle housing until tool bottoms tightly against the shims. Remove tool and install dust shield, lockwashers and nuts. Tighten nuts to 30-35 ft. lbs. Working from opposite side of axle housing, install other axle shaft with bearing until inner end of shaft contacts the axle shaft thrust block. Lightly tap end of axle shaft with a fibre mallet to insure shaft is contacting the thrust block (opposite shaft will be forced away from thrust block to its full travel). Install bearing carefully until no axle shaft endplay exists without preloading the bearing (rotate shaft during bearing installation to check against preload). At this point the bearing cup will protrude beyond face of axle housing flange. Hold Tool C-413 firmly against bearing cup and measure the distance between end of tool and flange with a feeler gauge. To obtain the correct endplay of .013-.018", add .013" shims to the above measurement *(NOTE* - If this gives a total thickness of shims that cannot be built up from the existing shims, use the next larger shim combination). Remove tool and install total shim pack and brake dust shield. Tighten nuts to 30-35 ft. lbs.

DIFFERENTIAL CARRIER ASSEMBLY REMOVAL & INSTALLATION: Raise car and block brake pedal so it cannot be depressed. Drain differential housing, then back off brake shoes with Tool C-845. Remove axle shafts (see above). *(NOTE - Retain shims found at each end of rear axle housing and mark them for reassembly in the sam location).* Disconnect rear universal joint and drop the propeller shaft. Remove bolts attaching carrier to housing and remove the carrier assembly. To install, reverse removal procedure.

OVERHAUL: *See "Chrysler, DeSoto, Dodge, Plymouth Hypoid" in 1957 Annual Data or lat r manual edition and note the following.*

Drive Gear Backlash - .006-.009".

Pinion Rear Bearing Rem val - To remove rear pinion bearing, use Tool C-293 and four No. 37 Adapters (Pinions without spacers), four No. 36 Adapters (Pinions with spacers except Imperial), four No. 26 Adapters (Imperial).

Pinion Bearing Preload - (All Mod ls) - Preload should be 29-30 inch lbs. (New bearings), 0-15 inch lbs. (Used bearings).

Pini n Setting & B aring Preload Adjustm nt (Cars With ut Spac r n Pini n Shaft): Adjustment procedures for this type rear axle assembly are the same as for Chrysler New Yorker and Imperial as indicated in 1957 Annual Data or later Manual edition.

FORD & MERCURY "DEEP-OFFSET" HYPOID

Ford Pass. Cars (1961)
Ford Thunderbird (1961)
Ford F–100 Trucks (1961)①
Mercury (1961)

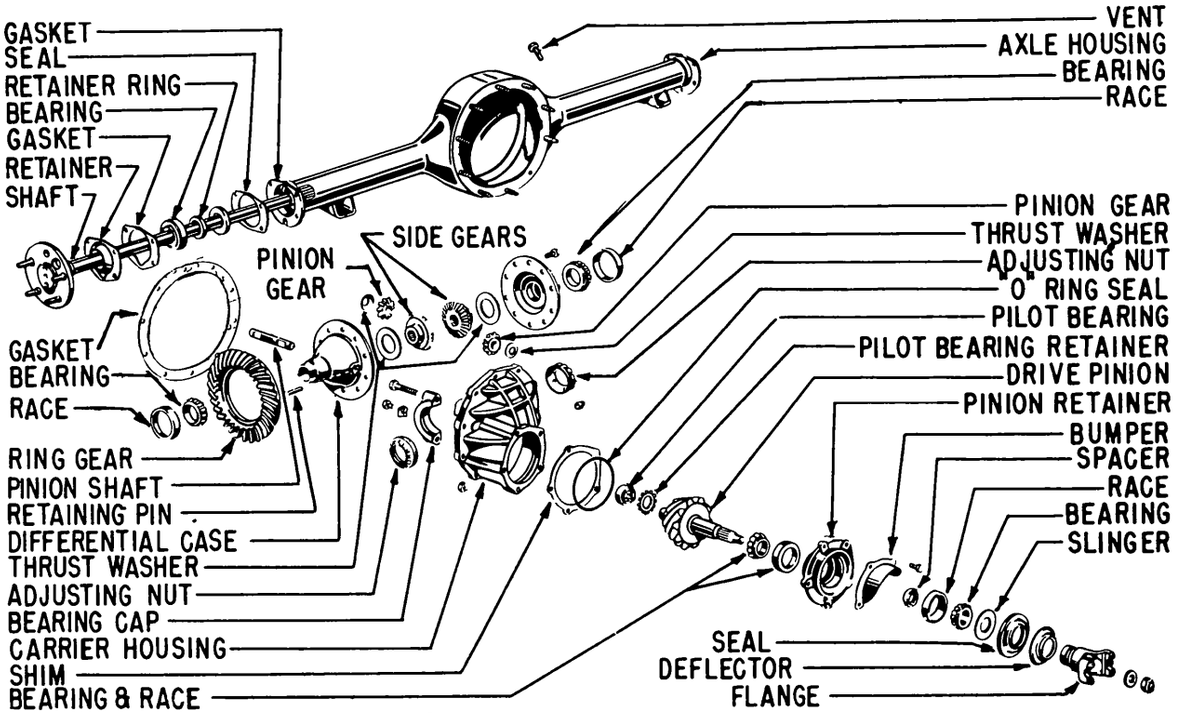
①—Spicer Model 44 used with Power–Lock Differentials.

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 MERCURY REAR AXLE LUBRICANT NOTE:* Use Lubricant C1AZ–19580–B (SAE 90), Ford Specification No. M2C49B and C1AZ–19580–A (SAE 80) Ford Specification No. M2C49A (Exc. cars with 390" Eng.) C1AZ–19580–E, Ford Specification M2C50B (Cars with 390" Eng.), when adding or replacing lubricant.

►*1961 MERCURY DIFFERENTIAL ASSEMBLY PRODUCTION CHANGE & PARTS USAGE CAUTION:* Parts for early and late type differential assemblies are not interchangeable except as indicated below. Late type have thicker side gears with distance between base of gear teeth and flange thrust face increased. Pinion gears to match side gears changed accordingly. Thrust surfaces in case (for thicker gears) moved outward .032". New type assembly identified by yellow paint mark. Always use two thrust washers (each side) when installing older type side gears in new type case to insure proper gear meshing.

►*1961 MERCURY 3.00–1 RATIO INSTALLATION NOTE:* This is a "Non–hunting" type gear tooth design with reference mark painted on a pinion tooth and a mating tooth of ring gear. Mate marks when assembling to maintain quiet operation.



►*1961 MERCURY REAR AXLE SHAFT BEARING NOTE:* Lubricate bearing bores in housing with Lubricant C1AZ–19590–A (ball joint grease), at any time axle shafts are removed to prevent corrosion.

DESCRIPTION: Banjo type housing, semi–floating type with "deep–offset" straddle mounted drive pinion. A separate differential assembly is used which can be removed for overhaul without removing rear axle assembly from car.

Axle Ratio & Identification Note: Ratio Code stamped under **Axle** on Patent Plate on left front body pillar. Axle ratios stamped on tag located under carrier to housing nut.

Axle Ratio	Standard – Code –	Power–Lock
2.91	8	H
3.00	6	F
3.10	3	C
3.20	5	
3.50	J	
3.56	1	A
3.89 Pass	2	B
4.00	4	
3.22	10	
3.70	11	
3.89 Truck	12	
4.11	13	

Axle Shaft Replacement: Remove wheel and tire from brake drum, then remove drum from flange. Work through hole in flange to remove wheel bearing retainer nuts and pull axle shaft with Tool 4235–N (Ford), 4235–C (Mercury) and T50T–100–A. Install one backing plate nut to hold plate in place.

FORD & MERCURY REAR AXLE ASSEMBLY

Axle Seal & Bearing Replacement: Nick bearing retainer with chisel to loosen it so it can be removed from shaft. Remove bearing with Tool T60K–1225–A (Ford Pass. & Truck), OCT–951 (T'Bird), 1225–D (Mercury). Install new bearing with same tools used to remove bearing (Ford Pass. & Truck, T'Bird), 4234–4 (Mercury). Use same tools to install retainer as used to install bearing. Remove seal with 1175–AE or 1175W (Ford Pass., T'Bird, & Mercury), 1175–AB (Truck), and install new seal with 1177 or 1177N (Ford Pass., Truck, T'Bird), 4245–B (Mercury).

OVERHAUL: *See "Ford & Mercury (Deep Offset) Hypoid" in 1957 Annual Data or later Manual edition and "Edsel & Ford Equa–Lock Differential" in 1959 Annual Data or later Manual editions and note the following:*

Four Pinion Differential: Disassembly – Same as for two pinion differential except as follows After removing differential assembly from carrier, drive out three differential pinion shaft retainers with drift and separate. Drive out long pinion shaft from end opposite retainer hole. Remove two short pinion shafts, driving each from center outward. Lift out center block and remove gears and thrust washers.

Reassembly – Place a thrust washer and side gear in differential case bore. Install four thrust washers and place pinion gears on side gear. Align washers and pinion gears with pinion shaft holes in case. Install center block so its four small diameter holes are aligned with holes in pinion gears and case. Use brass drift to drive in two short pinion shafts from outside of case. *NOTE – Align shaft retainer holes as each shaft is driven in place.* Drive long pinion shaft into place from retainer hole end of case (align shaft retainer hole with that in case). Place second side gear and thrust washer on top of four pinion gears, then install differential case cover so that the three shaft retainer holes in cover align with their corresponding holes in case. Install the three shaft retainer pins with a drift. A pinion or axle shaft can be inserted in the side gear spline to check free movement of gears.

►*SPECIAL TOOL NOTE:* Tools listed below supplement tools listed in "OVERHAUL" data.

Differential Side Bearing: Remover – T57L–4220–A (Ford), 4221–AE (Mercury).
Installer – T57L–4221–A (Ford), 4222–K (Mercury).

Pinion Pilot Bearing: Remover – T57L–4625–A and T53L–200–A (Ford), T4225–L (Mercury).
Installer – Same as remover (Ford), T46L–25 KA and T4625–K (Mercury).

Pinion Preload Indicator: Use inch–pound torque wrench.

Pinion Oil Seal: Remover – 1175AE or W (All).
Installer – T58L–4676–A (Ford), 4676–F (Mercury).

Pinion Front Bearing Cone: Remover – T57L–4614–A (Ford), Arbor Press and Plates (Mercury).
Installer – T57L–4621–B and T57L–4614–A (Ford).

Pinion Bearing Rear Cone: Remover – CJ–950 or OTC–951 (Ford), 4621–K (Mercury).
Installer – T57L–4614–A & T57L–4621–B (Ford), 4621–L (Mercury).

Pinion Front Bearing Cup: Remover – T57L–4614–A (Ford), 4615–D–1 & 1202–D (Mercury).
Installer – T57L–4614–A & T57L–4616–A (Ford), 4615–E (Mercury).

FORD ECONOLINE TRUCKS, COMET & FALCON HYPOID

Comet (1961)
Falcon (1961)
Econoline Trucks (1961)

►CHANGES, CAUTIONS, CORRECTIONS

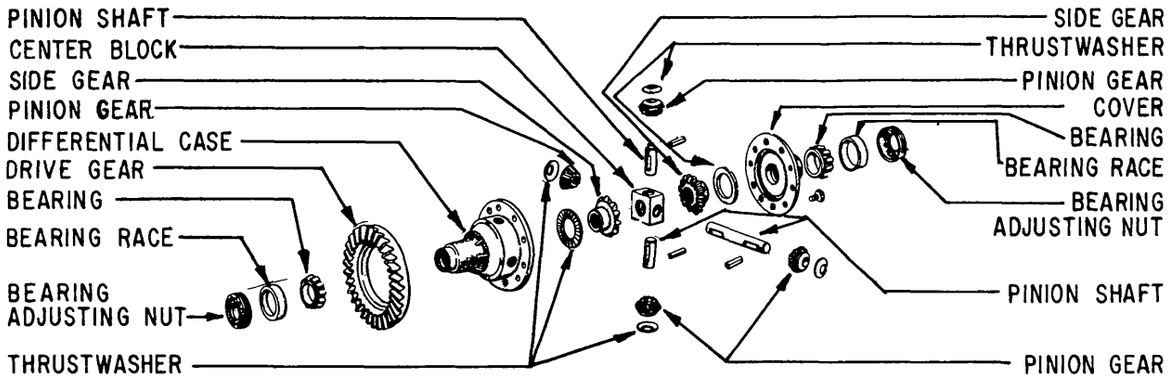
►*PARTS REPLACEMENT CAUTION: When replacing rear axle assembly parts, make sure part being installed is same as the part that was removed. Rear axle assemblies are different for the various car models and all parts are not interchangeable.*

►*RING GEAR & PINION INSTALLATION CAUTION (3.50–1 & 4.00–1 RATIOS):* These ring gear and pinion assemblies are the "non–hunting" type (pinion gear teeth mesh with same ring gear teeth) and it is important that marked tooth on pinion gear be meshed with marked tooth on ring gear.

►*AXLE SHAFT REMOVAL NOTE:* To prevent corrosion due to moisture in rear axle housing wheel bearing bores, it is recommended that bearing bores be lightly coated with ball joint lubricant, Part No. C1AZ–19590 –A, any time rear axles are removed.

►*PINION BEARING PRELOAD CAUTION: Rear universal joint companion flange nut controls pinion bearing preload. If this nut is loosened, pinion bearing preload must be adjusted.*

DESCRIPTION: Semi–floating, hypoid gear type with an integral type housing and Hotchkiss drive. Design is same as used on previous models.



►*AXLE IDENTIFICATION & RATIO NOTE:* Ratio code is stamped under "Axle" on Patent Plate located on rear face of left front door inner panel.

Axle Ratio Code

Code	Axle Ratio
3 (Comet & Falcon)	3.10–1
4 (Comet & Falcon)	4.00–1
5 (Comet & Falcon)	3.20–1
J (Comet & Falcon)	3.50–1
01 (Econoline Truck)	3.50–1
02 (Econoline Truck)	4.00–1

AXLE HOUSING ASSEMBLY: Removal – Raise vehicle and support it on the underbody, then loosen carrier rear cover and drain lubricant. Disconnect drive shaft at pinion flange and shock absorbers at axle housing. Remove both axle shafts (see below). Remove hydraulic brake "T" connection from axle housing (do not open hydraulic brake system line), then remove brake line from retainer clip on housing. Remove both brake backing plates from housing and support them out of way with wire. *CAUTION – Be careful not to damage brake lines or cables.* Support axle housing on a jack, then remove spring plates and "U" bolts. Remove axle assembly from under car.

Installation: Reverse removal procedure and tighten spring "U" bolt nuts to 13–20 ft. lbs.

FORD ECONOLINE TRUCK DIFFERENTIAL CASE

AXLE SHAFT: Removal – Remove wheel assembly from brake drum, then back off rear brake shoe adjustments. Remove brake drum–to–axle shaft flange nuts and remove. Working through hole in axle shaft flange, remove nuts securing wheel bearing retainer, then remove axle shaft from axle housing using a suitable "sliding hammer" type puller. *CAUTION – Do not dislodge brake backing plate. Use a single nut to hold plate in position after removal of axle shaft.*

Bearing & Seal Replacement – Remove seal from axle housing with a suitable puller. To remove bearing from shaft, nick bearing retainer deeply with a chisel, using care not to damage shaft, and remove retainer. Press bearing from axle shaft using an arbor press and a suitable tool to hold and support bearing. When installing seal in axle housing, coat outside edges of new seal with sealing compound, then install seal in housing with Tool 1177–B (Comet), T61E–1190–B1 (Falcon & Econoline Truck) making sure sealing lips point inward and that seal is seated against shoulder in housing. Install outer bearing race on shaft, then press new bearing on shaft, seating it firmly against shoulder. Press a new bearing inner retainer onto shaft, seating it firmly against bearing. *CAUTION – Do not attempt to press bearing and inner retainer on shaft at the same time.*

Installation: Reverse removal procedure and tighten bearing retainer mounting nuts to 30–35 ft. lbs.

OVERHAUL: *See 1960 Annual Data, Page 352, or later Manual edition and note the following:*

Differential Case (Two–Piece Type): Disassembly – Use a suitable puller and remove differential side bearings, then remove bolts attaching drive gear to differential case. Press drive gear from case or tap it off with a hammer. On passenger cars, drive out the single pinion shaft retainer and separate two–piece differential case. Drive out pinion shaft with a brass drift and remove gears and thrust washers. On Trucks, drive out the three pinion shaft retainers and separate differential case. With a brass drift, drive out long pinion shaft (drive from end opposite retainer hole), then remove two short pinion shafts (use a brass drift and drive from center outward). Lift out center block, then remove gears and thrust washers.

Reassembly – Place a thrust washer and side gear in differential case bore. *NOTE – Lubricate all parts with rear axle lubricant as they are assembled.* On passenger cars, drive pinion shaft into case with a soft hammer far enough to support a pinion thrust washer and pinion gear, then install thrust washer and slide pinion gear onto shaft and mesh with side gear. Place second pinion gear and thrust washer in position, and drive pinion shaft all the way into position. *NOTE – Be sure to align shaft retainer holes as shaft is being driven in.* Place second side gear on top of two pinion gears, then position thrust washer and install differential cover so shaft retainer hole in cover is aligned with hole in case. On truck models, install four pinion thrust washers, and place pinion gears on side cover, then align washers and pinion gears with pinion shaft holes in case. Install center block so that its four small diameter holes are aligned with holes in pinion gears and with holes in case. Use a brass drift and drive the two short pinion shafts into center block, being sure to align shaft retainer holes as each shaft is driven into place. Drive long pinion shaft into place from retainer hole end of case, being sure to align retainer hole with hole in case. Place second side gear and thrust washer on top of the four pinion gears and install differential case cover so that the three shaft retainer holes are aligned with holes in case. On all models, install shaft retainer pins with a drift (one on passenger cars and three on truck models). *NOTE – A pinion or axle shaft spline can be inserted in side gear splines to check for free rotation of differential gears.* Place drive gear on differential case and tighten bolts to 40–50 ft. lbs.

FORD TRUCK "BANJO HOUSING" HYPOID

F-350, P-400 (1961) Ⓒ
B,C,F,P-500 & 600 (1961) Std.

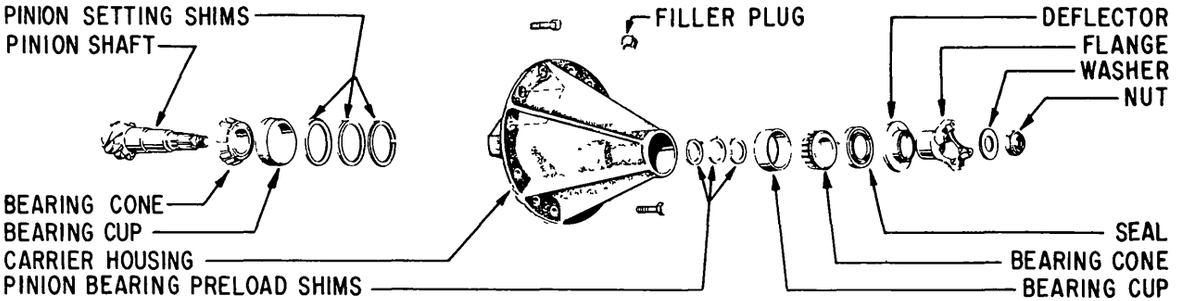
Ⓒ - "Single Casting" type carrier assembly.

►*DIFFERENTIAL SIDE BEARING NOTE: Right hand bearing and adjusting nut is larger than left hand bearing and adjusting nut. The larger right hand bearing cone has 19 rollers and the smaller left hand bearing cone has 22 rollers.*

►*1961 FORD REAR AXLE LUBRICANT NOTE:* Rear axle lubricant should be changed after first 8,000 miles (on or off highway) and at each 32,000 mile interval thereafter.

DESCRIPTION: Full floating, hypoid gear type with Hotchkiss drive.

►*REAR AXLE NOTE: Different model axle assemblies are used for the different model trucks. Assemblies used on F-350 & P-400 Series trucks have a single casting type diff rential carrier (other series trucks have a multiple casting carrier). Service procedure applies to all assemblies unless otherwise specified.*



►*AXLE IDENTIFICATION CODE & RATIO NOTE:* Code (type of axle used) is located on Rating Plate on left front cab pillar or glove box door, see table below. Axle ratio tag located at various places by axle type as follows: **Timken** - On Rockwell Std. Serial No. Plate on right rear face of axle housing above brake line. **Eaton** - Stamped on carrier housing.

Truck Model	Axle Model	Code	Ratio
F-P-350,400	Timken B 140	25	4.86
F-B-P-500	Timken C 100	32	6.20
		34	6.80
F-B-P-500;C-550	Timken D 100	41	5.83
		42	6.20
		44	6.80
C-600	Timken F 104	52	6.20
		54	6.80
F-B-C-600	Timken F-106	62	6.20
		64	6.80
		66	7.20
F-B-C-600	Eaton 1614-15	53	6.50 or 7.17

Axl Shaft R plac ment: Remove axle shaft stud nuts and lockwashers. Strike center of axle shaft flange with a hammer and drift to loosen tapered dowels, then remove dowels. Pull axle shaft from housing. To reinstall, place gasket in position on housing and install axle shaft. Install tapered dowels, lockwashers and nuts on studs. Tighten nuts to 50-70 ft. lbs.

Axl Ass mbly R m val (Integral Housing): Loosen wheel and axle shaft stud nuts, disconnect shock absorbers, raise rear of frame until weight is off springs. Disconnect flexible hydraulic line at frame, parking brake cable (if equipped) at equalizer, remove cables at brackets. Disconnect rear universal joint at flange, remove spring U-bolts, remove axle assembly.

Carri r R m val (Banj H using): Remove axle shafts (see above), disconnect drive shaft at rear joint flange.

FORD TRUCK (BANJO HOUSING) HYPOID "SINGLE CASTING" CARRIER ASSEMBLY

Support carrier assembly and remove carrier attaching bolts. Tighten puller screws (if provided) to loosen carrier from housing. Remove carrier.

Wheel Bearing Adjustment: Remove axle shafts (see above), use special bearing adjusting wrench and remove bearing locknut (outer nut), and lockwasher. Adjust bearings by turning bearing adjusting nut (inner nut) until tight, then back off 3/8 turn. Install bearing lockwasher. *NOTE - If adjusting nut equipped with dowel, make sure lockwasher fits over dowel.* Install bearing locknut and tighten. If flange type lockwasher is used, bend one flange over adjusting nut and one flange over locknut. Install axle shafts.

OVERHAUL: *See "Ford Truck 'Banjo Housing Type Rear Axle" in 1956 Annual Data or later Manual edition and note the following:*

►*OVERHAUL PROCEDURE NOTE (MODELS WITH "SINGLE CASTING" TYPE CARRIER ASSEMBLY):* Except as noted below, overhaul procedures for rear axle assemblies with this type carrier are the same as for "multiple casting" type carrier.

Disassembly: Pinion Shaft - With differential case assembly removed from rear axle housing, press pinion shaft out of flange, and out of pinion front bearing cone. Remove pinion bearing preload shims from pinion shaft (or from front bearing cone). Remove pinion flange oil seal with Tool T58L-101-A and T50T-100-A, then remove pinion rear bearing cup with Tool OTC-943 and 630-11. *NOTE - Use a micrometer and measure shim or shims which were installed under pinion bearing cup.* If pinion front bearing cup is to be removed, use a drift and drive it out of housing. Press pinion rear bearing cone from shaft using Tool T58L-101-A and T50T-100-A.

Pinion Setting: Pinion depth is adjusted by removing or installing shims located behind pinion rear bearing cup (between cup and carrier). **Increasing** the shim pack **decreases** pinion and drive gear assembled dimension. **Decreasing** the shim pack **increases** pinion and drive. gear assembled dimension. When a new pinion and ring gear are installed, check the markings on both old and new pinion and adjust pinion locating shim pack accordingly. A plus (+) marked pinion requires removal of shims in amount of the marking. A minus (−) marked pinion requires additional shims in amount of the marking. *;NOTE - B fore pini n is install d, check f r a backlash marking which may be tch d on pinion splin .*

Pinion Installation & Bearing Preload Adjustment: 1) Place pinion rear bearing cup shim pack in bore in carrier housing and press cup into case with Tool T53T-44807-B and arbor press. Check installation of cup by trying to insert a .0015" feeler gauge under cup. If pinion front bearing cup removed, install cup with Tool T53T-44807-B. If the new pinion being installed, add or subtract from original pinion bearing preload shim pack, then same amount in thousandths of an inch that was added or subtracted from shim pack behind pinion rear bearing cup.

2) Place Tool T53T-44807-B on press bed with open end upward, then place pinion front bearing cone on tool with tapered rollers pointing upward. Center bearing on tool. Place carrier housing with front end down, on pinion front bearing cone (carrier housing is now resting on pinion front bearing cones and rollers). Hold housing in this position and start pinion shaft (with rear bearing cone and preload shims in place) into pinion front bearing cone. Lower ram of press and press pinion shaft into front bearing cone. As pinion shaft is pressed into position, rotate carrier housing in both directions so bearing rollers seat properly. Gradually increase ram pressure with case still rotating and "feel" for preload on bearings.

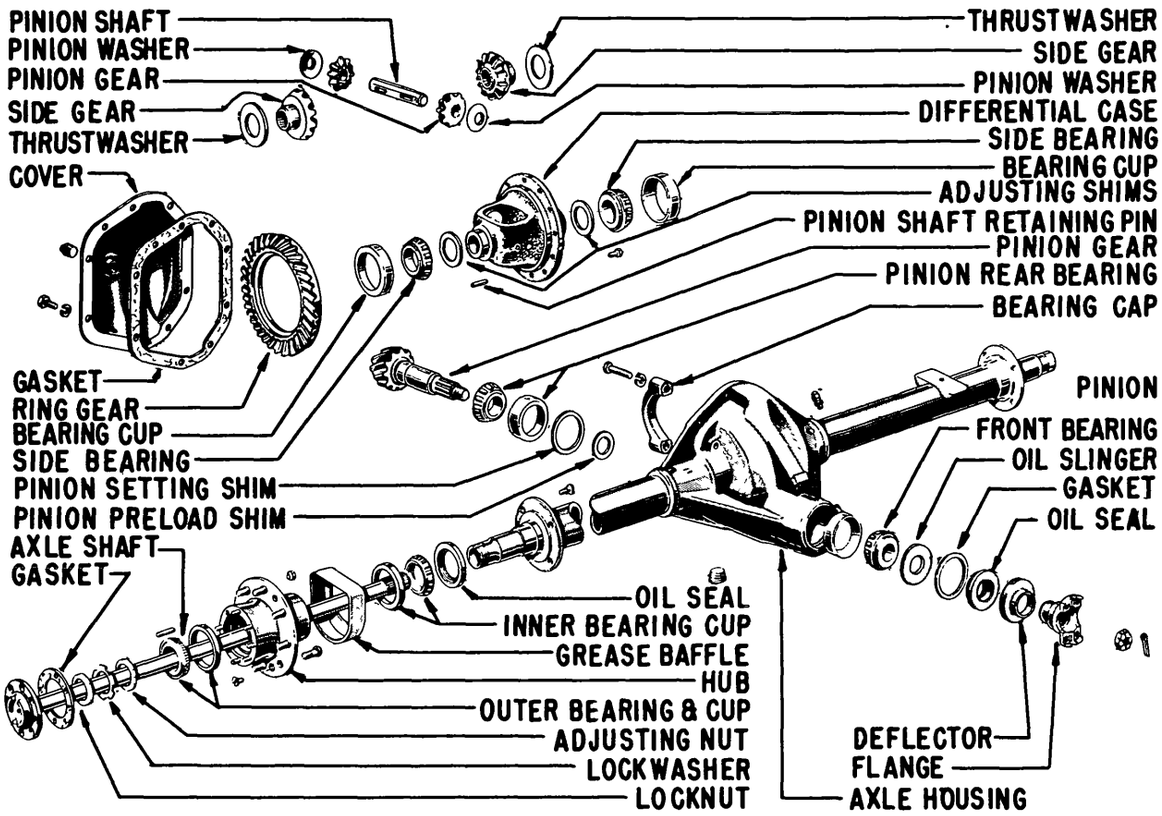
3) As soon as slight preload is felt, install a bolt in differential bearing support pedestal which is nearest to pinion gear, then; using a pound pull scale hooked to pedestal bolt, rotate case by pulling on scale. Keep scale at right angles to a line through center of pedestal bolt and through center of pinion gear. Note reading on scale while carrier is steadily rotated (disregard pull required to start carrier rotating). *NOTE - Th distance from center of pedestal bolt to center of pinion gear is approximately 2½". The scale reading in pounds, multiplied by 2½" (radius) is the actual pinion bearing preload.* Specified pinion bearing preload is 5 to 15 inch pounds with 5000 lbs. pressure applied (minimum scale reading should be 2 lbs., and maximum scale reading should be 6 lbs.). To **increas** preload, decrease the preload shim pack thickness. To **decrease** preload, increase shim pack thickness.

4) Adjust shim pack thickness as required, then press a new pinion flange seal into carrier housing with Tool T56T-4676-A. Support pinion gear on press bed and press pinion shaft flange into position with Tool T53T-4851-B. Remove carrier assembly from press and mount it in an overhaul stand, then install flat washer and nut on pinion shaft. Hold pinion flange and tighten shaft nut to 200-275 ft. lbs.

FORD TRUCK "INTEGRAL HOUSING" HYPOID

Ford F-250, 350 & P-350, 400 Trucks (1961)

DESCRIPTION: Spicer Models 60 & 70. Full-floating, hypoid gear with Hotchkiss drive. This axle does not have a separate carrier assembly. "Power-Lock" Differential Optional on F-250.



►*AXLE IDENTIFICATION CODE & RATIO NOTE:* Code (type of axle used) is located on Rating Plate on left front cab pillar or glove box door, see table below. Axle ratio tag on differential housing cover.

Truck Model	Axle Model	Code	Ratio
F-250	Spicer 60	B4②	4.56
F-250	Spicer 60	B6②	4.88
F-250	Spicer 60	24①	4.56
F-250	Spicer 60	26①	4.88
F-350,P-350,400	Spicer 70	22①	4.88
F-350,P-350,400	Spicer 70	23①	5.13
F-350,P-350,400	Spicer 70	29①	5.87

① – Regular. ② – Locking type.

AXLE SHAFT & WHEEL BEARING REPLACEMENT: Loosen axle shaft stud nuts, then raise truck and place jacks under rear axle housing. Remove axle shaft stud nuts. Loosen dowels by striking drift at center of flange and remove dowels and axle shaft. Remove seal assembly from studs and wiper from housing tube (if so equipped). Remove locknut, lock washer and adjusting nut. Place wheel type jack under wheels and relieve load on bearings. Remove outer bearing cone and pull wheel off axle. Use hard wood block to drive outer bearing cone and inner seal out of hub. If bearing cups to be replaced, drive them out with a drift. Use Tool T53T-1239-A and Detail 17 to replace cups. *NOTE – Pack bearing grease on both sides of each cup.* Place each bearing cone and roller assembly into wheel hub then install new inner seal with Tool T53T-1175-D (F-250, P-350), T53T-1175-B (F-350). Adjust wheel jack height so wheel will be installed straight on housing without damage to inner seal. Install outer bearing cone and adjusting nut. Torque adjusting nut to 50-80 ft. lbs. while rotating wheel in both directions, then back off nut 3/8 turn and install lockwasher. *NOTE – When adjusting nut has locking dowel, dowel must enter lock washer hole closest to dowel. When equipped with tabs, run locknut against lockwasher and bend tab of nut.* Torque locknut to 100-150 ft. lbs. Wheel will rotate freely with .001-.010" endplay. Reinstall wiper in tube, seal assembly and gaskets on axle shaft flange studs (same number of gaskets removed). Install axle shaft.

REMOVAL OF REAR AXLE ASSEMBLY: Loosen wheel stud nuts and axle shaft nuts. Disconnect rear shock absorbers from spring seat caps. Raise rear end of vehicle frame to remove weight from springs and place stands under frame. Disconnect hydraulic line at frame, parking brake cable (if so equipped) at equalizer and remove cables from support brackets. Disconnect drive shaft at universal joint and remove nuts from "U" bolts and remove spring seat caps. Roll axle from truck and drain lubricant.

FORD F-250 & P-350 TRUCK REAR AXLE

OVERHAUL: *See Ford Truck Hypoid in 1957 Annual Data or later Manual edition and note the following:*

Pinion Depth Setting Note: After pinion is installed in housing and preload is within limits, check depth setting (actual assembly dimension) with Depth Gauge using the large discs. Place dial indicator on high step. Nominal setting is 3.125".

Pinion Bearing Preload Shim Pack: When original shim pack is lost or questionable, use a .065" shim pack for trial build up.

FORD TRUCK TWO-SPEED REAR AXLE

F, B, P–500 & 600; C–550, 600 (1961)

DESCRIPTION: Two–speed planetary differential assembly with either a spiral bevel or hypoid ring gear and pinion. Spiral bevel pinion shaft is piloted at rear by a roller bearing. Shift control is electrically operated.

►*AXLE IDENTIFICATION CODE & RATIO NOTE:* Code (type of axle used) is located on Rating Plate on left front cab pillar or glove door, see table below. Axle ratio stamped on top of carrier housing below carrier assembly number.

Truck Mdl	Axl Mdel	Code	Ratio
P,B,C–500	Eaton 1350	D1	5.83/8.11
C–600	Eaton 13800	E1	5.83/8.11
	Eaton 13800	E2	6.33/8.81
F,B,C–600	Eaton 13802	F1	5.83/8.11
	Eaton 13802	F2	6.33/8.81
F,B,C–600	Eaton 16802,03	G3	6.50/9.04

AXLE SHAFT & WHEEL BEARING REPLACEMENT: Loosen axle shaft stud nuts, then raise truck and place jacks under rear axle housing. Remove axle shaft stud nuts. Loosen dowels by striking drift at center of flange and remove dowels and axle shaft. Remove seal assembly from studs and wiper from housing (if so equipped). Remove locknut, lock washer and adjusting nut. Plate wheel type jack under wheels and relieve load on bearings. Remove outer bearing cone and pull wheel off axle. Use hard wood block to drive outer bearing cone and inner seal out of hub. If bearing cups are to be replaced, drive them out with a drift. Use Tool T53T–1239–A and Detail 17 to replace cups. *NOTE – Pack bearing grease on both sides of each cup.* Place each bearing and roller assembly into wheel hub, then install new inner seal with Tool T54T –1175–E(F,B,C–600). Adjust wheel jack height so wheel will be installed straight on housing without damage to inner seal. Install outer bearing cone and adjusting nut. Torque adjusting nut to 50–80 ft. lbs. while rotating wheel in both directions, then back off nut 3/8 turn and install lockwasher. *NOTE – When adjusting nut has locking dowel, dowel must enter lock washer hole closest to dowel. When equipped with tabs, run locknut against lockwasher and bend tab of nut.* Torque locknut to 100–150 ft. lbs. Wheel will rotate freely with .001–.010" endplay. Reinstall wiper in tube, seal assembly and gaskets on axle shaft flange studs (same number of gaskets removed). Install axle shaft.

Axle Assembly Removal (Integral Housing): Loosen wheel and axle shaft stud nuts, disconnect shock absorbers, raise rear of frame until weight is off springs. Disconnect flexible hydraulic line at frame, parking brake cable (if so equipped) at equalizer, remove cables at brackets. Disconnect rear universal joint at flange, remove spring "U" bolts, remove axle assembly.

Carrier Removal (Banjo Housing): Shift axle into low ratio. Drain lubricant and remove axle shafts, see above. Remove electric shift unit from carrier housing. Disconnect drive shaft at rear universal joint flange. Support carrier on roller jack, then remove carrier to housing bolts and lockwashers (or stud nuts). Remove carrier from housing.

OVERHAUL: *See 1955 Annual Data Pg. 347 or later Manual edition.*

LINCOLN CONTINENTAL HYPOID

Lincoln Continental (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*REAR AXLE "CHUCKLE" NOISE CORRECTION:* Caused by excessive differential side gear clearance. Before replacing side gears, road test car to be sure noise is not caused by shock absorbers, "U" joints or other components. To install new side gears, raise body, drain lubricant, remove axle shafts and differential cover. DO NOT DISTURB PINION SHAFT ASSEMBLY. Drive out small roll pin, push binion shaft partially out then rotate differential assembly 180° and pull pinion shaft, pinions side gears and washers from case. Examine side gear bores in case for wear, galling or scoring. If worn excessively replace case. If case OK, install NEW OVERSIZE side gears Part No. C1VV–4236–A which have .002" larger chrome plated hubs, and NEW Thrust Washers Part No. C1VY–4236–A, which are hardened. *NOTE* – When installing new case, be sure to measure side gear bore. There must be .002" clearance for lubrication and maximum clearance should not exceed .0035".

DESCRIPTION: Semi–floating hypoid gear type with integral carrier housing and Hotchkiss drive. Two types of "Directed Power" differentials (Cone Clutch & Plate Clutch) Optional. *NOTE* – 1961 rear axle models have a pinion nose bumper to control upward movement of pinion nose during acceleration, larger wheel bearings, and both axle shafts are the same length and interchangeable.

REAR WHEEL BEARING & SEAL REPLACEMENT: *Same as previous models except for Tool No. Changes. See 1961 Tools below.*

DRIVE PINION SEAL & COMPANION FLANGE REPLACEMENT: *Same as for previous models except for Tool No. Changes. See 1961 Tools below.*

REMOVAL: Raise car and place jacks at rear of spring hangers. Drain lubricant by loosening cover bolts. Mark drive shaft, universal joints, slip yoke and companion flange for reinstallation in original position to maintain drive line balance. Remove two "U" bolts at rear universal joint and slide drive shaft forward to remove shaft. Cover output shaft with Tool 7657–J to stop oil leakage from transmission. Remove wheels, brake drums, wheel bearing retainer nuts and pull axle shafts and bearings. Disconnect rear shock absorbers, then remove brake line to axle clips and bolt holding junction block to axle housing. Remove parking brake cable retainers from "U" bolts then remove backing plates and brake lines (wire them to body). Remove axle "U" bolt nuts, bolts and spring insulator retainers. Remove axle housing assembly.

►*AXLE IDENTIFICATION CODE & RATIO NOTE:* Code Number or Letter stamped on Patent plate under Axle located at front body pillar between hinges. Number 7 indicates std. axle, Letter "G", indicates a locking differential. Axle ratio is 2.89–1. Directed Power differential assemblies have an additional metal tag attached to cover bolts.

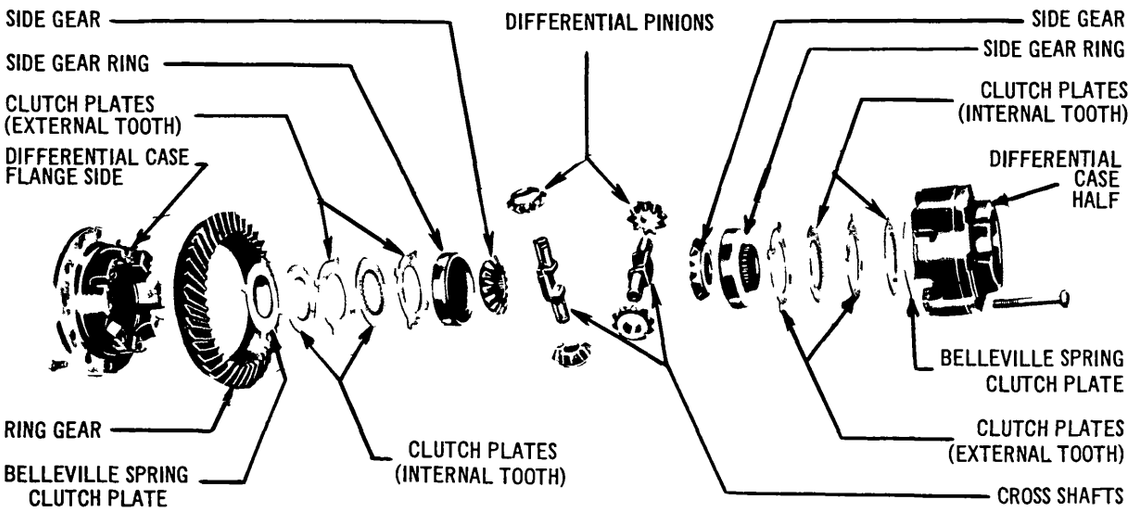
⑤ - "Belleville" Type Assy
⑥ - Plate Type Assy (Early), "Belleville" Type Assy (Later)
⑦ - Plate Type Assy

►CHANGES, CAUTIONS, CORRECTIONS

►*1958-61 CHRYSLER & DODGE "SURE-GRIP" DIFFERENTIAL PLATE PRODUCTION CHANGE TO ELIMINATE "CHATTER" OR "CLUTCH SLIPPAGE":* Use service package Part No 2070845 consisting of two Belleville type clutch plates and two Belleville type clutch discs on each left and right side of unit The parts in each clutch assembly starting at side gear ring will be a flat coated plate No 2070825, a Belleville disc No 2070826 (coned side away from center of differential) a Belleville coated plate No 2070827 (convex side the same as No 2070826), a flat disc No 2070828, and a flat coated plate No. 2070829.



DESCRIPTION: Design is similar to that used on previous models The addition of "Belleville" type plates in differential clutch pack, on some models, has changed the checking and adjusting procedure for those models, as indicated in "Overhaul" below.

REAR AXLE ASSEMBLY REMOVAL: *See Car Model Rear Axle Data.*

AXLE SHAFT REMOVAL: *See Car Model Rear Axle Data. NOTE* - When making conversion from one model axle to another, use axle shafts with same splines as as differential side gears.

DIFFERENTIAL ASSEMBLY REMOVAL AND INSTALLATION: *See Car Model Rear Axle Data*

OVERHAUL: *See "Power-Lock Differential (Plate Clutch Type)" in 1959 Annual Data, or later Manual edition, and note the following.*

POWER-LOCK DIFFERENTIAL (WITH "BELLEVILLE" TYPE PLATES)

►*DISASSEMBLY CAUTION* Before removing Power-Lock Differential from rear axle housing for "CHATTER" correction, suck out all old lubricant from housing and install correct amount of Car Manufacturer's Specified Lubricant

►*DIFFERENTIAL CLUTCH PACK ASSEMBLY CAUTION:* When removing clutch plates and discs, note the exact sequence and position of each type plate or disc for reassembly in identical arrangement "Belleville" type plate and/or disc must have the convex side away from center of differential

►*"V" RAMP CLEARANCE NOTE* Use of "Belleville Type" plates and/or discs eliminates need for checking ramp clearance If clearance at "V" ramp exists when this type clutch pack assembled, look for worn clutch parts Lincoln permits a slight clearance provided the clearance at all four shaft ends is uniform

LUBRICATION: Car manufacturers recommendations for Power-Lock Type Differentials are as follows
Buick - Part No 531536
Cadillac - M-P Gear Lub SAE-90 to Zero, SAE 80, below.
Chevrolet Pass - GM 3758790 or 791
Chrysler Corp - M-P Gear Lub
Lincoln - Part No COLY-19A508-B
Oldsmobile & Pontiac - M-P Gear Lub
Rambler - Rambler Approved Lub
Studebaker - S-P Twin-Traction Lub
Willys - Part No 94557

POWER-LOCK DIFFERENTIAL (CONE CLUTCH TYPE)

Lincoln Continental (Early 1961)

DESCRIPTION: Same design unit as used on previous models

REAR AXLE ASSEMBLY REMOVAL: *See Lincoln Continental Hypoid*

AXLE SHAFT REMOVAL: *See Lincoln Continental Hypoid*

DIFFERENTIAL ASSEMBLY REMOVAL & INSTALLATION: *See Lincoln Continental Hypoid*

OVERHAUL: *See "Power-Lock Differential (Cone Clutch Type)" in 1959 Annual Data or later Manual edition, and note the following*

Disassembly: With case assembly on bench (ring gear removed from case), check clearance between cross pins and ramps by manually raising a cross pin up one side of the ramp and inserting feeler gauges *NOTE - If clearance at this point is less than .045" it is not necessary to disassemble differential cas If clearance is greater than .045', proceed as follows* Remove case capscrews, then remove cover, clutch rings, side gears, cross pins, and pinion gears *NOTE - Identify each part and place on a clean cloth so that it may be reinstalled in the same relative location*

AXLE ASSEMBLY REMOVAL: Ford F-100 - Loosen wheel stud nuts and axle shaft nuts. Disconnect shock absorbers from spring seat caps and raise rear of truck to relieve weight from springs. Place safety jacks under frame. Disconnect hydraulic line at frame and parking brake cable (if so equipped) at equalizer, then remove cables from support brackets. Disconnect drive shaft at rear "U" joint flange and remove nuts from spring clips U bolts and remove spring seat caps. Roll axle from truck and drain lubricant.

Studebaker (All Models) - Remove the hub caps, loosen wheel nuts and remove axle shaft nut. Raise rear of car and support on stands under frame just ahead of rear springs. Remove wheels, hubs, and drums. Disconnect brake line at each rear wheel cylinder, remove brake pipe clamps and free brake line from rear axle housing. Take out backing plate bolts, pull backing plate out over end of axle shaft and tie up out of way. Remove adjusting shims located beneath backing plate. *(CAUTION – Save for reinstallation).* Disconnect propeller shaft by removing rear universal joint U-bolts

CONTINUED ON NEXT PAGE

SPICER HYPOID (C ntinued)

and nuts (wire caps together). Remove rear spring U-bolts from axle housing, disconnect rear shock absorbers. Remove rear axle assembly from beneath car.
Willys - Raise rear end of vehicle with hoist and support frame ahead of rear springs. Remove wheels and disconnect propeller shaft at rear universal joint companion flange. Disconnect brake hydraulic hoses, remove spring to axle "U" bolt clips and slide assembly from under vehicle.

AXLE SHAFT REMOVAL: Ford F-100 - Loosen wheel and axle shaft stud nuts, raise car and remove stud nuts and lockwashers. Strike center of axle shaft flange to loosen dowels and remove dowels (tapered). Remove axle shaft from housing.
Studebaker (All Models) - Remove wheel and hub using Puller J-1644-A. Remove backing plate retaining bolts and remove outer washer, retainer, reinforcing plate and felt washer (discard this washer). Free, hand brake cable from equalizer and frame guides and disconnect hydraulic brake line at wheel cylinder. Pull backing plate out over end of axle shaft and tie it up out of way. Remove endplay adjusting shims *(CAUTION - Sav for reinstallation).* Use Puller J-7935 with Hammer J-2619 to remove axle shaft.
Willys - Jack up wheel and remove hub cap, axle shaft nut. Use Puller C-319 to remove wheel hub. Remove screws attaching brake dust shield, grease and bearing retainers and brake assembly. Remove wheel shield and retainer. Pull axle shaft out but DO NOT lose adjusting shims.

AXLE SHAFT ENDPLAY ADJUSTMENT, WHEEL BEARING & SEAL REPLACEMENT: *See "Spic r Hypoid" in 1959 Annual Data or later Manual edition.*
OVERHAUL: *See "Spicer Hypoid" in 1959 Annual Data or later Manual edition and not the following.*
Pinion Depth Setting Not : "Zero Pinion Depth" for Ford F-100 Axle is 2.625", for Studebaker Model 27 Axle is 2.094" ± .0015".

1961 Studebaker Model 27 Axl To ls

Rear Pinion Replacer	J-8671
Diff. Side Brg. Replacer	J-8668
Front Pinion Brg. Replacer	J-8672
Rear Pinion Brg. Puller	J-8669
Diff. Side Brg. Puller	J-8670
Adapter Used With J-8670	J-8670-2

1961 Willys FJ-3 Model 27 To ls

Axle Shaft Oil Seal Driver	W-263
Pinion Front Bearing Driver	W-264
Pinion Rear Brg. Sleeve Installer	W-262
Pinion Setting Block/Gauge WW-99-B	"H" or W-101-24
Diff. Case Brg. Cone Driver	C-3716

►*MODEL 70 GAUGE BLOCK NOTE:* Use bottom surface of gauge block "G".

RAMBLER HYPOID

Rambler, All Series (1961)
►*DIFFERENTIAL THRUST BLOCK PRODUCTION CHANGE & LOW SPEED "CLICK" CORRECTION:* Later cars have a thrust block with increased outside diameter to reduce operating clearances.
DESCRIPTION: Own. Hypoid gear type. Semi-floating with Hotchkiss drive (American Models), Torque Tube Drive Classic & Ambassador Models. "Twin-Grip" limited slip differential Optional.

Axle Ratios

American	Classic 6	Classic V8	Amb. V8
2.87 (15-43)	3.31 (13-43)	3.15 (13-41)	2.87 (15-43)
3.31 (13-43)	3.78 (9-34)	3.55 (11-39)	3.15 (15-43)
3.78 (9-34)	4.11 (9-37)	4.10 (10-41)	3.54 (11-39)
4.11 (9-37)	4.38 (8-35)	4.44 (9-40)	4.10 (10-41)

REAR AXLE ASSEMBLY REMOVAL: American - Drain lubricant, raise car and support rear of body. Remove wheels then remove hubs. Disconnect hand brake cables at brakes. Use wrench J-4486 to remove propeller shaft coupling nut. Disconnect rear shock absorbers, rear brake line at bracket on floor pan and rear springs from body. Remove axle and springs as an assembly and remove springs.
Classic 6, V8 & Amb. V8 - Remove cover and drain lubricant. Raise car and support it at rear of body. Disconnect parking brake at equalizer and housing at torque tube bracket. Disconnect torque tube from transmission, brake hose at bracket on body pan, shock absorbers at brackets, stabilizer bar at axle tube.

Axle Shaft Removal: *CAUTION - Hub and axle shaft are serrated to mate and fit together and are marked to insure correct reassembly whenever hub removed.* To remove axle shaft, pull hub with Puller J-1644-B or J-736-B. Disconnect brake line and cable. Remove brake support plate by sliding plate, oil seal, and shims off axle shaft. Use special Puller J-2498-B to remove shaft from housing.
Axle Shaft Installation: Reverse removal procedure and note the following: *CAUTION* - Marks on outer face of hub and end of axle shaft must be aligned to insure proper mating of serrations. Tighten axle shaft nut to 250 ft. lbs. torque.
►*REPLACEMENT HUB & AXLE SHAFT CAUTION:* New hubs are not serrated and serrations will be cut in hub when it is assembled on axle shaft. New hub may be installed on old shaft (if serrations in shaft are in good condition) but an old hub must NOT be installed on a new shaft (serrations will not match). Tighten axle shaft nut to 250 ft. lbs. torque and check distance from outside face of hub to end of taper on shaft (hub overhzng on threaded portion of shaft). This distance must be 3/16". Punch mark new hub in line with mark on shaft. *NOTE - Rear springs held in position in seats by car weight and shock absorber travel limits.* Roll axle from chassis and disconnect truss rods, torque tube, and propeller shaft from axle. "Slip" or "Union" type couplings used which can be slipped off pinion shaft.
OVERHAUL: *See "Rambler Hypoid" in 1958 Annual Data or later Manual edition and note the tools used and shims available for these models.*

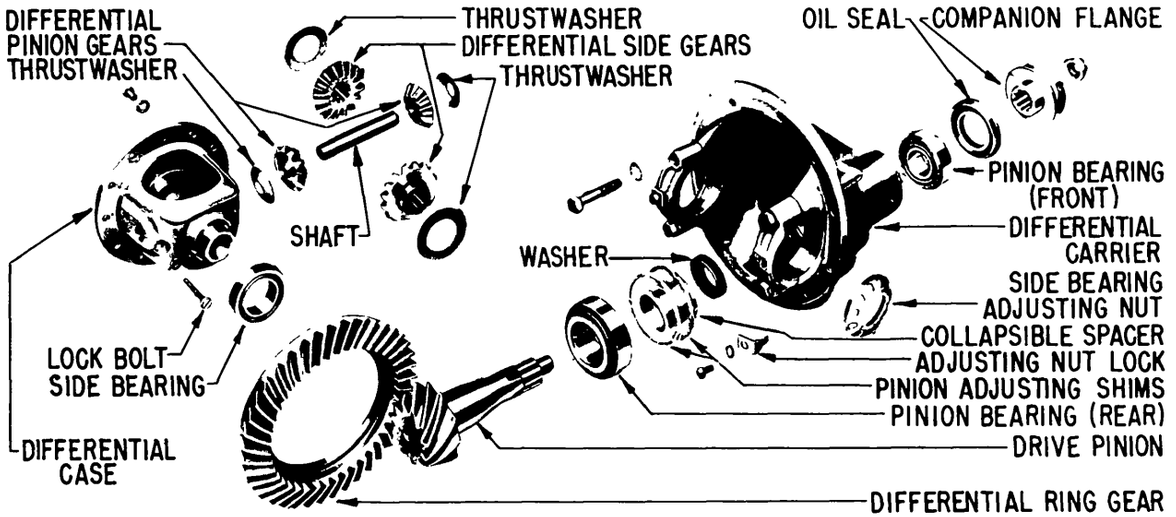
OLDSMOBILE HYPOID

Oldsmobile (1961)

DESCRIPTION: Rear axle design is same as used on previous models. Anti-Spin Differential Optional. *See "Power-Lock Diff. ("Belleville" & Plate Clutch Type)".*

►*REAR AXLE IDENTIFICATION CODE AND RATIO NOTE:* Rear axle ratio code and Anti-Spin Differential Identification letter stamped on rear flange of carrier assembly, Letter "L" following ratio code indicates Anti-Spin Differential. *See Code Table below.*

Rear Axle Code & Ratio Table



Code	Ratio
2	43:16 (2.69-1)
7	43:15 (2.87-1)
8	41:12 (3.42-1)
9	42:13 (3.23-1)
0	40:13 (3.08-1)

AXLE SHAFT: Removal - Remove wheel (left wheel has left hand threads) remove drum by removing two Tinnerman nuts from wheel studs. If nuts removed by turning off threads, they can be reused. If nuts damaged, new nuts must be used. Loosen backing plate nuts and loosen bearing retainer (do not move backing plate or brake line may be damaged). Pull shaft and bearing with Puller J-942 (do not allow shaft to drag on oil seal). Replace one nut to hold backing plate in position.

WHEEL BEARING & OIL SEAL REPLACEMENT: *(NOTE* - Wheel bearings have .012-.015" endplay between balls and the races. Do not reject bearing unless endplay is greater than .020" or if there is definite roughness between ball and race). With axle shaft removed, remove bearing retainer collar after splitting with a cold chisel. *(CAUTION* - Do not damage axle when removing collar). Using Tool J-947-2 and J-947-1, press off bearing in an arbor press. To install bearing, use Tool J-947-3 and Plate J-947-1 with an arbor press and press bearing over axle shaft, being sure that pressure is being applied to inner race of bearing. After bearing has been pressed firmly against axle shaft shoulder, press new bearing retainer collar on shoulder of shaft against bearing. Be careful not to damage shaft surface on which oil seal runs.

Oil Seal: With axle shaft removed, remove seal. Before installing a new seal, apply sealer around its outside diameter then install seal in housing with Tool J-5818. *CAUTION* - When installing axle shaft, be careful not to damage seal.

PINION SHAFT OIL SEAL REPLACEMENT: Mark pinion shaft nut before loosening so that it may be retightened to the exact same location. This will avoid necessity of resetting pinion bearing preload. Remove companion flange nut and washer, then remove companion flange with Tool 6295-01. Remove seal by driving it out of housing with a blunt chisel. Lubricate new seal and coat outer diameter with sealing compound. Tap seal into place using Tool J-5395. Apply seal lubricant, Part No. 567196 to outer diameter of flange and to lip of new seal. Install flange and tighten nut to marked position, then tighten nut 1/16" beyond alignment mark.

OLDSMOBILE & PONTIAC REAR AXLE ASSEMBLY (TYPICAL)

OVERHAUL: *See "Oldsmobile Hypoid" in 1957 Annual Data or later Manual edition and note the following:*

Ring Gear Backlash & Differential Side Bearing Adjustment: If backlash is not within limits of .005" minimum, .009" maximum, adjust backlash to .007" to .008" (preferred setting).

Pinion Gear Setting Shims: Pinion shims are furnished in the following sizes and are identified (other than by thickness) as follows: .004" (no notch), .005" (1 notch), .006" (2 notches), .007" (no notch), .010" (no notch), .013" (1 notch), .014" (2 notches), .015" (no notch), .016" (1 notch), .017" (2 notches).

PONTIAC HYPOID

Pontiac (1961)

DESCRIPTION: Rear axle design is same as used on previous models, except as indicated below. Safe-T-Track Differential Optional. *See "Power-Lock Diff. ("Belleville" & Plate Clutch Type)".*

Axle Ratios & Identification

Axle Ratio	①Code	②③Color
2.56-1 (41-16)	3	Gray
2.69-1 (43-16)	2	Red
2.87-1 (43-15)	7	Orange
3.08-1 (40-13)	0	Yellow
3.23-1 (42-13)	9	Brown
3.42-1 (41-12)	8	White
3.64-1 (40-11)	6	Blue
3.90-1 (39-10)	4	No Color

① - Stamped on lower right side of differential carrier attaching flange. ② - Color mark on end of axle shaft. ③ - Safe-T-Track Differentials also have color Green and lubrication tag next to oil filler plug.

AXLE SHAFT REMOVAL: Raise body to provide clearance and remove wheel. Clean dirt from end of housing to protect wheel bearing and remove brake drum. Remove bearing outer retainer bolt nuts. Use Puller J-942-1, if necessary, to remove axle shaft. *CAUTION - DO NOT dislodg backing plate or brake pip may be damaged.*

►*AXLE SHAFT CAUTION:* Axle shaft with left thread on wheel bolts must be installed on left side of car.

PINION SHAFT OIL SEAL REPLACEMENT: Mark position on companion flange, pinion nut, and pinion shaft to insure reassembly in the same location. *(NOTE* - If companion flange is to be replaced, it will not be necessary to mark the above parts as pinion bearing preload will have to be readjusted). Remove drive pinion nut and washer using Holding Tool J-6289, then remove companion flange with Puller J-6295. Remove oil seal by prying it out of carrier with a blunt tool. Oil lip of new seal and coat outer diameter with Permatex No. 3. Install seal by tapping into place with Tool J-5395. Install companion flange, then install washer and nut. Tighten nut until it and the companion flange are in the same position as marked at disassembly. *(NOTE* - Pinion nut will turn relatively easy until original position is approached and bearings begin to preload. Stop turning nut at this point and check position).

OVERHAUL: *See "Pontiac Hypoid" in 1957 Annual Data or later Manual edition and note the following.*

Wheel Bearing & Oil Seal Replacement: With axle shaft removed, remove oil seal from axle housing with Tool J-943. To remove bearing from shaft, install axle shaft in Tool J-947-P so tool engages outer race of bearing and ring enclosing bearing, then press bearing

CONTINUED ON NEXT PAGE

PONTIAC HYPOID (C ntinued)

and retainer from shaft with an arbor press. To install bearing, install outer bearing retainer on shaft (if removed), then install bearing on shaft with Tool J–947–P (tool should bear only on inner race), pressing it into position with an arbor press. Press a new bearing inner retainer ring in place against bearing with Tool J–947–P. *CAUTION – Do not press bearing and inner retainer on in one operation as edge radius of retainer will climb over corner of bearing inner race and force grease seals into balls.* To install seal in housing, coat new seal lip with oil and coat outside of seal retainer with Permatex No. 3 or similar compound, then install seal with Tool J–5818. Install axle shaft. *NOTE* – If both axle shafts removed, shaft with left hand threads on wheel bolts must be on left side of car. Install bearing outer retainer and gasket and tighten self-locking retainer nuts to 30–45 ft. lbs.

Ring Gear Backlash & Differential Side Bearing Adjustment: Backlash should be between .005"-.009". Tighten bearing cap bolts to 65–85 ft. lbs.

Carrier Oil Gallery Plug Replacement: *NOTE - This plug is located at forward end of differential carrier housing lower reinforcing web.* Mark position of companion flange, pinion nut and pinion shaft so all parts may be installed in exactly the same positions to maintain proper pinion bearing preload. Remove companion flange from pinion shaft, then thread a ½" bottom tap into plug until plug starts to turn. Remove plug by turning tap and pulling at the same time. To install plug, apply a light coat of permatex No. 3 to hole in carrier and to plug, then install plug, making sure that it does not enter drain hole. *CAUTION - Do not attempt to drill a hole in plug for removal as shavings will fall into drain hole.*

1961 4-WHEEL DRIVE FRONT AXLES

CHEVROLET TRUCK (4-WHEEL DRIVE)

Chevrolet ½, ¾-Ton Trucks (1961)

DESCRIPTION: Spicer Model 44-5F. Full-floating, integral housing, hypoid gear type with yoke and trunnion type axle shaft universal joints. Differential assembly is similar to differential assembly used in Spicer 44 rear axle.

Axle Ratio & Identification Note: Axle model stamped on front left face of center section, ratio tag attached to cover bolt.

Model	Ratio
½-Ton	3.91-1 (47-12)
¾-Ton	4.55-1 (50-11)

AXLE ASSEMBLY REMOVAL: Disassemble propeller shaft from front axle differential. Raise front end of truck to remove weight from springs and support truck on stands placed behind front springs. Disconnect connecting rod from steering arm and brake hoses from frame fittings, shock absorbers from axle brackets and disconnect U-bolts from axle and roll front axle from under truck.

AXLE SHAFT REMOVAL: Support vehicle with front wheel free. Place drain pan under wheel and remove hub grease cap. Remove axle shaft snap ring and remove drive shaft as follows: On K14 models, pull splined drive flange from shaft and hub and remove spacer from hub. On K25 models, remove stud nuts and washers, remove drive flange and gasket. On all models, remove bearing lock nut and lock ring and remove adjusting nut. Remove wheel, hub and drum as an assembly. Remove bolts and lock washers holding brake flange plate and spindle to steering knuckle. Remove flange plate from steering knuckle and support the plate so brake hose will not be damaged. Slide spindle from shaft and remove axle shaft and joint assembly.

WHEEL BEARING ADJUSTMENT: Adjust bearings by tightening nut using "T" handle wrench (12" long on each side). Rotate drum and tighten snugly. Loosen nut 45° and assemble lock washer by loosening nut to nearest hole then assemble outer nut. Tighten nut to 40 ft. lbs.

DIFFERENTIAL OVERHAUL: *See Spicer Hypoid & Power-Lock (Plate Clutch Type) Differential in 1959 Annual Data or Later Manual edition.*

FORD TRUCK (4-WHEEL DRIVE)

Ford, 4-Wheel Drive F-100 & F-250 Trucks (1961)

DESCRIPTION: Spicer Model 44-6F. Full-floating, hypoid gear type with Spicer "Cross Type" universal joints. Differential assembly is similar to differential assembly used in Spicer Model 44 rear axle.

Axle Ratio & Identification Note: Ratio Code stamped under AXLE on Patent Plate on left front body pillar. Axle ratios stamped on tag on differential housing cover.

Model	Ratio	ℂ Code
F-100	3.92	A
F-250 Std.	4.56	B
F-250 H.D.	4.56	D

ℂ - Standard or Locking type.

Axle Shaft: Removal - Remove hub grease cap, hub retaining snap ring, slide driving hub from between axle shaft and wheel hub and remove driving hub spacer. Remove locknut, washer and wheel bearing adjusting nut from spindle and remove wheel, hub and drum assembly (outer bearing will also come out). Remove inner bearing. Remove oil baffle from brake carrier plate. Remove brake carrier plate and spindle from spindle arm (unnecessary to disconnect brake line). Support carrier plate. Remove axle shaft assembly.

Installation & Wheel Bearing Adjustment - Install axle shaft assembly. Install spindle and brake carrier plate on spindle arm, tighten retaining screws and install oil baffle. Install wheel inner bearing on spindle, driving hub spacer, and wheel outer bearing and adjusting nut. While rotating wheel forward and rearward, tighten bearing adjusting nut with Tool T59T-1197-A until bearings are firmly seated and then back off adjusting nut 1/8 turn (45°). Install lockwasher on spindle (locking dowel on adjusting nut must enter lockwasher hole most closely aligned with dowel). Torque locknut to 40 ft. lbs. Install driving hub, snap ring and grease cup. Fill spindle arm with proper lubricant.

Spindle Arm: Removal - With axle shaft removed (see above), disconnect steering drag link from spindle arm and spindle connecting rod at both spindle arms. Remove 2-piece seal retainer from spindle arm, felt, rubber and steel rings from spindle arm (place on axle housing). Remove upper and lower spindle arm bearing caps and shims and remove spindle arm. Remove upper and lower spindle bearings with Tool T58L-101-A inserted in bearing and Puller Tool T50T-100-A.

Installation - Make sure felt and rubber seals and steel retainer are placed on axle housing in same order as removed (felt seal toward center of truck, then rubber seal and steel retainer). Install upper and lower spindle bearing cups in axle housing with Handle T53L-200-A and Driver T57P-4625-A and place bearings in cups (retain lower bearing with wheel bearing grease). Install spindle arm on axle housing and install upper and lower bearing caps (use old shims for a trial pack). Torque bearing cap bolts and stud nuts to 25 ft. lbs. Check bearing preload by rotating spindle arm with an **inch-pound** torque wrench installed on one of the bearing cap bolt heads. Turning torque should be 50-70 inch-pounds. Adjust shim pack at bearing caps to obtain correct preload. Install steel retainer, rubber and felt seals and 2-piece retainer. Connect spindle connecting rod and drag link. Install axle shaft assembly and adjust wheel bearing (see above).

Axle Housing Removal: Raise truck so front axle hangs freely. Remove axles and spindle arms (see above). Disconnect shock absorbers at lower end and front drive shaft at pinion flange. Support axle and remove spring clip (U-bolt) nuts and spring seats. Remove axle housing assembly.

DIFFERENTIAL ASSEMBLY OVERHAUL: *See "Spicer Hypoid" rear axl in 1959 Annual Data or later Manual edition.*

WILLYS JEEP, UTILITY, & FORWARD CONTROL (4-WHEEL DRIVE) FRONT AXLE

Willys CJ-3B, 5, 6 (1961) ①
Willys FC-150, 170 (1961) ①
Willys L6-226 (1961) ①
Willys F4-134 (1961) ①
① – For Rear Axle see Spicer Hypoid.

DESCRIPTION: Spicer Models 25, 27F, 27AF, 44 & 44F. Full-floating, integral housing, hypoid gear type with Spicer "Cardan Cross", "Bendix" or "Rzeppa" Constant Velocity universal joints. Differential assembly is similar to differential assembly used in rear axle. Power-Lock (Plate Clutch Type) differential optional.

►*AXLE IDENTIFICATION & RATIO NOTE:* Spicer Model stamped in center section of housing, ratio tag attached by cover cap screw, Power-Lock Differential identified by letter "T" or brass tag attached to cover screw that reads "USE LIMITED SLIP DIFFERENTIAL LUBE ONLY".

Mod l	Ratio
CJ-3B, 5, 6	5.38–1(8–43)
F4-134, 4 x 4, 4WD	5.38–1(8–43)

L6-226 4WD	②4.88–1(8–39)
FC-150	5.38–1(8–43)
FC-170 Std	③4.89–1(9–44)
FC-170 H.D. Modification	④4.89–1(9–44)

①–4.88–1(8–39 or 5.38–1(8–43) Optl.
②–5.38–1(8–43), or 4.27–1(11–47) Optl.
③–4.27–1(11–47) or 5.38–1(8–43) Optl.
④–5.89–1(9–53) Optl.

R m val: Support front end of car securely with a chain hoist, remove front wheels. Disconnect front shock absorbers, front brake line (at frame connection), and steering linkage (at idler lever on frame front cross member). Disconnect propeller shaft by removing universal joint "U" bolts at axle end of shaft. Place support jacks under axle housing so that springs relieved of weight, remove nuts on spring center clip "U" bolts, remove bolts at rear end of springs and lower springs, remove axle assembly from beneath car.

Axle Shaft & Universal Joint Assy. Removal: Remove wheel, hub cap, axle shaft nut and washer. Take out drive flange cap screws and remove flange with puller. Bend lip of bearing adjusting nut lockwasher out, remove locknut, lockwasher, adjusting nut, and bearing locking washer. Remove wheel hub and bearing assembly. *(CAUTION*–Use care not to damage oil seal). Disconnect brake tube, take out mounting screws on backing plate, remove backing plate and wheel spindle. Pull axle shaft and universal joint assembly out of housing.

►*INSTALLATION CAUTION:* Adjust front wheel bearings and bleed brakes after installation completed.

Steering Knuckle Bearings: Steering knuckle assembly is mounted on two "stub" kingpins with taper roller bearings seated in ball end of axle housing at inner end of each kingpin. Upper bearing cap has shim pack for bearing adjustment. Disassemble bearings as follows:

Disassembly – First remove hub and brake drum assembly, wheel bearings, axle shaft and universal joint assembly, wheel spindle, and steering tie rod socket. Remove screws holding oil seal retainer halves, remove screws retaining upper and lower bearing caps. Withdraw bearing cap and stub shaft assemblies. *(CAUTION – Do not lose bearing adjusting shims under top bearing cap).* Lift steering knuckle off axle housing. If necessary to remove bearing cups from axle housing, use special driver, Tool W–138. Wash all parts in cleaning solution and inspect bearings and races for wear, scores, or cracks.

Reassembly & Bearing Adjustment – Reverse disassembly procedure and note the following: Install one each .003", .005", .010", .030" shims at the top only. *NOTE – A shim pack of .058" thickness is added at bottom face of kingpin boss on steering knuckles at production. Maintain this shim pack at bottom and mak adjustments at the top only.* Install bearing caps, lockwashers, and screws and tighten securely. Check preload on bearings by hooking a spring scale in hole in knuckle arm for tie rod socket. Take a reading when knuckle has just started its sweep. King pin bearing preload should be 12–16 lbs. with seal and axle shaft removed. Remove or add shims to secure this preload. A washer may be added between end of cap and bearing when removal of all shims does not correct preload, then reinstall and adjust shims.

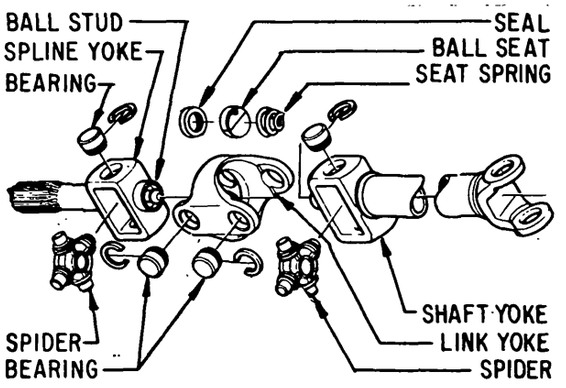
Oil Seal Assembly – Before installing oil seal felt, make a diagonal cut across top side of felt so it may be slipped over axle. Install assembly as follows: Split oil seal, backing ring assembly, oil seal felt and the two seal retainer plate halves. Install eight retaining screws.

Wheel Bearing Adjustment: Tighten inner adjusting nut until there is a slight drag on the bearings as the hub is turned, then back off nut 1/6 turn and install locking washer and nut. Tighten locknut securely and bend lockwasher over the locknut.

DIFFERENTIAL OVERHAUL: *See Spicer Hypoid & Power–Lock (Plate Clutch Type) Differential in 1959 Annual Data or later Manual edition.*

CONSTANT VELOCITY UNIVERSAL JOINTS

Buick (1961)
Buick Special (1961)
Linc ln (1961)
Oldsmobil F-85 (1961)



►*PROPELLER SHAFT HANDLING CAUTION: To prevent damage to constant velocity universal joint center metal ball when removing shaft assembly from car or when handling the assembly after removal, care must be taken to support shafts at both sides of constant velocity joint if shaft is moved horizontally. Do not allow one end of shaft to hang free or allow universal joint to bend at a sharp angle. Shaft assembly may be carried in a vertical position without damage to constant velocity joint.*

DESCRIPTION: Constant velocity type universal joint consists of two single joints connected with a special link yoke with a center ball and socket between joints to maintain relative position of the two units. This center ball causes each of the two joints to operate through exactly one half of the complete angle between front and rear propeller shafts, resulting in both shafts turning at a constant velocity.

LUBRICATION: Buick - *NOTE - Universal joints are lubricated for life and require no additional lubrication except as follows:* Center metal ball must be lubricated every 5000 miles with Multi-purpose Grease E.P. No.1. Fitting in universal joint is accessible through rear hole of frame tunnel (rotate drive line to line up fitting with hole). A special fitting, Alemite Part No. 326635 or equivalent is required to apply lubricant to fitting.

Lincoln: Lubricate three fittings on universal joint with chassis lubricant every 6000 miles.

Oldsmobile: Every 20,000 miles, disassemble and clean universal joint, then repack with sodium soap, fine fibre grease (Marfak Heavy Duty or equivalent).

CONSTANT VELOCITY UNIVERSAL JOINT

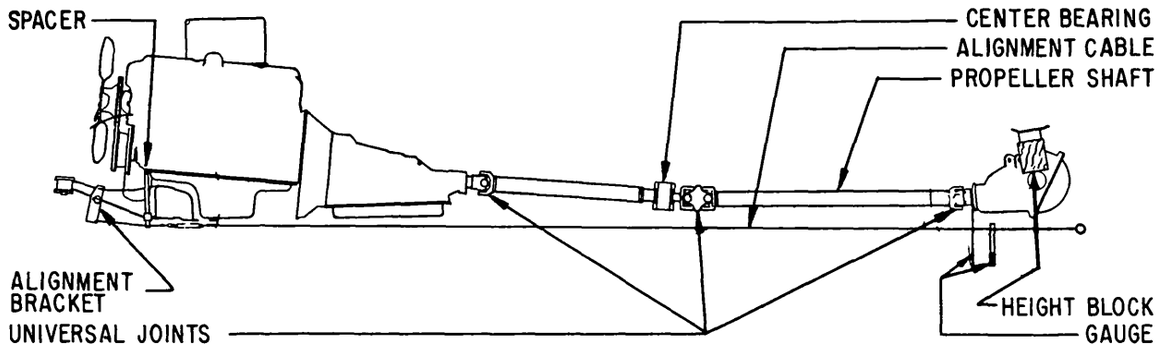
BUICK, CADILLAC, OLDSMOBILE PROPELLER SHAFT ALIGNMENT

Buick (1961)
Buick Special (1961)
Cadillac (1961)
Oldsmobile (1961)
Oldsmobile F-85 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*BUICK & BUICK SPECIAL PROPELLER SHAFT BALANCE CAUTION:* Paint mark on propeller shaft and "X" mark on pinion shaft (Buick Std.) or companion flange (Buick Special) must be opposite each other (180° apart) when assembled in order to maintain drive line balance. When paint and/or "X" mark not visible, scribe propeller shaft and pinion or companion flange for reassembly in original position.

►*OLDSMOBILE F-85 DRIVE LINE SHUDDER WHEN STARTING CORRECTION:* Caused by too high nose angle setting. Check nose angle and reset to specifications.



►*F-85 TOOL KIT BT-30-2 CHECKING GAUGE MODIFICATION NOTE:* Remove Plastic handle. Cut two new 1/8" notches (opposite sides) exactly 3 31/64" (Station Wagon), 3 27/64" (Sedan) from center of notch to end of tool from which you removed handle. Reinstall handle on opposite end and scribe the words "Station Wagon" and "Sedan" on respective side of tool.

►*PROPELLER SHAFT HANDLING CAUTIONS: To prevent damage to constant velocity universal joint center metal ball when removing shaft assembly from car or when handling the assembly after it is removed, care must be used to support shaft on both sides of constant velocity joint if shaft is moved horizontally. Do not allow one end of shaft to hang free or allow universal joint to bend at a sharp angle. Shaft assembly may be carried in a vertical position without damage to constant velocity universal joint.*

►*1961 BUICK (EXC. BUICK SPECIAL) PROPELLER SHAFT PRODUCTION CHANGE: Later shaft assemblies have been changed to eliminate the rear slinger on front propeller shaft. Locknut has been increased in thickness to compensate for removal of slinger.*

DESCRIPTION: Measurement of rear universal joint angle (for correct propeller shaft alignment) is accomplished by the use of a spring loaded steel cable stretched between front of chassis and rear axle carrier, on centerline of propeller shaft. When rear universal joint angle is adjusted correctly, the steel cable will clear underside of pinion flange by a definite amount.

CHECKING & ADJUSTING PROPELLER SHAFT ALIGNMENT: Buick (Exc. Buick Special) - Use Alignment Set, J-8973 as follows: Raise rear of car body and install Rear Tubular Spacers, J-8973-19 with upper end over head of rear compression bumper mounting bolt (at each side of car) and with lower ends of spacers resting on axle housing, then lower car body onto spacers. Remove nut from differential carrier mounting stud on each side of lowest stud. Thread Extensions, J-8973-17 on these two studs and attach Bracket J-8973-16 with bent lip toward rear, using original stud nuts. Attach hook of Bracket J-8973-15 over center of front frame crossmember, then with shallow slot of

PROPELLER SHAFT ALIGNMENT GAUGE TOOL INSTALLATION

Engine Height Plate J-8973-14 down, place wide upper end against flange of engine oil pan being certain plate rests on **flat** portion of pan flange. With cable in notch in spacer, pull clamp tight and hook it through a slot in rear bracket so one of the stops is to rear of bracket. Measure distance from centerline of cable to machined surface immediately in front of slinger on pinion flange. Distance should be 3 3/8"±1/16". If measurement is not within specifications, remove adjusting bolt (through two holes) and loosen two clamping bolts (through hole and slotted hole) and adjust arm until universal joint angle is correct. Install adjusting bolt through set of holes that most nearly coincide. Tighten bolts to 60 ft. lbs. Recheck measurement.

Buick Special: Use Alignment Set, J-8973 as follows: Raise rear of car body and install spacer blocks J-8973-20 (Station Wagons), J-8973-21 (Sedans) so slots straddle rubber bumpers. Hold spacer block up against bumper mounting straps and allow car to settle until axle housing contacts blocks. Remove differential cover bolt on each side of lowest cover bolt, then using these two bolts, attach Rear Bracket J-8973-16 so slotted portion of bracket is vertical. Tighten bolts securely. Engage Front Attaching Bracket J-8973-13 in front crossmember assembly using hole immediately to rear of front mount. Hook slot of bracket into rear of hole. Place Engine Height Rod J-8973-3 (notched end down) through round hole in front crossmember assembly so upper end of pin bears against engine oil pan between front oil pan bolts. Place cable in notch of height rod, pull cable tight and hook into rear bracket so one of stops on cable is to rear of bracket slot. Measure perpendicular distance from cable to machined surface immediately in front of slinger on rear flange. This distance should be 3¼"±1/16". If measurement is not within specifications, shims must be added or subtracted between lower control arm forward mounting brackets and underbody side rail. *Add or remove shims in equal amounts on both sides of car.*

Cadillac Vertical Alignment: Use Propeller Shaft Alignment Gauge Set J-8905 as follows: Place car on a level surface or on a suitable hoist. *NOTE - Gasoline tank must be full.* Remove two bolts from bottom front face of flywheel cover and install Bracket J-8905-20, securing it in place with the two bolts removed from cover. Remove two nuts and washers from two lower studs on front face of differential carrier assembly and install Rear Bracket J-8905-7, securing it in place with nuts. Measure and record standing height (direct vertical distance between top of rear axle housing and frame). *NOTE - Use average of right and left hand measurements.* Install Spacer Rods, J-8905-16, between top of rear axle housing and lowest underside surface of frame on both sides, then load down or raise car to hold spacers securely. Install spring end of Alignment Cable, J-8905-2 in slot in Front Bracket and other end of cable in Rear Bracket. *CAUTION - Propeller shaft must be checked at rear, center, and front before any adjustment is made. When checking, make certain that gauges are held as vertically as possible, and all gauge readings should be taken with marked side of gauges facing front of car.* Check propeller shaft height at rear by placing end of Gauge J-8905-21, on bottom of propeller shaft, ½" forward of weld at rear yoke. Note propeller shaft height by checking relation of gauge notch "R" to cable. Check propeller shaft height at center by inserting end of Gauge J-8905-21, in hole in bottom of frame tunnel until gauge rests against bottom of propeller shaft. Note propeller shaft height by checking relation of gauge notch "C" to cable. Check propeller shaft height at front by placing end of Gauge J-8905-6 against machined surface of transmission slip yoke (rounded surface of shaft that enters transmission extension). Note propeller shaft height by checking relation of notch in gauge arm to cable. If propeller shaft was not within specifications as indicated by gauges and cable, adjust as indicated in table below.

Propeller Shaft Adjustment

Checking Location	Shaft Too High ①	Shaft Too Low ①	Adjusting Location
Rear	Add	Remove	②
Center	Remove	Add	③
Front	Remove	Add	④

① - Add or remove shims.
② - Rear Lower Control Link. See adjusting procedure below.
③ - Propeller shaft center mount. See adjusting procedure below.
④ - Engine rear mount. See adjusting procedure below.

Adjustment (Rear Lower Control Link) - Add or remove shims between front mounting brackets for lower control arm links and the No. 4 outriggers. Shims are available in thicknesses of 1/32" and 1/16". *CAUTION - Shims*

CONTINUED ON NEXT PAGE

BUICK, CADILLAC, OLDSMOBILE PROPELLER SHAFT ALIGNMENT (C ntinued)

of equal thickness must be added or removed from right and left control links.

Pr p ller Shaft C nter Mount - Add or remove shims between bottom of center bearing support bracket and frame tunnel. Shims are available in thicknesses of 1/8" and 1/16".

Engine R ar Mount - Add or remove washers between engine rear mount and engine rear support crossmember. Washers of equal thickness must be added or removed at both legs of mount.

►*CADILLAC ADDITIONAL ADJUSTMENT TO COMPENSATE FOR INCORRECT STANDING HEIGHT:* In the event standing height at rear of car was not within specifications of 5¾"-6" as measured and recorded before checking propeller shaft alignment (see above), variations must be made in propeller shaft alignment as follows If standing height was 5½-5¾", add 1/16" shim at center mount. If standing height was 6-6¼", remove 1/16" shim at center mount *NOTE - If there are no shims at center mount, remove 1/16" shim from both lower control link brackets, and add 1/64" washers to both engine rear mount legs.* If standing height was 6¼-6½", remove 3/32" shim thickness from both lower control link brackets and remove 1/16" shim from center mount. *NOTE - If there are no shims at center mount, remove 1/8" shim thickness from both lower control link brackets, and add 5/32" washer to both engine rear mount legs.*

Cadillac H riz ntal Adjustment: After checking vertical alignment, proceed as follows· Hang plumb bobs, J-8905-14 over both front and rear of propeller shaft so they hang free and clear any obstruction, then hang Alignment Gauge, J-8905-17, on cable at rear of propeller shaft between plumb bob lines. Move cable in slot in rear bracket until extended arm of gauge (upper part) is centered between plumb bob lines Hang Horizontal Alignment Gauge, J-8905-17 on cable at front of propeller shaft between plumb bob lines Move cable in slot in front bracket until arm of gauge (lower part) is centered between plumb bob lines. *NOTE - If it was necessary to align cable at either end, recheck cable alignment at opposite end.* Hang gauge on cable (using proper slot) with printed side of gauge facing front of car Position gauge just under center bearing support mounting bolts. Check alignment of bolt head centers in relation to marks on gauge. Bolt heads should align with marks on gauge within 1/16" If shaft is out of horizontal alignment, it will be necessary to move center bearing support either to right or left as required *NOTE - In some cases, bolt mounting holes may hav to be slotted with a rat-tail file Slide front of propeller shaft toward rear of car to provide clearance for filing bolt holes.*

Oldsmobil (Std.): Use Tool BT-30-1 and BT-30-2. Connect cable at front frame crossmember, see diagram. Install rear bracket on the two lower right studs on differential carrier Hook cable in upper hole on rear bracket, then install spacer between cable and bottom of front engine mount. Install hold down clamps around axle housing (lower hook end should point toward front end of car). Install upper hook into 3/4" hole in frame immediately above axle housing. Adjust turn buckles on clamps until wooden blocks fit snugly between axle housing and rubber bumpers. *NOTE - It may be necessary to lift car to install wooden blocks.* Position gauge, see diagram, and check differential nose angle alignment. If cable is not within limits of gauge notch, the nose angle can be corrected by lengthening or shortening the lower suspension arm.

Oldsmobile F-85: Use alignment tool BT-30-2 and install on car in the same manner as for Buick Special (above), including special spacer block between axle housing and rubber bumpers. With indicator of Tool Set BT-30-2 placed against differential pinion companion flange cable must be in correct notch, see Tool Modification below. If necessary to adjust, remove shims from front of rear lower suspension arm (cable below notch); add shims (cable above notch). *NOTE* - The same amount of shims must be added or removed from both sides of car. 1/8" shim will raise or lower nose angle of differential assembly approximately 1/16".

CHEVROLET (PASS. CAR PROPELLER SHAFT ALIGNMENT

Chevrolet Pass. Cars (1961)

►*PROPELLER SHAFT SHUDDER CORRECTION:* Correct propeller shaft angle as indicated below.

PROPELLER SHAFT ANGLE CHECK & ALIGNMENT: Front shaft angle "A", rear shaft angle "B", pinion shaft angle "C" and frame riding height "D" must be within limits as shown in table below. *NOTE* - When vehicle driven continuously at maximum load conditions, angle "B" may be increased approximately ¼-½° (in negative direction).

Angle "A" - Is relation of engine angle to front propeller shaft angle. Place protractor on rocker arm cover for engine angle, up against front propeller shaft for front shaft angle. *NOTE* - DO NOT lean on front fender when taking engine angle.

Angle "B" - Is relation of front and rear propeller shaft angles. To determine rear propeller shaft angle, place protractor up against rear propeller shaft.

Angle "C" - Is relation of rear propeller shaft angle to pinion shaft angle. To determine pinion shaft angle, rotate rear universal joint to bring machined surface down parallel with floor and place protractor on this surface.

Riding Height "D" - Is distance from top of axle housing to frame kick-up. This measurement must be equal within ¼" on each side.

NOTE - Support car on tires, ramp or twin post hoist (not on frame hoist) when making angle checks.

Determining Angles - Angles "A", "B", "C" are the result of subtracting rearmost of the two angles from preceding one (example - Engine angle minus front propeller shaft angle), except when second angle is "up at rear" (Higher at rear of protractor than at front), the second angle should be added to first one.

Correcting Angles - Std. Procedure - 1) When angle "A" is not correct, change number of shims under transmission support. Adding shims reduces angle, reducing shims increases angle.

2) When angle "C" is incorrect, change number of shims at upper arm attaching point. Adding shims reduces angle, reducing shims increases angle.

NOTE - Correcting angles "A" and "C" should automatically correct angle "B". See Optional Procedure below for correcting angles "A" and "C".

Optional Procedure - For correcting angles "A" and "C", loosen or remove frame center bearing support bolts (under center section) and insert transmission shims between frame section and the support inside driveshaft tunnel. *CAUTION* - Always recheck angles "A" and "B".

Vibration Note - If objectional vibration exists when joint angles are within specifications, readjust angle toward opposite limit (high toward low or low toward high limit).

Angles & Height Specifications

Angle "A"	Angle "B"	Angle "C"	Height "D"
Pos. 2½-3°①	Neg. 1-1½°②	Pos. 2¾-3¼°③	Pos. 6¼ ± 3/8"

① - Pos. 2¾° desired. ② - Neg. 1¼° desired.
③ - Pos. 3° desired.

CHRYSLER CORP. PROPELLER SHAFT ALIGNMENT

Chrysler (1961)
Imperial (1961)
DeSoto (1961)
Dodge & Dart (1961)
Lancer (1961)
Plymouth (1961)
Valiant (1961)

EXCEPT IMPERIAL

REAR UNIVERSAL JOINT OPERATING ANGLE: Check and adjust as follows·

►*CHECKING CAUTION:* Car weight must be on wheels (use drive-on type hoist or platform) and there must be no extra weight in trunk.

Checking R ar Universal J int Angle: 1) Remove rebound plate and bumper from top of differential carrier housing Place spirit level protractor on machined surfaces of rebound plate bosses Level bubble and note reading. *NOTE - Carrier housing should incline downward slightly. To adjust, install a tapered shim between rear spring and seat on axle housing with thick end toward rear of car.* Recheck angle.

2) Place protractor on underside of propeller shaft near rear universal joint. Note reading. Add this reading and pinion angle reading (above). Total should be 2°. Add or remove shims as above to obtain 2° total angle. Tighten rebound plate assembly bolts to 200 inch-lbs. and rear spring U-bolt nuts to 70 ft. lbs.

IMPERIAL

PROPELLER SHAFT: Removal - Remove front universal joint clamps from transmission yoke (unnecessary to remove bushings if retainer strap used). Remove rear universal joint clamp in same manner. Remove center bearing housing bolts and shims from under housing Remove front and rear propeller shaft and center bearing as an assembly.

CONTINUED ON NEXT PAGE

CHRYSLER CORP. PROPELLER SHAFT (C ntinu d)

Installation: Insert front propeller shaft over body crossmember and tighten front universal joint-to-transmission yoke bolts to 170 inch-lbs. Connect rear universal joint to rear axle pinion yoke and tighten bolts to 170 inch-lbs. Place same number of shims as removed under center bearing housing, install housing and tighten bolts to 30 ft. lbs.

CENTER BEARING: Disassembly - After propeller shaft assembly removed, clean bearing housing and note the index marks on rear of front shaft and shoulder of sliding yoke. Straighten tab of star washer and unscrew cap from front shaft. Slide star washer and slinger from center bearing housing. Pull sliding yoke, cap, and seal from front shaft. Remove bearing housing from front shaft and press bearing from housing.

►*BEARING SERVICE NOTE:* Bearing is permanently sealed and no lubrication or service required except replacement.

Reassembly: Repack internal splines of front shaft with multi-purpose grease and install slinger on shaft. Press bearing into housing and install on front shaft. Install slinger and star retaining washer. Lubricate inside of seal and install cap and seal on sliding yoke using care not to damage seal on splines of yoke. Align index marks of front shaft and yoke and install yoke. Tighten retaining cap enough to compress seal firmly on shaft of yoke but free enough to permit free back and forth movement of yoke in front shaft. Lock retaining cap by bending tab of washer into notch in cap.

PROPELLER SHAFT ALIGNMENT: *NOTE - Make sure fuel tank is full and check shaft indexing by unscrewing cap seal retainer. "O" mark on splined yoke should line up with keyway in shaft.* With car level and weight of car on the wheels, remove differential carrier rebound bumper plate. Remove shims from both rear axle control strut frame brackets. Place Aligning Gauge J-6845 on machined pads of differential carrier and center the bubble. *NOTE - Level of gauge must be on same side of propeller shaft each time gauge is used.* Place gauge on rear propeller shaft near rear universal joint. Entire bubble should be within three graduations from center of gauge. If edge of bubble is ahead of the third graduation, change rear axle pinion angle as follows: Install 2° tapered shims between both rear springs and axle housing pads with thick edge of shim toward **front** of car. Tighten spring U-bolt nuts and install shims behind control strut brackets so space is filled. Tighten brackets. Install differential carrier rebound bumper plate.

CENTER BEARING HEIGHT ADJUSTMENT: Install Gauge Adapter part of Tool J-6845 on front propeller shaft near front universal joint. Place gauge of tool on rear propeller shaft at rear universal joint and adjust gauge to center bubble. Attach gauge to pins on adapter. For each graduation leading edge of bubble is **forward** of center, **add** one shim under center bearing housing bracket. For each graduation trailing edge of bubble is to **rear** of center, **remove** one shim from under center bearing housing bracket.

LINCOLN CONTINENTAL PROPELLER SHAFT ALIGNMENT

Lincoln Continental (1961)

PROPELLER SHAFT ANGLE: *NOTE* - Vibration or "shudder" upon fast acceleration, or when coasting using engine as a brake, may be caused by either rear axle being loose in springs or by excessive propeller shaft angle. Propeller shaft angle is the result of Pinion Nose Angle in relation to Riding Height with "U" bolt nuts tight.

Pinion Nose Angle - Place vehicle on known level surface that will allow access to rear axle pinion nose. Drill a small hole in common protractor at exact center of base (0°) line, and insert a line through hole with a light weight attached for bob. Place base of protractor vertically against front face of pinion housing and read where lines crosses scale.

Riding Heights - Place vehicle on smooth level floor. Inflate tires to 24 lbs. with full fuel tank and all loading removed from passenger and luggage compartment. Push rear bumper down (at center) 1" and release slowly. Measure distance from top center of axle housing to top of frame kick-up at rear of bumper bracket. Raise center of bumper 1" and release slowly and again measure distance. Average of two readings is true riding height. Riding height should be 7.2-8.5" with 8" normal.

Riding Height	℄ Pinion Nose Angle
6 inches	4° Down
7 inches	3½° Down
8 inches	3° Down
9 inches	2½° Down

℄ - Tolerance ±¼°.

Check Pinion Nose Angle with Riding Height as shown in table above. When Nose Angle does not correspond with Riding Height, remove rear axle "U" bolt nuts and install appropriate wedges (½, 1, & 1½°), between each spring insulator upper retainer and axle housing mounting pad, with no more than one wedge to be used on a side. Install "U" bolts and torque to 50-60 ft. lbs. *NOTE - Be sure lower insulator retainer contacts upper retainer.*

STUDEBAKER PROPELLER SHAFT

Studebaker Six & V8 (1961)

DRIVE LINE ALIGNMENT: Raise rear wheels off floor and put transmission in neutral. Clean shaft with sandpaper. With dial indicator measure runout of propellor shaft at front center and rear, while turning shaft slowly by hand. *NOTE – Make nd measurements about 1½" back from weld joint.* Maximum runout should be .010" at front or rear and .015" at center. If not within limits check flanges of transmission and differential. Measure shaft runout and end nearest flange and mark flange at highest runout. Disconnect universal joint, rotate flange 180° and reassemble. Check runout again. If high side of runout is still on same side, flange is at fault. If rotating flanges does not correct runout, replace shaft and/or flanges.

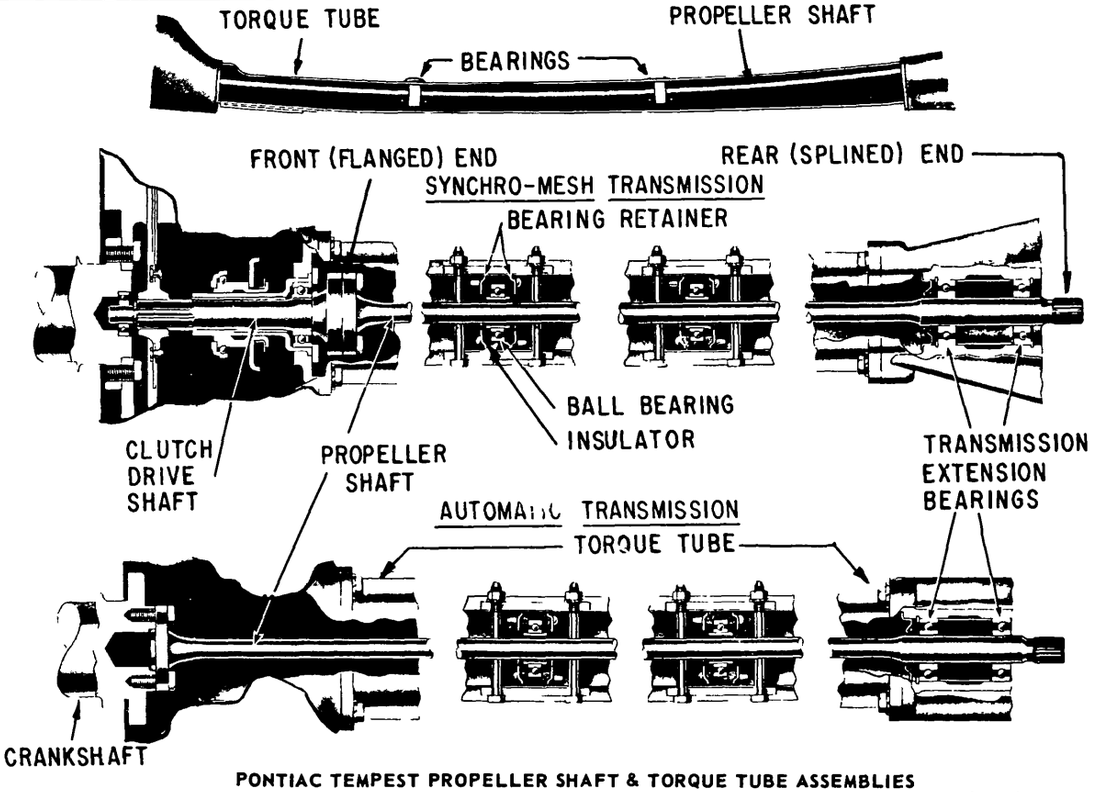
DRIVE LINE ANGLE CHECKING & ADJUSTMENT: Check angles with level gauge or protractor. *NOTE – Manufacturer recommends use of Special Protractor Gauge J–7181 for best results.* Raise car on drive—on hoist with weight on wheels and frame level. Bounce body up and down several times to normalize spring position and DO NOT DISTURB this position when taking angle checks.

Front Universal Joint Angle: Place gauge against clean surface of propeller shaft near front universal joint, so pendulum or pointer is free to swing. Move protractor scale so pointer is set at 90° mark. Remove gauge (do not disturb setting) and place it on clean bottom surface of starter housing. When pointer comes to rest, read degrees indicated from 90° mark. This reading represents front universal joint angle. Angle should be 4–5°.

Rear Universal Joint Angle: Proceed as for Front Universal Joint Angle Check except in second operation, place adjusted gauge vertically against forward edge of differential housing in back of universal joint. *NOTE – Gauge must not contact pinion bearing oil seal.* When pointer comes to rest, read degrees indicated from the 180° mark. This reading represents rear universal joint angle. Angle should read 4½–5½°.

CAUTION – For best results there should be approximately ½° greater angle at rear than at front.

ADJUSTMENTS: To change **front** universal joint angle, add or remove shims or spacer washers at engine rear support insulators. To change **rear** universal joint angle, add or remove wedge type caster shims at axle pad and rear springs.



1961 PONTIAC TEMPEST PROPELLER SHAFT & TORQUE TUBE

P ntiac Tempest (1961)

DESCRIPTION: This new flexible propeller shaft which is supported on two rubber insulated, sealed ball bearing assemblies secured in a "hat" section, curved, torque tube is constructed of a triple alloy forged steel that is heat treated, shot-peened, and coated. The propeller shaft flange is splined at the rear to transmission shaft and is flanged at the front for connection to engine flywheel (automatic transmission); clutch drive shaft (synchro-mesh transmission). The curved "hat" section type torque tube in which propeller shaft and bearing assemblies are enclosed, is bolted to engine housing and transmission housing, rigidly joining the two together.

REMOVAL: Synchro-m sh Transmission Cars - Remove bolts retaining propeller shaft damper bearings, then remove parking brake cable from torque tube. On V8 engine cars, remove exhaust crossover pipe. On all models, disconnect transmission control rod from transmission, then remove gearshift housing and control rod. Remove flywheel housing bottom cover and support rear of engine with a jack stand. Remove torque tube access hole cover and remove six bolts from propeller shaft flange. Place a rag between propeller shaft and torque tube to prevent damage to coating on shaft, then remove bolts connecting torque tube to flywheel housing. Support torque tube, then remove the bolts securing torque tube to housing and pry torque tube and propeller shaft away and down from flywheel housing. Place a block of wood (approximately 3" square) between transmission extension and floor of car to position transmission for reassembly. Support torque tube with a stand. Remove bolts securing torque tube to transmission. *CAUTION - Torque tube and propeller shaft ar now h ld in place only by bearings in transmission extension and must be supported to prev nt bearing or shaft damag .* Remove propeller shaft and torque tube as an assembly by pulling on propeller shaft flange. *CAUTION - Pull propeller shaft straight out of transmission so that shaft will not bind in transmission or transmission extension.* Place torque tube and shaft assembly on a bench and pull propeller shaft out of torque tube. *CAUTION - When removing shaft from torqu tub , forc should not be necessary. If necessary, us a flat drift through bearing retainer bolt hole to spr ad torqu tube away from bearing retainer. B v ry car ful n t to damage coating on prop ller shaft.*

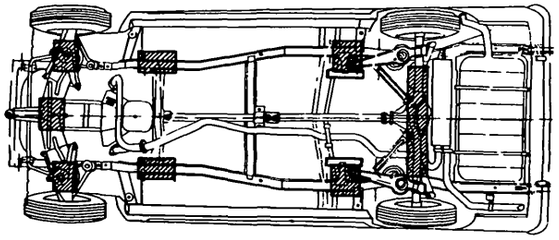
Automatic Transmission Cars: *NOTE - Due to design change on later mod ls only, disconnect exhaust pipe and lower rear stabilizer bar.* Remove bolts retaining propeller shaft damper bearings, then remove parking brake cable and vacuum line from torque tube and throttle valve linkage from transmission. On V8 engine cars, remove exhaust crossover pipe. Remove flywheel bottom cover, then support engine with a jack stand. Remove bolts connecting propeller shaft flange to flywheel and back out (about half way) bolts connecting torque tube to flywheel housing. Place a rag or cloth between propeller shaft and torque tube to prevent damage to coating on shaft, then use a screwdriver to pry propeller shaft flange (while holding with hand) rearward far enough to clear recess in flywheel. Remove bolts connecting torque tube to flywheel housing and pull torque tube and propeller shaft down and away from flywheel housing. Complete removal in same manner as for synchro-mesh transmission cars (above).

PONTIAC TEMPEST PROPELLER SHAFT & TORQUE TUBE ASSEMBLIES

BEARING INSULATOR & RETAINER: Removal - With propeller shaft removed from torque tube, remove screws from bearing insulator retainer, then remove insulator from each bearing. *CAUTION - Do not attempt removal of bearing from shaft as these parts are serviced only as an assembly.*

Installation: Install rubber insulator on each bearing, starting with bearing toward flange first, then place insulator retainers in position and secure with two self tapping screws. *CAUTION - Be very careful not to scratch or nick propeller shaft when installing insulator or retainer.*

INSTALLATION: Synchro-mesh Transmission Cars - Assemble propeller shaft in torque tube and place a cloth or rag between front of propeller shaft and torque tube so that coating on propeller shaft will not be damaged. *CAUTION - Propeller shaft should be replaced in torque tube without using force. If necessary, use a flat drift through bearing bolt holes to spread torque tube away from bearing retainer.* Install propeller shaft in transmission being careful to engage spline of propeller shaft into transmission and journal diameter into transmission extension bearings so as not to damage journal surface. *CAUTION - Ch ck splin alignment into transmission extension, and if absolut ly necessary, tap front flange lightly with a soft rubber hammer. Be sure splines are completely engaged in transmission.* Install bolts connecting torque tube to transmission extension and tighten to 30-45 ft. lbs., then remove block of wood between transmission and floor. Insert propeller shaft in place on clutch drive shaft and tighten bolts finger tight. Remove rag or cloth from inside torque tube, then install and tighten torque tube to flywheel housing bolts finger tight. Tighten propeller shaft flange to clutch drive shaft bolts to 40-80 ft. lbs. and torque tube to flywheel housing bolts to 40-80 ft. lbs. Install torque tube access cover screws to 40-80 inch pounds, then install and adjust gearshift housing and transmission control rod. Start and idle engine for approximately one minute, then install and tighten damper bearing retainer bolts and tighten to 8-12 ft. lbs.



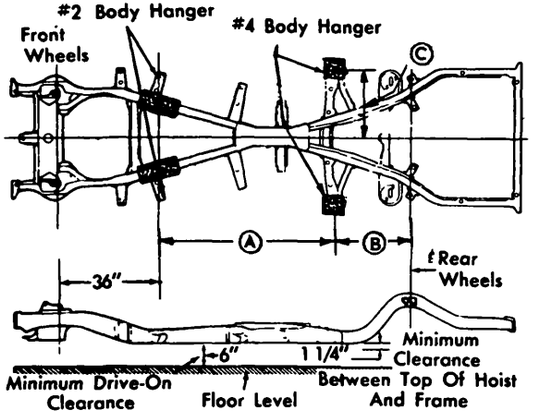
Automatic Transmission Cars: Install propeller shaft and torque tube in same manner as for synchro-mesh transmission cars (above) and note the following: Tighten bolts securing propeller shaft flange and torque tube to flywheel and flywheel housing to 30-45 ft. lbs., then install flywheel housing bottom cover. Install throttle valve linkage and adjust *(see "Carburetor" on Car Model page).* Remove support from engine. On V8 models, install exhaust crossover pipe. Start and idle engine for approximately one minute, then install and tighten bearing retainer bolts to 8-12 ft. lbs. Install parking brake cable and vacuum line.

BUICK & BUICK SPECIAL

Jacking & Hoisting: All Cars - *CAUTION - When lifting at lower control arm, lifting pad must not contact st ering arm or linkage or damage will result.*

Buick Special - Jack or lift car at points shown in illustration.

Buick - Jack car at spring seat on front lower control arms or center of front crossmember (front), and along entire length of rear axle housing (rear). Lift car at front frame side rails just forward of body floor pan (front), and rear of frame side rails at lower control arm front pivot (rear).

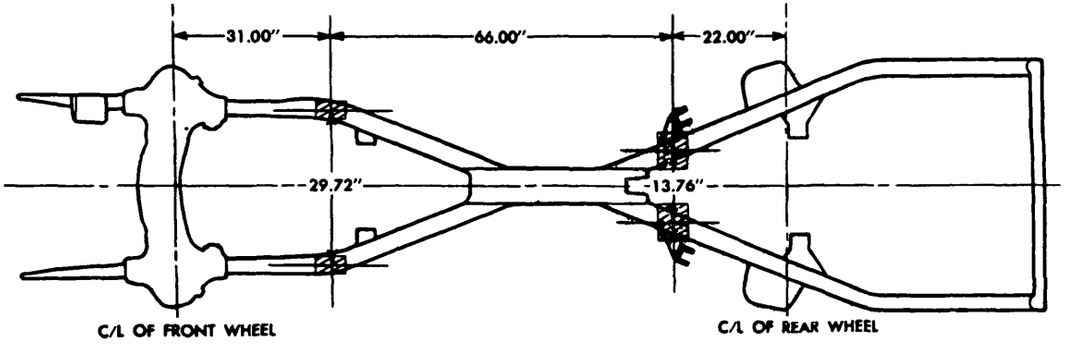


BUICK SPECIAL HOISTING POINTS

CADILLAC

H isting: Hoisting equipment that engages suspension, axle, or wheels is preferred. With this type equipment, use caution to prevent damage to shock absorber mounts, exhaust pipe and mufflers. When using a frame contact type hoist, special adapters must be used on hoist rails to assure engagement with car frame at locations indicated by shaded areas in illustration. Take care to prevent hoist adapters contacting any part of the No. 2 body hanger. Hoist contact at rear should be at outer ends of No. 4 body mounting brackets. In no case should rear contacts be less than 32½" apart. *CAUTION - Hoist should not contact rear lower control link front mounting bracket. DO NOT lift Series 75 or Commercial Chassis cars on frame contact hoist as severe stress and misalignment will result due to length of frame and car.*

Cadillac Frame Dimensions



Series	Dimension A	Dimension B	Dimension C
60 & 62	64.50"	29.50"	16.25"
75	84.30"	29.50"	16.25"
CC	93.25"	26.75"	20.00"

CADILLAC FRAME CONTACT POINTS

CHEVROLET CARS & CORVETTE

H isting: Equipment engaging suspension, axle, or wheels is preferred. With this type equipment, use caution to prevent damage to shock absorber mounts, exhaust pipes and mufflers. When using a frame contact hoist, special adapters must be used on hoist rails to assure engagement with car frame at locations indicated by shaded areas in illustration.

CHEVROLET FRAME CONTACT POINTS

CHEVROLET TRUCKS

Jacking: Following list of jacking points will assist wheel and tire assembly changes with vertical type emergency jacks supplied with trucks.

Front

10, 20, 30 Models - Lower arm pivot or torsion bar socket.

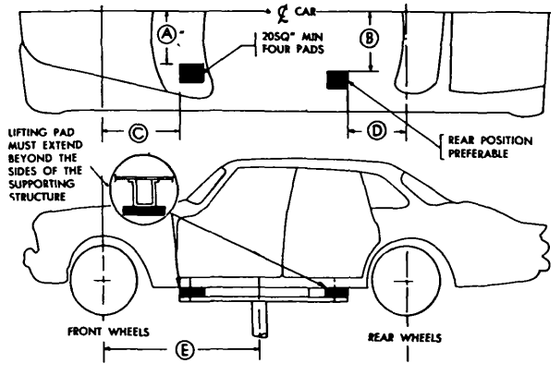
40 Models - Frame side rail ahead of steering gear or idler support.

50, 60 Models - Frame side rail behind front crossmember. Use hardwood block between front crossmember and upper control arm to reduce jack travel.

Rear

10, 20, 30 Models - Axle housing.

40 Models - Spring, ahead or behind axle.



50, 60 Models - Spring, in front of axle housing.

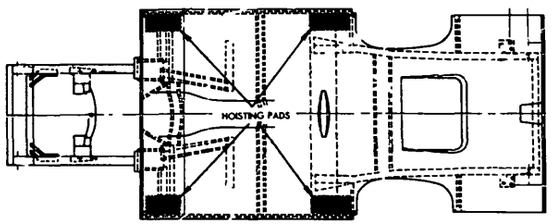
CHRYSLER, DE SOTO, DODGE & DART LANCER, PLYMOUTH, VALIANT

Jacking: Locate jack **only** under rear axle housing or under front suspension lower control arms. *CAUTION - Jack must not contact any part of und rbody.*

Hoisting (Frame Contact Hoist): This type hoist must be equipped with proper adapters so car will be supported in correct places as shown in illustration, and to specifications listed below.

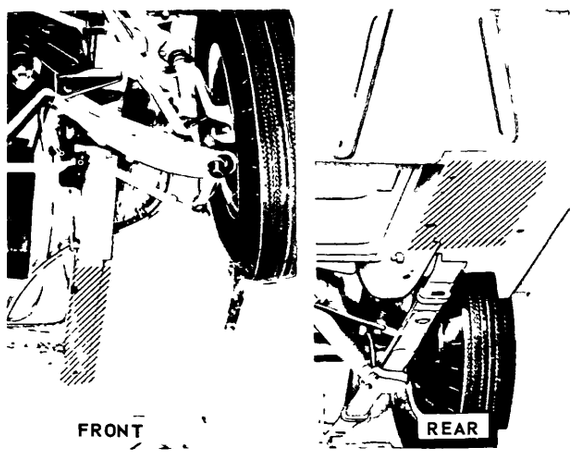
	A	B	C	D	E
Chrysler RC1, 2	16.50"	17.25"	24"	22"	54"
Chrysler RC3, 4	16.50"	17.25"	28"	22"	59"
DeSoto			24"	22"	54"
Lancer	14.2"	16.2"	20.3"	23.7"	48"
Plymouth	16.50"	17.25"	24"	18"	54"
Valiant	14.2"	16.2"	20.3"	23.7"	48"

CHRYSLER, DE SOTO, DODGE, LANCER, PLYMOUTH, VALIANT FRAME CONTACT POINTS



COMET, FALCON, THUNDERBIRD

Jacking: Either side of car may be raised at front by jack contact at lower arm strut connection. Either side of front end may be raised by jack pressure on front crossmember or crossmember to which stabilizer is connected. Either side of rear end may be raised by jack contact on rear crossmember. *Do not put pressure on fu l tank.*



H isting: Check all drive-on type hoists for possible interference with car underbody. Modify hoist and approach ramps as necessary to provide clearance.

Rail & F rk Lift (Twin Post) Hoists - Front adapters or hoist plates must be carefully positioned to contact lower suspension arms and must be large enough to cover entire spring seat area. Rear adapters or forks must be positioned under rear axle (forks must not contact axle at points more than 1" outboard from circumference welds near differential housing). *CAUTION* - Raise car slowly and make certain that rear shock absorbers are not damaged.

Fram C ntact Hoist - Frame contact hoist adapters are necessary to lift car. Hoist adapter pads should cover at least 12 square inches (Falcon), or 24 square inches (T-Bird) of underbody areas shown in illustrations.

THUNDERBIRD FRAME CONTACT POINTS

FALCON FRAME CONTACT POINTS

CORVAIR CARS & TRUCKS

SEDANS, STATION WAGONS, GREENBRIER, TRUCKS

Jacking: Sedans & Station Wagons - Jack at lifting areas shown in illustration. *CAUTION* - Jack tab must catch outer body flange to prevent jack sliding too far under car.

Greenbrier & Trucks - Use jack pads between front and rear wheels as shown in illustration. Pin on load rest of jack must engage in hole in jack pad.

Hoisting (Frame Contact Hoist): All Models - Hoist must contact shaded lifting areas shown in illustrations.

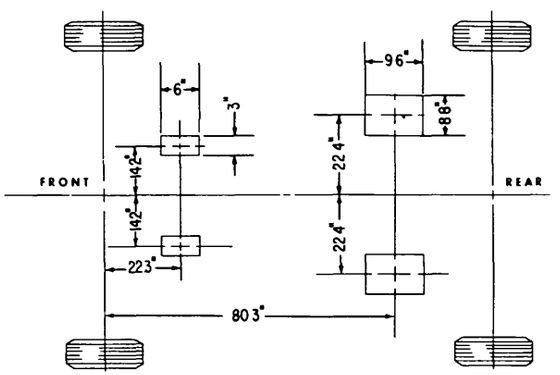
OLDSMOBILE

Jacking: Support car at suspension points only. Do not support car at extreme ends of frame or at center of frame side rails.

Hoisting (Frame Contact Hoist): Lift car at shaded areas shown in illustration.

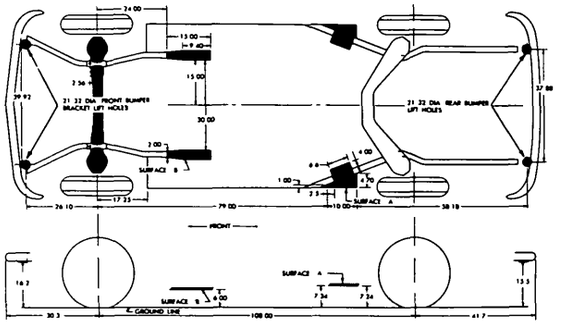
OLDSMOBILE F-85

Hoisting (Frame Contact Hoist): Place contact pads of hoist at circled lifting points shown in illustration. Lift arms must not interfere with hand brake intermediate lever.



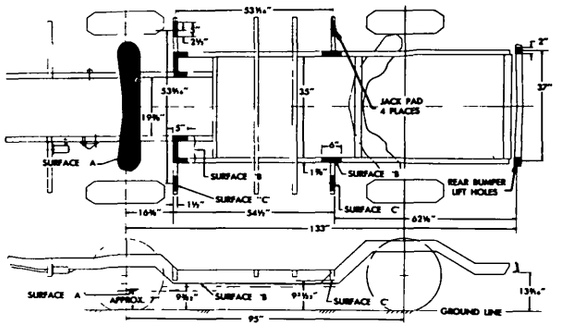
PONTIAC

Hoisting (Frame Contact Hoist): Lifting pads must be positioned at shaded areas shown in illustration to prevent damage to other parts. Ground clearance is 7½" front, 6" rear.

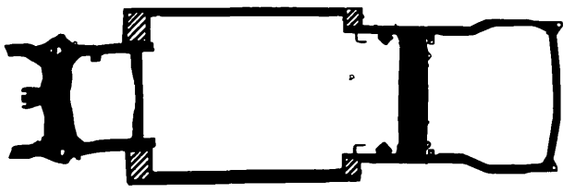


PONTIAC TEMPEST

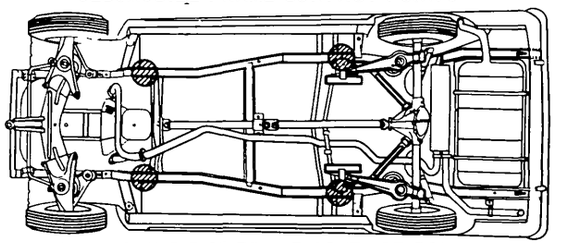
Lifting: Lift car at any accessible point on frame side rail, at front crossmember, or front or rear lower control arms. *CAUTION* - 1) Avoid rear shock absorber brackets. 2) DO NOT lift at bumpers, torque tube, axle shafts, transaxle or engine. 3) Torque tube and exhaust system are lower than frame side rails and adapters must be used to provide clearance.



Towing: Tow **only** at front or rear crossmembers. DO NOT tow by bumpers, axle shafts, or steering linkage.



COMET FRAME LIFT DIMENSIONS



CORVAIR (SEDANS & STATION WAGONS)

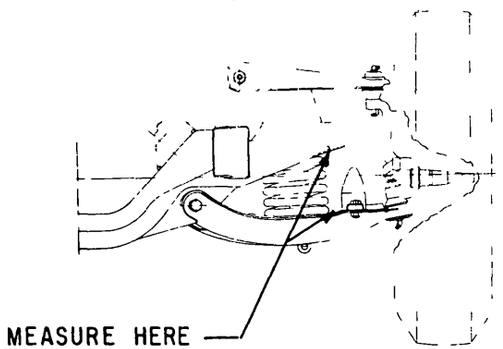
BUICK FRONT SUSPENSION (EXCEPT BUICK SPECIAL)



Buick Series 4400, 4600, 4700, 4800 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

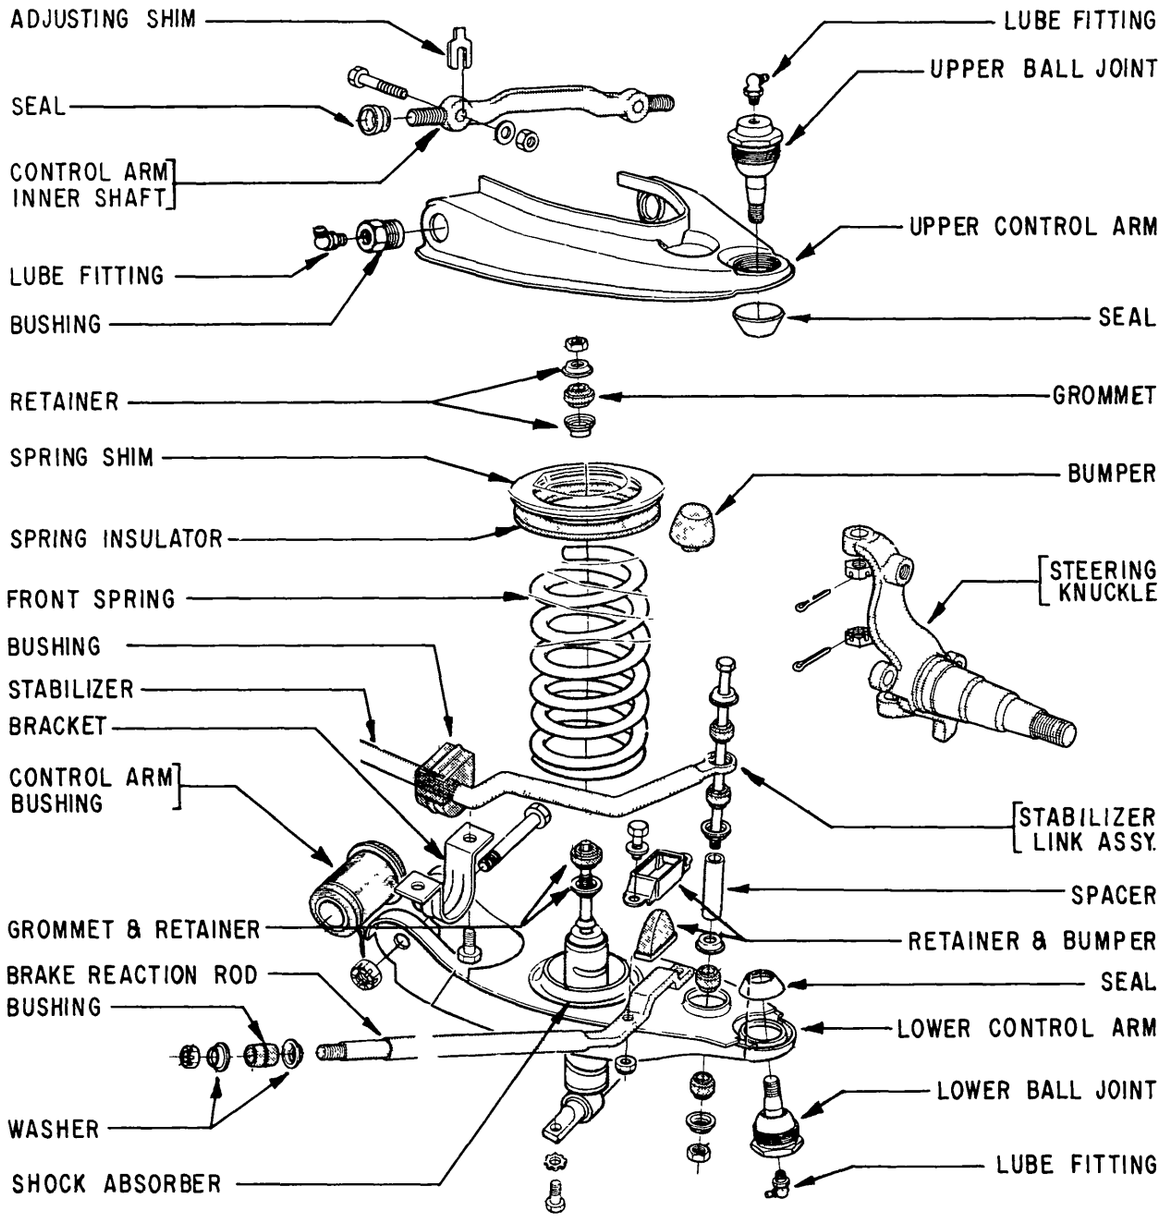
►*BRAKE REACTION ROD TIGHTENING SPECIFICATION & ATTACHING BOLT, WASHER & NUT PRODUCTION CHANGE:* On later cars, longer bolt, Part No. 186626, two hardened steel washers, Part No. 1348315, and nut, Part No. 9413997 are used to attach reaction rod to lower control arm. With new bolts, washers must be installed under bolt head and under nut. Tighten to 60-65 ft. lbs. Earlier cars with shorter bolts and single washer must be tightened to 65-70 ft. lbs. Tighten nuts on forward end of reaction rod-to-bracket to 60-80 ft. lbs.

DESCRIPTION: New design ball joint type front suspension assembly with lower control arms pivoted to frame members by rubber bushings. Lower control arms are maintained in position by brake reaction rods mounted between lower control arms and frame members. Upper control arms are pivoted on a shaft attached to a bracket on frame member.

ADJUSTMENT: *CASTER & CAMBER ADJUSTMENT CAUTION* - Alignment Set Height Tool J-8973-23 must be installed between lower control arm and frame front crossmember at a point just inboard of the rubber rebound bumper on each side of car. Install Rear Spacers J-8973-19 between frame and axle housing with top of spacer positioned over bolt at rear of bumper. It is not necessary to use additional weight to hold car on spacer blocks or height tools as they are designed to raise car slightly. *Correct alignment height must be maintained when making caster and camber adjustments.*

RIDING HEIGHT MEASUREMENT

Kingpin Inclination: 9°52' at 0°50' camber. Not adjustable.



Caster: Neg. 1 1/3°±1°. Both sides equal within ¾°.

Camber: Pos. 1° to Neg. ½° (Pos. 1/3° desired). Both sides equal within ¾°.

Toe-In: 3/16-9/32".

Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 22½°.

►*CASTER & CAMBER SHIMMING NOTE: Adjustment is made by shimming at upper control arm shaft. Maximum shim pack at either location must not exceed .500" with no more than five shims.*

1961 BUICK (EXC. SPECIAL) FRONT SUSPENSION ASSEMBLY

Front Riding Height: 6.06"(All models), measured between upper surface of lower crossmember and spring housing on crossmember. See illustration. To correct add 1/8" shim between top of spring and housing. If more than three shims are required, replace spring.

Front Wheel Bearing: Tighten adjusting nut to 15 ft. lbs. while rotating wheel, then back off nut and re-torque to 10 ft. lbs. If a spindle hole lines up with one of the six nut slots, back off nut 1/12 turn and install cotter pin. If neither spindle hole lines up with nut slot, back off nut a maximum of 1/6 turn and install cotter pin.

CONTINUED ON NEXT PAGE

BUICK (EXCEPT BUICK SPECIAL) FRONT SUSPENSION (Cont.)

REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Remove upper mounting stem nut, grommet retainer, and grommet, then remove two lower mounting bracket-to-lower control arm bolts and lower shock through lower control arm.

Installation: Install lower grommet retainer and grommet (small end up) on shock stem and install shock through lower control arm. Install shock bracket to lower control arm bolts and tighten to 15-25 ft. lbs. Assemble top grommet (small end down), grommet retainer, and nut on stem and tighten to 5-10 ft. lbs.

UPPER BALL JOINT: Removal - Raise and support car under frame, then remove wheel and tire. Loosen but do not remove nut on ball joint tapered stud, then rap steering knuckle sharply in area of stud to disengage stud. With another jack, support car weight under lower control arm and remove nut from ball joint stud. Lower jack under lower control arm slightly, being careful not to damage brake hose. Raise upper control arm and remove rubber bumper under upper control arm. Use a 1 7/8" socket and unscrew ball joint from control arm.

Installation: Install replacement ball joint and carefully pick up original threads on upper control arm and seat ball joint securely against control arm. Turn grease fitting toward rear of car. Turn ball joint stud so cotter pin hole is fore and aft and assemble dust shield over stud. Move knuckle up by jacking under outer edge of lower control arm. Clean stud and tapered hole in knuckle, then install stud in knuckle and tighten nut to 30-40 ft. lbs. and install cotter pin. Reinstall rubber bumper, wheel and tire assembly.

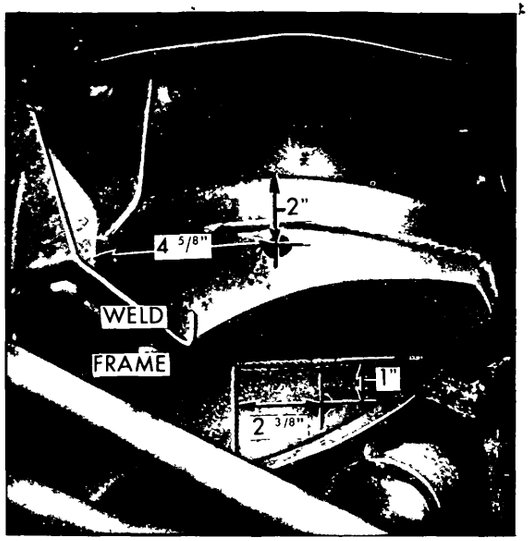
LOWER BALL JOINT: Removal - Raise car and support under frame side rails, then remove wheel and tire. Remove wheel hub, then remove brake backing plate and place above upper control arm on frame spring seat. *NOTE - It is not necessary to remove brake hose from wheel cylinder.* Place a floor jack under lower control arm as far outboard on arm as possible, leaving approximately ½" clearance between jack and control arm. Loosen but do not remove nut on ball joint stud. *CAUTION - Do not loosen nut more than 1/8".* Rap knuckle in area of stud to disengage stud from knuckle, then raise jack against lower control arm. Remove nut and raise knuckle off ball joint stud. Use a 2 1/8" socket and unscrew ball joint from lower control arm.

Installation: Install a new ball joint into threads of lower control arm and seat ball joint firmly against control arm. Point grease fitting toward centerline of car, then install grease shield. Install knuckle over ball joint stud and rap with a hammer to seat stud in knuckle. Install nut and tighten to 60-70 ft. lbs. and install cotter pin. Install a new "O" ring seal over spindle and install backing plate and hub assembly. Tighten the ¾" bolt and nut to 60-75 ft. lbs.; 11/16" bolt and nut to 40-60 ft. lbs.; and the brake anchor bolt to 130-150 ft. lbs. Install wheel bearings and adjust (see above), then install wheel and tire.

STEERING KNUCKLE: Removal - Remove upper and lower ball joint studs from steering knuckle (see above) and remove knuckle.

Installation: Reverse removal procedure.

UPPER CONTROL ARM: Removal - Remove upper control arm ball joint from steering knuckle (see "Upper Ball Joint" above), then remove control arm shaft-to-frame bracket nuts, carefully noting location and thickness of adjusting shims between shaft and frame bracket. Remove control arm assembly. *NOTE - If right hand upper control arm is being removed, it will be necessary to remove generator.*



Disassembly: Clamp arm assembly in a vise and remove bushings and shaft. If necessary, remove ball joint assembly (see "Upper Ball Joint" above).

Reassembly: Assemble new grease seals on shaft and position shaft in arm. Start new bushing in original threads of arm and thread shaft into bushing to aid in alignment. Tighten bushing to 70 ft. lbs. Start second bushing into original threads of arm with shaft threaded into opposite bushing. After bushing has been threaded part way into arm, rotate shaft to engage threads of second bushing. Tighten bushing to 70 ft. lbs. *NOTE - Shaft should be free to turn by hand.* Install grease fittings and lubricate bushings. Rotate shaft to center shaft in arm so there is an equal distance between bolt holes in shaft and arm at both sides.

Installation: Reverse removal procedure, being careful to locate the steel washers under heads of shaft-to-frame bracket bolts. Install original shim packs in their proper locations between shaft and frame bracket. Tighten shaft-to-frame bracket bolts to 80-120 ft. lbs. Install upper ball joint (see "Upper Ball Joint" above), then check and adjust front end alignment.

COIL SPRING: Removal - Raise car and support under frame side rails. *NOTE - Raise car sufficiently high to allow lower control arm to be positioned nearly straight down with a jack placed beneath ball stud end of control arm.* Remove wheel, brake drum, and bearings, then remove steering arm-to-knuckle bolts and nuts. Remove brake anchor pin-to-knuckle bolt and slide backing plate assembly off spindle and place out of way. Remove brake reaction rod-to-lower control arm bolts, nuts and special flat washers, then remove control arm-to-frame compression bumper. Remove stabilizer link, spacer, grommet and retainers. Remove stabilizer bar bracket and shock absorber. Place a floor jack under lower control arm as far outboard as possible without damage to ball joint grease fitting or remove grease fitting and place jack under ball joint. *NOTE - Floor jack must be placed parallel with lower control arm with handle of jack toward opposite side of car to allow lower control arm to travel through its normal arc without bending arm or deforming inner bushing. Control arm must be lowered nearly straight down to remove spring.* Disconnect lower ball joint from knuckle (see "Lower Ball Joint" above), then lower jack to allow control arm to swing completely down and relax spring. Use a long pry bar to release spring from spring seat. *CAUTION - Spring, insulator, and shim (if used) will pop out on floor. Stand clear of spring to avoid injury.*

►*COIL SPRING REPLACEMENT TOOL NOTE:* Examine frame in area of upper spring seat for two 5/8" holes (see illustration) which must be used with Tool J-9195. If holes are not present, locate and drill as indicated in illustration.

DRILLING LOCATIONS

Installation: Tape insulator and shim (if used) to top of spring, then assemble Tool J-9195-3 (plate) and J-9195-4 (retainer) between spring coils approximately two coils up from lower end of spring. Position assembly up against spring seat and assemble tool draw bars, bearings, and nuts to frame and plate, inserting bent ends of draw bars in 5/8" holes in frame. Rotate spring so when control arm is raised, lower end of spring will be located in depression in lower control arm. Tighten draw bar nuts alternately and evenly to compress spring until lower end of spring is approximately even with lower (outboard) edge of spring seat in lower control arm. Push lower control arm down and force the lower end of spring into spring seat. Remove rebound bumper under upper control arm, then raise lower control arm with floor jack placed as far out on arm as possible. With lower control arm safely supported, make sure rubber seal is in place on ball stud, then position cotter pin hole in ball stud fore and aft and position knuckle on tapered stud. Install stud nut tighten to 60-70 ft. lbs. and install cotter pin. *NOTE - It may be necessary to add weight to front of car in order to compress spring sufficiently to allow installation of ball joint stud nut.* Remove spring installer, Tool J-9195.

Installation: Remove and replace old rubber bushing if worn, then install larger diameter washer on brake reaction rod first, with concave side away from nut. Install rod through bushing in frame bracket and install washer with smaller diameter, and nut. Do not tighten. Install frame compression bumper over brake reaction rod, then install two bolts and washers and tighten to 60-65 ft. lbs. (cars with hardened steel washer under attaching nuts); 65-70 ft. lbs. (cars without hardened steel washers under attaching nuts). *CAUTION - These bolt nuts must be tightened to the exact specifications as indicated above.* Tighten nut at front end of reaction rod to 60-80 ft. lbs. and install cotter pin. Check and adjust caster and camber.

LOWER CONTROL ARM: Removal - Remove coil spring (see above), then remove bolt and nut at inner end of lower control arm and remove arm. Remove bushing by pushing or driving from frame using a suitable tool.

CONTINUED ON NEXT PAGE

BUICK (EXCEPT BUICK SPECIAL) FRONT SUSPENSION (Cont.)

Installation: Drive a new lower control arm bushing into frame until it bottoms. Slip lower control arm over bushing and install bolt and nut. Tighten nut to 80-120 ft. lbs. and install a cotter pin. DO NOT back off nut to align hole in bolt for cotter pin installation. Bend tabs of cotter pin. Reinstall coil spring (see above).

NOTE - Retainer-to-plate nut tool is accessible through spring seat hole in lower control arm. Reinstall brake backing plate, steering arm and attaching bolts. Tighten front steering arm bolt nut to 40-50 ft. lbs., rear bolt nut to 60-75 ft. lbs. and anchor bolt to 130-150 ft. lbs. Reinstall brake reaction rod and compression bumper and tighten nuts to 60-70 ft. lbs. *CAUTION - If there is any question of serviceability of brake reaction rod-to-lower control arm bolts, nuts and washers, see "Brake Reaction Rod" below for special parts required. DO NOT use standard bolts, nuts, or washers at this location.* Install stabilizer bar and shock absorber. Install wheel, hub, and brake drum assembly and adjust wheel bearings (see "Front Wheel Bearings" above).

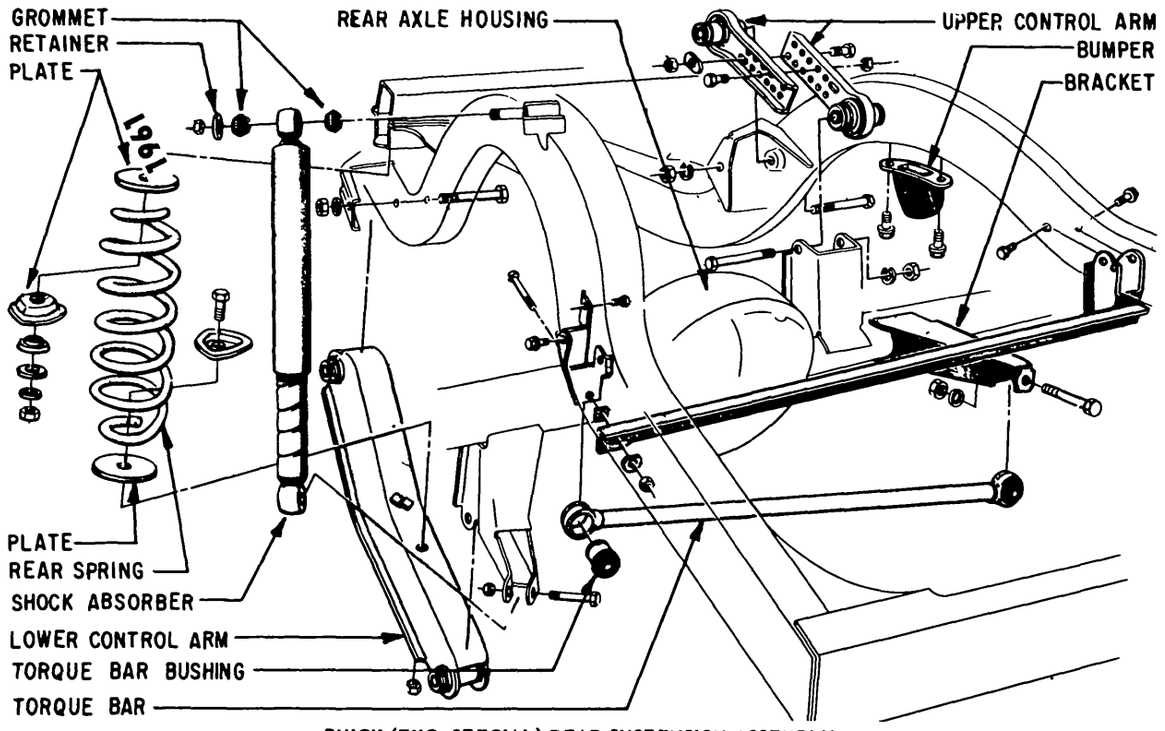
BRAKE REACTION ROD: *CAUTION - Whenever it is necessary to replace brake reaction rod-to-lower control arm attaching bolts, nuts, and washers, use the special parts furnished in Service Package, Part No. 1389760 only. DO NOT USE standard bolts, nuts, and washers.*

Removal: Raise front of car and remove nut from front end of brake reaction rod. Remove control arm-to-frame compression bumper, then remove brake reaction rod by sliding it out of its rubber bushing on frame front crossmember.

BUICK (EXCEPT BUICK SPECIAL) REAR SUSPENSION

Buick Series 4400, 4600, 4700, 4800 (1961)

DESCRIPTION: Coil spring, three link type rear suspension having two lower control arms connected between rear axle housing outer ends and frame side rails. These two control arms take all driving and braking forces. A single upper control arm connected to right side of rear axle housing and to right frame side rail prevents axle housing from rotating during braking and acceleration. This upper control arm is a two piece design having vernier-spaced holes and two slotted holes for adjustment of rear universal joint angle (differential housing "nose" angle).



REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Raise rear of car and remove shock absorber lower mounting bolt and rubber bushings. Remove upper shock absorber mounting stem nut, upper grommet retainer and grommets, then remove shock absorber.

Installation: Inspect all rubber bushings and grommets and replace if necessary. Assemble grommets in upper shock absorber eye, then install shock with grommets over stud in frame and install washer and nut. Tighten nut to 35-45 ft. lbs. Install lower end of shock absorber and grommets in bracket, then install pivot bolt (do not tighten). Lower rear of car and tighten lower shock absorber pivot bolt to 35 ft. lbs. min. *CAUTION - Car weight must be on rear wheels when tightening shock absorber lower end.*

COIL SPRING: Removal - Raise rear of car and support on frame stands, then mark universal joint and pinion flange for correct reinstallation. Disconnect universal joint U-bolt clamps at pinion flange and slide propeller shaft forward on slip spline far enough to clear rear companion flange. Wire propeller shaft up out of way. *CAUTION - Do not allow constant-velocity universal joint to bend to end of its travel.* To provide slack in brake line, disconnect brake line bracket at rear suspension crossmember. Position floor jack under control arm below axle housing and raise tension slightly to relieve tension on shock absorber, then disconnect shock absorber at axle bracket. Remove nut from lower spring clamp bolt and carefully lower jack to fully extend spring and remove bolt and spring clamp from lower control arm. Remove upper spring clamp and remove spring. *CAUTION - Do not completely lower floor jack as this will cause strain on brake hose.*

Installation: Assemble upper insulators on stud between frame and top of spring, then position top of spring up against insulator and assemble spring clamp, clamp insulator, flat washer and lockwasher and nut on stud. DO NOT tighten at this time. Place short piece of 2 x 4 between lower end of spring and axle housing (this will hold spring forward on lower control arm to aid in attaching spring to arm). Raise control arm to contact spring and slip spring seat between spring and control arm. Insert a long tapered punch through control arm bolt hole from bottom to maintain alignment of control arm and spring seat hole. Slip spring clamp over punch and position straight side of clamp along straight end of spring. Rotate spring if necessary to locate spring end at top as follows: On left side, top spring end should be toward rear of car. On right side, top spring end should be toward front of car. Tighten upper clamp nut to 15-20 ft. lbs. Raise control arm until lower spring clamp bolt can be installed, then tighten nut to 20-30 ft. lbs. Install lower control arm to bracket on rear axle and tighten attaching bolt nut to 100-140 ft. lbs. Attach shock absorber to axle bracket and remove wood block, then tighten shock absorber nut to 35 ft. lbs. Attach propeller shaft to rear companion flange. Reinstall brake bracket

BUICK (EXC. SPECIAL) REAR SUSPENSION ASSEMBLY

LOWER CONTROL ARM: Removal - Disconnect rear spring at lower end (see above), then with bottom of spring positioned off of lower control arm and towards differential carrier, raise rear axle assembly and re-

CONTINUED ON NEXT PAGE

BUICK (EXCEPT BUICK SPECIAL) REAR SUSPENSION (C ntinu d)

connect rear shock absorber. With axle housing supported remove lower control arm rear bracket bolt (if necessary, reposition jack further forward under nose of carrier and slowly raise to relieve bind at control arm bushing). Remove lower control arm front bracket nut and bolt, driving bolt out with a brass drift, then remove control arm.

Installati n: *NOTE - B fore installing control arm, check front edges of control arm brackets and remove burrs.* Position control arm in front bracket and install bolt, washer and nut, but do not tighten. Slowly raise rear axle assembly until control arm rear bushing is aligned with bracket bolt hole (line up with a tapered punch), then install bolt, washer and nut, but do not tighten. Disconnect shock absorber at lower end, then lower rear axle assembly and position coil spring on its seat (place a short wooden block between lower end of spring and axle housing). Insert spring seat between spring and control arm, then insert a long tapered punch through control arm bolt hole from bottom to maintain alignment of control arm and spring seat hole. Slip a clamp over punch and position straight side of clamp along straight edge of spring. *NOTE - On left spring, top spring end should be toward rear of car. On right spring, top spring end should be toward front of car. If springs are not positioned as above, loosen top spring clamp bolts and position as necessary, then tighten clamp bolts to 15-20 ft. lbs.* Hold spring in position, and with lower spring clamp plate correctly positioned, install bolt with nut on bottom and tighten to 20-30 ft. lbs. Raise rear axle assembly and install lower end of shock absorber, then remove wood block. Tighten shock absorber bolt to 35 ft. lbs. minimum, and control arm bushing bolts to 90-110 ft. lbs. *NOTE - Car should be in normal load position when tightening shock absorber and lower control arm bolts.* Connect propeller shaft (see "Coil Spring" above) and install brake line bracket to rear suspension crossmember.

TRACK BAR: Removal - Raise car and support so weight of car is on rear springs, then remove pivot bolt and and nut attaching track bar to bracket on axle housing and to track bar bracket on left side of car. Remove track bar.

Installati n: If bar is bent, install a new one. DO NOT try to straighten. If necessary to replace bushings, press old bushings out from side which has no flange. Install new bushing by pressing on flanged side of bushing until flange is in contact with eye of bar. Reverse removal procedure and tighten bolts to 40-50 ft. lbs. (at frame side rail); 110-140 ft. lbs. (at axle housing). *CAUTION - Car must be at normal trim h ight when tight ning track bar bolts.*

UPPER CONTROL ARM: Replacement - *NOTE - Upper control arm bushings not available separately. If necessary to replace, install new arm assembly.* Upper control arm can be removed by disconnecting bolts at both ends. When installing, tighten bolts to 100 ft. lbs. *CAUTION* - This arm controls rear universal joint angle. If necessary to replace arm or if arm adjustment is disturbed, rear universal angle must be adjusted. *See "Propeller Shaft" in Rear Axle section.*

BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION

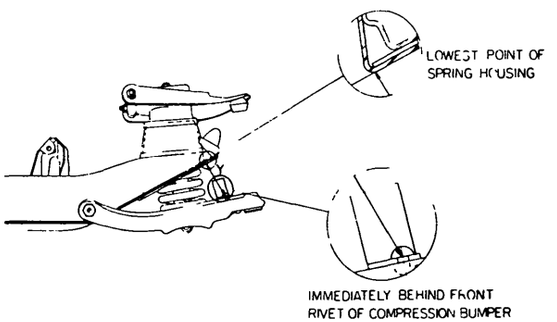
Buick Special (1961)
Oldsmobile F-85 (1961)

DESCRIPTION: Independent suspension with ball joints connecting steering knuckle to upper and lower control arms. The entire front suspension system is mounted on front suspension crossmember which is attached to car underbody by three isolation mounts. The complete suspension unit can be removed from car as a single unit.

ADJUSTMENT: *BUICK ADJUSTMENT CAUTION: Front 'Alignment Height Tool J-8973-22 and Rear 'Alignment Height Tool J-8973-21 (Rear Height Alignment Tool J-8973-20 for Station Wagons) must be installed when checking and setting caster and camber.*

Steering Axis Inclination: Buick Special - 7½° (Camber within specified limits). Not adjustable.
Oldsmobile F-85 - 7°30' at 0° Camber.

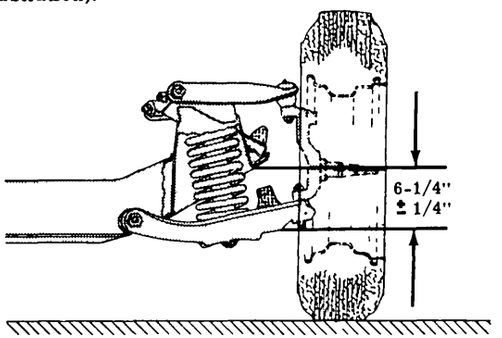
Caster: Buick Special - Neg. 2¾°±½° (Cars before Serial No. 1H1504352 Flint and 1H2502044 South Gate). Neg. 2°±½° (Cars after the above serial numbers). Both sides equal within ¾°.
Oldsmobile F-85 - Neg. ¾° to Pos. 1¾°. Both sides equal within ¾°.



Camber: Buick Special - Neg. ¼° to Neg. 1°. Both sides equal within ¾°.
Oldsmobile F-85 - Neg. 3/8° to Pos. 3/8°. Both sides equal within ¾°.

►*CASTER & CAMBER SHIMMING NOTE: 'Adjustment is made by adding or removing shims between upper control arm shaft and bracket on front crossmember. Maximum shim pack at either location must not exceed .380". Tighten control arm shaft bolts to 60-85 ft.*

Toe-In: Buick Special - 1/16-1/8" (Cars before Serial No. 1H1504352 Flint and No. 1H2502044 South Gate). 1/8-3/16" (Cars after above serial numbers).
Oldsmobile F-85 - 0-1/8".



Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 23°40' (Buick Special); 23° (Oldsmobile F-85). Not adjustable.

Front Riding Height: Buick Special - 4.40" (All models at curb weight) measured from a point immediately behind front rivet of compression bumper on lower control arm to lowest point of spring housing (see illustration). *NOTE - Spring shims are not available for adjusting riding height.*

BUICK SPECIAL RIDING HEIGHT

Oldsmobile F-85 - 6¼±¼" (All Models at curb weight) measured from lower side of gauge hole in lower control arm to metal surface of spring upper housing (see illustration).

OLDSMOBILE F-85 RIDING HEIGHT

Front Wheel Bearings: Buick Special - Tighten adjusting nut to 15 ft. lbs. while rotating wheel, then back off nut and re-torque to 10 ft. lbs. If a spindle hole lines up with one of the six nut slots, back off nut 1/6 turn and install cotter pin. If neither spindle hole lines up with nut slot, back off nut a maximum of 3/12 turn and install cotter pin.
Oldsmobile F-85 - Tighten adjusting nut to 10-15 ft. lbs., then back off nut 1/6 to 1/4 turn and install cotter pin.

REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Remove two upper and two lower shock absorber attaching bolts, then raise car (support on wheels) and remove shock absorber through lower control arm.

Installation: Reverse removal procedure and tighten attaching bolts to 15-25 ft. lbs.

LOWER BALL JOINT: Removal - Raise and support car at front crossmember, then place a jack ¼" below coil spring under lower control arm. Loosen ball joint nut (do not remove), then rap steering knuckle at ball joint stud with a brass drift or hammer to loosen stud. Remove nut and unscrew ball joint.

Installation: Lubricate with aluminum soap grease, then tighten ball joint in control arm until hex starts to shave metal from arm. Raise stud into knuckle and install nut, then tighten to 35-60 ft. lbs. and install cotter pin.

UPPER BALL JOINT: Removal - Raise and support car at front crossmember, then remove wheel and tire. Loosen ball joint nut (do not remove), then rap steering knuckle at ball joint stud with a brass drift or hammer to loosen stud. Support brake assembly, raise arm and unscrew ball joint from upper control arm.

Installation: Lubricate with aluminum soap grease, then tighten ball joint in control arm until hex starts to shave metal from arm. Insert stud in knuckle and install nut, then tighten to 35-60 ft. lbs. and install cotter pin. Install wheel and tire.

CONTINUED ON NEXT PAGE

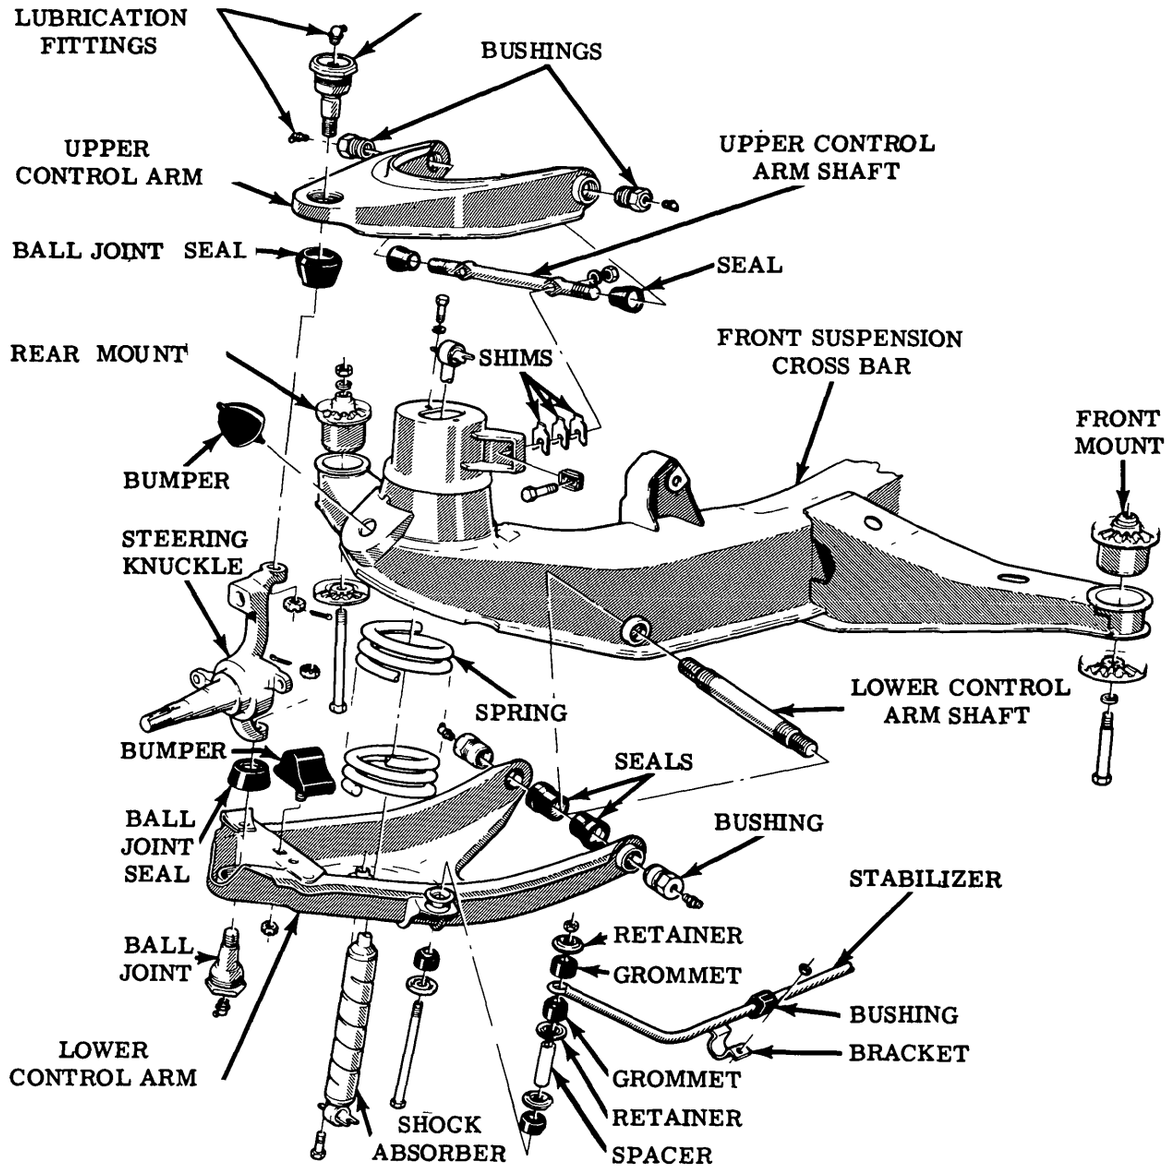
BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION (C ntinu d)

STEERING KNUCKLE: Removal - Raise and support car at front crossmember, then remove wheel, hub and drum assembly. Remove backing plate without disconnecting brakehose (leave steering arm connected to tie rod end). *NOTE - Support backing plate out of the way.* Disconnect ball joints from steering knuckle (see above).

Installation: Reverse removal procedure and tighten ball joint stud nuts to 35-60 ft. lbs. and backing plate to steering knuckle bolts to 55-80 ft. lbs.

COIL SPRING: Removal - Raise front of car and support at underbody with floor stands. Remove wheel assembly and disconnect stabilizer link from lower control arm, then remove s. ck absorber. Position a floor jack to support lower control arm ball, between spring seat and ball joint. Disconnect lower control arm ball joint from steering knuckle (see "Lower Ball Joint" above). Slowly lower floor jack until spring is fully extended and remove spring.

Installation: *NOTE - Top of spring is identified by a flat coil.* While holding spring against pilot in front crossmember, tilt spring so it will pilot in lower control arm, then rotate spring so end of bottom coil will index with edge of hole in control arm spring seat. *NOTE - Coil should not cover any portion of hole.* Position floor jack between spring seat and ball joint, then raise control arm until ball joint is tight in steering knuckle. Tighten ball joint nut to 35-60 ft. lbs. Install shock absorber and connect stabilizer to lower control arm and tighten nut to 13-17 ft. lbs.



LOWER CONTROL ARM: Removal - Remove coil spring (see above), then remove pivot shaft bushings from control arm assembly and remove control arm.

Installation: Lightly coat threads of shaft with chassis lubricant and start bushing onto threads of shaft. Place Spacer Tool J-8808 on shaft between control arm and crossmember, then with spacer against front crossmember and control arm against spacer, tighten bushing until hex of bushing seats firmly into arm. Remove spacer and install bushing at opposite end of shaft.

LOWER CONTROL ARM SHAFT: Removal - Remove lower control arm, then thread Installer & Remover J-8907 or J-8907-1 on rear of lower control arm shaft approximately 7/8" and tighten lock bolt of tc old tool to shaft. *NOTE - Do not thread tool tightly on shaft.* Turn Tool J-8907 clockwise to remove shaft through front of crossmember. Remove tool, then remove shaft. *NOTE - Threads on rear of shaft are smaller than threads at front of shaft.*

Installation: Position shaft through front of crossmember with "F" on shaft toward front. Install same tool used for removal, then coat threads of shaft with Lubriplate and thread shaft into crossmember until shaft extends an equal distance from front and rear of crossmember (approximately 1 11/16"). *CAUTION - Measure and make sure shaft extends an equal distance from front and rear of crossmember.* Install lower control arm

UPPER CONTROL ARM: Removal - Raise car and support under lower control arm, then remove wheel. Disconnect upper ball joint from knuckle (see "Upper Ball Joint" above). Support hub assembly, then remove inner control arm shaft bolts and remove arm. Note location of shims between shaft and crossmember bracket,

BUICK SPECIAL & OLDSMOBILE F-85 FRONT SUSPENSION

Disassembly: Clamp arm assembly in a vise and remove old bushings and shaft.

Reassembly: Assemble new grease seals on shaft, then apply a light coating of Lubriplate to shaft threads and position shaft in arm. Start new bushing in original threads of arm and thread shaft into bushing to aid in alignment. Tighten bushing until hex section of bushing seats firmly into arm. Start second bushing into original threads of arm with shaft threaded into opposite bushing. After bushing has been threaded part way into arm, rotate shaft to engage threads of second bushing. Tighten bushing until hex section seats firmly into arm. *NOTE - Shaft should be free to turn by hand.* Install grease fittings and lubricate bushing. Rotate shaft so distance between shaft bolt holes and arm are equal at both sides.

Installation: Assemble upper control arm and shaft assembly to bracket and install original shim packs in their proper location. Tighten shaft-to-bracket bolts to 60-85 ft. lbs. Reinstall upper ball joint on knuckle,

BUICK SPECIAL & OLDSMOBILE F-85 REAR SUSPENSION

Buick Special (1961)
Oldsmobile F-85 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

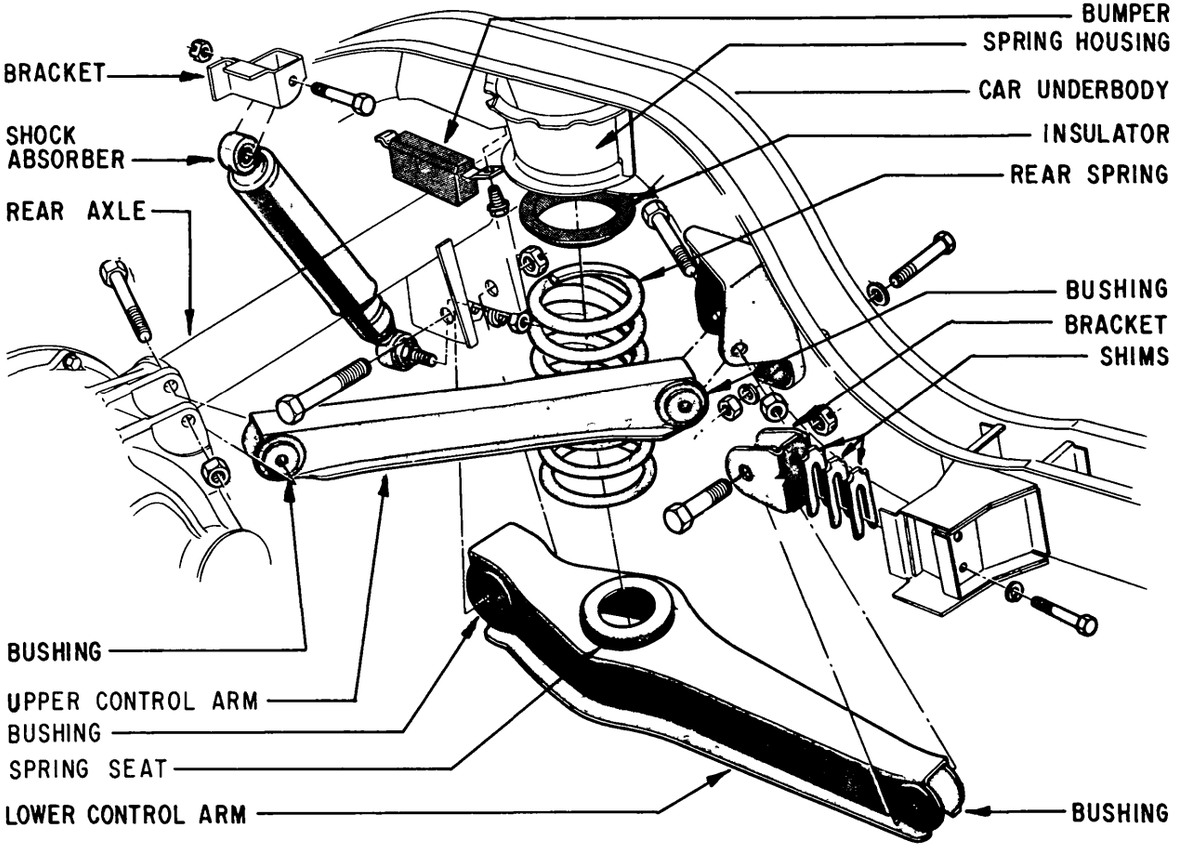
►*1961 OLDSMOBILE F-85 REAR COIL SPRING RATTLE CORRECTION:* This condition may be diagnosed as a body rattle and can be corrected as follows: Remove rear coil spring, then grind a flat surface on top side of lowest coil. Starting from top of end of lowest coil grind down 1/8" and taper back approximately 3". Cut one Spring Insulator, Part No. 578828 in half, and force one section between the two top coils of each spring to prevent these coils from making contact. Position original insulator on spring 180° from original location, then reinstall spring.

DESCRIPTION: Coil spring, four link type suspension having two lower control arms mounted between outer ends of rear axle housing and car underbody. Two upper control arms are mounted angularly between rear axle differential housing and car underbody.

ADJUSTMENT: *NOTE - Rear universal joint angle must be checked and adjusted whenever rear lower control arms are replaced. See "Propeller Shafts" in Rear Axle Section.*

REAR RIDING HEIGHT: Buick Special - 6.65"±3/8" (Exc. Station Wagon); 5.94"±3/8" (Station Wagon) measured from top of rear axle tube of axle housing to base of rebound bumper on car underbody.

Oldsmobile F-85: 6¼-6¾" (Exc. Station Wagons); 5 7/8-6 3/8" (Station wagons)measured from top of rear axle tube of axle housing to base of rebound bumper on car underbody.



REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Raise and support rear axle, then disconnect shock absorber at upper and lower brackets and remove.

Installation: Loosely attach shock absorber to both brackets, then tighten lower stud nut to 30-45 ft. lbs. and upper nut to 45-60 ft. lbs.

REAR COIL SPRINGS: Removal - Raise and support rear of car, then slightly raise and support rear axle assembly with a floor jack. Provide slack in parking brake cables by disconnecting at cable hanger. Disconnect shock absorber from bracket on axle housing, then lower rear axle assembly fully and remove coil spring and insulator.

Installation: Position coil spring with ground (flat) end of spring and insulator at top and tang at lower end located in notch of lower control arm. Raise rear axle assembly and connect shock absorber to bracket on axle housing and tighten nut to 30-45 ft. lbs. Connect parking brake cable at hanger.

BUICK SPECIAL & OLDSMOBILE F-85 REAR SUSPENSION

LOWER CONTROL ARM: Removal - Remove coil spring (see above), then disconnect lower control arm at bracket on axle housing. Disconnect front bracket from underbody and remove lower control arm and bracket. *CAUTION - Note number and thickness of shims found between underbody and bracket.*

Installation: *NOTE - Inspect rubber bushings and replace as required (bushings are replaced through one side of arm only). If control arm is bent or damaged it must be replaced.* Assemble front bracket on control arm and tighten nut to 85-110 ft. lbs. *NOTE - When bracket is in normal position, the arms of bracket will be angled downward.* Bolt front bracket to underbody with original number of shims in place and tighten bolts to 45-60 ft. lbs., making sure that lockwashers are in place at heads of bolts. Connect control arm to bracket on axle housing and tighten bolt to 85-110 ft. lbs., then install rear coil spring. Check rear universal joint angle and adjust as necessary. *See "Propeller Shaft" in Rear Axle Section.*

UPPER CONTROL ARM: Removal - Raise rear of car and support rear axle assembly, then disconnect upper control arm at carrier housing by removing arm bolt and locknut. Disconnect control arm at front bracket and remove control arm.

Installation: *NOTE - Inspect rubber bushings and replace as necessary (bushings are replaced through one side of arm only). If control arm is bent or damaged, it must be replaced.* Position control arm with flange on bushings facing forward and open side of control arm down. *NOTE - Right and left upper control arms are interchangeable.* Install control arm bolts and locknuts at front and rear and tighten to 85-110 ft. lbs. *NOTE - It may be necessary to rotate axle housing slightly for alignment of bolt holes.*

CADILLAC FRONT SUSPENSION

Cadillac (1961)

►CHANGES, CAUTIONS, CORRECTIONS

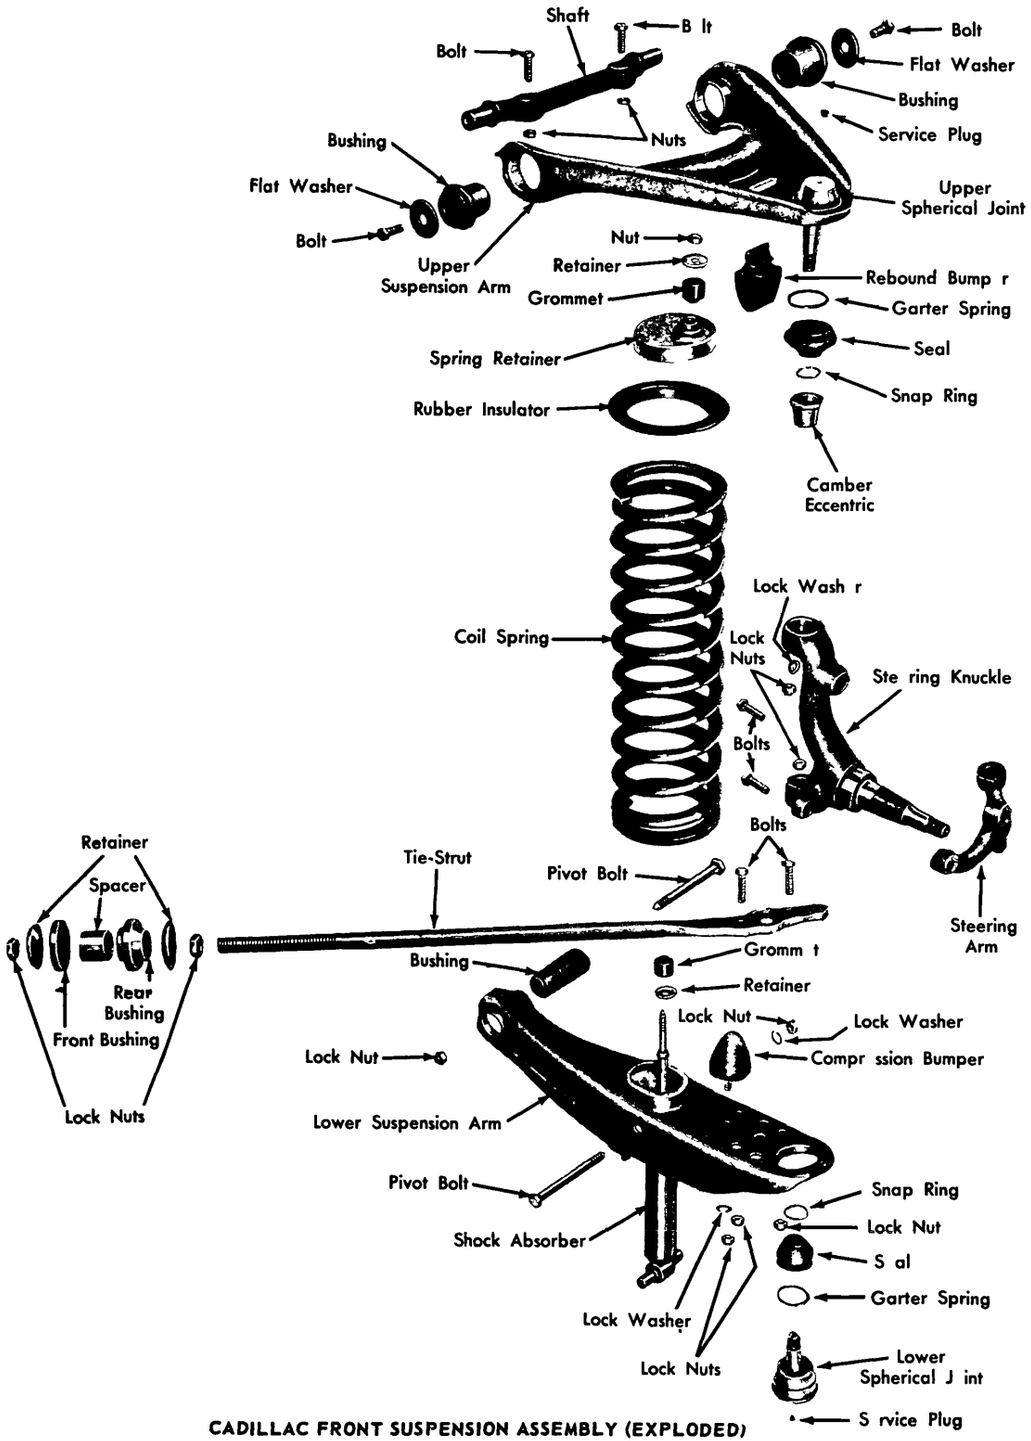
►*1961 CADILLAC "CREAKING" NOISE CORRECTION:* In addition to the "creaking" noise, a wheel "thump" may also be noted. Remove rubber bushing assemblies at frame end of tie-strut and examine spacers and washers for damage. Replace if necessary. Make sure that machine threads on tie struts are not excessively rough which would cause the "stover" nuts to lose locking effect. Install new "stover" nuts and tighten to 30-40 ft. lbs. *CAUTION - Always use new "stover" nuts whenever tie-strut is disassembled at this point.*

►*1961 CADILLAC UPPER CONTROL ARM SHAFT PRODUCTION CHANGE & INSTALLATION NOTE:* Upper control arm shaft diameter has been changed in production beginning with Eng. No. 053805. A new tool, Bushing Installer Set, J-8999-15 must be used for installation of the new bushings. The above tool may also be used on all previous 1961 models.

►*1961 CADILLAC LOWER CONTROL ARM BALL JOINT SQUEAK CORRECTION:* If this condition is caused by water leaking into lower ball joint and it is necessary to repack the joint, a new kit, Part No. 3631822 consisting of clamps, fasteners, and plug is available for replacement. Beginning with Eng. No. 082672, the lower ball joint seal is cemented at the lower lip to prevent water leakage. When installing the new seal, force out any water trapped in joint by applying lubricant. Install clamp so it is facing squarely forward, parallel to car centerline. When properly installed, upper half of garter spring should be exposed at top edge of clamp.

DESCRIPTION: New design "ball-joint" type with upper and lower control arms connected to frame members by rubber bushings. A new "tie strut" is connected between outer end of lower control arm and front crossmember to carry fore and aft load of front wheels. Caster adjustments are made by adjusting nuts on threaded end of struts. The new upper control arm ball joints connects upper control arm to steering knuckle through a camber adjustment eccentric. Camber adjustments are made by turning this eccentric to reposition upper ball joint stud.

ADJUSTMENT



CHECKING & ADJUSTING: Before checking and adjusting front wheel alignment, check and correct any looseness in spherical "ball joints", steering gear, and connections. Check and correct standing height (*see "Trim Dimensions" below*). Inflate tires to correct pressure and check for runout. Make sure car is at curb weight.

Tire Inflation: Series 60 & 62 - 24 lbs. (front & rear). **Series 75** - 28 lbs. (front & rear). **Commercial Chassis** - 24 lbs. (front); 30 lbs. (rear).

Steering Axis Inclination: 6° at 0° camber. Not adjustable.

Camber: Left Wheel - Pos. 3/8° to Neg. 1/8°(0° preferred). **Right Wheel** - Pos. 1/8° to Neg. 3/8° (Neg. ¼° preferred). Left wheel must have ¼° to ½° more positive camber than right wheel.

CONTINUED ON NEXT PAGE

CADILLAC FRONT SUSPENSION ASSEMBLY (EXPLODED)

CADILLAC FRONT SUSPENSION (C ntinu d)

Adjustm nt - Loosen ball joint stud nut one turn and tap bottom to loosen camber eccentric in knuckle support, then use Camber Adjusting Wrench, J-9231 and turn camber eccentric until proper adjustment is obtained. *NOTE - Final position of joint stud should be in rear portion of camber eccentric to retain steering arm angl in correct position.* Tighten stud nut to 50-65 ft. lbs.

►*CAMBER ADJUSTMENT NOTE:* If difficulty is encountered loosening camber eccentric from steering knuckle, cut a piece of 7/16" diameter steel rod to a length of 20", chamfering it on one end and rounding it off on the other. Back off self-locking nut on ball joint stud **on turn,** and thread a standard nut halfway on stud. Insert round end of steel rod inside nut and against bottom of stud, then pound on end of tool with a heavy hammer to break camber eccentric loose.

Cast r: Neg. ½° to Neg. 1½°. Adjustment must be within ½° or less on both sides.
Adjustm nt - Remove splash shield over threaded end of lower control arm "tie strut", then rotate retaining nuts on forward ends of "tie strut" as necessary to obtain proper caster adjustment. After adjustment is made, hold rear nut with a wrench and tighten front nut to 55-70 ft. lbs.

T e-In: 3/16" to 1/4".

T -Out n Turns: With outer wheel at 20°, inner wheel should be 22°11'. Not adjustable.

Trim Dim nsi ns: Before checking trim height, make sure that trunk is empty and fuel tank is full. Normalize position of springs by working bumper up and down and release slowly, permitting car to assume normal position. At the front, measure distance from top of rear flange on lower control arm to center of forward lower rivet on frame side rail. *NOTE - The above mentioned rivet is nearly on centerline of front coil soring. When measuring, hold rule vertical, seating it on lowest part of support arm flange, directly below rivet.* Standing trim height should be equal on both sides of car within 3/8" (see table below for specifications). To adjust, at rear of car, measure distance between top of rear axle housing to lower underside surface of frame. Rear standing trim height should be equal within ½" on both sides of car (see table below for specifications).

Trim Heights

Body Cod ©	Front Height	Rear Height
"A"	7 1/2"	6"
"B" & "L"	7 7/16"	6"
"C" & "K"	7 5/8"	6"
"E" & "F"	7 7/16"	5 7/8"
"G"	7 15/16"	6"
"J"	7 9/16"	5 7/8"
"M"	7 3/8"	5 13/16"
"R" & "S"	8"	6 13/16"
"Z"	8 1/2"	4"

© - Part of Engine Serial Number. *See "Model Identification" on Cadillac Car Model Page.*

REMOVAL & INSTALLATION

SHOCK ABSORBER: R moval - Remove upper retaining nut, retainer, and grommet at upper suspension arm frame mounting bracket, then remove bolt holding lower end of shock to lower suspension arm. Remove shock.

Installati n: Reverse removal procedure and tighten bolt at lower end to 90-110 ft. lbs.

FRONT STABILIZER: R m val - Disconnect stabilizer at lower control arm, then remove brackets and stabilizer from frame.

Installation: Reverse removal procedure and tighten bracket-to-frame bolts to 18-25 ft. lbs.

LOWER CONTROL ARM TIE-STRUT: Removal - Raise front of car and place jack stands under frame side rails, then remove splash shield covering inner ends of tie strut. Disconnect stabilizer link from lower arm. Remove nut and retainer from threaded end of strut at front frame crossmember, and back off rear nut. Disconnect strut from lower control arm and remove rear bushing retainer and nut from strut. Remove bushings and bushing spacer from frame.

Installation: Insert bushing in rear spacer and install assembly in frame through rear side of crossmember. Install nut on tie strut and run to bottom of thread, then install rear bushing retainer with concave side toward nut. Install tie strut through rear bushing in front crossmember and install front bushing on end of tie strut, sliding it into position in frame crossmember (front bushing should lock in rear bushing). Install bushing retainer with flat side against bushing and install nut (do not tighten). Attach end of tie strut to lower control arm and tighten nuts to 30-40 ft. lbs. Connect stabilizer link to lower control arm, then lower car to floor and tighten front nut on tie strut to 30-40 ft. lbs. *NOTE - This setting supersedes previous setting of 55-70 ft. lbs.* Tighten rear nut, compressing bushing until retainer bottoms on metal spacer in bushing. Adjust caster (see above), then install splash shield.

UPPER CONTROL ARM BALL JOINT SEAL: Removal - Raise front of car and place jack stands under lower control arms, then remove lock nut and special flat washer from ball joint stud. Scribe a mark on camber eccentric and steering knuckle (for alignment at installation), then strike ball joint stud with a soft mallet to free it from steering knuckle. Raise up on upper control arm and remove ball joint from knuckle. Using Puller, J-8990, remove camber eccentric from ball joint stud. Wipe seal surface clean, then remove garter spring and seal. Clean joint pivot with solvent and inspect for looseness or binding. Replace joint if necessary.

►*BALL JOINT STUD REMOVAL NOTE:* If difficulty is encountered loosening stud from knuckle, see "Upper Control Arm Removal" below for new method of loosening ball joint stud and eccentric.

Installation: Using a new seal, turn seal inside out, then place snap ring inside seal, just over bottom hole, pressing in on bottom of seal until snap ring seats itself in groove around hole. Apply a small amount of lubricant around hole in seal and install seal on ball joint stud. Unroll seal until lip engages in recess around joint housing. Allow air to enter seal by momentarily prying lip of seal away from joint housing with a small screwdriver. Squeeze seal, sliding snap ring end up on stud, then install new garter spring with Tool J-9148. *CAUTION - Mak sur spring s cur s lip of seal in r c ss all around joint housing.* Install camber eccentric and align marks on eccentric and steering knuckle. Install a standard nut on ball joint stud and tighten until eccentric locks in knuckle, then remove standard nut, and install special flat washer and locking nut. Tighten to 50-65 ft. lbs. Pry out service plug from ball joint cover and discard plug. Use Repacking Gun, J-9280 and repack joint through plug hole with special lubricant. *CAUTION - Fill joint with lubricant, but do not allow seal to "balloon".* Install new service plug in ball joint cover. Check camber and adjust if necessary.

LOWER CONTROL ARM BALL JOINT SEAL: Removal - Remove lower control arm and coil spring (see below), then secure control arm in a vise and remove ball joint seal in same manner as for upper control arm ball joint seal. *NOTE - Seal can be replaced on lower control arm ball joint without removing control arm from car as follows:* Break ball joint loose from steering knuckle, then loosen anchor bolt and brake backing plate-to-steering knuckle bolts for clearance and disengage ball joint stud from knuckle. Move knuckle out of way and remove ball joint seal in same manner as for upper control arm ball joint.

Installation: Reverse removal procedure.

►*UPPER CONTROL ARM BALL JOINT REPLACEMENT NOTE: Do not attempt to remove ball joint assembly from upper control arm. Upper control arm and ball joint are serviced as a complete assembly.*

LOWER CONTROL ARM BALL JOINT: Removal - Remove lower control arm and coil spring (see below), then remove garter spring and seal from joint. Position Tool J-8999-7 on arbor press anvil and place lower control arm on tool with ball joint cover resting on tool. Position Ball Joint Remover, Tool J-8999-9 over joint stud until it seats on joint housing, and press ball joint out of arm.

Installation: Position support, Tool J-8999-7 on arbor press anvil and place lower control arm on support, so that ball joint mounting hole is encompassed by support. Insert new ball joint in arm, stud end first, then position Ball Joint Installer, J-8999-5 on flanged portion of joint housing and press joint into arm until joint flange bottoms on mounting hole flange. Install lower control arm and coil spring.

UPPER CONTROL ARM: Removal - Raise and support front of car with jack stands under lower control arms. Remove wheel, then remove locking nut and special flat washer from ball joint stud. *NOTE - If difficulty is encountered in freeing stud from knuckle, see n te below.* Strike bottom of stud with a soft hammer to free it from knuckle support. Remove shaft mounting bolts at frame tower and remove control arm and shaft assembly. *NOTE - For access to shaft mounting bolt nut (on early cars with bolt head upward) use a ¾" offset wr nch through openings in tower.* If necessary, remove camber eccentric with Puller J-8990. *CAUTION - Ball joint and upper control arm are serviced as a complete assembly. Do not attempt to remove joint from arm.*

►*BALL JOINT STUD REMOVAL NOTE:* If difficulty is encountered loosening stud from knuckle, cut a piece of 7/16" diameter steel rod and cut to a length of 20", then proceed as follows: Remove stud nut and special flat washer, then install a standard nut about halfway up stud. Insert round end of steel rod inside nut and against bottom of stud, then pound on end of tool with a heavy hammer to break it free.

CONTINUED ON NEXT PAGE

CADILLAC FRONT SUSPENSION (C ntinu d)

Installation: Position upper arm assembly on frame tower and install mounting bolts and lock nuts. Tighten nuts to 70 ft. lbs. *NOTE - This supersedes previous specification of 110-130 ft. lbs.* Install camber eccentric on ball joint stud if previously removed, then install ball joint stud and camber eccentric into knuckle and install a standard nut on end of ball joint stud. Tighten nut until camber eccentric locks in knuckle support, then remove standard nut and install special flat washer and locking nut and tighten to 50-65 ft. lbs. Install wheel and check front end alignment. *CAUTION - If necessary to replace bolt, nut or washer attaching control arm inner shaft to frame use only bolt, Part No. 427569; washer, Part No. 1477585; nut, Part No. 9411971.*

UPPER CONTROL ARM SHAFT & BUSHINGS: Removal - With upper control arm removed from car, remove bolt and washer from each end of shaft. Position support, Tool J-8999-2 on arbor press anvil and place one end of control arm on support with outer end of bushing resting in support. Install Spacer, Tool J-8999-1 around shaft between arm ends, then insert Driver, Tool J-8999-6 through bushing in opposite arm and thread driver into end of shaft. Use arbor press and press driver downward until there is sufficient clearance between flange on upper shaft and upper bushing to install Tool J-8999-4. Remove arm assembly from arbor press and remove driver and spacer tools. Install "C" Washer, Tool J-8999-4 between shaft flange and bushing and place this end of arm on Support, Tool J-8999-2, with outer end of bushing resting in support. Reinstall Spacer, Tool J-8999-1 between arm ends and insert Driver, Tool J-8999-6 through upper bushing, then thread driver into end of shaft. Press shaft downward until bushing is removed. Repeat the above procedure for bushing on opposite side of control arm.

►*1961 CADILLAC UPPER CONTROL ARM SHAFT PRODUCTION CHANGE & INSTALLATION NOTE:* Upper control arm shaft diameter has been changed in production beginning with Eng. No. 053805. A new tool, Bushing Installer Set, J-8999-15 must be used for installation of the new bushings. This tool may also be used for bushing installation on earlier cars.

Installation: Position Bushing Installer, Tool J-8999-16 (part of Tool J-8999-15) on arbor press anvil, then insert bushing in one end of arm and place arm and bushing on installer, with outer end of bushing seated in installer tool. Place shaft between arm ends, aligning end of shaft with bushing inner sleeve. Position bushing on opposite end of shaft and place second Bushing Installer J-8999-16, on top of bushing. Hold assembly in place by exerting slight pressure on arbor press. Check alignment of bushing, arm ends and shaft, then install Spacer, J-8999-1 around shaft between arm ends to prevent arms from collapsing when bushings are installed. Press bushing onto shaft until both bushing flanges bottom on arms. *NOTE - If bushings do not butt flush against shoulder of shaft, attaching bolts, when installed, will seat them in position.* Remove tools from arm assembly, then install flat washer, lockwasher, and screw on each end of shaft. *CAUTION - Do not tighten screws until control arm is installed on car and car weight is on wheels, then tighten screws to 60 ft. lbs.*

LOWER CONTROL ARM & COIL SPRING: Removal - Disconnect shock absorber at its upper mount, then raise front of car support with jack stands under frame side rails. Disconnect stabilizer link and tie strut at lower control arm, then remove shock absorber. Remove wheel assembly and brake drum and loosen the two bolts securing brake backing plate to steering knuckle. Remove nut from pivot bolt in lower control arm at frame mount. Position jack under outer end of lower control arm so jack is not supporting control arm, then remove locking nut from lower ball joint stud and install a standard nut on stud, running it to within two threads of knuckle support (this will prevent control arm from dropping when ball joint is broken free of knuckle support). Strike knuckle support with a hammer in area of ball joint stud to break it loose. *NOTE - Raise opposite rear corner of car to increase spring load on lower control arm and aid in breaking joint loose.* Raise jack under lower control arm sufficiently to remove spring load, then remove nut from ball joint stud. Tilt brake backing plate outward from bottom and slowly lower jack, then remove spring and insulator. Remove pivot bolt from lower control arm at frame mount and remove control arm.

Installation: Place end of lower control arm in frame mount and install pivot bolt (do not install nut), then tape rubber insulator to top of spring (shim and insulator on top of right hand spring on all air conditioned cars except Series 75). *NOTE - Either end of spring may be used at top. Both ends are the same.* Install top of spring in upper seat of spring tower and rotate spring so that bottom tang end fits between raised edge on top of lower control arm and centerline of shock absorber. *NOTE - Raised edge of lower control arm faces front of car on right side and rear of car on left side.* With a hydraulic jack placed under outer end of lower control arm, tilt brake backing plate outward from bottom, and raise arm into position. Guide spring into position with tang end between raised edge on top of lower control arm and centerline of shock absorber. *NOTE - When control arm is raised, shock may have a tendency to rotate, mispositioning tang end. End of tang must be between raised edge of arm and centerline of shock after spring is installed.* Guide ball joint stud into knuckle support, then install a standard nut on joint stud and tighten nut until stud seats in knuckle support. Remove standard nut and install special locking nut on stud, tightening it to 60-75 ft. lbs. Install nut on lower control arm pivot bolt but do not tighten until car is resting on all four wheels. Tighten anchor bolt on brake backing plate to 90-110 ft. lbs. and bend locking tang over one flat of bolt head. Install shock absorber (see above) but do not tighten lower nut until car is resting on all four wheels. Install tie strut on lower control arm and tighten nuts to 30-40 ft. lbs., then install stabilizer link. Install brake drum and wheel assembly and lower front end of car. Connect shock absorber at upper end and tighten nut on lower end to 90-110 ft. lbs. Tighten nut on lower control arm pivot bolt to 55-70 ft. lbs. Check wheel alignment and adjust if necessary.

LOWER CONTROL ARM BUSHING: R m val - With lower control arm removed, position Support, Tool J-8999-2 on arbor press anvil and insert larger diameter end of bushing in support. Place Spacer, Tool J-8999-8 around bushing sleeve between flanged sides of arm, then position Bushing Remover, Tool J-8999-10 on bushing sleeve and press bushing out of arm.

Installation: Position Support, Tool J-8999-2 on arbor press anvil and insert smaller diameter flanged end of bushing mount in support. Install new bushing in arm, smaller diameter end of bushing first, until bushing pilots itself in opposite flanged end. Place Spacer, Tool J-8999-8 around sleeve of bushing between flanged sides of arm, then position bushing Installer, Tool J-8999-9 over end of bushing and press bushing into arm until installer tool bottoms on flanged bushing mount. Install lower control arm and coil spring.

STEERING KNUCKLE: Removal - Raise front of car and place jack stands under frame side rails, then remove wheel assemblies and brake drum. Straighten locking plate on anchor bolt and remove anchor bolt, locking plate, and two bolts securing brake backing plate to steering knuckle. Position steering arm out of way and remove support plate, grease guard, and brake backing plate from knuckle. Wire backing plate to a convenient location to prevent damage to brake hose. Place a jack under lower control arm, then remove stud nut and break ball joint loose from control arm. Break joint loose from upper control arm and remove stud from upper knuckle support. Remove steering knuckle from lower ball joint stud.

Installation: Reverse removal procedure, tightening brake backing plate attaching bolts to 60 ft. lbs. and anchor bolt to 90-110 ft. lbs.

CADILLAC REAR SUSPENSION

Cadillac, Exc. Commercial (1961)

DESCRIPTION: Four link, coil spring type similar to design used on previous models.

REMOVAL & INSTALLATION

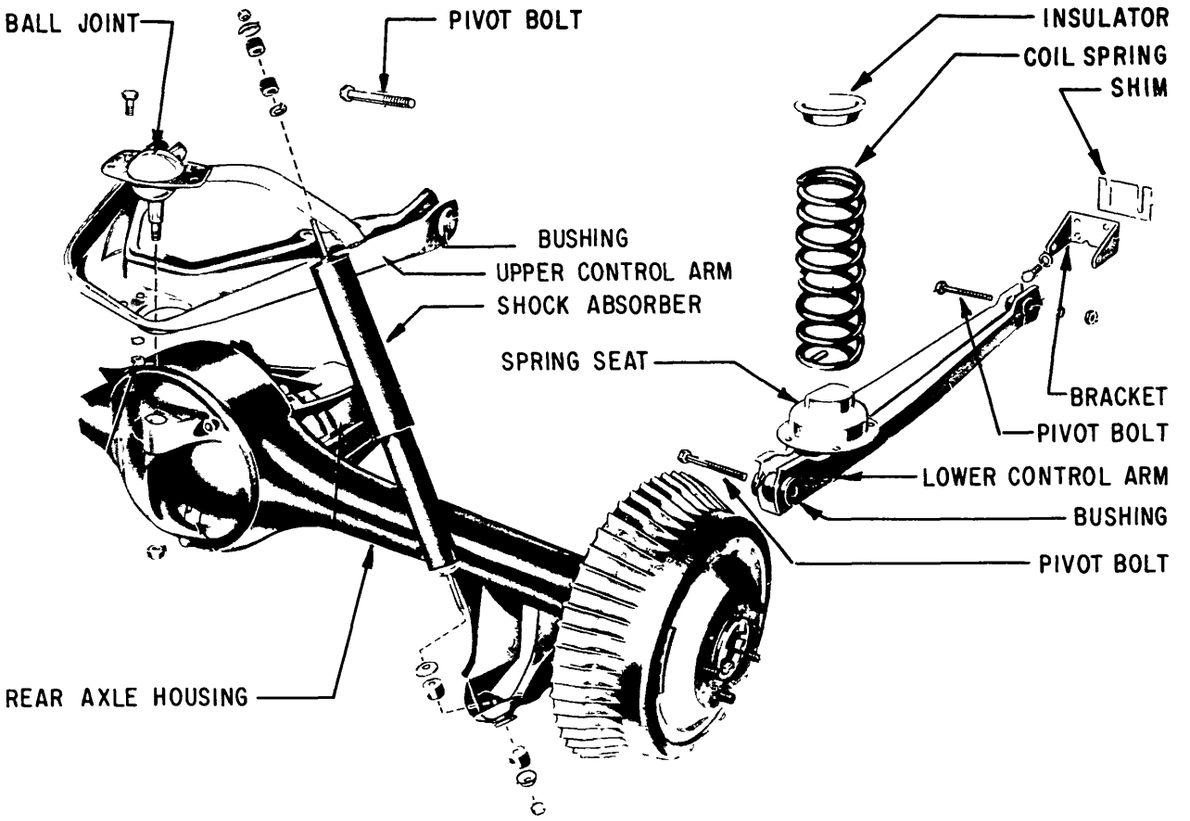
REAR SPRING: Removal - Raise and support rear of car under frame side rails, then remove wheel on side spring is being removed. Disconnect parking brake line clamp from control link, then place a jack under control arm at rear of front pivot to relieve tension on pivot bolt. *CAUTION - Insert a drift punch through hole in bottom of control arm to prevent jack from slipping.* Remove control arm pivot bolt at front and slowly lower control arm, then remove coil spring.

Installation: Tape upper rubber insulator to top of spring and place spring in upper seat of frame tower. Seat bottom of spring on control arm spring seat, then with jack placed under control arm, raise front end of arm into position. *NOTE - Place a jack under front end of differential housing to assist in aligning bolt holes.* Install front pivot bolt but do not tighten nut. Install brake line bracket on control arm, then lower car to floor. With car weight on wheels and car at normal standing height, tighten control arm pivot bolts to 85-95 ft. lbs.

REAR TRIM HEIGHT: With car trunk empty (except spare tire), and with a full tank of gas, normalize position of springs by working bumper up and down, then release bumper and allow car to assume its normal position. Measure distance from top of rear axle housing straight up to lower underside surface of frame. This distance should be as indicated in table below. *NOTE - Rear standing height should be equal within ½" on both sides of car.*

Rear Trim Dimensions

Series & Model	①Height
60 Special	5 13/16"
62 Exc. Convertible	6"
62 Convertible	5 7/8"
63 Sedan DeVille	6"
63 Coupe DeVille	5 7/8"
63 Eldorado Biarritz	5 7/8"
67 Seventy-Five Sedan & Limosine	6 13/16"
68 Commercial	②4"



① - Plus or minus 3/8". ② - Semi-elliptical spring.

UPPER CONTROL ARM BALL JOINT: Removal - Raise car and support under front and rear frame side rails, then place a jack under forward end of differential housing and raise slightly to relieve tension on drive line. Remove nut from ball joint and strike mounting base with a hammer in area of ball stud to break joint loose. Grind off rivet heads and punch out all four mounting rivets, being careful not to damage rivet holes, then remove ball joint.

Installation: Install ball joint on upper control arm and secure in place with four bolts, nuts, and lockwashers provided in service replacement kit. Tighten nuts to 35-40 ft. lbs. *NOTE - Bolts must be installed with heads up.* Adjust jack at front of differential housing until ball joint stud will go into mounting hole, then install nut and tighten to 50-65 ft. lbs.

UPPER CONTROL ARM: Removal - Raise car and support under front and rear frame side rails, then place a jack under forward end of differential housing and raise slightly to relieve tension on drive line. Disconnect ball joint stud from control arm, then remove two pivot bolts securing front arms to frame crossmember. *NOTE - Bushings in control arms can be removed and replaced using an arbor press.*

Installation: Reverse removal procedure and tighten pivot bolt nuts to 110-130 ft. lbs. Tighten ball joint stud nut to 50-65 ft. lbs.

CADILLAC REAR SUSPENSION

LOWER CONTROL ARM: Removal - Remove coil spring (see above), then disconnect rear end of control arm from mounting bracket on axle housing. *NOTE - Bushings in control arm can be removed and replaced using an arbor press.*

Installation: Reverse removal procedure and tighten front and rear control arm bolts to 85-95 ft. lbs. after car is lowered to floor and is at normal riding height.

CHEVROLET PASS. CAR FRONT SUSPENSION

Chevrolet Pass. Cars (1961)

DESCRIPTION: Ball joint type with coil springs and direct acting shock absorbers mounted between spring seats on lower control arms and spring pockets in front crossmember.

ADJUSTMENT: Before adjusting front end alignment, check the following: Loose or improperly adjusted steering gear, play or excessive wear in ball joints, loose tie rods or steering connections, improper front spring height (see "Riding Height" below), tire pressure, wheel bearings, and shock absorbers. Make adjustments at curb weight.

Steering Axis Inclination: 7°11'. Not adjustable.

Caster: 0°±½°. To adjust, add or remove shims at either front or rear upper control arm inner shaft attaching bolt as necessary.

Camber: Pos. ½°±½°. To adjust, add or remove shims at both front and rear upper control arm inner shaft attaching bolts as necessary.

Toe-In: 1/8-1/4".

Toe-Out on Turns: With inner wheel at 20°, outer wheel should be 17°54'. Not adjustable.

Riding Height: With car on a level floor, bounce car, then allow to settle to normal height. Measure distance from floor to center of front inner pivot of lower control arm, then record this measurement. Measure distance from floor to lower face of lower steering knuckle ball joint boss (on the same side of car) and record this

CONTINUED ON NEXT PAGE

CHEVROLET PASS. CAR FRONT SUSPENSION (C ntinu d)

measurement. The difference between the above two measurements should be as indicated in table below. If not within limits, replace spring. *NOTE - Spring nds are not flat and shims should not be used.*

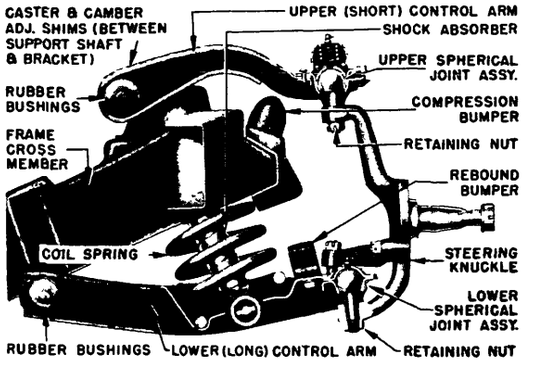
Riding Height

Model	Height
6 Cyl. 2 & 4-Dr. Sed. Ⓒ	3"±1/4"
V8 2 & 4-Dr. Sed. Ⓒ	3 5/16"±1/4"
6 Cyl. & V8 2 & 4-Dr. Sport Sed. Ⓒ	3 5/8"±1/4"
Convertible (All)	3 1/2"±1/4"
Station Wagon (All)	4 1/8"±1/4"

Ⓒ - If these models are equipped with 8.00 x 14 tires, add 19/64" to above measurements.

REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Hold upper stem of shock absorber from turning (¼" wrench), then remove retaining nut and lockwasher. Remove bolts retaining lower shock absorber pivot to lower control arm and pull shock absorber assembly and mounting out at bottom of spring housing.



Installation: Reverse removal procedure and tighten upper retaining nut to 15-25 ft. lbs.

COIL SPRING: Removal - Raise and support car at frame side rails so control arms swing free, then remove wheel, stabilizer bar (if so equipped), and shock absorber. Loosen lower ball joint-to-steering knuckle nut and the two lower control arm cross shaft bushing bolts. Place Tool J-6874-1 across top of sixth coil, then loosely secure Tool J-6874-2 to upper shoe of tool, using attaching capscrews and washers. *NOTE - "V" notch in upper shoe of tool and raised notch in lower shoe should contact spring.* Insert Tool J-6874 up through center of spring and attach to upper and lower shoe assembly with bolt and nut. Position spacer under shock absorber mounting hole and against bottom of lower control arm. Install special bearing washer and Tool J-6874-5. Locate bearing against spacer and large washer against bearing, then insert screw, Tool J-6874-5 up through large washer bearing and spacer and thread into Tool J-6874 and tighten snugly. Center shoe assembly on spring and tighten screw until a very slight amount of compression is placed on spring, then firmly tighten down the two capscrews securing upper and lower shoes to lock these shoes to spring. Turn head of screw until spring is compressed just enough to clear spring tower, then remove lower ball joint-to-steering knuckle nut. *NOTE - If may be necessary to assist spring out of tower with a pry bar.* Disconnect lower ball joint from steering knuckle and lower control arm and spring. Immediately release compression on spring. *CAUTION - Be very careful when lowering control arm to prevent injury or damage by spring.*

Installation: *NOTE - If a new spring is being installed, remove spring compressing tool assembly from old spring and install on new spring in same manner. Place spring in its seat on lower control arm and install remaining parts of tool and compress spring.* With spring compressed sufficiently to clear spring tower, immediately install lower ball joint into steering knuckle and secure in place with nut. Release compression on spring and at the same time use a drift to guide spring into its proper seat. Tighten lower ball joint-to-steering knuckle nut to a minimum 50 ft. lbs. and install cotter pin. Install shock absorber, stabilizer bar and wheel and drum assembly, then remove car from support. Tighten two lower control arm cross shaft bushing bolts to 45-55 ft. lbs.

LOWER CONTROL ARM: Removal - Remove coil spring (see above), then remove control arm cross shaft-to-frame attaching bolts and remove control arm.

Disassembly: If necessary to remove ball joint (see "Ball Joint" below). Remove bolt, lockwasher and collar from each end of cross shaft, then thread a 7/16" - 20 capscrew (furnished with Tool J-5888) to bottom of threads in one end of cross shaft. Support control arm in an arbor press on Tool J-5888-3, making sure that bushing flange does not contact support, then press on capscrew until bushing is free of control arm. Remove bushing from opposite end of cross shaft in same manner.

CHEVROLET FRONT SUSPENSION

Reassembly: With cross shaft in position in control arm and control arm supported on Tool J-7052-1 & J-5888-3, start bushing into control arm and over end of cross shaft. *NOTE - End of cross shaft with two bolt holes must be toward front of control arm.* Install Tool J-7052-5 over bushing, being sure that three piece spacer is not overlapping bushing holes in control arm. Press bushing into control arm until flange contacts control arm. Install bushing in opposite arm in same manner. After complete installation, cross shaft should be free enough to be rotated by hand. Install collar, lockwasher, and capscrew in each end of cross shaft but DO NOT TIGHTEN.

Installation: With control arm in position, attach with three lockwashers and special washers under rear bolt; front bolts and anchor nuts. After coil spring is installed, and car is on floor with weight on wheels, tighten cross shaft bushing bolts to 45-55 ft. lbs.

UPPER CONTROL ARM: Removal - Raise and support car at outer end of lower control arm, then remove wheel. Remove ball joint stud from steering knuckle with Tool J-6627 (Pitman Arm Puller). Disconnect upper control arm inner shaft from crossmember, noting number and thickness of shims at each bolt location. *NOTE - Bolts attaching control arm to fram memb r must be cut off or removed to allow proper cl aranc for control removal.* Remove upper control arm from car.

Disassembly: If necessary to remove ball joint (see "Ball Joint" below). Remove capscrews, lockwashers, and collars from both ends of cross shaft, then install 3/8" - 24 capscrew (furnished with Tool J-5888) in one end of cross shaft. Support control arm in an arbor press on Tool J-5888-3, making sure that bushing flange does not contact support, then press out bushing. Remove bushing from opposite side of arm in same manner.

Reassembly: Install arm in arbor press with Tool J-7052-2 in place and press in one bushing while supported on Tool J-5888-3. Install cross shaft in arm, then invert in press and press in second bushing, using the same tools. *Cross shaft should be able to be turned by hand.* Install collar, lockwasher and capscrew in ends of shaft, but DO NOT TIGHTEN.

Installation: Install upper control arm in car and make sure attaching studs are in position. Install two nuts and bolts retaining upper control arm shaft to crossmember, then install same thickness of shims as removed at each bolt location. Install new rubber seal on ball joint stud, then install ball stud through knuckle and tighten securely. Install wheel and lower car to floor. Bounce front end of car to centralize bushings, then tighten bushing collar bolts to 35-40 ft. lbs.

BALL JOINT (UPPER & LOWER): Testing - *NOTE - If excessive wear is indicat d in upp r ball joints, both upper and lower ball joints sh uld b replaced.* To check upper ball joint, raise and support car under outer end of lower control arm. then remove wheel assembly. Remove ball joint stud from steering knuckle with Tool J-6627 (pitman arm puller). Install a stud nut on ball stud and measure torque required to turn the ball joint assembly with a torque wrench. This torque should be 2 ft. lbs. minimum or 15 lbs. maximum.

Removal: With car supported as above and joint disconnected from steering knuckle (support knuckle assembly to avoid damage to brake hose), center punch rivets, then drill them out, being careful not to enlarge holes in control arm.

Installation: On upper control arms, ream rivet holes out to 21/64" diameter. *NOTE - Upp r and low r ball joint replacement parts are in thre pi c s. M tal inn r seal is to be carefully pressed in plac on joint h using, and the rubber outer seal sh uld th n b placed ver inner seal.* Install new joint against underside (lower arm), top side (upper arm) and retain in place with special bolts and nuts supplied with new joints. Tighten to 20-25 ft. lbs. *NOTE - Tight n nut on ball j int forging to 35-45 ft. lbs.*

CHEVROLET PASS. CAR REAR SUSPENSION

Chevrolet Pass. Cars (Exc. Corvette) (1961)

DESCRIPTION: Rear suspension is similar in design to previous models except that lower control arm bushings are a new design and the upper control arm is now connected to rear axle housing at right hand side on top of axle tubes and to bracket on frame right side rail. A tie rod is attached to frame left side rail and to right hand side of rear axle housing.

REMOVAL & INSTALLATION: *See 1958 Annual Data, Page 343, or later Manual edition and note the following:*

Upper Control Arm & Bushings: Removal - Raise car on a hoist that will support rear axle housing or wheels, then remove rear pivot bushing bolt at rear axle housing. *NOTE - Rear axle must be supported in such a way as to prevent axle housing from rotating about the lower control arm rear pivot, and to also relieve load on pivot bushings.* Remove bolts, lockwashers, and nuts securing upper control arm bracket to frame bracket or crossmember. *CAUTION - NOTE number of shims removed at this control driveline angles.* Remove arm from car. Remove bolt, nut and washer attaching upper control arm to bracket and separate control arm from bracket. With control arm bushing centered over Tool J-7574-4 and Tool J-7574-3 in place and with arm resting horizontally by supporting at opposite end, press or tap bushing from arm using Tool J-7574-1 and Tool J-7079-2 (Driver Handle). Repeat procedure for opposite end of control arm.

Installation - Turn arm to opposite side (bushing can only be installed from one direction), center bushing hole over support Tool J-7574-4 and install Tool J-7574-3 between flanges at hole location. *NOTE - Tool J-7574-3 will prevent overcompression of arm during overtravel.* Fix Tool J-7574-2 on driver handle, then start bushing into hole and press or tap in place. Check to see that no interference or cocking takes place. Flange of bushing must be seated against arm. Repeat procedure for opposite end of arm. Tap front of upper control arm into control arm bracket, then install bolt, lockwasher and nut but do not tighten. Set control arm (with front bracket installed) on axle housing bracket and tap into place. Install bolt (head of bolt must be toward outboard side), lockwasher and locknut but do not tighten. Align forward end of upper control arm bracket with frame bracket or crossmember, then install two lower bolts through control arm bracket and frame bracket or crossmember. *CAUTION - Make sure shims removed at disassembly are reinstalled in original locations.* Install both nuts and lockwashers. Install upper bolt and flat washer from front of bracket, then install lockwasher and nut. Tighten the three bracket bolt nuts to 60-80 ft. lbs. *NOTE - If a new control arm was installed, check driveline angles (see Chevrolet Special Data).* Lower car to floor, then bounce rear of car several times to settle bushings. Tighten upper control arm nuts to 80-90 ft. lbs.

Lower Control Arm Bushing Replacement: Removal (Front Bushing) - With control arm and bushing centered over Tool J-7574-4 and with Tool J-7574-3 in place, and with arm resting horizontally by supporting at opposite end, press or tap bushing from arm using Tool J-7574-5 and driver handle. *NOTE - Be sure to place the remover on end of bushing with the flange.* **(Rear Bushing)** - Repeat above operations for opposite end using Tool J-7574-1 in place of Tool J-7574-5.

Installation (Front Bushing) - Fix Tool J-7574-6 onto driver handle, then start bushing into hole and press or tap in place. Check to see that there is no interference or cocking. Flange of bushing must seat against arm. **(Rear Bushing)** - Repeat above operation for rear bushing using Tool J-7574-2 in place of Tool J-7574-6.

Rear Suspension Tie Rod: Removal - Remove nut, washer and bolt from left hand side and nut and washer from stud on right side that secures tie rod to brackets. Remove tie rod.

Bushing Replacement - With tie rod centered over Tool J-7877-2 and with tie rod supported horizontally, press or drive bushing from rod, using Tool J-7877-1 and J-7079-2. With tie rod centered over Tool J-7877-2 and rod supported horizontally, press or drive bushing into arm using Tools J-7877-3 and J-7079-2. *NOTE - Tool J-7877-2 should bottom on rod when bushing is fully seated.*

Installation - Mount tie rod to right hand stud, then install nut and special washer but do not tighten. Install bolt, lockwasher and nut to left hand bracket but do not tighten. Lower car to floor and bounce rear end several times, then tighten nuts to 55-70 ft. lbs.

Rear Standing Height Measurement ℄

Model	6 Cyl.	8 Cyl.
2 & 4 Dr. Sed. (Exc. Spt. Sed.) ..	5 43/64"	5 59/64"
2 & 4 Dr. Spt. Sed.	5 43/64"	5 43/64"
Convertible	5 9/16"	5 9/16"
Station Wagon	6 11/64"	6 11/64"

℄ - Measurements are plus or minus ¼".

Corvair, All Models (1961)

DESCRIPTION: Ball joint type suspension with ball and socket joint connecting upper and lower control arms to steering knuckles. Coil springs are mounted between lower control arm and tower in front crossmember. Shock absorbers are mounted within coil springs on lower control arm and connected at top to tower in front crossmember. On 500, 700, and 900 Series, a strut rod is connected between outer ends of lower control arms and brackets that trail back from front crossmember. On these models, caster adjustment is made with this strut rod. On 1200 Series (including Greenbriar), the lower control arm is of different design, having front and rear legs, similar to upper control arm. A strut rod is not used on these models and caster adjustment is obtained by shimming at upper control arm.

TIRE INFLATION: Maintain tire pressure as indicated in following table.

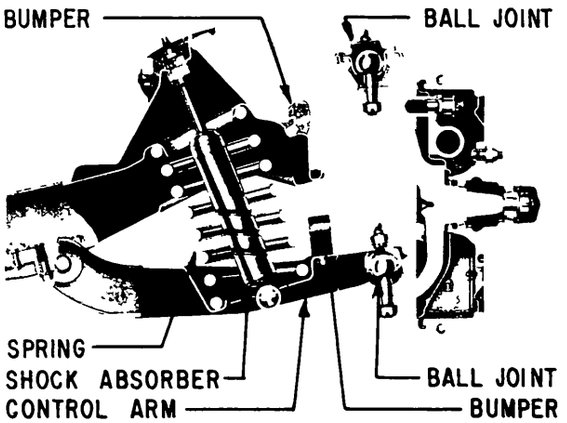
Tire Pressure

Model	Hot	Cold
500, 700, 900 Series (Front)	18 lbs.	15 lbs.
500, 700, 900 Series (Rear)	30 lbs.	26 lbs.
1200 Series, 4-Ply (Front)	28 lbs.	24 lbs.
1200 Series, 4-Ply (Rear)	28 lbs.	24 lbs.
1200 Series, 6-Ply (Front)	32 lbs.	28 lbs.
1200 Series, 6-Ply (Rear)	32 lbs.	28 lbs.

ADJUSTMENT: Adjust front wheel alignment using following sequence:

CORVAIR FRONT SUSPENSION

Camber: Pos. ½° ±½° (Series 500, 700, 900); Pos. ¾° ± ¼° (Series 1200). Camber must be equal on both sides of car within ¼° (Series 500, 700, 900); ½° (Series 1200). To adjust, loosen upper support shaft-to-crossmember bolts and add or remove shims as necessary. *NOTE - Shims must be added or removed equally at both front and rear bolts.*



Caster: Pos. 1½° - 2° (Series 500, 700, 900); Pos. 2½° ±¼° (Series 1200). Caster must be equal on both sides of car within ¼° (Series 500, 700, 900); ½° (Series 1200).

Series 500, 700, 900 - Adjust caster by turning nuts at rear of strut rod. Lengthening this rod by turning nuts increases caster. Shortening rod by turning nuts, decreases caster. *NOTE - Because of manufacturing tolerances, it is possible to run out of threads on strut rod or cause front spring to be cocked in its seat and rub spring tower. Only when this happens is it permissible to shim unevenly at upper control arm. If shims are changed, check camber.*

Series 1200 - To adjust, loosen upper support shaft-to-crossmember bolts and add or remove shims at either front or rear bolt to obtain correct caster adjustment.

Toe-In: 1/4" to 3/8" (Series 500, 700, 900); 1/16" to 3/16" (Series 1200). Loosen clamp bolts at each end of each tie rod and turn each tie rod as necessary to obtain proper toe-in with steering gear on "high point" for straight ahead travel.

►*TOE-IN NOTE (REAR WHEELS): A rear wheel toe-in adjustment is necessary on all models. See "Corvair Rear Suspension".*

CORVAIR SERIES 1200 FRONT SUSPENSION ASSEMBLY

Toe-Out on Turns: Series 500, 700, 900 - With inner wheel at 20°, outer wheel should be 18°. Not adjustable.

Series 1200 - With outer wheel at 20°, inner wheel should be 23°. Not adjustable.

Steering Axis Inclination: 7° ±½° (Series 500, 700, 900); 7¼° ±½° (Series 1200). Not adjustable.

Riding Height: With car at curb weight (full tank of gas and spare tire), position car on a level floor, then

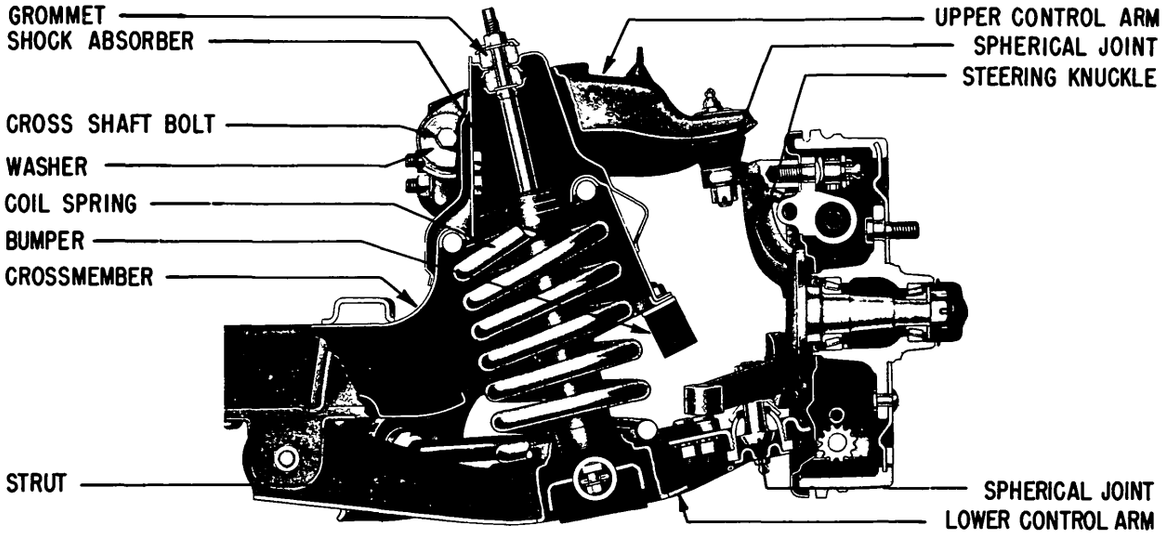
CONTINUED ON NEXT PAGE

CORVAIR FRONT SUSPENSION (Continued)

bounce and rock car several times and allow to settle. **Series 500, 700, 900** - Measure distance from floor to bottom of rocker panel 27" back from centerline of front wheel. This measurement should be 9 3/8"+1/2". Measure opposite side of car in same manner. Difference between the two measurements must not exceed ½". To correct riding height, replace springs. *CAUTION - These springs do not have flat ends and shims must not be used.*

Series 1200 - Measure distance from center of lower control arm pivot bolt to floor. This distance should be 11 7/8". Measure opposite side in same manner. Difference between the two measurements must not exceed ½". To correct riding height, replace springs. *CAUTION - These springs do not have flat ends and shims must not be used.*

REMOVAL & INSTALLATION



See 1960 Annual Data, Page 376, or later Manual edition and note the following:

COIL SPRING (SERIES 1200): Removal - Pry out upper rebound bumper, then raise car and support on jack stands so front control arm hangs free. *NOTE - Position stands so control arms may be raised or lowered with a floor jack.* Remove shock absorber, then position a piece of 2" x 4" lumber, 16¼" long between top of upper control arm and behind reinforcing channel above wheel. Make sure upper corner of this wood support is placed behind reinforcing channel toward inside of car. Place a floor jack under lower control arm and raise until wood support is forced firmly against channel. Disconnect lower control arm ball joint stud from steering knuckle, then raise lower control arm and free stud from knuckle boss. Swing wheel out far enough to clear lower arm, and block or wire in this position. Carefully lower jack supporting control arm until spring is decompressed and remove spring.

Installation: Seat spring in tower with end of spring coil in contact with step in spring seat, then swing lower control arm up as far as possible and seat spring in control arm. Place floor jack under lower control arm and raise until ball joint stud may be placed into steering knuckle boss (make sure dust cap is in position on ball stud). When stud will enter hole in knuckle, lower jack and install stud nut. Tighten to 60-94 ft. lbs. and continue to tighten until cotter pin holes are lined up and install cotter pin. Raise lower control arm and install upper rebound bumper in proper hole, then to seat it in position, slowly lower the control arm until upper arm presses point of bumper through hole in spring tower.

LOWER CONTROL ARM (1200 SERIES): Removal - Remove coil spring (see above), then disconnect lower control arm inner shaft from crossmember.

Disassembly: Remove bolt, lockwasher and collar from each end of cross shaft, then thread a 7/16" - 20 capscrew (furnished with Tool J-5888) to bottom of threads in one end of cross shaft. Support control arm in an arbor press on Tool J-5888-3, being careful not to allow bushing flange to contact support, then press

CORVAIR SERIES 500, 700, 900 FRONT SUSPENSION ASSEMBLY

on capscrew until bushing is free of control arm. Repeat this operation to remove bushing from opposite end of shaft.

Reassembly: Install cross shaft in control arm and position Tool J-7052-1, then support control arm with Tool J-5888-3 and hand start bushing into control arm and over end of cross shaft. *NOTE - End of cross shaft with two bolt holes must be toward front of control arm.* Install Tool J-7052-5 so three piece spacer does not overlap bushing holes in control arm, then press bushing into control arm until flange concontacts arm. Repeat procedure for bushing at opposite end of cross shaft. Install collar, lockwasher and capscrew in each end of shaft but DO NOT TIGHTEN.

Installation: Install control arm on crossmember and attach with lockwashers, bolts and anchor nuts. Install coil spring, then with car weight on wheels, tighten cross shaft bushing bolts to 45-55 ft. lbs.

UPPER CONTROL ARM (1200 SERIES): Removal - Raise and support car under outer end of lower control arm, then remove wheel assembly. Disconnect and remove ball joint stud from steering knuckle with Tool J-6627 (pitman arm puller), then wire hub, drum and steering knuckle in position to prevent damage to brake hose. Remove nuts retaining upper control arm to crossmember, noting number and thickness of shims found at each bolt, and remove control arm.

Disassembly: Remove capscrews, lockwashers and collars from both ends of cross shaft, then install a 3/8" - 24 capscrew (furnished with Tool J-5888) in one end of shaft. Support control arm in an arbor press on Tool J-5888-3, being sure that flange of bushing does not contact support, then press bushing out of arm, repeat this procedure for opposite bushing.

Reassembly: Install control arm in press with Tool J-7052-2 in place between legs of control arm and press in bushing. Install cross shaft in arms and invert assembly in press, and press in second bushing. *NOTE - Cross shaft should be free enough to turn by hand.* Install collar, lockwasher and capscrew in each end of cross shaft, but DO NOT TIGHTEN.

Installation: Reverse removal procedure and lower car to floor. Bounce front end to centralize bushings, then with weight of car of wheels, tighten bushing capscrews to 35-40 ft. lbs.

BALL JOINTS (UPPER & LOWER): Removal - With coil spring removed and control arms hanging free, remove lube fitting from joint, then mark center of rivet heads with a center punch and drill through head with a ¼" drill. Cut off heads with a chisel and remove balance of rivets with a punch. Remove ball joint.

Installation: On upper control arms, ream rivet holes out to 21/64". Position new ball joint assembly on control arm and install special bolts through mounting holes and tighten nuts securely. *CAUTION - Use only the bolts (specially hardened) furnished with ball joint assembly.* Complete installation by reversing removal procedure.

FRONT SUSPENSION CROSSMEMBER: Removal - Remove steering relay rod from car, then remove bolts retaining idler arm to frame. Disconnect brake main cylinder line and rear brake feed line from junction block at top center of cross member. Use a suitable jack under crossmember and remove the four bolts holding crossmember to underbody, then remove crossmember.

Installation: Reverse removal procedure and note the following: Tighten crossmember mounting bolts to 100-110 ft. lbs. and idler arm-to-frame nuts to 13-22 ft. lbs.

CHEVROLET TRUCK FRONT SUSPENSION

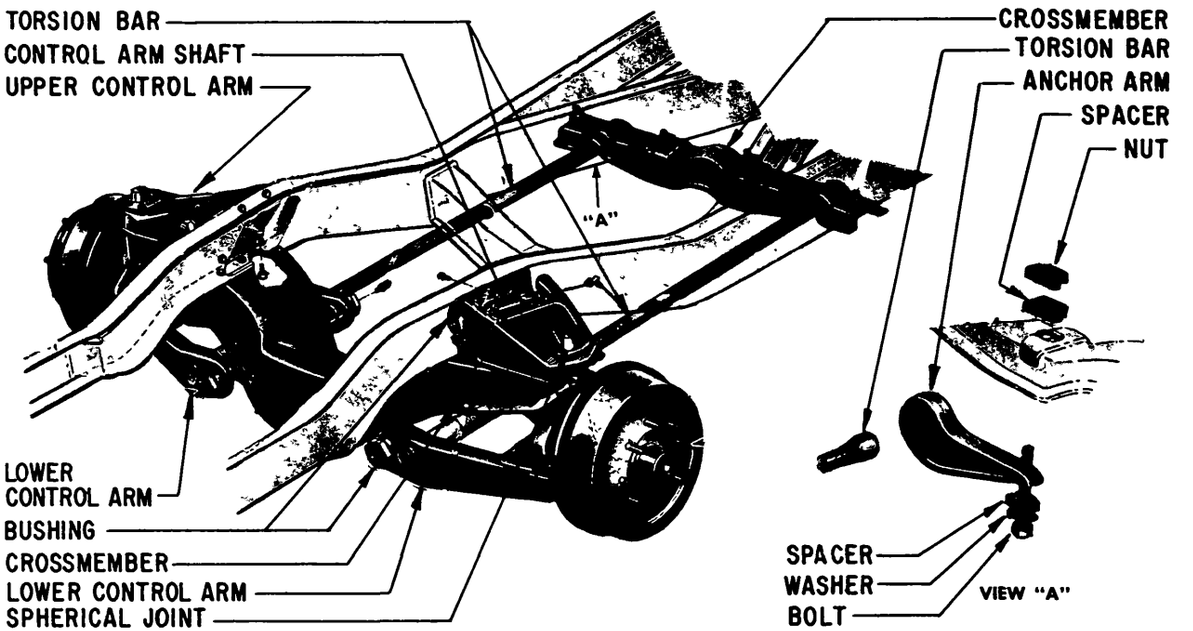
Chevrolet Trucks (Exc. Fwd. Cont. & 4-Whl. Dr.) (1961)

►*NOTE: See "Truck "I" Beam Suspension" for Fwd. Cont. & 4-Whl. Dr.*

DESCRIPTION: Same design as used on corresponding previous models.

ADJUSTMENT: *NOTE - Truck curb height must be checked and corrected before making camber and caster adjustment.*

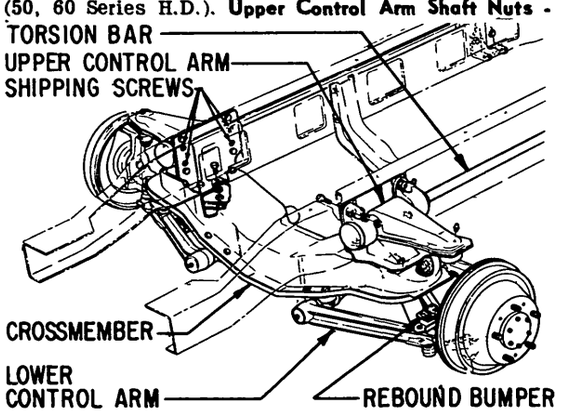
Truck Curb Height: 10, 20, 30, 40 Series - 4½" measured from bottom edge of crossmember to top outer flange of lower bumper bracket at centerline of spindle. Adjust torsion bar rear anchor to obtain correct height.



50, 60 Series - 5 1/16" measured from bottom edge of crossmember to top outer flange of lower bumper bracket at centerline of spindle. No adjustment provided. If dimension not correct, replace torsion bars.

Caster (10, 20, 30, 40 Series): Pos. 1°±½°. *NOTE - Change shims between upper control arm spacer and bracket at either front or rear bolt.* One .0299" shim added to rear bolt changes caster a **minus** 24' and camber a **minus** 1'. One .0299" shim removed from rear bolt changes caster a **plus** 24' and camber a **minus** 2'. *NOTE - .0598" and .1196" shims are available to reduce the number of shims.* The shim pack at each bolt location should not exceed 5/8" (twenty-one .0229" shims). The total difference in shims between front and rear bolts should not exceed .33" (eleven .0299" shims).

Caster (50, 60 Series): Neg. 1° to 0° (Left Hand Side); 0° to Pos. 1° (Right Hand Side). Preferred setting is Neg. ½° (Left Hand Side); Pos. ½° (Right Hand Side). *NOTE - If there is insufficient adjustment to obtain Neg. ½ caster on left hand side, set left side as close as possible to this desired negative angle. Caster on right side should then be set 1° greater than caster at left side, without exceeding right caster limits. In any event, right wheel caster should be at least ½° more positive than left wheel caster.* Caster adjustments are made by changing locations of lower control arm shafts with reference to notched plates welded to crossmember. Check caster to determine amount of change required to obtain proper caster, then mark location of control arm shaft with reference to notched attaching plate. Loosen four shaft-to-crossmember bolts to free shaft from notches in attaching plates, then move shaft rearward to decrease caster or forward to increase caster. *NOTE - Moving shaft a distance of one notch changes caster approximately ½°. Tighten bolts and recheck adjustment.*



Camber (10, 20, 30, 40 Series): Pos. ½°±½°. *NOTE - Changing shims between upper control arm spacer and bracket at both front and rear bolts equally.* One .0299" shim added or removed from both bolts changes camber 10'38". Removing shims decreases camber. Adding shims increases camber. *See "Caster" above for available shim thickness and total thickness of shim packs.*

Camber (50, 60 Series): 0° ± 1/3°. *NOTE - Changing shims between upper control bracket and support at both front and rear bolts equally.* One .0299" shim added or removed changes camber approximately ½°. Adding shims increases camber. Removing shims decreases camber. *CAUTION - Make sure that the Phillips type screws (installed during manufacture) located in upper control arm brackets have been removed and discarded. These screws are needed during plant assembly only.* Remove two upper nuts and bolts attaching control arm bracket to frame and loosen two lower nuts. Lift truck at front crossmember until control arm bracket can be pried away from support. Insert or remove shims as required.

CHEVROLET TRUCK FRONT SUSPENSION (10, 20, 30, 40 SERIES)

►*UPPER & LOWER CONTROL ARM SHAFT & BRACKET NUT TIGHTENING SPECIFICATION CAUTION:* These nuts must be tightened to the following specifications: **Lower Control Arm Shaft Nuts** - 90-115 ft. lbs. (10, 20 Series); 100-135 ft. lbs. (30, 40 Series); 180-240 ft. lbs. (50, 60 Series Exc. H.D.); 315-420 ft. lbs. (50, 60 Series H.D.). **Upper Control Arm Shaft Nuts** - 60-75 ft. lbs. (10 Series); 85-110 ft. lbs. (20 Series); 120-155 ft. lbs. (30, 40 Series). **Upper Control Arm Bracket Nuts** - 125-165 ft. lbs. (50, 60 Series).

CHEVROLET TRUCK FRONT SUSPENSION (50, 60 SERIES)

Toe-In (10, 20, 30, 40 Series): 3/16-1/4" (both wheels). Loosen clamp bolts at ends of each tie rod and turn tie rod until proper toe-in is secured and steering gear is on "high point" for straight ahead travel.

Toe-In (50, 60 Series): *NOTE - Toe-In (Toe-Out) varies in relation to trim height of vehicle. See table below for correct toe-out specification at indicated trim height.*

Toe-In Specifications

Trim Height ①	②Toe-Out
6½-7½"	1/4"
5½-6½"	3/16"
3-5½"	1/16"
3" or Less	Overloaded

① - See "Truck Curb Height" above for measurement procedure.

② - Plus or minus 1/16". The above specifications are for both wheels, total.

Steering Axis Inclination: 8½°±½° (Series 10, 20, 30, 40); 7°±½° (Series 50, 60).

Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 21¾° (Series 10, 20, 30, 40); 23° (Series 50, 60).

REMOVAL & INSTALLATION: *See 1960 Annual Data, Page 369, or later Manual edition and note the following:*

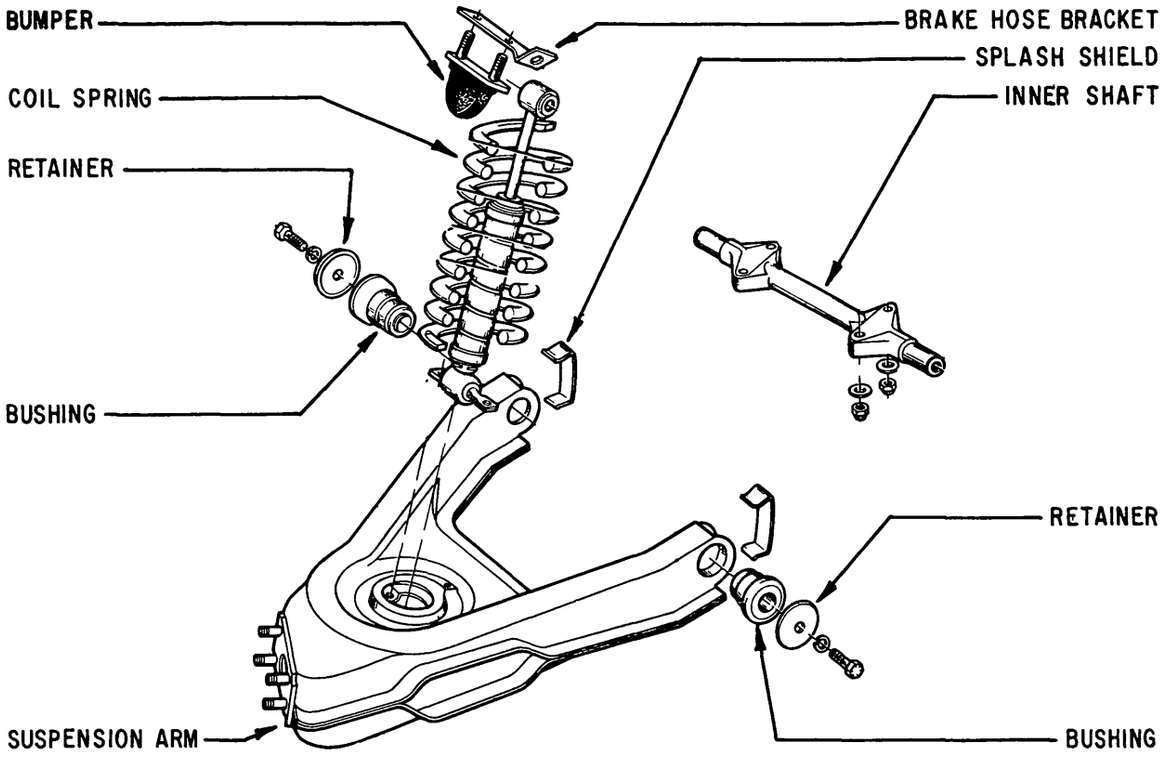
Torsion Bar Anchor Bolt: A new lower spacer having a locating lug is used in production. *CAUTION - This spacer must be installed so lug is positioned inboard or convex surface on spacer will not seat in mating curvature of torsion bar control arm.*

CORVAIR & PONTIAC TEMPEST REAR SUSPENSION

Corvair, All Models (1961)
Pontiac Tempest (1961)

►*1961 PONTIAC TEMPEST REAR SPRING NOISE CORRECTION (EARLY CARS):* This condition may be caused by brake hose support contacting spring coils. To correct, remove bracket and grind away sufficient material to provide spring clearance. Later cars have the bracket changed in production.

DESCRIPTION: Independently sprung with individual single control arm on each side of car. Coil type rear springs are mounted between control arm and frame crossmember. Shock absorbers are mounted within coil springs.



ADJUSTMENT: Toe-In - 0-1/8" (Corvair Series 500, 700 900 & Pontiac Tempest); ¼-½" (Corvair Series 1200). *NOTE - If drive-on type equipment is used, reverse car and back into position. Toe-In (overall) will be read as toe-out (readings taken from rear of tires rather than front).* To adjust, add or remove shims equally at each side of front edge of transmission case, with engine rear support loosened (All Corvair models); at front edge of differential (Pontiac Tempest). *CAUTION - Shims must be added or removed equally from each side.* DO NOT attempt to adjust one wheel at a time. A shim added to each side will decrease toe-in. Removal of shim from each side will increase toe-in. *NOTE - Because of manufacturing tolerance and parts "stack-up" it is possible to have toe-out on one wheel and toe-in on opposite wheel. In this case, adjust the wheel with toe-out as close as possible to specifications, but not letting opposite wheel go out of specification. If for example, one wheel toes-out by ¼", then opposite wheel must toe-in enough to give overall specified toe-in.*

Camber: 1½°±½° (Corvair Series 500, 700, 900); ¾°±½° (Corvair Series 1200). Not adjustable. If camber is not within limits, either the crossmember is out of alignment with body or it has become distorted due to collision.

Rear Riding Height: With car at curb weight (full tank of gas and spare tire), position car on a smooth level floor, then bounce rear end several times and allow to settle to its normal height.

Corvair Series 500, 700, 900 - Measure distance from floor to bottom of rocker panel 29" ahead of centerline of rear wheel. This measurement should be 9"±½". Measure opposite side of car in same manner. The difference between the two measurements must not exceed ½". To correct riding height, replace springs. *CAUTION - These springs do not have flat ends and shims must not be used.*

Corvair Series 1200 - Measure distance from center of rear suspension control arm pivot bolt to floor. This measurement should be 14 5/16"±1/2". Measure opposite side of car in same manner. The difference between the two measurements must not exceed ½". To correct riding height, replace springs. *CAUTION - These springs do not have flat ends and shims must not be used.*

CORVAIR & PONTIAC TEMPEST REAR SUSPENSION ASSEMBLY

Pontiac Tempest - 3 7/8", measured directly behind rear spring between control arm upper bumper bolt and top of upper control arm. To correct riding height, replace springs.

REMOVAL & INSTALLATION: *See 1960 Annual Data, Page 377, or later Manual edition and note the following:*

Rear Suspension Crossmember (Pontiac Tempest): Remove transmission and differential assembly (see "Pontiac Tempest Transaxle"), then remove both shock absorbers and coil springs (support control arms with a jack). Disconnect parking brake cables at rear equalizer, then remove fuel line and brake line from clip on top of crossmember. Disconnect brake lines at junction block and remove two bolts at each side connecting crossmember to body, then lower crossmember from car. *CAUTION - Be sure that crossmember is properly supported before lowering from car.*

Installation: Place crossmember in position and install four attaching bolts, tightening them to 60-80 ft. lbs. Complete installation by reversing removal procedure.

CORVETTE FRONT SUSPENSION

Chevrolet Corvette (1961)

DESCRIPTION: Independent linked parallelogram type with direct acting shock absorbers and coil spring. "Threaded Bushing" pivot points used on upper and lower control arms for connection to steering knuckle.

ADJUSTMENT & PARTS REPLACEMENT: *See "Suspension & Wheel Alignment" in Manual and note the following:*

Tire Inflation: 24 lbs. (Normal driving), 36 lbs. (Sustained high speed).

Kingpin Inclination: 4°±3/8°. Not adjustable.

Caster: 2°±½°. Loosen clamp bolt in upper end of knuckle support, remove lubricant fitting at outer end of upper control arm, then insert an Allen wrench through hole and turn pivot until correct caster setting is secured. *NOTE - Pivot pin must be turned in full turns only for caster setting, otherwise camber will be changed.*

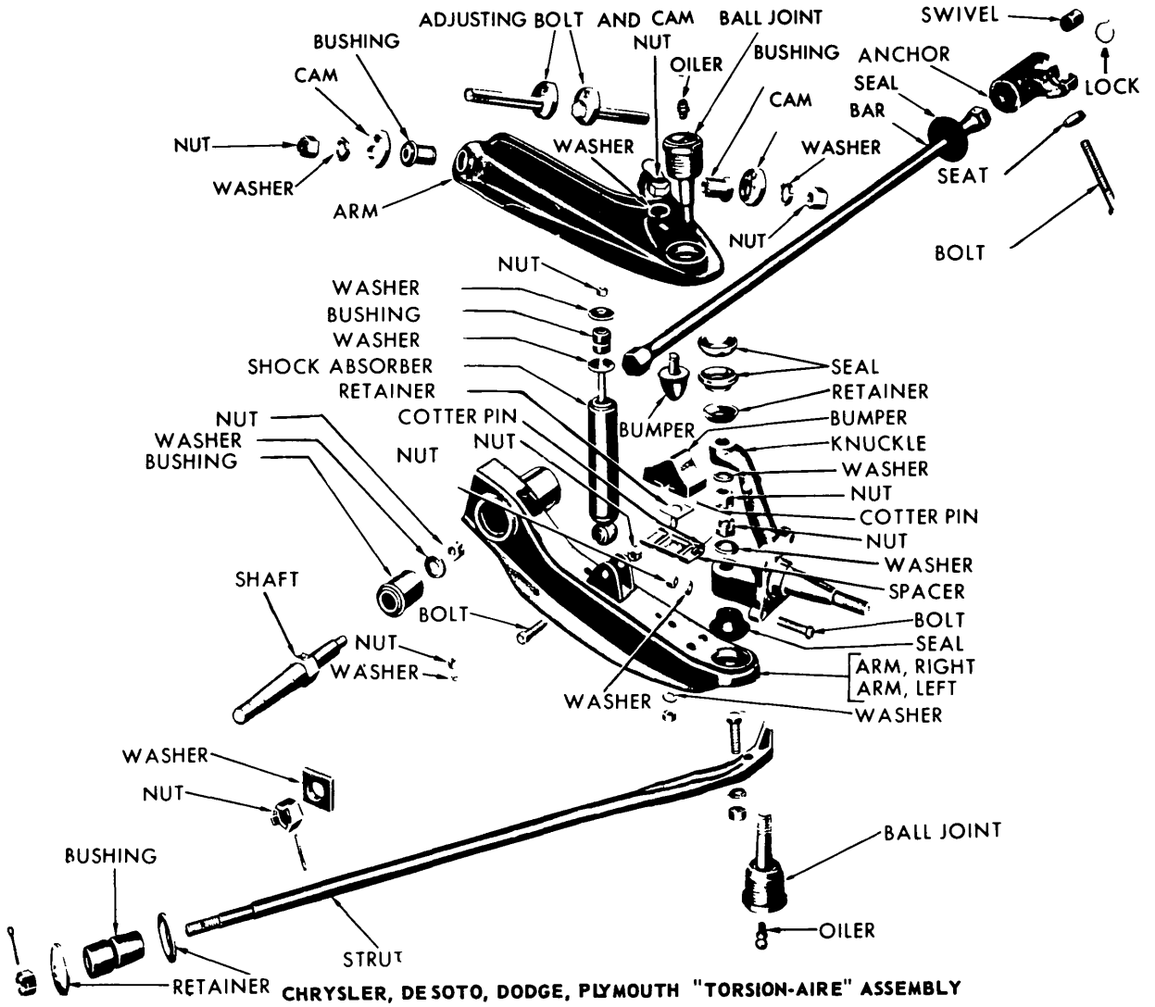
Camber: 0°±½°. After adjusting caster (above), rotate pivot bolt not more than ½ turn in either direction to secure correct camber. Entire range of adjustment is obtained in ½ turn of pivot bolt.

Toe-In: 1/8"-3/8". Loosen clamp bolts at left hand tie rod and turn rod (right hand tie rod is one-piece non-adjustable type), tighten clamp bolt to 8-12 ft. lbs.

Toe-Out on Turns: With inner wheel at 20°, outer wheel should be 17°. Not adjustable.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "TORSION-AIRE"

Chrysler, D S to, D dg , Plymouth (1961)



DESCRIPTION: Front suspension assembly design is similar to preceding models with eccentric type bolts at inner ends of upper control arm for adjusting camber and caster. Upper control arms attach to brackets welded to the frame by the use of special bolts having an integral cam at the head of the bolt. A matching removable cam is installed at threaded end of bolt. The brackets are provided with slotted holes and each bracket has cam retainers welded to its front and rear faces to engage cams on upper control arm attaching bolts. Rotating the head of cam bolts causes the upper control arm to move horizontally in slots provided in bracket. Turning one bolt will move the upper control arm ball joint fore or aft to affect caster (more than camber). Turning both bolts on one side an equal amount in same direction will move the upper ball joint in or out to affect camber.

ADJUSTMENT: Front suspension height must be correct before measuring caster and camber and the car must be kept at the same level when measurements are made. To properly position car for measurements, bounce car, front end first, then rear, several times by grasping center of bumpers. Release bumpers on the down stroke each time after same number of bounces.

Fr nt Susp nsi n H ight: Checking - Make sure car is on a level floor, tires inflated to recommended pressure, and car at curb weight (full gas tank, no passengers or load). Measure from lowest point of lower support arm ball joint to floor and from underside of lower control arm bushing (at center line of bushing housing). *NOTE - Under car weight, the bushing housing will always be higher than the ball joint housing.* The difference between these two figures should be as specified in table below. If the difference in measurements between the two sides of the car are less than 1/8" of each other and are within limits specified, suspension height is correct. If these measurements differ more than 1/8" or if one or both of them are outside specified limits, the torsion bars must be adjusted.

► *TORSION BAR ADJUSTMENT NOTE: Torsion bar adjusting bolt should only be loosened or tightened with a torque wrench, with car supported to relieve load on torsion bars. If more than 200 ft. lbs. is required to turn adjusting bolt, then bolt and swivel must be replaced.*

Adjustm nt - Tighten or loosen adjusting bolt at rear end of each torsion bar until measurement differences are as specified. *NOTE - Jounce car at front and rear after making adjustment prior to height check. Also when torsion bar spring adjustment is made, check alignment of front whe ls and headlight aiming.*

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "TORSION-AIRE" ASSEMBLY

Front Suspension Height Limits

Model	Height Difference
All Models (Exc. Sta. Wgn.	2"±1/8"
Stn. Wgn. & Cars with H.D. Springs	2 3/8"±1/8"

Caster: Neg. ½° ± ½° (Manual Steering); Pos. ¾° ± ½° (Power Steering). Adjust caster by turning **one** eccentric bolt at a time as necessary to obtain correct setting. *NOTE - Turning both eccentric bolts in opposite directions affects caster with a minimum amount of change in camber.*

Camber: Right Wheel - Pos. ¼°±¼° (¼° preferred). **Left Wheel** - Pos. ½°±¼° (½° preferred). Adjust camber by turning **both** eccentric bolts equally in same direction as necessary to obtain correct setting. *NOTE - Turning both eccentric bolts equally in same direction affects camber with a minimum amount of change in caster.*

Steering Axis Inclination: 5½° to 7½°. No adjustment provided.

Toe-In: 3/32-5/32" (1/8" preferred).

Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 21½° ± 1°.

REMOVAL & INSTALLATION: *See 1957 Annual Data , Page 341, or later Manual editions.*

COMET & FALCON FRONT SUSPENSION

Comet (1961)
Falcon (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 UPPER & LOWER CONTROL ARM BALL JOINT SEAL REPLACEMENT NOTE (EARLY CARS):* A new boot-type upper and lower ball joint seal, Part No. C1DD-3A105-A, is being used in later production and can be installed on all previous models. *NOTE - If replacement ball joints have been installed with hex-head bolts, these bolts must be removed and replaced with round-head bolts, Part No. C2DA-3A486-A.* Thoroughly clean ball joint studs, sockets and area surrounding the sockets before installing boots.

►*1960-61 UPPER & LOWER BALL JOINT SERVICE REPLACEMENT TIGHTENING SPECIFICATION CHANGE:* Upper and lower ball joint attaching bolts should be tightened to 12-15 ft. lbs. This supersedes previous specifications of 28-45 ft. lbs.

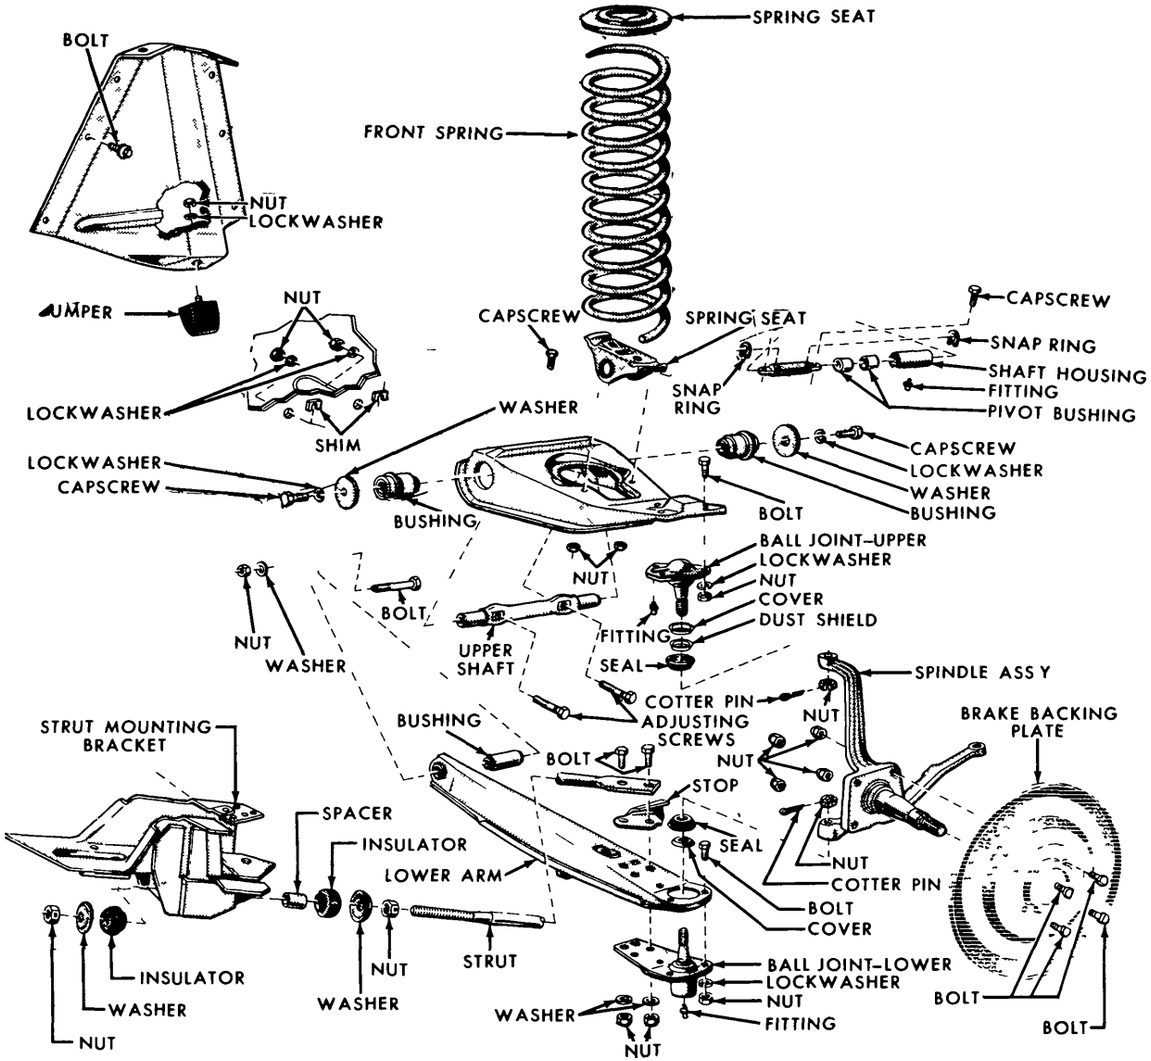
DESCRIPTION: "Ball-Joint" type suspension with front coil spring and shock absorber mounted between upper control arm and tower in wheel housing. Lower control arm is connected to underbody with a mounting bolt. A strut connected between outer end of lower strut and bracket at forward end of underbody prevents horizontal movement of lower control arm. Shims located between upper control arm inner shaft and mounting bracket control camber and caster adjustments.

CHECKING & ADJUSTING: Before adjusting front end alignment, inflate tires to specified pressure (see below). Raise front of car and check front suspension ball joints for looseness, wear, or damage. *CAUTION – Do not raise car with jack under lower suspension arms.* Check steering gear mountings and all linkage for looseness. Adjust front wheel bearings. Check tracking of front and rear wheels.

►*ADJUSTMENT NOTE: Previous adjustment specifications are superseded by the following:*

Tire Inflation: Falcon - (Sedan) 24 lbs. front & rear. (Station Wagon) 22 lbs. front, 30 lbs. rear. (Ranchero) 24 lbs. front, 30 lbs. rear.
Comet - 22 lbs. front, 26 lbs. rear.

Caster: 0° to Pos. 1°. Preferred setting is ½° (Comet), 0° (Falcon). *NOTE - Maximum variation from side to side should not exceed ½° (¼° preferred).*



Camber: 0° to Pos. 1° (½° preferred). *NOTE - Maximum variation from side to side should not exceed ½° (¼° preferred).*

Toe-In: 9/32"±1/32".

Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 20¾°.

Front Riding Height (Comet): Synchro-mesh Trans. - 4 3/16" (2-Dr. Sedan); 4¼" (4-Dr. Sedan & 2-Dr. Sta. Wgn.); 4 1/16" (4-Dr. Sta. Wgn.), all plus or minus 3/8". **Automatic Trans.** - 4 7/16" (2-Dr. Sedan); 4 3/8" (4-Dr. Sedan); 3 15/16" (2-Dr. Sta. Wgn.); 4 5/16" (4-Dr. Sta. Wgn.), all plus or minus 3/8".

►*FRONT RIDING HEIGHT MEASUREMENT NOTE (COMET):* With car at curb weight on a level surface, measure the distance between center of lower control arm-to-frame attaching bolt and surface of floor, then measure distance between lower surface of lower control arm ball joint and floor. The difference between these two measurements is the front riding height. See above.

COMET AND FALCON FRONT SUSPENSION ASSEMBLY

Shimming Procedure: Camber and caster adjustments are made by adding or removing shims between upper control arm inner shaft and mounting pad. To change caster, remove or add shims at one of the mounting bolts. The removal of shims at front bolt or installation of shims at rear bolt will cause ball joint on upper control arm to move forward. Reversing this procedure will cause joint to move to rear. A 1/32" change of shim thickness at either bolt will change caster angle ½°. *NOTE – The difference between shim thicknesses at the two bolts should not exceed 1/16" and the maximum thickness of shim stack at each bolt must not exceed 9/16".* To adjust camber, remove or install equal shim thicknesses at both bolts. Removal of shims at both bolts will move upper ball joint inward, and installation of shims will move upper ball joint outward. A 1/16" change in shim thickness at both bolts will change camber angle 1/3°.

Lower Control Arm Strut Adjustment: Adjust length of strut by turning front and rear nuts securing strut rod to bracket on frame member to a length of 17 5/8" measured from back face of rear insulator washer to center strut-to-lower control arm attaching bolt. The correct distance between insulator washers (measured from outer surfaces) should be 1.27"±1/32" when strut rod nuts are tightened to 40-55 ft. lbs.

►*LOWER CONTROL ARM STRUT INSULATOR REPLACEMENT CAUTION:* DO NOT interchange 1960 and 1961 parts. Use only Kit, Part No. C1DZ-3468-A for replacement on 1961 models.

REMOVAL & INSTALLATION: *See 1960 Annual Data, Page 374, Later Manual Edition.*

THUNDERBIRD FRONT SUSPENSION

Ford Thund rbird (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 UPPER CONTROL ARM BALL JOINT NOISE CORRECTION:* Drill out rivets securing ball joint assembly to upper control arm, then remove ball joint assembly from car. Replace ball joint bearing with Part No. C1SS-3394-E. Install ball joint, using a new "O" ring coated with head gasket sealer installed between ball joint flange and underside of upper control arm. Secure assembly in place with hardened, fine thread bolts and lockwashers. *NOTE - The above parts ar furnished in Kit, Part No. C1SZ-3349-A.*

►*1961 FRONT COIL SPRING "CLICKING" NOISE CORRECTION:* This noise may be caused by adjacent coils at top or bottom of spring contacting each other. To correct, rework a spring insulator, Part No. C1VV-5A321-B by cutting a V-slot out of raised portion where spring "pigtail" would normally fit. Thread insulator between first and second coils (at both upper and lower end of spring). Retain in place with plastic electricians tape.

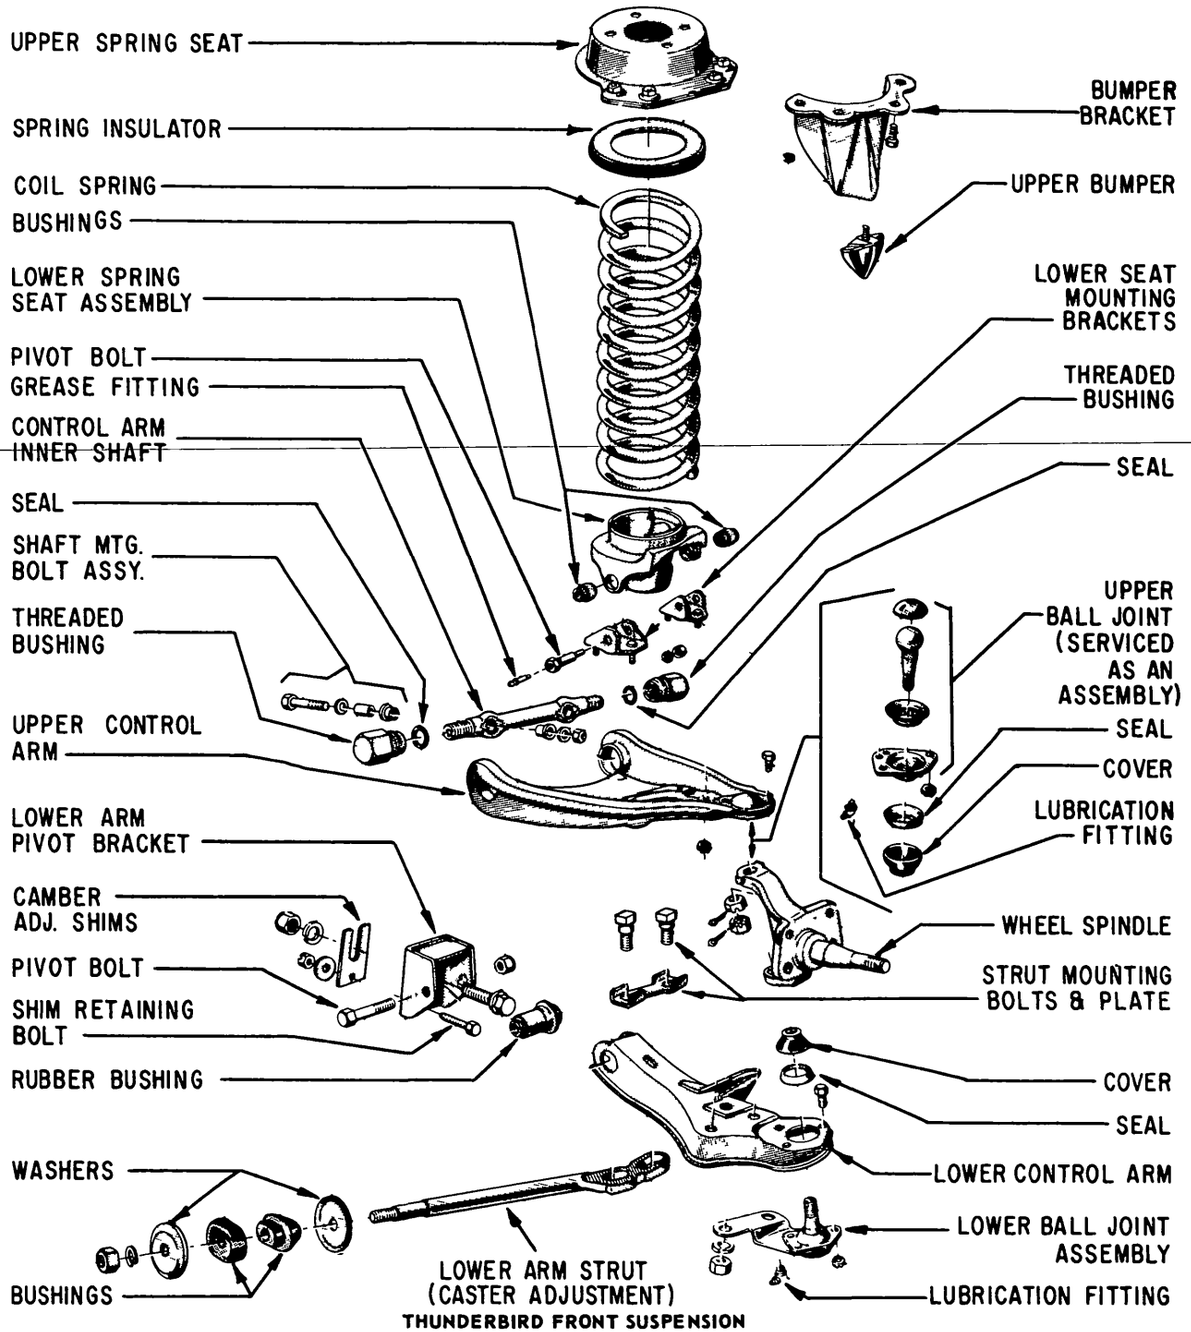
►*1961 FRONT SHOCK ABSORBER NOISE CORRECTION (EARLY CARS):* Install new upper bushings and washers from Kit, Part No. C1SZ-18198-B. Tighten stud nut to 15 ft. lbs.

►*1961 SPINDLE CONNECTING ROD SLEEVE INTERFERENCE CORRECTION:* Rotate adjusting sleeve so that bolts are at bottom of sleeve and are not binding connecting rod ends.

DESCRIPTION: New design "ball-joint" type front suspension system with coil spring mounted between top of upper control arm and bracket attached to car underbody. Upper and lower control arms are pivoted on shafts attached to brackets on underbody with the lower control arms additionally supported by strut rods connecting outer end of lower control arm to forward end of underbody. Camber adjustments are made by adding or removing shims from between lower control arm pivot shaft bracket and car underbody. Caster adjustments are made by repositioning strut on outer end of lower control arm. Front shock absorbers are mounted within front coil springs.

ADJUSTMENT: With tires properly inflated and car at normal curb weight, check and adjust in the following sequence.

Tir Inflati n: 24 lbs. (front & rear).



Cast r: Neg. ¼° to Neg. 1¼°. Maximum difference between front wheels should not exceed ½° (¼° preferred).

Adjustm nt - Loosen bolts attaching strut to lower control arm, then raise strut so it is free of serrations on arm. Lengthen distance between strut forward mount and edge of control arm to decrease caster and shorten distance to increase caster.

Camber: 0° to Pos. 1°. Maximum difference between front wheels should not exceed ½° (¼° preferred).

Adjustment - Remove or install shims between lower control arm pivot bracket on car underbody. Shims are available in thicknesses of .023-.027" and .113-.127". A 1/16" change of shim thickness will change camber angle 1/3°. *NOTE - Shim pack thickn ss must not x- c d 11/16".*

Toe-In: 1/16-1/8". Turn sleeve on each tie rod equally in opposite directions as required.

THUNDERBIRD FRONT SUSPENSION

Toe-Out On Turns: With outer wheel turned 20°, inner wheel should be turned 20½°. Not adjustable.

CONTINUED ON NEXT PAGE

THUNDERBIRD FRONT SUSPENSION (C ntinued)

REMOVAL & INSTALLATION

WHEEL SPINDLE: Removal - Raise front of car and support under chassis, then remove wheel, hub, and drum. Remove brake backing plate from spindle and wire up put of way. Disconnect tie rod end from spindle, then loosen both upper and lower ball joint stud nuts, but do not remove. Position a box wrench over lower end of Tool T57P-3006-A and position tool so each end contacts a ball joint stud. *CAUTION - Tool should seat firmly against ends of both studs, not against stud nut.* Turn wrench until tool places studs under tension, then loosen studs in spindle by tapping spindle near studs with a hammer. DO NOT loosen studs in spindle with tool pressure alone. Remove stud nuts and spindle from both studs.

Installation: Position on upper and lower ball joints and install stud nuts and tighten to 60-80 ft. lbs. Continue to tighten nuts until cotter pin holes line up with slots, then install cotter pins. Complete installation by reversing removal procedures.

SHOCK ABSORBER: Removal - Raise car and support under lower control arm, then lower car slightly. Disconnect lower end of shock absorber from spring lower seat, then open hood and remove shock absorber upper mounting plate bolts and bolts attaching mounting plate-to-dash panel brace at dash panel. Remove shock absorber, mounting pad and brace.

Installation: Assemble shock absorber mounting stud to plate with washer and insulator and tighten retaining nut. Position shock absorber and mounting plate assembly in place and install and tighten attaching bolts. Lower car slightly with safety stands under lower control arm and insert shock absorber stud through hole at bottom of spring lower seat. Install insulator, washer, and retaining nut on shock stud and tighten to 15-25 ft. lbs.

FRONT SPRING: Removal - Raise front of car and place a safety stand under lower control arm, then lower car slightly. Remove shock absorber (see above), then remove wheel, hub, and drum assembly. Remove upper suspension arm bumper and raise car slightly off safety stand to lower upper control arm. Insert the lock bar of Tool T61B-5310-A through top of spring and position bar on seventh coil from bottom. Slide tool bearing over tool shaft against the integral nut. Insert shaft through shock absorber mounting hole in lower spring seat so that end of shaft will thread into lock bar. Compress spring by turning shaft into lock bar until top coils are drawn out of spring upper seat. Remove bolts retaining spring seat to upper control arm and remove spring and seat as an assembly. Place spring in a vise and turn tool shaft out of lock bar to release spring, then remove bar and shaft.

Installation: Tape rubber insulator to upper end of spring in three places, then place spring in a vise and place spring lower seat against lower end of spring. Slide bearing of Tool T61B-5310-A over tool shaft against integral nut, then insert shaft through shock absorber mounting hole in spring lower seat. Insert lock bar of Tool T61-5310-A on seventh coil from spring lower end. With spring seat positioned, compress spring completely between seventh and first coil, then remove spring from vise. Position spring assembly on upper arm and align with spring upper seat. Install lower seat mounting bolts and nuts. Turn tool shaft out of tool lock bar, releasing spring into upper seat. Install shock absorber and mounting assembly, then lower car slightly with safety stand under lower control arm, raising upper arm enough to position shock absorber stud through lower spring seat. Install insulator, washer and retaining nut and tighten to 15-25 ft. lbs. Install upper arm bumper, wheel, hub, and drum assembly, then check front end alignment.

UPPER CONTROL ARM: Removal - Raise front of car and support under lower control arm, then remove front spring (see above). Remove upper ball joint (see "Wheel Spindle" above). Remove upper control arm inner shaft retaining nuts and washers, then remove upper control arm.

Disassembly: Remove nuts securing lower spring seat mounting brackets to control arm, then remove grease fittings from spring seat pivot bolts and remove spring seat assembly. Position upper arm inner shaft in a vise and unscrew bushings from shaft and arm. Remove assembly from vise and separate inner shaft from arm.

Reassembly: *NOTE - If either bushing is worn or damaged, replace both bushings. When replacing inner shaft, use only new bushings.* Position shaft in arm and install new bushings on shaft and arm. *NOTE - Turn bushings so shaft is centered in control arm (centerline of shaft attaching bolts holes should be 1.85±.02" from side of arm).* Tighten bushings to 15-25 ft. lbs.

Installation: Reverse removal procedure and adjust front end alignment.

LOWER CONTROL ARM: Removal - Raise and support car under chassis, then remove wheel, hub, and drum assembly. Remove brake backing plate and wire up out of way. Disconnect stabilizer and strut from lower control arm, then disconnect lower ball joint from spindle (see "Wheel Spindle" above). Remove lower control arm pivot bracket retaining nut and the shim retaining nut, then remove lower control arm. Place lower control arm assembly in a vise and remove pivot bolt, then separate pivot bracket from lower arm.

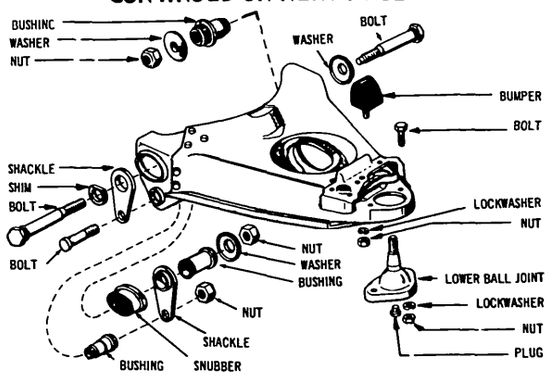
Installation: Assemble pivot bracket to lower control arm and install pivot bolt. Tighten pivot bolt nut snug, but do not tighten until control arm is installed on car. Complete installation by reversing removal procedure, then adjust front end alignment.

UPPER & LOWER BALL JOINTS: *NOTE - Upp r ball joint can be replaced with upper control arm in car after removing wheel, hub, and drum assembly and disconnecting upper ball joint stud from spindle. Procedures are the same as for replac ment with control arm removed from car.*

Removal: With control arm removed from car, drill a 1/8" pilot hole completely through rivet, then drill off rivet head with a 3/8" drill. Drive all rivets out of holes, and remove ball joint assembly.

Installation: *NOTE - Upper control arm ball joint is furnished in a kit and is assembled at installation. Lower ball joint is serviced only as an ass mbly. Both upper and lower ball joints are furnish d with hardened steel bolts that must b used f r attaching to control arm. DO NOT ATTEMPT to riv t replacement ball joints to control arms.* Clean end of arm and remove any burrs from edges of holes. On lower control arm, install ball joint and install and tighten special bolts furnished with ball joint assembly. On upper ball joint, assemble ball joint and install bearing in upper control arm. Coat the "O" ring found in kit with head gasket sealer and install between ball joint flange and underside of upper control arm. Install ball joint assembly and secure in position with special bolts furnished with ball joint package. Complete installation by reversing removal procedure.

FORD & MERCURY FRONT SUSPENSION



Ford Pass. Cars (1961)
Mercury (1961)

DESCRIPTION: Ball joint type suspension similar to design used on previous models except that lower control arms used on Mercury 800 & Monterey are connected at the front to frame crossmember through a shackle and rubber bushing. On all models, threaded steel bushings are used on upper control arm inner shaft pivots. Camber and caster adjustments on all models are controlled by shims located between upper control arm inner shaft and bracket on frame crossmember.

ADJUSTMENT: Before adjusting front end alignment, inflate tires to correct pressure, then raise front of car and check front suspension ball joints for looseness, wear or damage. *NOTE - Lower ball joint is not spring loaded and a slight normal looseness will be found when car is raised and wheel is hanging free.* Check steering gear mounting and all linkage for looseness. Adjust front wheel bearings. Check tracking of front and rear wheels.

Kingpin Inclination: 7° at Pos. ¾° camber. Not adjustable.

CONTINUED ON NEXT PAGE

MERCURY 800 & MONTEREY
LOWER CONTROL ARM

FORD & MERCURY FRONT SUSPENSION (C nt)

Caster: Neg. ½° to Pos. ½°. *NOTE - Maximum caster variation between wheels must be less than ½°, with ¼ pref rred.*

Camber: Pos. ¼° to Pos. 1¾°. *NOTE - Maximum camber variation b tween wheels must be less than ¼°.*

Toe-In: 1/8-1/4".

T e-Out n Turns: With outer wheels turned 20°, inner wheels should be 24¼°.

►*CAMBER & CASTER ADJUSTMENT NOTE: Camber and Cast r adjustments are made by adding or removing shims from between upper control arm shaft and bracket on cr ssm mber.*

OVERHAUL: *See 1957 Annual Data, Page 344, or later Manual edition and note th following:*

UPPER CONTROL ARM INNER PIVOT SHAFT BUSHING: Rem val & Installation - With upper control arm shaft removed from car, hold shaft in a vise and turn bushing off shaft and out of control arm. Install a new "O" ring seal in each bushing, then coat inside of each bushing with a small amount of multi-purpose lubricant (coat outer threads also). *CAUTION - An excessive amount of lubricant inside bushing will force the "O" ring out of place when bushing is installed.* Insert inner shaft in upper control arm, making sure that "bow" in shaft is upward, then install Tool T58P-3044A (Ford); Tool 3082-A (Mercury). With tool inserted between arms of upper control arm to properly locate arms the correct distance apart, place tool in a vise and thread bushing on each end of shaft, then turn bushings in until hex heads bottom on upper arm. *NOTE - New upper arms are not threaded. Bushings are self-tapping type.* Tighten bushing to 160-190 ft. lbs. Remove assembly from vise and remove tool, then check to see that shaft rotates with moderate effort. If shaft binds, check for misalignment

LOWER CONTROL ARM (MERCURY 800 & MONTEREY): Removal - Remove in same manner as for conventional lower control arm assembly.

Disassembly: *NOTE - Do not wash ball joint assembly with solvent.* Remove shackle nut, then tap the two horseshoe-shaped spacers of Tool 3079-M7 between shackle plates and ends of large elliptical bushing. Using an arbor press, support arm and shackle assembly with support cup, Tool 3069-M1 (small end) against inner shackle plate. Insert remover, Tool 3069-M2 into upper inner bushing and press bushing through both shackle plates and into support cup. Remove inner shackle plate and the outer plate and bolt assembly. Press lower bushing from arm using support cup, Tool 3069-M1 (small end) and remover, Tool 3069-M4. Press upper outer bushing from arm using support cup. Tool 3069-M1 (large end) and remover, Tool 3060-M6. Remove lower arm rear bushing using support cup, Tool 3069-M1 (small end) and remover, Tool 3069-J.

Reassembly: *NOTE - Clean bushing bores in arm. Use silicone or liquid soap as lubricant during reassembly.* Install rear bushing using replacer, Tool 3069-M5, support cup, Tool 3069-M1 (small end), and a piece of flat stock across large end of support cup. Press bushing into place until points of ribs on bushing sleeve bottom on arm. Start upper outer bushing squarely into arm by lightly tapping it into position. Use a piece of flat stock on bed of press to support upper outer bushing and press bushing into place using support cup, Tool 3069-M1 (large end) and Tool 3069-M6 over small end of support cup. Press bushing into place until shoulder of bushing sleeve bottoms on arm. Press lower bushing into arm using replacer, Tool 3069-M3, support cup, Tool 3069-M1 (small end), and a piece of flat stock across large end of support cup. Insert bolt of shackle plate and bolt assembly through lower bushing with threaded end of bolt toward inside of arm. Add inner shackle plate, then install and snugly tighten nut. Position the two horseshoe-shaped spacers, Tool 3069-M7 between shackle plates and upper outer bushing, then center shackle plates. Support the assembly and, using replacer, Tool 3069-M5, lightly tap upper inner bushing to start it squarely into position in inner shackle plate. Press upper inner bushing through shackle plates using replacer, Tool 3069-M5, support cup, Tool 3069-M1 (small end), and a piece of flat stock over large end of support cup. Remove spacers and tighten nut. *NOTE - If ball joint was removed, install new joint using parts supplied in ball joint kit. Tighten nuts to 28-35 ft. lbs. Make sur ball joint is completely filled with specified lubricant.*

Installation: Reverse removal procedure.

LANCER & VALIANT "TORSION-AIRE" FRONT SUSPENSION

Lancer (1961)
Valiant (1961)

DESCRIPTION: Independent type with torsion bars instead of conventional type coil springs. Upper control arms are attached to brackets which are welded to shock absorber tower and to body horizontals (side rails). Lower control arms are attached to the "K" type front suspension crossmember which is connected to body horizontals (side rails). Ball joints are used to attach both upper and lower control arms to steering knuckles. Torsion bars are anchored at rear to engine rear support member in the body and at the front to lower control arm. Eccentric bolt assemblies at upper control arms control camber and caster adjustments. Car riding height is controlled by a lever assembly at front end of each torsion bar.

TIRE INFLATION: Tir s Cold - 24 lbs. (Front, All Models); 24 lbs. (Rear, Sedan & 2-Seat Sta. Wgn.); 28 lbs. (Rear, 2 & 3-Seat Sta. Wgns. With Captive Air Tires). *NOTE - Captive Air Tires are standard on 3-S at and optional on 2-Seat Station Wagons.*

ADJUSTMENT: With car at curb weight (fuel tank full but with no luggage or passenger load), tires at recommemded pressure (see above) and with front suspension and steering linkage in good condition, make adjustments in the following order:

►*NOTE: Jounce car up and down several times at center of bumpers (rear bumper first) prior to taking each measurement. Car should be jounced the same number of times and the bumper should be released at the same point in cycle each time.*

Front Riding Height: Jounce car and measure from lower ball joint to floor and from control arm torsion bar spring anchor housing to floor. Subtract first measurement from second measurement. The difference should be 1¾" ± 1/8". The difference from one side of car to the other should not exceed 1/8". To adjust, turn nut on lower side (inner end) of lower control arm clockwise to increase height and counterclockwise to decrease height. After adjusting, jounce car and recheck height.

Caster: Neg. ½° ±½° (Manual Steering). Pos. ¾° ±½° (Power Steering). Adjust caster by turning **one** eccentric bolt at a time as necessary to obtain correct setting. *NOTE - Turning both eccentric bolts in opposit directions affects caster with a minimum amount of change in camber.*

Camber: Right Wheel - Pos. ¼°±¼° (Pos. ¼° preferred); **Left Wheel** - Pos. ½°±¼° (Pos. ½° preferred). Adjust camber by turning **both** eccentric bolts equally in same direction as necessary to obtain correct setting. *NOTE - Turning both eccentric bolts in same direction affects camber with a minimum amount of change in caster.*

Toe-In: 1/8" ± 1/32". Turn both tie rod adjusting tubes equally with steering wheel centered and steering gear on "high point" for straight ahead travel. *NOTE* - Before tightening clamps, turn tie rod assembly so sockets are either against front or back sides of studs. Tighten bolts to 15 ft. lbs.

Steering Axis Inclination: 6½° to 8½°. Not adjustable.

Toe-Out on Turns: With inner wheel at 20°, outer wheel should be at 17° 40' ± 1°.

REMOVAL & INSTALLATION: *See 1960 Annual Data, Page 384, or later Manual edition.*

LINCOLN CONTINENTAL FRONT SUSPENSION

Lincoln Continental (1961)

►*1961 LINCOLN CAMBER & CASTER ADJUSTMENT*

NOTE; If difficulty is encountered in moving upper control arms shaft bolts for camber and caster adjustments, after bolts have been loosened, it may be due to undersized nuts wedging in the channel. Remove bolts and drive nuts out of channel in crossmember bracket using a blunt punch. Replace undersize nuts with Part No. 374381-S1.

DESCRIPTION: New design ball joint type suspension system with the following features. Upper control arm shaft is mounted in slotted holes in crossmember bracket and caster and camber adjustments are made by moving serrated upper arm. Lower control arm is connected to chassis at the inner end by a single rubber cored bushing. Fore and aft movement of wheel is controlled by a drag strut connected to lower control arm and to a point forward on number one crossmember.

ADJUSTMENT: Before adjusting alignment, check tires for proper inflation, wheel bearing adjustment, and for looseness or wear in front suspension.

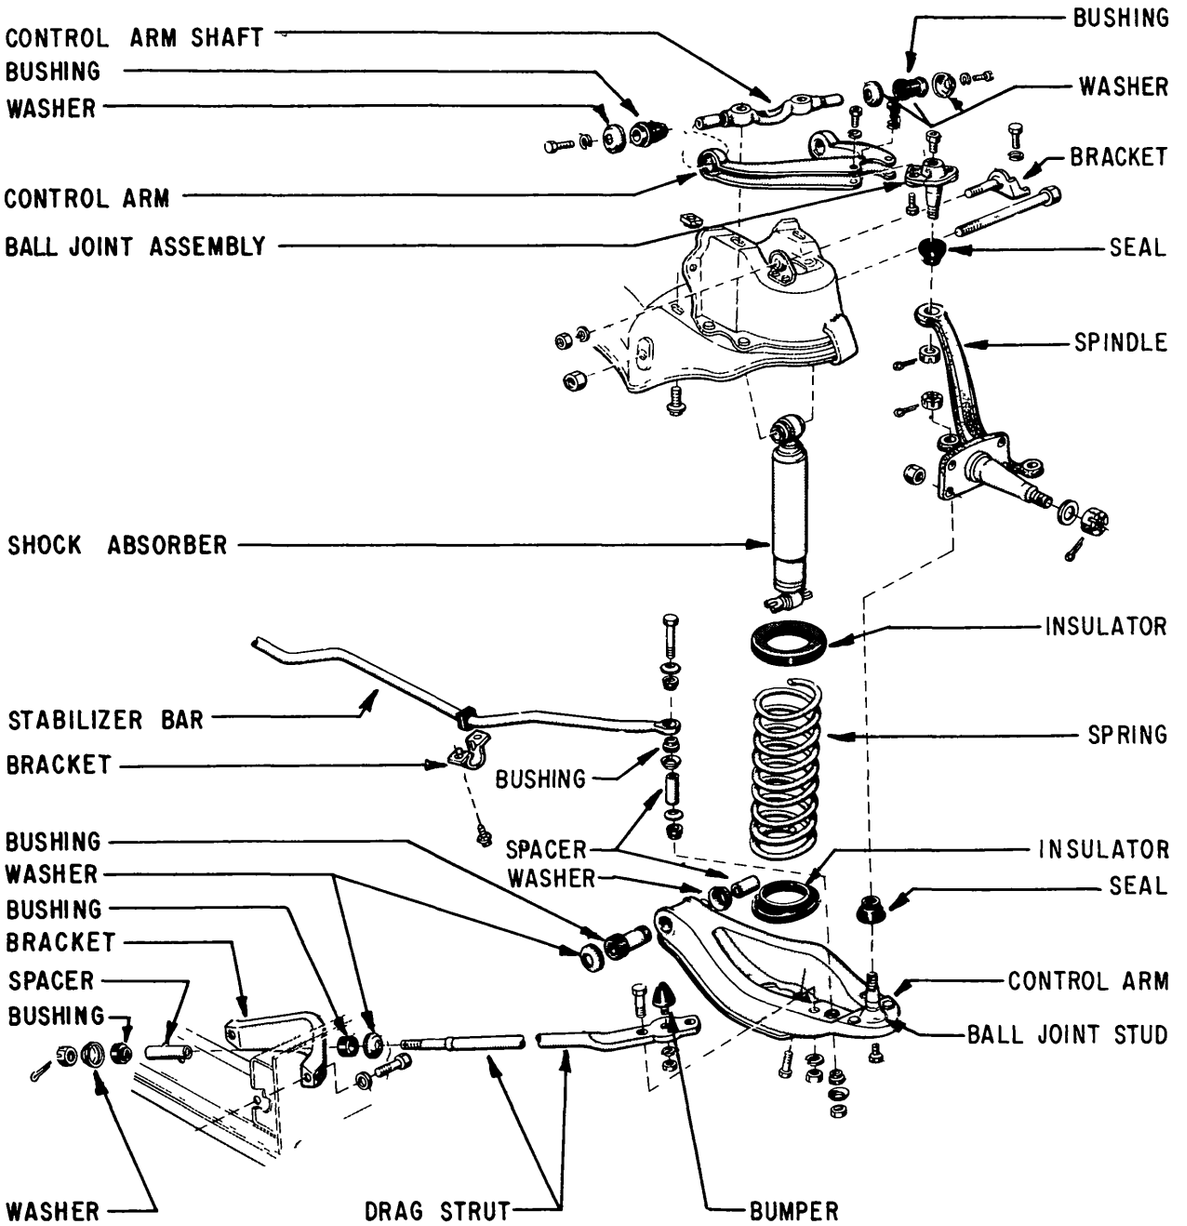
Kingpin Inclination: 7° at ¾° camber. Not adjustable.

Caster: 0° to Neg. 1½° (¼° preferred). Both sides equal within ½°. Caster is controlled by movement of serrated upper control arm shaft on frame member. A 3/32" movement of either end of upper control arm shaft will change caster ½°. Tighten shaft attaching bolts to 100-125 ft. lbs.

Camber: 0° to Pos. ¾° (¼° preferred). Both sides equal within ½°. Camber is controlled by movement of serrated upper control arm shaft on frame member. A 3/64" movement of entire shaft will change camber ¼°. Tighten shaft attaching bolts to 100-125 ft. lbs.

Toe-In: 1/16-3/16".

Toe-Out on Turns: With inner wheel at 20°, outer wheel should be 17°48'. Not adjustable.



Riding Height: 5 3/16" to 6 1/8" (5¾" preferred). With car on a level floor and tires properly inflated, gas tank full and luggage compartment empty, push front bumper down about an inch, then release very slowly. Measure distance between top of drag strut and the ledge on inside of number two crossmember pocket just forward of bumper striking pad. The drag strut measuring point is midway between front attaching bolt and rubber bumper pad. Riding height difference between both sides of car should not exceed ½".

REMOVAL & INSTALLATION

LOWER BALL JOINT: Removal - Raise car and place support under each side rail to rear of lower control arm in area of lifting pad. Remove wheel, hub and drum, then remove brake backing plate and wire up out of way. Loosen lower ball joint stud nut two turns, then use a brass hammer and tap spindle until ball joint stud pops loose against nut. Place a jack under spring pocket in lower control arm, and raise arm slightly. Place a support stand under lower arm for safety. Remove nut from ball joint stud and raise upper arm and spindle until spindle clears ball stud. Prop upper arm in raised position. Remove ball joint rivet heads with a chisel and punch remaining part of rivets from holes and remove joint.

Installation: Install new joint using parts supplied in kit, and tighten bolts to 22-28 ft. lbs. *NOTE - Make sur joint is compl tely packed with specified lubricant.* Complete installation by reversing removal procedure, noting the following points: Tighten ball joint stud nut to 70-90 ft. lbs., then continue to tighten until cotter pin holes line up. Tighten backing plate attaching bolts to 75-85 ft. lbs.

UPPER BALL JOINT: Removal - Place a jack under outer end of lower control arm and raise arm, then place a support stand under side rail in lifting pad area. Remove wheel and tire and loosen upper ball joint stud

LINCOLN CONTINENTAL FRONT SUSPENSION ASSEMBLY

CONTINUED ON NEXT PAGE

LINCOLN CONTINENTAL FRONT SUSPENSION (Cont)

nut two turns. Pry arm upward and tap spindle at stud boss with a brass hammer until ball stud loosens against nut. Remove nut and raise upper control arm, freeing ball joint stud from spindle. Wire upper end of spindle to underbody to prevent damage to brake hose. Remove ball joint retaining nuts and bolts and remove joint.

Installation: Install new joint using parts supplied in kit. Tighten nuts to 22-28 ft. lbs. *NOTE - Make sure ball joint is completely filled with specified lubricant.* Complete installation by reversing removal procedure, noting the following points: Tighten ball joint stud nut to 60-80 ft. lbs., then continue to tighten until cotter pin holes line up.

SHOCK ABSORBER: Removal - Remove upper eye stud nut of shock absorber, then remove upper eye stud bracket-to-crossmember retaining bolt and remove stud bracket. Remove bolts retaining shock absorber to lower control arm and remove shock absorber.

Installation: Reverse removal procedure and note the following: Tighten lower retaining nuts to 22-28 ft. lbs. Tighten upper eye bracket nut to 40-55 ft. lbs. Tighten stud bracket-to-crossmember bolt to 22-28 ft. lbs. **after upper eye stud is tightened.**

COIL SPRING: Removal - Raise car and support under each body side rail to rear of lower control arm in area of lifting pad, then remove wheel, hub and drum. Loosen backing plate for clearance. Remove shock absorber, and disconnect drag strut from lower arm. Disconnect stabilizer bar from suspension arm, then loosen (do not remove) lower ball joint from spindle (see "Lower Ball Joint" above). Place a jack under outer end of lower ball joint and raise arm several inches, then remove ball joint nut. Lower jack until spindle and spring are free, and remove spring and insulators.

Installation: Place a jack under outer end of lower control arm, then tape upper and lower spring insulators to spring. Compress coil spring with Tool 5310-A, and place spring and insulators in position, making sure that both ends of spring are properly seated. Raise lower control arm and guide lower ball joint into spindle boss. Install ball joint stud nut and tighten to 70-90 ft. lbs. Continue to tighten until cotter pin holes line up and install cotter pin. Connect stabilizer bar to lower arm and tighten nut to 22-28 ft. lbs. Connect drag strut to lower arm and tighten nuts to 70-90 ft. lbs. Install shock absorber, then tighten brake backing plate retaining nuts to 75-85 ft. lbs. If lower control arm removed, see "Lower Control Arm" below.

UPPER CONTROL ARM: Removal - Place a jack under outer end of lower control arm and raise arm, then remove wheel and tire. Disconnect upper ball joint from spindle (see "Upper Ball Joint" above). Mark position of upper control arm inner shaft on underbody to aid in making camber and caster adjustments after installation, then remove upper control arm-to-underbody retaining bolts and remove control arm.

Disassembly: *CAUTION - Do not wash ball joint with solvent.* Remove bolts, lockwashers, and cup washers from ends of control arm shaft, then assemble remover, Tool 3044-LA, to shaft at front bushing. Press bushing out of arm using support cup, Tool 3069-H, and remover, Tool 3044-AB3. Remove shaft and rear bushing inner cup washer. Remove rear bushing using support cup, Tool 3069-H, and remover, Tool 3069-L.

Reassembly: *NOTE - Both control arm bushings are pressed into arm from outside toward inside of arm. Use silicone or liquid soap as a lubricant when assembling shaft and bushings.* Press control arm rear bushing into arm using support cup, Tool 3069-H, and replacer, Tool 3068. Press bushing in until shoulder stop is reached. With rear bushing cup washer on shaft, insert end of shaft into rear bushing, then press front bushing onto shaft and into arm using replacer, Tool 3068. Bottom bushing against flange in arm. Install cup washers, lockwashers and bolts at end of upper control arm shaft. *CAUTION - Do not tighten these bolts at this time. Tighten only after control arm is installed on car and weight of car is on wheels. DO NOT SUBSTITUTE bolts at this point. Use only specified bolt if replacement is required.*

Installation: Position upper control arm shaft on underbody member and line up marks made before removal of arm. Install retaining bolts and tighten to 100-125 ft. lbs. Guide ball joint stud into spindle, then install ball stud nut and tighten to 60-80 ft. lbs. Continue tightening nut until cotter pin holes line up and install cotter pin. Install wheel and tire, then with weight of car on wheels, tighten bolts at ends of upper control arm shaft to 70-90 ft. lbs. Check front wheel alignment.

LOWER CONTROL ARM: Removal - Remove coil spring assembly (see "Coil Spring" above), then remove lower control arm-to-crossmember nut, bolt, washers, and spacer, then remove arm.

Disassembly: *CAUTION - Do not wash ball joint with solvent.* To remove ball joint, remove rivet heads with a chisel and drive remaining portion of rivets from holes. Press bushings out of inner end of control arm with Tools 3069-H, AA1 and AA2.

Reassembly: *NOTE - Apply silicone or liquid soap to shell of new bushing before installation.* Place bushing in arm with flange end of bushing at front of arm, then press bushing into arm until shoulder on bushing seats against arm. In addition to tools used for removal, use Tool 3069-M5 for bushing installation. If ball joint was removed, see "Lower Ball Joint" above, for installation.

Installation: Connect inner end of lower control arm to underbody crossmember, but do not tighten. Install coil spring assembly, then with car weight on wheels, tighten lower control arm-to-crossmember bolt retaining nut to 110-140 ft. lbs.

WHEEL SPINDLE: Removal - Raise car and support under each side rail to rear of lower control arm in area of lifting pad, then remove wheel, hub, drum, and brake backing plate. Disconnect steering connecting rod from spindle arm, then remove upper and lower ball joint studs from spindle (see "Upper and Lower Ball Joints" above).

Installation: Reverse removal procedure and tighten steering connecting rod ball stud nut to 40-55 ft. lbs. Continue to tighten nut until cotter pin holes line up, then install cotter pin.

CHEVROLET, FORD, WILLYS RIGID TYPE FRONT AXLE

Chevrolet, Fwd. Control (1961)
Chevrolet 4-Wheel Drive (1961)
Ford, All Models (1961)
Willys, All Models (1961)

DESCRIPTION: Rigid type front axle assemblies with either a single "I" beam axle (2-Wheel Drive Trucks) or with a front axle housing assembly (4-Wheel Drive Trucks).

ADJUSTMENT: Specifications are as follows:

Kingpin Inclination

Model	Inclination
Chevrolet Fwd. Control	7½° ±½°
Chevrolet 4-Wheel Drive	7½° ±½°
Ford Econoline	7½°
Ford (Exc. 4-Whl. Drive)	4°
Ford 4-Wheel Drive	7½°
Willys, All Models	7½°

Caster

Model	Caster
Chevrolet Fwd. Control	Pos. 2° ±½°
Chevrolet 4-Wheel Drive	Pos. 3° ±½°
Ford Econoline	Pos. 3½° ±¾°
Ford F-100, F-250, P-400	Pos. 3°
Ford F-350, P-350	Pos. 4°
Ford F-500, F-600, B-500, B-600	Pos. 4°
Ford P-500 (137" WB)	Pos. 3°
Ford P-500 (154" WB)	Pos. 3½°
Ford 4-Wheel Drive	Pos. 3¼°
Willys, All Models	Pos. 3°

Camber

Model	Camber
Chevrolet Fwd. Control	Pos. 1½° ±½°
Chevrolet 4-Wheel Drive	Pos. 1½° ±½°
Ford Econoline	Pos. 3/8° ±¾°
Ford (Exc. 4-Wheel Drive)	Pos. 1°
Ford 4-Wheel Drive	Pos. 1½°
Willys 2-Wheel Drive	Pos. 1°
Willys 4-Wheel Drive	Pos. 1½°

Toe-In (Both Wheels)

Model	Toe-In
Chevrolet Fwd. Control	1/4-5/16"
Chevrolet 4-Wheel Drive	1/8-3/8"
Ford Econoline	3/32±1/32"
Ford (Exc. Econoline)	1/16"
Willys, All Models	3/64-3/32"

Toe-Out on Turns

Model	① Toe-Out
Chevrolet Fwd. Control	23½°
Chevrolet 4-Wheel Drive	21¾°
Ford Econoline	21½°
Willys 2-Wheel Drive	21°45'
Willys 4-Wheel Drive	20°

① - With outer wheel turned 20°, inner wheel should be as indicated in table.

OLDSMOBILE (EXCEPT F-85) FRONT SUSPENSION

Oldsmobile, Exc. F-85 (1961)

DESCRIPTION: "Ball-Joint" type with shock absorbers mounted with front coil springs. Design is similar to that used on previous models except that upper and lower control arm inner pivot shaft bushings are not replaceable. Control arm, shaft and bushing assembly is furnished only as a complete unit.

ADJUSTMENT: Tire Inflation - Front - 24 lbs. (Series 88 & S-88 with 8.00 x 14 tires. Series 98 with 8.50 x 14 tires and Air Conditioning). 22 lbs. (Series 88, S-88 & 98). **Rear** - 22 lbs. (All Models except Fiesta); 24 lbs. (Fiesta).

Steering Axis Inclination: 11° at 0° camber. Not adjustable.

Caster: 0° to Neg. 1°.

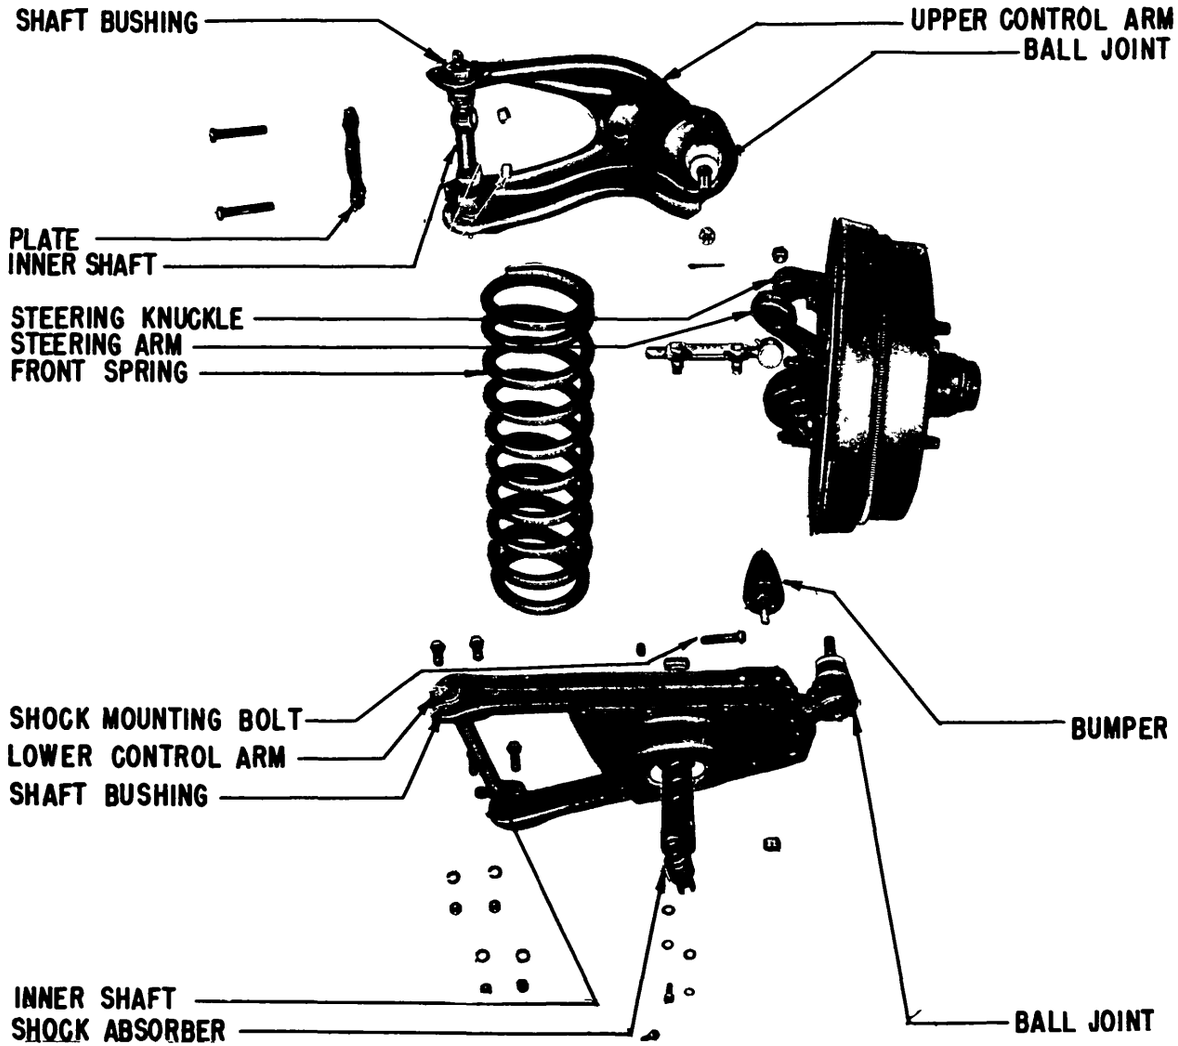
Camber: Neg. ¼° to Pos. ½°. Variation between sides of car should not exceed ½°.

►*CASTER & CAMBER ADJUSTMENT NOTE:* Add or remove shims between upper control arm inner pivot shaft and bracket on crossmember.

Toe-In: 0-1/16". To adjust, loosen clamp bolts at each end of steering tie rod adjustable sleeves. With steering wheel set in straight ahead position, rotate sleeves as necessary to obtain correct toe-in. Position tie rod to relay rod ball studs to bottom of slot in relay. Position inner clamps so edge of clamp is not adjacent to slot in adjusting sleeve.

Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 23° (Manual Steering); 24° (Power Steering). Both specifications are plus or minus ½°. Not adjustable.

Riding Height: 11 3/8" to 12 1/16" measured from underside of front spring lower seat to underside of upper seat. To measure, insert a 1/8" welding rod in drain hole of lower spring seat (inboard side of spring) and push it up to contact underside of upper spring seat. Mark rod, then remove and measure distance rod was inserted. To adjust, replace spring.



REMOVAL & INSTALLATION

SHOCK ABSORBER: Removal - Remove upper pivot bolt from shock absorber, then remove screws and lockwashers attaching shock absorber to lower control arm and remove shock absorber.

Installation: Reverse removal procedure and tighten upper pivot nut to 65-75 ft. lbs. Tighten lower capscrews to 15-25 ft. lbs.

UPPER CONTROL ARM: Removal - Raise front of car and place jack stands under lower control arm (between spring seats and ball joints). Remove wheel, then loosen upper ball joint stud nut and install Tool J-8806. *NOTE - Tool should be positioned so loosened upper ball joint stud nut holds tool in place.* Expand tool and break stud loose from knuckle, then remove tool and pull stud free from knuckle. Disconnect ground strap from control arm. Support hub and drum to prevent brake hose damage, then remove pivot shaft to frame attaching nuts from under fender and remove wheel alignment shims, control arm and pivot shaft assembly from car. *NOTE - Keep each shim pack separat f r installati n in riginal position.*

Installation: Reverse removal procedure and tighten control arm pivot shaft nuts to 85-110 ft. lbs. Tighten ball joint stud nut to a minimum of 40 ft. lbs. (tighten nut as necessary to install cotter pin).

OLDSMOBILE (EXCEPT F-85) FRONT SUSPENSION

LOWER CONTROL ARM & COIL SPRING: Removal - Raise front of car and support with jack stands placed under frame side rails. Remove wheel assembly and disconnect stabilizer link from lower control arm, then remove shock absorber. Position a floor jack under lower control arm between spring seat and ball joint and raise floor jack until it supports lower control arm. Disconnect lower ball joint from steering knuckle with Tool J-8806 (use same procedure as for upper ball joint). Slowly lower jack to floor until spring is fully extended and remove spring. *NOTE - Right and left springs on cars with ut air conditi ning should not be interchanged. Coil spring part number is stamped on outer sid of nd coil.* To remove lower control arm, remove pivot shaft to crossmember attaching bolts.

Installation: Reverse removal procedure and note the following: Tighten control arm pivot shaft bolt nuts to 75-95 ft. lbs. To install spring, tape insulator to top of spring in at least six places (top of spring is identified by a flat coil). While holding spring and insulator against pilot on frame crossmember, tilt spring so it will pilot in lower control arm, then rotate spring so end of bottom coil will index with edge of hole in control arm spring seat (coil should not cover any part of hole). Position floor jack between spring seat and ball joint and chain upper control arm to base of jack, then raise control arm until ball joint is tight in knuckle. Tighten

CONTINUED ON NEXT PAGE

OLDSMOBILE FRONT SUSPENSION (C ntinu d)

ball joint stud nut to 40 ft. lbs. minimum (tighten nut as necessary to install cotter pin).

►*UPPER & LOWER CONTROL ARM INNER SHAFT BUSHING NOTE:* Control arm bushings are not replaceable. Control arm and bushing assemblies are furnished only as a complete unit, including control arm pivot shaft. If necessary, tighten upper control arm shaft to bushing screws to 35-45 ft. lbs. and lower control arm shaft to bushing screws to 50-60 ft. lbs.

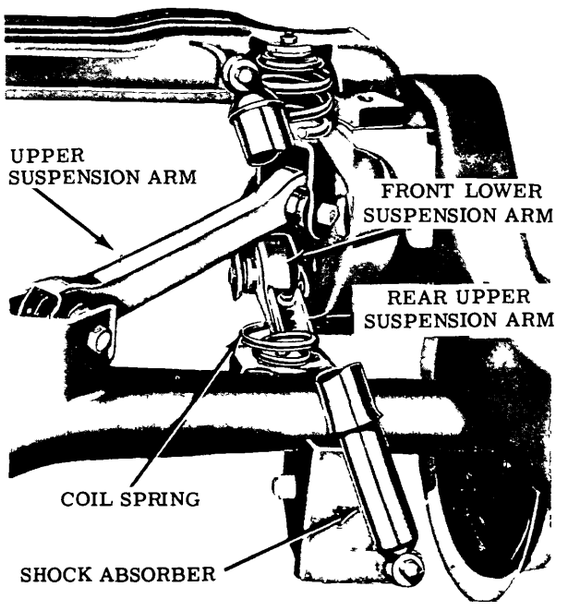
STEERING KNUCKLE: Rem val - Raise and support front of car with floor stands placed under lower control arm between spring seat and ball stud. Remove wheel and brake drum, then remove brake backing plate (without disconnecting brake line). Leave steering arm connected to rod end. Disconnect control arm ball joints from steering knuckle (see "Upper & Lower Control Arms" above), and remove knuckle.

Installation: Reverse removal procedure and tighten brake backing plate anchor bolt to 85-110 ft. lbs. Tighten steering arm-to-knuckle-to-backing plate nuts to 80-130 ft. lbs. Check wheel alignment.

LOWER CONTROL ARM BALL JOINT REPLACEMENT: Raise front of car and support outer end of lower control arm, then remove wheel assembly. Disconnect lower ball joint from steering knuckle with Tool J-8806. Block steering knuckle, backing plate and drum assembly away from lower control arm. Drill a 5/16" hole 1¼" deep in rivet (through head), then use a 7/8" drill and drill deep enough to remove rivet head. Drive rivet out of control arm and ball joint. Repeat this procedure with other rivet. Install new ball joint using special bolts furnished. *NOTE - If rivets cannot be driven out, then the bottom heads must be drilled out. Be very careful not to elongate holes in lower control arm when drilling rivets.*

OLDSMOBILE (EXCEPT F-85) REAR SUSPENSION

Oldsm bil (Exc. F-85) (1961)



►*1961 OLDSMOBILE (EXC. F-85) REAR COIL SPRING RATTLE CORRECTION:* If this condition is noticeable on rough roads, full throttle acceleration, light braking or cornering, it may be caused by rear springs contacting frame side rail or crossmember and can be corrected as follows: Rotate spring so that upper spring end (pigtail) is 45° to right on both springs, from straight forward position. Rotate both spring clamps clockwise until they are tightly seated in both upper and lower spring ends.

DESCRIPTION: Coil spring type with two upper and two lower control arms. Upper control arms are connected to rear axle housing adjacent to differential carrier and to bracket on frame side rail. Lower control arms are connected between outer ends of rear axle housing and bracket on frame side rail. Lower control arms are adjustable for length and control the differential nose angle.

RIDING HEIGHT: 5 13/16-6 9/16" (Exc. Sta. Wgn.); 5 3/8-6 1/8" (Sta. Wgn.) measured from top of axle housing to frame.

►*SHOCK ABSORBER INSTALLATION NOTE:* Tighten upper pivot bolt and nut to 75-95 ft. lbs., and lower stud nut to 30-46 ft. lbs.

COIL SPRING: Rem val - Raise rear of car and disconnect shock absorber from axle housing, then disconnect parking brake cable clamp at frame and loosen suspension arms at frame and axle. Support frame, then remove upper and lower spring mounting bolts, washers, insulators and clamps. Remove coil spring and two remaining insulators.

OLDSMOBILE (EXCEPT F-85) REAR SUSPENSION

Installation: Reverse removal procedure and note the following: Tape upper and lower insulator to coil spring without obstructing bolt hole. Before tightening bolts, make sure that clamp stop is against end of coil spring. Tighten upper and lower spring attaching bolts to 45-65 ft. lbs. *CAUTION - Do not connect shock absorbers or tighten arm assembly bolts until weight of car is resting on rear springs.*

CONTROL ARMS: Removal - *NOTE - Upper and lower control arm bushings cannot be replaced in service. Bushings and control arms are available only in complete assemblies.* Raise and support rear axle housing, then support frame at side rails. Disconnect support arms at rear axle housing and frame side rails and remove control arms.

Installation: *CAUTION - When installing a new lower control arm, the same corresponding holes should b aligned as on the original arm.* Install upper arm and the lower arm front section with open side of channel facing downward. Lower control arms are stamped "Front" and "Rear" for proper installation. DO NOT tighten attaching bolts until car is at normal height on floor, then tighten attaching bolts to 65-75 ft. lbs.

PONTIAC (EXCEPT TEMPEST) FRONT SUSPENSION

Pontiac, Exc. Tempest (1961)

DESCRIPTION: Front suspension is same design as used on previous models.

ADJUSTMENT: *NOTE - Before checking or adjusting, inflate tires to correct pressure, check adjustment of front wheel bearings and check steering gear and linkage for excessive looseness. Check and adjust camber and caster with car at normal curb height, see "Riding Height" below.*

Tire Inflation: Inflate tires to following pressures with tires cold.

Tire Size	Pressure Front	Rear
8.00-14 (Exc. Air Cond.)	22 lbs.	22 lbs.
8.00-14 (Air Cond.)	24 lbs.	22 lbs.
8.50-14 (Exc. Safari & Air Cond.)	20 lbs.	20 lbs.
8.50-14 (Air Cond. Exc. Safari)	22 lbs.	20 lbs.
8.50-14 (Safari)	22 lbs.	24 lbs.

Steering Axis Inclination: 4°50' at 0° camber. Not adjustable.

Caster: Neg. 1½°±½°. *See "Shimming Procedure" below.*

Camber: Pos. ¼°±½°. *See "Shimming Procedure" below.*

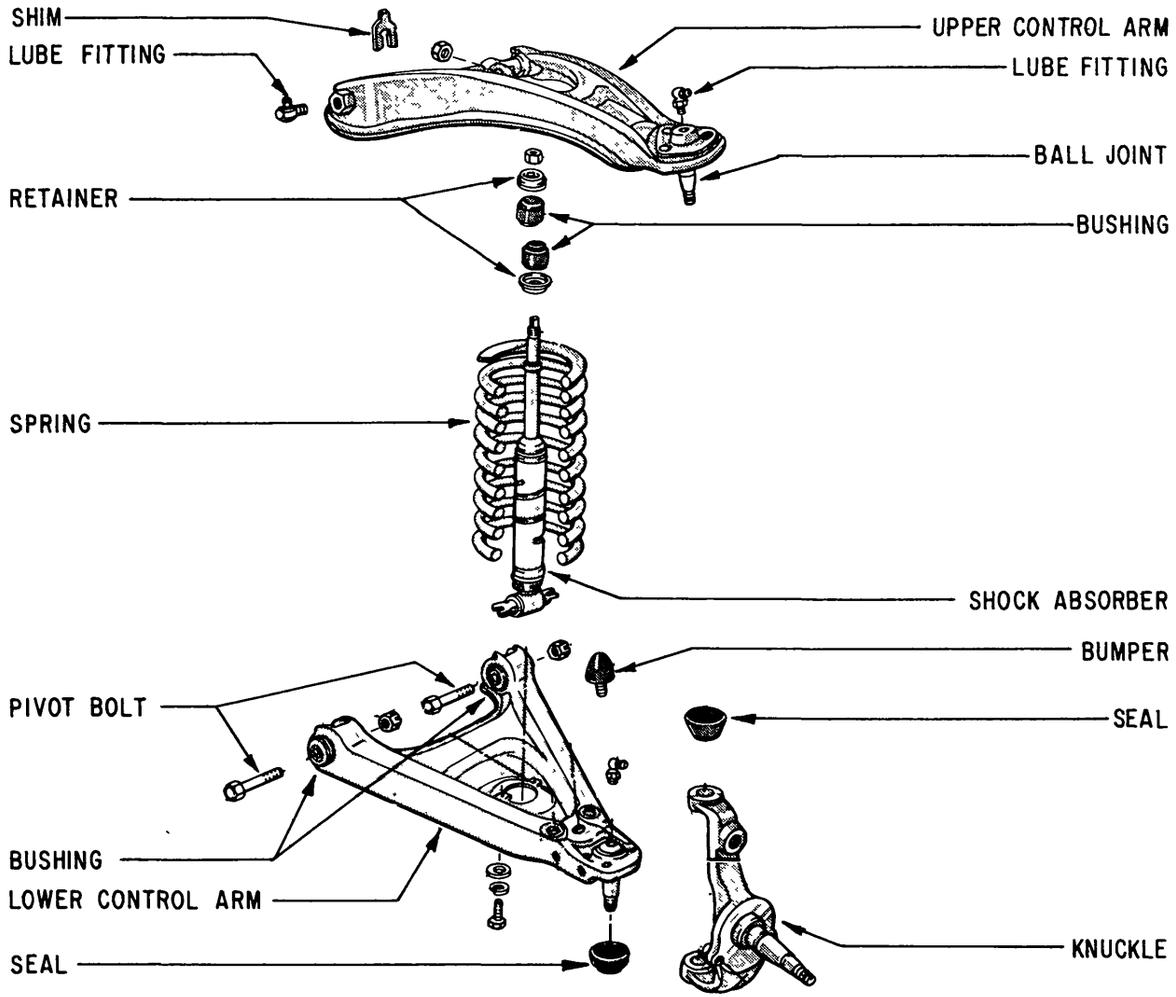
Toe-In: 0-1/8" with trammel 9" from floor.

Toe-Out on Turns: With inner wheel turned 20°, outer wheel should be turned 19°. Not adjustable.

SHIMMING PROCEDURE: Adjustments for camber and caster are made by placing shims between upper control arm pivot shaft and frame. Caster and camber adjustments can be made at the same time. To decrease positive caster, add shims at front bolt. To increase positive caster, remove shims from front bolt. To increase camber, add shims to both front and rear bolts.

Riding Height: 3¾-4" (3 15/16"), measured from top of lower control arm to underside of frame directly behind centerline of spring. *NOTE - For camber and caster adjustment, a spacer (steel bar stock ½" x ½" square) cut to a length of 3 15/16" may be installed between lower control arm and crossmember at centerline of spring to position car for correct riding height.*

REMOVAL & INSTALLATION



SHOCK ABSORBER: Removal - Raise and support car so weight is off front wheels, then remove nut, retainer and grommet attaching upper end of shock to frame. *NOTE - Do not turn piston rod while loosening nut.* Remove lower bolts and remove shock absorber through lower control arm.

Installation: Reverse removal procedure and note the following: Tighten upper nut to 60-120 inch pounds, and lower bolts to 15-25 ft. lbs.

COIL SPRING: Removal - Raise and support front of car with a jack placed under front crossmember, then remove wheel, shock absorber, and disconnect lower end of stabilizer link from lower control arm. Disconnect steering linkage from knuckle. Install spring compressor, Tool J-7592 as follows: Locate one compressor plate in one of the upper coils of spring so that ramp faces down against coil, then locate other plate in one of the lower coils with ramp facing up. *NOTE - Plates must parall l centerlin f spring with hol s in plate prop rly aligned.* Place retainer, J-7592-6, cup side up, over threaded end of rod, J-7592-5, followed by bearing, then start long nut, J-7592-3 on rod. Insert rod, hex end first, up through both plates, then slide retainer, J-7592-4, cut side down, over end of hex rod and secure with "C" clip, seating clip down in retainer. While holding upper end of rod, turn nut at lower end and compress spring. Disconnect inner end of lower control arm from frame crossmember, then swing inner end of arm down and remove spring. *NOTE - If desired, spring can be removed by disconnecting ball joint stud from knuckle and swinging outer end of arm down.*

Installation: Reverse removal procedure and tighten lower control arm attaching bolts at inner end to 150-175 ft. lbs. Tighten steering arm-to-knuckle nut to 60-95 ft. lbs.

LOWER CONTROL ARM: Removal - Remove front spring, then disconnect and remove ball joint stud from steering knuckle with Tool J-6627.

PONTIAC (EXC. TEMPEST) FRONT SUSPENSION ASSEMBLY

Bushing Replacement: With lower control arm removed, use an arbor press and support arm on remover, J-7022-1, then place spacer, J-7022-7 around bushing. With sleeve, J-7022-3 between control arm and arbor, press bushing from arm. Remove other bushing from opposite leg of arm in same manner. Press new bushings into arm by supporting arm on remover, J-7022-1, in an arbor press. Install spacer, J-7022-7 between sides of control arm leg and use sleeve, J-7022-3 between arbor and bushing to press bushing into position. Repeat with other bushing on opposite leg.

Installation: Reverse removal procedure and tighten control arm-to-frame bolts to 150-175 ft. lbs. Tighten ball joint stud nut to 80-95 ft. lbs.

UPPER CONTROL ARM: Removal - Place a jack under lower control arm, then raise and remove wheel. Remove

CONTINUED ON NEXT PAGE

PONTIAC FRONT SUSPENSION (C ntinu d)

ball joint stud from steering knuckle with J-6627. Disconnect control arm shaft from frame and remove shaft and arm assembly.

Disass mbly: Remove front and rear threaded bushings from control arm assembly and remove control arm shaft.

R assembly: Place tool, J-7167 in position and expand until distance between inner faces of arms is 8 31/32", then place pivot shaft with new rubber seals in position on control arm. Lubricate pivot shaft threads with graphite grease, then start bushing on pivot shaft and into arm at the same time. Tighten so head of bushing is firmly seated against control arm (150-175 ft. lbs.), Center pivot shaft in control arm and install other bushing, being sure threads index so there is no bind. Tighten so head of bushing is tightly against control arm (150-175 ft. lbs.), and remove spreader tool. Check to see that distance between inner faces of shaft ends of control arms is correct. Turn shaft in arm to centralize so distance between bolt hole to arm is equal at both ends. *NOTE - Frictional drag of shaft in bushings should not exceed 50 inch pounds.*

Installation: Position upper control arm and shaft on frame member and install bolts and self-locking nuts. Tighten to 80-95 ft. lbs. Assemble control arm to upper ball stud and tighten nut to 80-95 ft. lbs. Lubricate control arm shaft and ball studs, replace wheel and check wheel alignment.

BALL JOINT REPLACEMENT (UPPER & LOWER): With control arm removed, chisel or drill heads of rivets retaining ball joint to control arm and drive out rivets, then remove ball joint assembly. Install a new joint, retaining with special bolts, nuts and washers supplied with new joints. *CAUTION - Use only special alloy bolts supplied with stud package for this operation.* Tighten nuts to 10-12 ft. lbs.

PONTIAC (EXCEPT TEMPEST) REAR SUSPENSION

P ntiac, Except T mp st (1961)

►CHANGES, CAUTIONS, CORRECTIONS

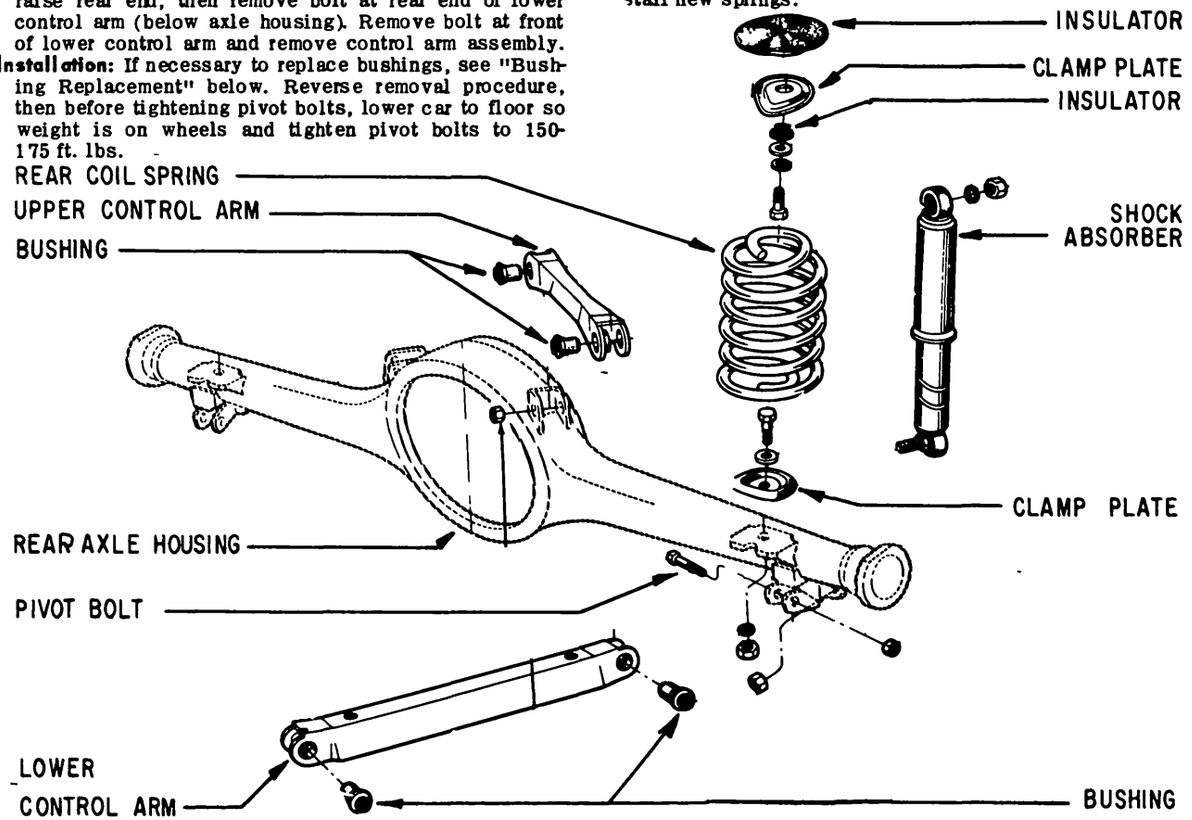
►*1961 REAR SPRING INTERFERENCE WITH SHOCK ABSORBER CORRECTION:* Loosen spring clamp bolts and shift spring forward at bottom to provide normal operating clearance. If necessary to rotate spring for maximum clearance, pigtail end of spring must be at forward side and parallel to front edge of spring seat on axle.

DESCRIPTION: Coil spring type suspension consisting of a lower control arm at each side connected between outer end of axle housing and frame member. An upper control arm on each side is connected to rear axle housing adjacent to differential carrier and to outboard end of frame crossmember. Upper and lower control arms are not adjustable.

COIL SPRING: R m val - Raise car with a chain fall until rear wheels are approximately 8" off floor, then support frame at both sides. Remove wheel assembly, brake bracket tube and line from crossmember. Disconnect shock absorbers from axle housing brackets, then remove pivot bolt from rear end of lower control arm. Raise car as necessary and carefully lower rear axle assembly to allow spring to expand. Remove upper spring retainer nut, bolt, lock washer, flat washer, rubber insulator and spring clamp with insulator. Remove spring clamp at bottom of spring, and remove spring.

Instdlati n: Place upper spring clamp in each end of new spring to determine at which end spring clamp fits best. After selecting best end for upper clamp, scribe a mark on spring and also on spring clamp (when spring and upper clamp are installed, alignment of marks will insure proper mating of parts and seating of upper clamp on spring). Position upper clamp on spring, aligning marks on spring and clamp, then thread lockwasher, flat washer and rubber insulator onto bolt. Insert bolt through upper clamp, aligning marks on upper clamp and spring. Holding assembly in this position, place fabric upper insulator over end of bolt. Install upper bolt and clamp as an assembly in position on spring. Turn spring, maintaining alignment, to give maximum clearance between front of spring and frame. Tighten upper clamp bolt to 45-55 ft. lbs. Install lower clamp on spring and insert bolt, lockwasher, flat washer and tighten bolt to 45-55 ft. lbs. Raise axle assembly and tighten shock absorber attaching nuts to 45-60 ft. lbs. Attach brake tube bracket and line to crossmember and install wheel assembly.

UPPER CONTROL ARM: Removal - *CAUTION - Replace n c ntrol arm assembly at a tim to prev nt axl rolling or slipping sideways.* Place car on a hoist and raise rear end, then remove bolt at rear axle housing and lift upper control arm to clear axle housing mounting bracket. Disconnect upper control arm at frame and remove control arm assembly.



Installation: If necessary to replace bushings, see "Bushing Replacement" below. Reverse removal procedures and tighten pivot bolts to 150-175 ft. lbs.

LOWER CONTROL ARM: Removal - *CAUTION - Replace one control arm assembly at a time to prevent axle rolling or slipping sideways.* Place car on a hoist and raise rear end, then remove bolt at rear end of lower control arm (below axle housing). Remove bolt at front of lower control arm and remove control arm assembly.

Installation: If necessary to replace bushings, see "Bushing Replacement" below. Reverse removal procedure, then before tightening pivot bolts, lower car to floor so weight is on wheels and tighten pivot bolts to 150-175 ft. lbs.

BUSHING REPLACEMENT (UPPER & LOWER CONTROL ARMS): With control arm removed from car, support bushing end of control arm on Tool J-8481-2 and install spacer, Tool J-8481-5 around bushing. Use an arbor press and Tool J-8481-4 to press old bushing from arm. Repeat at opposite end for other bushing. To install bushing, use same tools, except that Tool J-8481-1 must be used to press new bushing into position.

RIDING HEIGHT: 6-6½" (6 5/16") measured from top of axle housing to frame at a point approximately 1½" outward from rubber bumper on frame. To correct, install new springs.

PONTIAC (EXC. TEMPEST) REAR SUSPENSION ASSEMBLY

PONTIAC TEMPEST FRONT SUSPENSION

Pontiac Tempest (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 PONTIAC TEMPEST FRONT SPRING SQUEAK CORRECTION:* Improper seating of upper end of coil spring may cause this condition. To correct, remove coil spring and grind off pigtail end of spring so it is in line with other spring coils.

DESCRIPTION: Independent wheel suspension with an "A" frame type upper control arm and a cantilever type lower control arm combined with a compression strut mounted between outer end of lower control arm and front crossmember side rail. Rear end of strut rod is threaded and mounted in a rubber bushing. Front end is bolted to lower control arm. The front suspension unit is constructed so it is integral with front crossmember and can be removed as a complete assembly (after removal of coil springs).

ADJUSTMENT

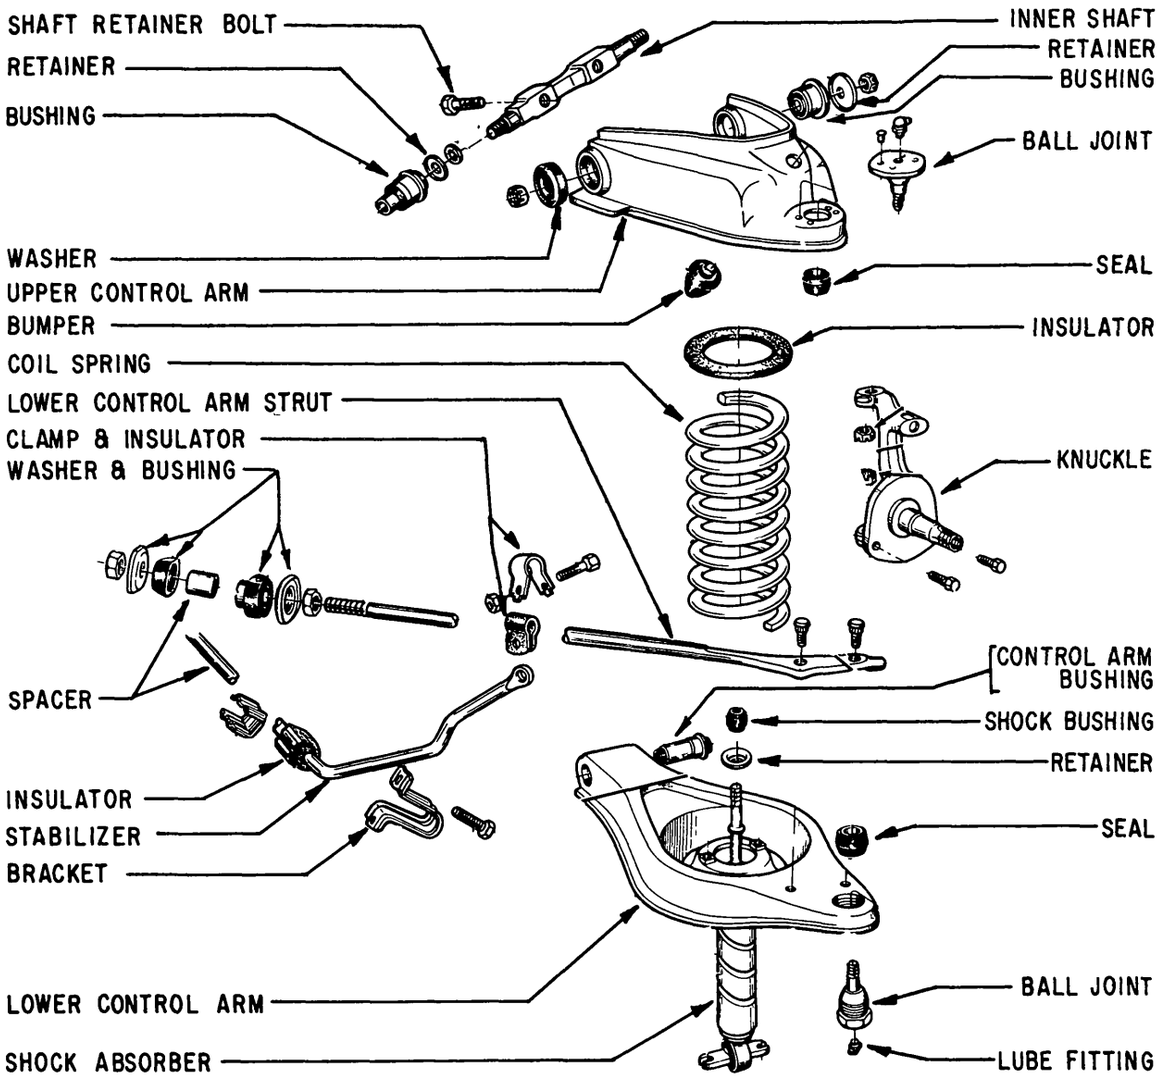
Tire Inflation: 22 lbs. with tires cold (front & rear). *NOTE - 6.50x15 Station Wagon rear tires should be inflated to 24 lbs.*

Steering Axis Inclination: 6½° at 0°camber. Not adjustable.

Caster: Neg. 1°40'±30'. To adjust, add or remove shims between upper control arm inner shaft and front crossmember side rail. *NOTE - If proper adjustment cannot be obtained by shimming, adjust length of strut rod. Caster is increased by lengthening rod and decreased by shortening rod. After adjustment of strut rod, tighten nut to 70-85 ft. lbs. and bend overlocking tab on two sides of nut.*

Camber: Pos. 0° 8' ±30'. Set camber on left side 0° 15' greater than on right side of car. Add or remove shims at both front and rear of upper control arm inner shaft as necessary to obtain correct camber.

Toe-In: 0-1/8".



Toe-Out on Turns: With inner wheel turned 20°, outer wheel should be 18-19°.

Riding Height: Front - 4 1/3"-4 1/2" measured between top of strut rod (front end) and lower control arm bumper bolt, directly in front of spring. **Rear** - 3 7/8" measured at a point directly behind spring between top of control arm and bumper attaching bolt.

REMOVAL & INSTALLATION

SHOCK ABSORBER REPLACEMENT: Support car on side rails so front suspension hangs freely and so that clearance is sufficient on front lower control arms to allow removal of shock absorber. Hold flat part of shock upper stud and remove nut, cup washer and grommet, then remove lower attaching bolts. Withdraw shock absorber and remove cup washer and grommet. To install, reverse removal procedures and tighten lower attaching bolts to 15-25 ft. lbs. Tighten upper nut to 5-10 ft. lbs. *NOTE - Upper nut must be bottom dat nd of thr ads.*

FRONT COIL SPRING REPLACEMENT: Remove shock absorber (see above), then remove strut rod-to-control arms nuts and lockwashers. *NOTE - Studs ar pr ss d into strut and strut is und r slight t nsi n fr m rubb r grommet on opposite end.* Place a jack stand under control arm and take up slightly on spring tension. Remove lower ball stud from steering knuckle with Tool J-6627, then raise hoist until spring is free and withdraw spring. *NOTE - A bar placed through control arm and into spring tower will retain spring and keep it from slipping free.* To replace, set rubber insulator in place in crossmember spring tower and place spring on control arm. Use a jack stand under outer end of control arm, then raise arm by lowering hoist. Install ball stud in steering knuckle and tighten nut to 55-70 ft. lbs. *CAUTION - D not back off nut wh n aligning hol s t install c tt r pin.* Attach strut rod to control arm and tighten nuts to 40-55 ft. lbs. *NOTE - D not chang positi n f large nuts at gromm t nd of strut as caster adjustment will b chang d.* Install shock absorber (see above).

PONTIAC TEMPEST FRONT SUSPENSION ASSEMBLY

LOWER CONTROL ARM REPLACEMENT: Remove shock absorber and coil spring, then remove control arm inner pivot nut, flat washer and bolt and remove control arm. To install, set control arm in position and install bolt washer and nut but do not tighten until coil spring and shock absorber have been installed and lowered to floor, then bounce car several times and tighten control arm pivot bolt to 75-90 ft. lbs.

UPPER CONTROL ARM REPLACEMENT: Support car at outer end of lower control arm, then remove wheel and tire assembly. Remove upper stud from knuckle with

CONTINUED ON NEXT PAGE

PONTIAC TEMPEST FRONT SUSPENSION (Continu d)

Tool J-6627. Remove two nuts retaining upper control arm shaft to front crossmember, noting the number of shims at each bolt. Remove sheet metal access hole plugs opposite control arm retaining bolts and remove bolts through access holes. To install control arm, reverse removal procedures and note the following: Install same number of shims as removed, between crossmember and pivot shaft at each bolt location, then tighten bolts to 55-70 ft. lbs. Install a new rubber seal on ball joint stud and tighten nut to 55-70 ft. lbs.

BALL JOINT REPLACEMENT: Lower Control Arm - With lower control arm in a vise, remove self-tapping joint from control arm with 1 9/16" socket. To install, start ball joint into control arm, then secure in place with a 1 9/16" socket. Install lube fitting and lubricate with chassis lubricant. Install a rubber cap over stud.

Upper Control Arm: Prick punch center of the four rivets and drill through the heads. Use a sharp chisel and cut off rivets, being careful not to enlarge holes in control arm. Tap rivets out with a punch and remove ball joint. To install, place a new joint against upper side of control arm and secure joint to arm with four special nuts and bolts furnished with replacement part. Tighten nuts to 10-12 ft. lbs. *CAUTION - Use only alloy bolts furnished for this op ration.*

STRUT ROD REPLACEMENT: Remove nuts securing rod to lower control arm, then remove nut, lock tab, washer and grommet from rear end of rod. Remove rod from crossmember bracket and remove rubber grommet, spacer, washer, lock tab and nut. Studs in end of rod are pressed in and can be removed by driving them out. To install, install forward nut on rear end of shaft and position it about 1" from end of threads. Install lock tab, washer, spacer and grommet. Place rod in position in crossmember bracket and install remaining grommet, washer, lock tab and nut, then snug up rear nut. Install rod on lower control arm and tighten nuts to 40-55 ft. lbs. Lower car to floor and adjust caster. Tighten nut at rear of rod to 70-85 ft. lbs. and bend over lock tabs on front and rear nuts.

FRONT SUSP ENSION CROSSM EMBER: Removal - *NOTE - Front crossm mb r can be removed as a complete unit including whe ls and brake assemblies, or after all compon nts hav b n r moved. It is suggested that front springs b r moved before disconnecting crossmember from car.* Raise car and install jack stands under crossmember assembly so as to support crossmember when disconnected from car, then install a suitable engine support. Remove wheels and disconnect steering linkage at toe rod ends. Disconnect engine mounts at crossmember and remove ground straps from crossmember on both sides. Disconnect brake lines at junction block on crossmember and fuel line from crossmember clip. Remove three crossmember retaining bolts, washers, and nuts at each side of crossmember, then raise car and remove crossmember.

Installati n: Reverse removal procedures and note the following: Tighten crossmember attaching bolts to 70-85 ft. lbs., engine mount bolts to 30-45 ft. lbs. and tie rod end nuts to 55-70 ft. lbs. *NOTE - Do not back off nuts when aligning holes to install cotter pins.*

RAMBLER FRONT SUSPENSION

Rambler Am rican, S ri s 6101 (1961)
Rambler Classic 6 & V8, Series 6110 & 6120 (1961)
Rambler Ambassador, Series 6180 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*LOWER CONTROL ARM THROUGH BOLT TIGHTENING CAUTION:* The lower control arm through bolt which also acts as the front shock absorber lower anchor (on all models) is specially heat treated and must be properly tightened to 110-125 ft. lbs *DO NOT REPLACE THIS BOLT WITH ONE THAT IS NOT HEAT TREATED.*

►*TOE-IN ADJUSTMENT NOTE (Cars with Power Steering):* Operate engine to permit steering pump oil pressure to center valve spool in control valve assembly before checking or adjusting toe-in.

►*CAR LEVELING NOTE (EXCEPT AMERICAN):* On 1956-61 cars, an aluminum alloy front spring spacer (¼" thick), Part No. 3202359, is available to assist in leveling a car that leans at right or left front corner. Install spacer on spring seat with spring cushion and spring resting on spacer. *CAUTION - If two spacers are used, install one spacer on upper spring seat and one on lower spring seat.* The addition of one spacer will raise affected corner approximately ½".

DESCRIPTION: Basic design is similar to that used on previous models Upper control arms are connected to steering knuckles by trunnion assemblies. On Rambler American, the upper trunnion assembly is integral with front spring lower support. On other models, coil spring lower support is threaded on upper trunnion.

CHECKING & ADJUSTING: *CAMBER & CASTER ADJUSTMENT NOTE - Eccentric bolts at inner end of lower control arms (series 10, 20 & 80), shims between lower control arm shaft and frame (American), control camber and caster adjustments.*

Tire Inflation: 24 lbs. Front & Rear (Exc. 6180), 22 lbs. (6180 Front), 20 lbs. (6180 Rear). Cold.

►*CAPTIVE AIR TIRE PRESSURE NOTE:* 29 lbs. (Inner Chamber), 24 lbs. (Outer Chamber). All models.

Steering Axis Inclination: 8° (American), 6½° (Others).

Cast r (Series 10, 20 80): Except Power St ring - 0° to Pos. ½° (Pos. ½° preferred). **Power Steering** - Pos. ½° to Pos. 1° (Pos. 1° preferred).

Caster (American Series 01): Except Power Steering - 0° to Pos. ½° (Pos. ½° preferred). **Power Steering** - Pos. 1½° to Pos. 2° (Pos. 2° preferred).

Camber: Neg. ¼° to Pos. ¼° (0° preferred). *See "Camber & Caster Adjustment" below.*

►*CAMBER & CASTER ADJUSTMENT (SERIES 10, 20 & 80):* Lower control arm attaching bolts are provided with eccentric washers, one being attached to the bolt and the other keyed to threaded end of bolt. Loosening attaching bolt nut will permit turning the bolt and eccentrics for adjustment of camber and caster. Adjust caster first, using one bolt as necessary, then adjust camber, turning both bolts equally as required.

►*CAMBER & CASTER ADJUSTMENT (RAMBLER AMERICAN):* "U" type spacers are installed between lower control arm pivot bar and mounting surface. Increasing number or thickness of spacers at either front or rear mounting bolt permits adjusting caster angle. Increasing or decreasing equally at both front and rear bolts will change camber angle. *NOTE - Lower control arm pivot bar brace must be loosened before making camber or caster adjustments. When reinstalling brace, tighten attaching bolts to 90-95 ft. lbs.*

Toe-In: 1/16-3/16" (Exc. Series 20 & 80); 3/16" (Series 20 & 80). On all models (Exc. Series 20), loosen clamps and rotate adjusting tube on each front wheel tie rod equally in opposite directions. On Series 20, loosen clamps and rotate adjusting tube on steering drag link adjacent to right side idler lever. Adjust steering wheel for correct spoke position by rotating adjusting tubes equally in same direction (Exc. Series 20), by rotating adjusting tube on pitman arm-to-steering arm link (Series 20).

►*TOE-IN ADJUSTING TUBE CLAMP POSITIONING FOR MAXIMUM CLEARANCE:* Open end of clamp should be toward REAR (Exc. Series 20); toward FRONT (Series 20) when clamp bolt is tightened.

Toe-Out on Turns: With inner wheel at 25°, outer wheel should be 21½° (American), 22° (Others).

REMOVAL & INSTALLATION: *See 1958 Annual Data, Page 355, or later Manual editions.*

RAMBLER (EXCEPT AMERICAN) REAR SUSPENSION

Rambler, All Series Exc. American (1961)

DESCRIPTION: Rear springs are mounted between seats on rear axle housing and seats on car underbody and are held in position by weight of car on springs and by extended limits or shock absorbers A rear stabilizer bar connected between car underbody on right side and a bracket on left side of rear axle housing prevents prevents lateral movement of rear axle assembly. Shock absorbers are mounted adjacent to rear springs on forward side of rear axle housing and are connected to a bracket on rear axle housing and to car underbody assembly. Rear wheel driving force is transmitted to car body by a torque tube between rear axle housing and transmission.

SHOCK ABSORBERS: Removal - Disconnect shocks from car underbody and from bracket on rear axle housing and remove shock.

Installation: Reverse removal procedure.

REAR COIL SPRINGS: Removal - Raise and support rear of car with a jack stand placed under car underbody, then raise rear axle assembly to approximately normal ride position. Disconnect shock absorbers at bracket on rear axle, then lower rear axle sufficiently to free springs from seats. Springs can then be lifted out. *CAUTION* - When lowering rear axle assembly be careful not to lower it to the point where a strain will be placed on torque tube connection at transmission.

Installati n: Reverse removal procedure.

STUDEBAKER FRONT SUSPENSION

Studebaker (1961)

►*1961 LARK (EXC. POWER STEERING) TOE-IN SPECIFICATION CHANGE:* Toe-In should be set to 3/16-1/4". This setting supersedes previous setting of 1/16-1/8".

DESCRIPTION: Front suspension design is the same as used on previous models.

ADJUSTMENT: Before checking or adjusting front wheel, alignment, inflate tires to correct pressure, check adjustment of front wheel bearings and check steering gear and linkage for excessive looseness. Make the necessary corrections.

Tire Inflation: Front – 24 lbs. (Exc. Sta. Wgn.); 26 lbs. (Sta. Wgn.); **Rear (5.90 x 15)** – 20 lbs. (Exc. Sta. Wgn.); 26 lbs. (Sta. Wgn.). **Rear (6.40–15)** – 20 lbs. (Exc. Sta. Wgn. & Taxi); 24 lbs. (Sta. Wgn.); 22 lbs. (Taxi).

Rear (6.70 x 15) – 20 lbs. (Exc. Sta. Wgn.); 24 lbs. (Sta. Wgn.).

►*CAPTIVE AIR TIRE NOTE:* **Front** – 24 lbs. **Rear** – 22 lbs. (Sta. Wgn. with "Hide-A-Way" third seat.)

Kingpin Inclination: 6° at 0° Camber. Not adjustable.

Caster: Pos. ¼° to Neg. 1¼° (Lark); Neg. 1½° to Neg. 3° (Hawk), with not more than ½° variation between wheels. *NOTE - Adjust caster before making camber adjustment.* To adjust caster, loosen kingpin clamp bolt, then remove lubrication fitting from rear bushing at upper control arm outer pin. Insert an Allen wrench into pin and turn it until proper caster is obtained (a full turn will change caster ½°).

Camber: 0° to Pos. 1° (½° greater camber is desired on left side). To adjust camber (after caster adjustment completed), turn outer pivot pin using an Allen Wrench to obtain desired setting. *NOTE – ½ turn of the pin covers entire range of camber adjustment.*

Toe-In: 3/16-1/4" (Lark, except Power Steering); 1/16-1/8" (Hawk, all models & Lark with Power Steering). Adjust as follows: With steering gear cam lever shaft on high point of cam (steering wheel spoke straight across) and left wheel in straight ahead position (adjust left hand tie rod to bring wheel into straight ahead position if necessary). Adjust **right hand** tie rod to obtain desired setting.

Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 23½° to 24½°. Not adjustable.

REMOVAL & INSTALLATION: *See 1957 Annual Data, Page 351, or later Manual editions.*

1961 FRONT WHEEL BEARING ADJUSTMENT

BUICK & BUICK SPECIAL

Tighten spindle nut to 15 ft. lbs. while turning wheel, then back off nut and retighten to 10 ft. lbs. If cotter pin holes do not line up, back off nut 1/6 turn (Buick Special); 1/12 turn (Exc. Buick Special). Do not back nut off more than 3/12 turn (Buick Special); 1/6 turn (Exc. Buick Special). Install cotter pin.

CADILLAC

Rotate wheel and tighten adjusting nut to 30 ft. lbs., then back off nut ¼ turn and install cotter pin. *NOTE - If cotter pin cannot be installed in either of the two spindle holes, loosen adjusting nut and back off as necessary.*

CHEVROLET PASS. CARS & CORVAIR

While rotating wheel, tighten spindle nut to 20 ft. lbs. (Chevrolet Pass. Cars); 80 inch lbs. (Corvair, all models), then back off adjusting nut one flat (Exc. Corvair 1200 Series); one half flat or less (Corvair 1200 Series). Install cotter pin.

CHEVROLET TRUCKS

While rotating hub, tighten spindle nut to 33 ft. lbs. (Series 10-40); 40 ft. lbs. (Series 50-60), then back off adjusting nut to nearest hole in spindle (ball bearings); 1/6 turn (taper roller bearings). Install cotter pin.

CHRYSLER, DESOTO, DODGE, PLYMOUTH, LANCER & VALIANT

Tighten wheel bearing adjusting nut to 90 inch lbs. (Chrysler & DeSoto); 180 inch lbs. (All others) and position locknut on nut with one pair of slots in line with cotter pin hole, then back off lock and adjusting nut to next slot (Chrysler & DeSoto); 1½ slots (All others). On Chrysler & DeSoto, install cotter pin. On all others, remove nut lock and reposition it on adjusting nut so cotter pin can be installed, then install cotter pin.

COMET, FORD (EXC. THUNDERBIRD), FALCON, MERCURY & ECONOLINE TRUCKS

Rotate front wheel hub and tighten adjusting nut to 11½-12½ ft, lbs. (Ford, Falcon, & Econoline Trucks); 11-14 ft. lbs. (Comet & Mercury), then back off adjusting nut at least one castellation, but not more than two. Line up nearest slot in nut with cotter pin hole and install cotter pin.

FORD TRUCKS (EXC. ECONOLINE)

With front wheel rotating, tighten adjusting nut until a noticeable drag is felt, then back off adjusting nut at least one but not more than two castellations. Lock adjusting nut in this position with cotter pin.

LINCOLN

With adjusting nut lock removed, tighten adjusting nut to 15-20 ft. lbs., then position nut lock on adjusting nut so that a set of slots in nut lock are in line with cotter pin holes in spindle. Back off nut lock and adjusting nut together until next set of slots line up with cotter pin, then install cotter pin.

THUNDERBIRD

With adjusting nut retainer removed, tighten adjusting nut to 11½-12½ ft. lbs. with wheel rotating, then back off adjusting nut so that endplay clearance is .001-.007". Position nut retainer on nut and align set of slots with cotter pin hole. *NOTE - Do not rotate adjusting nut when installing nut retainer.*

OLDSMOBILE SERIES 88, S88 & 98

Tighten adjusting nut to 17 ft. lbs., then back off nut and retighten to 4 ft. lbs. If necessary, back off adjusting nut to nearest cotter pin slot and hole for installation of cotter pin..

OLDSMOBILE F-85

With wheel rotating, tighten adjusting nut to 10-15 ft. lbs., then back off 1/6 to 1/4 turn maximum and install cotter pin.

PONTIAC (EXC. TEMPEST)

Tighten adjusting nut to 27 ft. lbs., then back nut off to "finger loose" and retighten to 25-35 inch lbs. If slot in nut does not line up with hole in spindle, tighten nut only enough for installation of cotter pin in first hole. *CAUTION - Do not exceed 110 inch lbs.*

PONTIAC TEMPEST

While rotating drum, tighten adjusting nut to 10-12 ft. lbs., then back nut off one flat. If cotter pin holes do not line up, continue to back off adjusting nut to near-hole. *NOTE - Final adjustment should be 1 - 1½ flats backed off from initial tightened position.*

RAMBLER

Rotate wheel and tighten adjusting nut until it is firmly seated and causes a drag on wheel. Back off adjusting nut to first castellation or until cotter pin hole is aligned, then install cotter pin. *NOTE - Wheel must be free to rotate without play in hub and bearings.*

WILLYS 2-WHEEL DRIVE

Rotate wheel and tighten adjusting nut until wheel binds, then back off adjusting nut 1/6 turn. If necessary, back nut off further for installation of cotter pin.

STEERING LINKAGE

►*POWER STEERING LINKAGE NOTE:* Linkage on these cars is essentially the same as linkage for manual steering cars.

AMERICAN MOTORS

Rambler (All Series): Linkage – Except on Series 20, relay rod is connected between pitman arm and steering idler arm with tie rod on left side connected between pitman arm and steering arm. On right side, tie rod is connected between idler arm and steering arm. On Series 20, relay rod is connected between idler arm at each frame side rail and steering arm at right and left sides of car. A tie rod at forward side of suspension crossmember connects pitman arm to steering arm. Ball and socket joints are adjustable on Series 01, 10, & 80 and are not adjustable on Series 20.

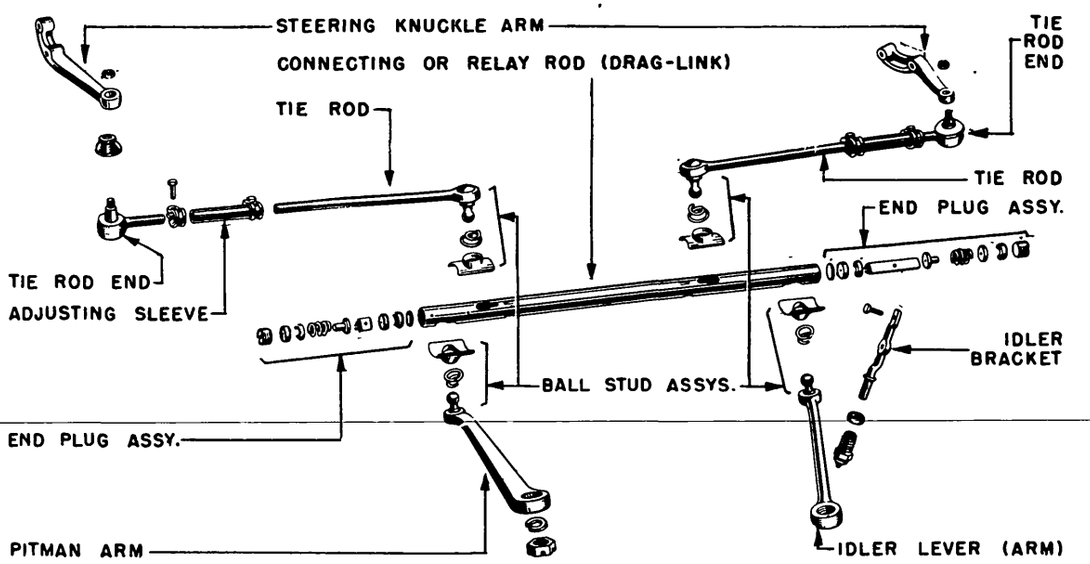
Ball & Socket Joint Adjustment – Tighten adjusting plug until solid contact is made, then back off plug to first cotter pin hole, not to exceed ¼ turn or less than 1/8 turn. *NOTE – On Series 10 pitman arm side, tighten and plug solid, then back off 1½–2 turns.*

CHRYSLER CORP.

Chrysler, Imperial, DeSoto, Dodge, Dart, Lancer, Plymouth, Valiant: Linkage – Consists of idler arm bracketed to right frame side member and connected to right end of drag link. Pitman arm is connected to left end of drag link. Individual tie rods, connected to drag link near its center, have sleeve adjustment for toe–in.

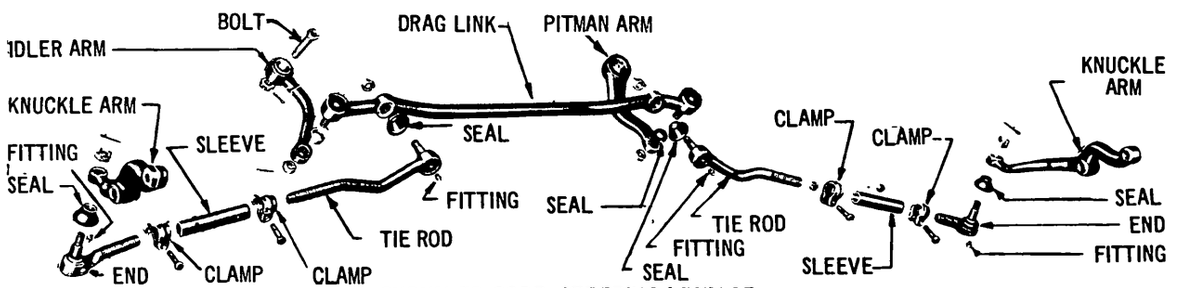
Idler Arm Bushing Replacement – Idler arm with bushing is serviced only as an assembly. When bushing worn, replace assembly. Opening in idler arm bracket between idler arm bushing positions or contact points should be 2¼". Bend bracket to correct.

FORD MOTOR CO.



Comet, Falcon, Ford Pass. Cars, Lincoln, Mercury, Thunderbird: Linkage – Consists of steering (pitman) arm–to–idler arm rod which transmits motion from steering gear through steering arm which is attached to left end of steering arm–to–idler arm rod, then to front wheels through the tie rods. Tie rods have adjustable sleeves on outer ends for toe–in adjustment. An idler arm is attached to right side of underbody.

Tie Rod End Replacement – *NOTE – Idler (intermediate) rod ends are not replaceable. Complete rod assembly should be replaced when rod ends are worn.* Remove nut from ball end stud, then place a support behind arm near stud and tap with a soft hammer to drive it out of arm. *CAUTION – DO NOT use a wedge type ball stud separator because of special design of ball studs.*



Idler Arm & Bushing Replacement – Idler arm and bushing are replaced as an assembly. Bushing is not replaceable separately. *NOTE – Replace idler arm bracket if threads are worn or bracket is bent. DO NOT attempt to straighten a bent idler arm bracket.*

Ford Trucks: Linkage – Consists of a connecting rod between front wheels. Rod has adjustable features at both ends. Spindle arm, attached to connecting rod at left end, is in turn attached to a one–piece drag link with manual adjustment features at both ends. Rear of drag link is attached to sector shaft arm.

Drag Link Adjustment – Remove cotter pins from each end of drag link. Tighten each drag link plug until drag link ball springs are fully compressed. Back off each plug to first cotter pin hole, then install new cotter pins.

GENERAL MOTORS STEERING LINKAGE (TYPICAL)

CHRYSLER CORP. STEERING LINKAGE

GENERAL MOTORS

Buick (Except Special): Linkage – Parallelogram type linkage consisting of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each front wheel. Adjustable sleeves at end of each tie rod for toe–in adjustment. Intermediate rod end plug adjustment provided at pitman arm end of intermediate rod on manual steering cars only.

Idler Lever & Support Adjustment – In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is 2 15/16–3 1/16".

Intermediate Rod End Plug Adjustment (Pitman Arm End On Manual Steering Cars) – With socket bearings properly seated around pitman arm socket, tighten end plug tight, then back out 4±1/8 turns and install cotter pin. *CAUTION – If end plug is tight before head is flush with end of rod, check for improper positioning of bearings around ball stud.*

Buick Special: Linkage – Parallelogram type linkage consisting of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each front wheel. Adjustable sleeves at end of each tie rod for toe–in adjustment. Intermediate rod end plug adjustment provided at both pitman arm and idler lever ends of intermediate rod on both manual and power steering cars.

Idler Lever & Support Adjustment – In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is ½".

Intermediate Rod End Plug Adjustment – Adjust plugs on both pitman arm and idler lever ends of intermediate rod as follows: Turn end plug up tight, then back off plug ¼–¾ turn (½ turn preferred) and install cotter pin.

Cadillac: Linkage – Consists of a drag link between steering gear pitman arm and idler arm mounted on right frame side rail, and individual tie rods between drag link and each wheel. Adjustable sleeves at outside ends of tie rods for toe–in adjustment. No. ad-

CONTINUED ON NEXT PAGE

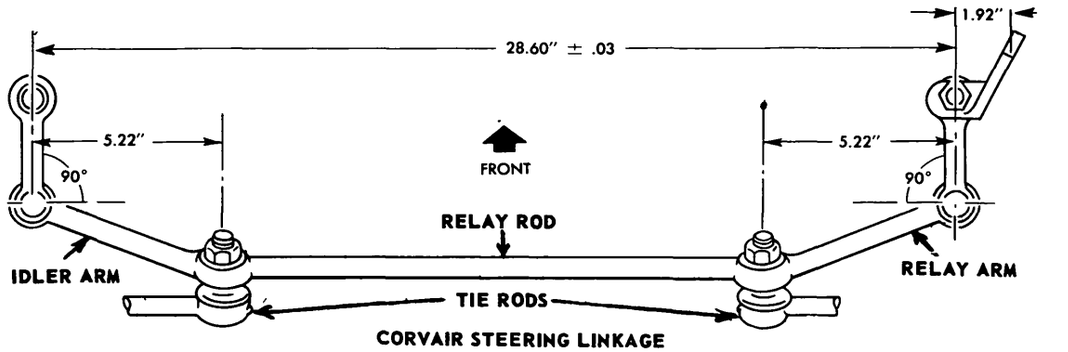
STEERING LINKAGE (C nt.)

justment plugs are provided at drag link ends as drag link is attached to idler and pitman arms by spherical pivots.

Drag Link Height Adjustment – Place a straight bar across two adjustable jacks directly below drag link. Adjust height of jacks so distance from top of bar to centerline of lower control arm pivot bolts is equal on both sides (adjust jacks so distance is an even number of inches). Measure distance from top of bar to lower edge of drag link on both sides using a combination square and level with bubble centered in level. *CAUTION – Do not reposition bar or move car.* Difference in measurement between 1st measurement (top of bar to centerline of lower control arm pivot bolts) and 2nd measurement (top of bar to lower edge of drag link) should be 2 15/16"±1/16" and equal at both inner pivot points within 1/16". If idler arm end of drag link not within limits, loosen idler arm support mounting screws and move support. If proper adjustment still not obtainable, remove and bend idler arm slightly. If pitman arm end of drag link not within limits, loosen steering gear mounting bolts and move gear. If proper adjustment still not obtainable, remove and bend pitman arm slightly. *CAUTION – Bend pitman and idler arms off the car and cold.*

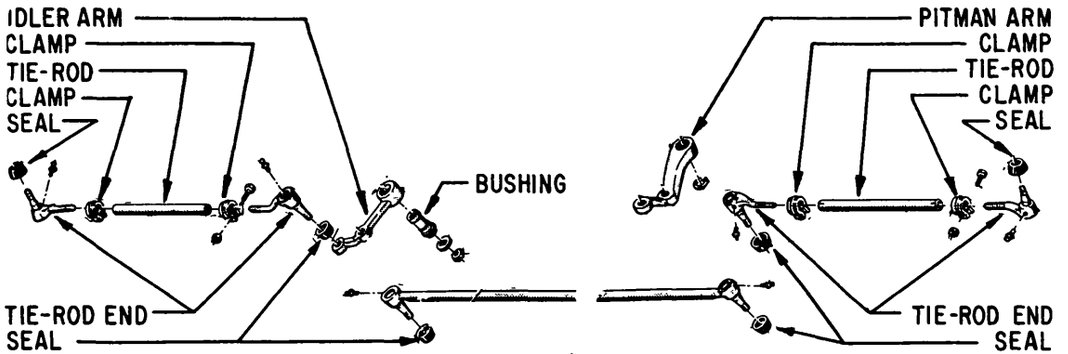
Chevrolet Pass. Cars: Linkage – Consists of steering relay rod between pitman arm and idler arm. Pitman arm connected to relay rod by an adjustable ball and socket joint. Individual adjustable tie rods are installed between relay rod and each front wheel.

Relay Rod Ball Joint Adjustment – Remove cotter pin from end of relay rod and tighten end plug until springs are compressed and plug bottoms. Back off end plug ¾ turn plus amount necessary to insert cotter pin, then insert pin.



Idler Arm Inspection – Remove idler arm from bracket and remove relay rod from idler arm. Remove idler arm stud seals and all grease, then inspect idler arm for damage or wear. Place idler arm in vise, turn nut on stud until nut bottoms on threads. Torque to turn stud should be not less than 1 ft. lb., nor more than 10 ft. lbs. Replace idler arm when turning torque not within limits.

Chevrolet Trucks: Linkage – Consists of two tie rod assemblies connected between pitman arm and wheel on left hand side and between idler arm and wheel on right hand side. A relay rod is connected between pitman arm and idler arm.



Idler Arm Inspection–*See "Chevrolet Pass. Cars" above.*

Idler Arm Bushing Replacement – *NOTE – On Series 10 through 40, idler arm bushing is not replaceable.* On Series 50 & 60, remove idler arm, then press bushing out with Tool J–1614. *NOTE – When pressing bushing from housing, pressing tool must thread down through one bushing and onto top of lower bushing. After pressing this bushing out, turn support housing over and press second bushing out. Always press from inner rim of bushing toward outside of housing.* Press new bushing into place with Tool J–7079–2 and J–8522. Bushings will be properly located in bore when pressed in until tool contacts housing.

Corvair: Linkage – Consists of a relay rod connected between pitman arm and steering idler arm located on right hand side of frame. Tie–rods are connected between relay rod and each front wheel. Bushing on pitman arm end of relay rod is replaceable.

CORVAIR STEERING LINKAGE

COMET & FALCON STEERING LINKAGE (OTHER FORD MOTOR SIMILAR)

Relay Rod Bushing Replacement – With relay rod removed from car, drive bolt out of bushing, then use a suitable size socket to press bushing sleeve and rubber out of relay rod. Press a new bushing into place with Tool J–8357. *CAUTION – When installing relay rod in car, idler arm and pitman arm must be in proper alignment (see illustration). Be sure to hold hex head of bushing bolts so bushing will not be twisted.*

Oldsmobile (Except F–85): Linkage – Consists of steering relay rod between pitman arm and idler arm, bracketed to right frame side rail. Individual adjustable tie rods are attached to center portion of steering relay rod and are provided with adjustable sleeves for toe–in adjustment. Toe–in adjustment is the only adjustment necessary for steering linkage.

Oldsmobile F–85: Linkage – Consists of steering relay rod between pitman arm and idler arm which is bracketed to right frame side rail. Individual adjustable tie rods are attached to relay rod and are provided with adjustable sleeves for toe–in adjustment.

Relay Rod End Plug Adjustment – Thread plugs into relay rod until tight, then back off ¼–¾ turn and install cotter pin with head to front of car.

Idler Arm & Support Adjustment – Thread idler arm support with seal into bushing until distance from upper face of idler arm to shoulder of support is ½". *NOTE – Idler arm must be able to rotate 90° in each direction from straight ahead position.*

Pontiac & Pontiac Tempest: Linkage – Consists of steering connecting rod between pitman arm and idler arm, bracketed on right frame side rail, and individual adjustable tie rods between steering connecting rod and each front wheel. Tie rods have adjusting sleeves at outer ends for toe–in adjustment.

Idler Lever & Support Adjustment – With lever and support off car, thread idler support into bushing until distance between upper face of idler arm and shoulder at thread end of idler support is 11/16".

STUDEBAKER-PACKARD

Studebaker Lark & Hawk: Linkage – Consists of two adjustable tie rods attached to bellcrank mounted at center of frame crossmember. Bellcrank is attached to steering gear pitman arm by a reach rod (drag link).

Bellcrank Bearing Adjustment – Insert shims between lower thrust washer and shaft until there is no end-play. Shaft should turn freely in bearings. Lock nut securely with cotter pin.

WILLYS MOTORS

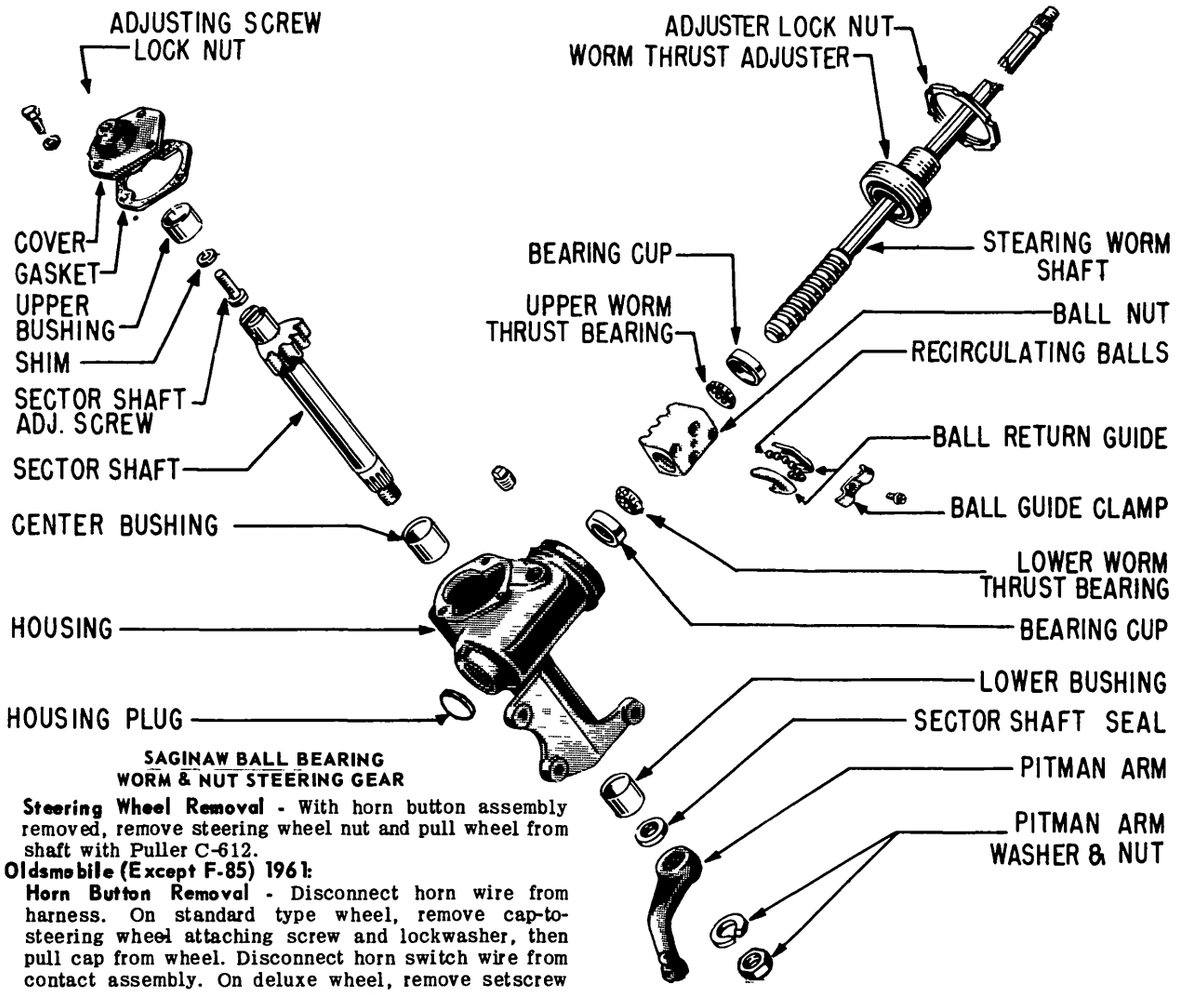
Willys (All Models): Linkage – Bellcrank on frame crossmember linked to each front wheel by adjustable tie rods and to steering gear pitman arm by a steering connecting rod (drag link).

Connecting Rod End Plug Adjustment – On idler arm end of connecting rod, screw plug in firmly against ball, then back off ½ turn (except FC–150), 1/8–1/4 turn (FC–150), and install cotter pin. On pitman arm end, screw plug in firmly against ball, then back off 1 full turn (except FC–150), 1/8–1/4 turn (FC–150) and install cotter pin.

SAGINAW WORM & NUT
(Continued)

Chevrolet Trucks 1961:
Steering Wheel Removal - Remove horn button and steering shaft nut and washer. Install a puller (J-2927) into threaded holes in steering wheel hub. Remove steering wheel.

Corvair Cars & Trucks 1961:
Steering Wheel Removal - Pry out horn button, then remove screws holding receiver cup and bushing spacer to steering wheel and remove flat bellville spring. Remove nut and washer from steering shaft and insert a puller (J-2927) into threaded holes in steering wheel hub. Remove steering wheel. *CAUTION - Do not lose spring or seat on shaft under steering wheel.*



Comet & Falcon 1961:
Horn Button Removal - Disconnect horn wire under instrument panel at left side of steering column, then press down on horn button or ring and turn counterclockwise until it lifts out of steering wheel. Remove horn button and spring, then remove steering wheel (see below). Remove turn indicator lever and indicator mechanism retaining screws, and lift mechanism to one side. Remove screws retaining horn button contact and pull wire and contact from steering column.
Steering Wheel Removal - Remove horn button or ring (see above), then remove steering wheel nut and pull wheel from shaft with Puller 3600-AA or 3826 (Comet), 3600-N (Falcon).

Ford Pass. Cars 1961:
Horn Button Removal - Disconnect horn wire at bullet connector under instrument panel, then push down on horn ring assembly and turn counterclockwise until it lifts out. Remove horn ring spring and horn ring contact brush, then remove steering wheel (see below). Remove wire cover on left side of steering column, then remove two contact retaining screws and remove contact and wire assembly.
Steering Wheel Removal - With horn ring, spring and horn contact brush removed (see above), remove steering wheel with Puller 3600-AA.

Ford Trucks 1961:
Steering Wheel Removal - Disconnect horn wire at instrument panel or at horn relay. Press down on horn button or ring and turn counterclockwise until it lifts out, then remove horn button and spring. Remove steering wheel nut and remove steering wheel with Puller 3600-N (Econoline), 3600-AA (Others).

Mercury 1961:
Horn Button Removal - Remove horn ring or steering wheel hub cap by pressing down and turning counterclockwise. Remove steering wheel (see below), then remove horn contact plate and brush assembly.
Steering Wheel Removal - With horn ring and related parts removed, remove nut from steering shaft and remove steering wheel Puller 3600-AA or 3826.

Lancer & Valiant 1961:
Horn Button Removal - Disconnect negative ground cable from battery, then rotate horn button ¼ turn counterclockwise and remove button. Remove three screws and bushings from horn button base and remove horn ring. Disconnect wire from horn switch and remove base or switch.

SAGINAW BALL BEARING WORM & NUT STEERING GEAR

Steering Wheel Removal - With horn button assembly removed, remove steering wheel nut and pull wheel from shaft with Puller C-612.

Oldsmobile (Except F-85) 1961:
Horn Button Removal - Disconnect horn wire from harness. On standard type wheel, remove cap-to-steering wheel attaching screw and lockwasher, then pull cap from wheel. Disconnect horn switch wire from contact assembly. On deluxe wheel, remove setscrew if present, then pry cap and emblem assembly from shroud. On all models, remove steering wheel (see below). On deluxe wheel, disconnect horn switch wires from contact assembly lead, then remove the four shroud attaching screws and shroud. Remove staking from wheel hub and remove contact assembly from steering wheel.
Steering Wheel Removal - With cap and emblem removed (see above), remove steering wheel nut, then pull wheel with Puller BT-61-9.

Oldsmobile F-85 1961:
Steering Wheel Removal - On standard wheel, remove cap by loosening attaching screw with a Phillips screwdriver inserted into access hole in side of cap, then slide cap off wheel. On deluxe wheel, pry cap from wheel. Disconnect horn wire and remove nut and washer from steering shaft. Pull steering wheel from shaft with Puller BT-61-9.

Pontiac (Except Temp st) 1961:
Steering Wheel Removal (Std. Wh l) - Pry horn button out, remove horn button retainer, contact ring, pivot contact, spring and insulator. Remove steering shaft nut and washer and contact plate. Remove steering wheel with Puller J-3044. Remove coil spring and seat from shaft.
Steering Wheel Removal (Deluxe Wheel) - Twist and lift out steering wheel ornament. Remove lock nut, retaining nut, and washer from steering shaft, then pull horn ring and contact assembly from shaft. Remove contact assembly from horn ring. Remove pivot contact, spring and insulator from steering wheel hub, then pull steering wheel with Puller J-3044. Remove coil spring and seat from shaft.

Pontiac Temp st 1961:
Steering Wheel Removal - Lift ornament out and remove both nuts and washer from steering shaft. Remove

CONTINUED ON NEXT PAGE

SAGINAW WORM & NUT (C ntinu d)

horn ring or receiver cup, then remove pivot ring and bellville spring. Remove contact assembly. Pull steering wheel with Puller J-3044-01.

Rambler 1961:

Steering Wheel Removal - Remove horn ring or button and pull steering wheel from steering shaft with Puller J-5290.

Studebaker 1961:

Ste ring Wh l R m val - Pry out steering wheel cap, then remove horn ring retaining screws and remove ring and insulators. Remove steering wheel retaining nut and lock plate. Pull steering wheel from shaft with an adapter and Puller J-5473.

Valiant 1961: *See "Lancer & Valiant 1961" above.*

STEERING GEAR REMOVAL & INSTALLATION

►*STEERING GEAR INSTALLATION NOTE: To install steering g ar assembly, reverse removal procedures.*

Buick (Except Special) 1961: Removal - Disconnect flexible coupling from steering shaft flange. Remove pitman arm. Remove left fender skirt baffle. Remove steering gear. *NOTE - Som cars have .030" spacers under steering gear attaching bolts which must be replaced when steering gear installed.*

Buick Special 1961: Removal - *NOTE - Pitman arm cannot be r moved or installed with steering gear installed on crossmember. If pitman arm is to be removed from gear, loosen pitman arm nut before disconnecting gear from crossmember. When installing gear, do not tighten pitman nut until after steering gear is installed on crossmemb r.* Remove lower coupling clamp bolt and nut, then loosen clamp retaining mast jacket to toe pan cover and "U" bolt retaining jacket to instrument panel. Pull mast jacket assembly up far enough so lower coupling can be removed from worm shaft. Raise car and disconnect pitman arm from intermediate rod, then loosen pitman arm nut with Tool J-8987. Remove steering gear-to-crossmember attaching bolts and remove gear assembly. *NOTE - Do not remove pitman arm from shaft unl ss pitman shaft assembly or seal is to be r moved.*

Ch vrolet Pass. Cars 1961: Removal - Remove pitman arm (Tool J-6632 or J-5504). Remove splash pan, then remove steering gear-to-frame bolts and shims. Remove coupling clamp bolts and remove steering gear and shaft from under car.

►*CHEVROLET LOWER COUPLING REPLACEMENT NOTE:* If lower coupling is to be removed, it will be necessary either to lower the steering gear from its original position, or the mast jacket, upper steering gear shaft, coupling and intermediate shaft must be loosened and pulled up far enough to permit coupling to be removed from worm shaft.

Chevrolet Trucks 1961: Removal - Loosen bolt attaching lower end of intermediate shaft to steering gear, then disconnect pitman arm from steering shaft, using Puller J-6632. Remove all steering gear-to-frame attaching bolts and remove steering gear.

C rvair Pass. Cars 1961: R m val - Remove pitman arm with Tool J-6627, then disconnect coupling, remove gear attaching bolts, and remove gear by sliding it forward and down.

C rvair Trucks 1961: R moval - Remove bumper and left front outer extension panel. Remove steering connecting rod from pitman arm. Remove steering wheel (see above). Remove direction signal assembly and mast jacket-to-dash clamp. Remove steering gear attaching bolts and remove steering gear.

Comet & Falcon 1961: Removal - Raise front of car and place on stands, then remove pitman arm from sector shaft. Remove steering gear bolts from underbody and disconnect transmission shift rods at shift levers. Pull rubber seal up on steering column and fold floor mat aside. Move dash panel insulation out of way, then remove retaining screws from steering column weather seal on dash panel and remove column cover plates and gasket. Disconnect horn and direction signal wires under instrument panel. Also disconnect neutral switch wires. Remove steering wheel (see above). Remove upper bearing sleeve and spring, then remove turn indicator lever. Remove steering column clamp-to-instrument panel bolts and remove clamp (upper and lower halves) and remove insulator. Slide steering column tube assembly from steering shaft, guiding shift levers up through rubber seal at dash panel. Remove steering gear and shaft assembly out toward front through engine compartment.

Ford Pass. Cars 1961: Removal (Without Flexible Coupling) - Remove pitman arm from sector shaft and disconnect muffler inlet pipe if necessary. Remove steering gear attaching bolts. Disconnect neutral switch wires at switch and loosen steering column lower clamp. Disconnect shift levers from gearshift connecting rods. Remove steering wheel (see above) and disconnect horn and direction signal wires. Remove steering shaft upper bearing sleeve and spring. Disconnect steering column-to-instrument panel bracket and remove selector dial indicator cover and control selector indicator. Remove steering column weather seal screws and place both halves of steering column opening cover plate out of way. Remove steering column tube assembly, then remove steering gear and shaft through passenger compartment.

Removal (With Flexible Coupling) - Remove pitman arm from sector shaft and disconnect muffler inlet pipe if necessary. Remove steering gear attaching bolts and flexible coupling clamp bolt. Remove steering gear.

Ford F-100 & F-250 Trucks 1961: Removal - Disconnect horn wire from bullet connector below instrument panel, loosen steering column lower clamp and slide clamp down. Disconnect remote control shift control rods at shift levers. Remove steering wheel (see above). Remove steering column upper bushing spring and bushing. Disconnect direction signal wires and remove from retaining clip. Remove steering column bracket clamps and rubber sleeve. On floor mounted gearshift lever models, pull steering column tube off shaft. On remove control shift models, remove steering column shields from floor pan. Remove engine oil filter on V8 trucks. Remove exhaust pipe from exhaust manifold if necessary on 6 Cyl. trucks. Disconnect clutch retracting spring and remove clutch equalizer shaft outer bearing bracket and shaft (do not loosen the four split bearings). Remove inner bearing bracket. Remove pitman arm from sector shaft and wedge sector shaft opening in arm if necessary. Remove steering gear attaching bolts and remove gear from under truck (floor mounted gear shift lever), through passenger compartment (remote control shift lever). Loosen steering column tube lower clamp and remove tube.

F rd Ec n lin Trucks 1961: Rem val - Disconnect horn and direction signal wires under instrument panel and free them from retaining clip. Fold floor mat out of way, pull up rubber seal, and remove steering column floor pan cover. Remove steering column-to-instrument panel clamp, disconnect transmission shift rods from shift tube arms. Remove steering gear attaching bolts, and pitman arm attaching bolt and nut. Spread pitman arm and partially remove it from sector shaft, then remore steering gear from pitman arm. Lift steering column, shift tube, and steering gear assembly out through passenger compartment.

Mercury 1961: Removal (Without Flexible Coupling) - *See "Ford Pass. Cars 1961" above.*

Removal (With Flexible Coupling) - *See "Ford Pass. Cars 1961" above.*

Lancer & Valiant 1961: Removal - Raise car and remove pitman arm, then remove bolts attaching steering gear to frame. Remove bolt from coupling clamp at upper end of steering worm shaft, then support steering gear and tap coupling assembly upward with a mallet until it is free from shaft splines. Remove steering gear.

Oldsmobile (Except F-85) 1961: Removal - Remove steering wheel (see above), upper bearing spring and seat, then remove mast jacket cover plate from toe pan. Disconnect horn, direction signal, and neutral switch wires from switches and connector. Remove cap from upper mast jacket bracket and disconnect upper clamp. Disconnect shift linkage and battery cable sleeve from lower end of mast jacket. Loosen lower clamp and remove mast jacket from gear and worm shaft. Remove pitman arm from pitman shaft. Remove steering gear attaching bolts and remove steering gear.

Oldsmobile F-85 1961: Removal (Manual Steering) - Remove coupling clamp bolt and slide clamp off coupling onto steering gear worm shaft. Disconnect horn wire at harness and remove horn shroud from center of steering wheel. Remove steering wheel (see above). Pull horn contact plate out of recess in actuator assembly and remove upper bearing-to-actuator assembly retaining clip. Pull steering shaft up out of steering column about 2" and block in position. Pull relay rod off pitman arm. Remove steering gear attaching bolts and remove steering gear.

Removal (Power Steering) - Remove coupling flange attaching nuts and lockwashers, and ground wire from flange attaching bolt. Disconnect hoses from pump and gear. Raise steering shaft about 2" as detailed for manual steering gear above. Disconnect pitman arm from relay rod, remove steering gear attaching bolts and remove steering gear.

Pontiac (Except Tempest) 1961: Removal - Remove pitman arm from pitman shaft, scribe mark worm shaft flange and steering shaft, and disconnect lower flange from steering shaft. Remove steering gear attaching bolts and remove steering gear.

Pontiac Tempest 1961: Removal - Remove steering wheel (see above). Remove steering gear attaching bolts and remove steering gear and shaft assembly.

Rambl r 1961: Removal (Series 10 & 20) - Disconnect battery, remove steering wheel (see above) and jacket tube support plate screws. Loosen jacket tube bracket-to-instrument panel mounting bolts. Remove pitman

CONTINUED ON NEXT PAGE

SAGINAW WORM & NUT (C ntinu d)

arm. Support front of engine and remove engine front support crossmember. Mark location of turning radius stop plate, then remove plate. Remove steering gear attaching bolts and remove steering gear.

Removal (Series 80) - Disconnect battery, remove steering wheel (see above) and jacket tube support plate screws. Loosen jacket tube bracket-to-instrument panel mounting bolts. Remove left front wheel. Mark location of turning radius stop plate, then remove plate. Loosen steering gear attaching bolts, then remove pitman arm. Remove left exhaust manifold. Remove power steering hose bracket from engine left front support, support engine and remove engine left front support mounting bracket. Remove front crossmember (leave stabilizer bar attached). Remove steering gear.

Studebaker 1961: Removal - Remove battery, disconnect horn switch wire at connector, and battery cable at starter switch. On Hawk, remove battery box. Remove steering wheel and steering post jacket assembly. *NOTE - On V8 models (except Hawk), remove distributor cap, disconnect left front engine support and raise l ft front corner of engine about 1½".* Remove reach rod from pitman arm. Remove steering gear attaching bolts, turn gear upside down, lift and remove through engine com partment.

Valiant (1961): Removal - *See "Lancer & Valiant 1961" above.*

OVERHAUL

DISASSEMBLY: Remove pitman arm from sector shaft if arm still attached. Loosen sector shaft adjusting screw locknut, back out adjusting screw, then remove housing side cover with sector shaft attached. Remove gasket. Separate sector shaft from side cover by unscrewing adjusting screw. *Do not lose shim.* Loosen worm thrust bearing adjuster locknut and back out adjuster several turns, then remove housing end cover and gasket. Remove lower thrust bearing, worm shaft, and upper bearing from housing. *CAUTION - Do not allow ball nut to run down to either end of worm or damage to ends of ball guides will result.* If ball nut is to be disassembled, remove ball return guide clamps and guides from ball nut, turn ball nut over to remove balls. *CAUTION - Hold shaft and ball nut assembly over a wide pan while disassembling to retain all balls. It is very important that balls be counted and the same number of balls reinstalled when gear is assembled. Remove ball nut from worm shaft.*

REASSEMBLY: 1) Use suitable tools to remove and install bushings, bearings, bearing cups, and seals as necessary. On some models, sector shaft bearings are needle bearing type; other models use bushings. New bushings do not require reaming.

2) Place worm shaft flat on bench and slip nut over worm with ball guide holes up and shallow end of rack teeth to left of steering wheel position. Align grooves in worm and nut by sighting through guide holes. Count out one-half the number of balls removed at disassembly and drop them into one of the guide holes while turning the worm gradually away from the hole until guide hole is full from bottom of one guide hole to the bottom of the other. *NOTE - In cases where balls are stopped by end of worm, hold down the balls already dropped into hole and rotate worm back and forth.* Lay one-half of guide, groove up, on bench and place remaining balls in it. These remaining balls should fill guide. Close this half of guide with other half and hold both halves of guide together and plug each end with vaseline to hold balls in place. Push guide into holes of nut to complete one circuit. Repeat same operation with other circuit. Reassemble ball guide clamp to nut with lockwashers under clamp screws and tighten screws securely.

3) Place worm shaft and nut assembly into housing and place upper roller bearing over worm shaft. Place new housing end cover gasket over end of worm shaft, then slide housing end cover over worm shaft and assemble it to housing. Install lower roller bearing. Install worm bearing adjuster and locknut. *NOTE - W rm b aring preload adjusting may be mad at this time, or mad when steering gear is assembled.* Assemble sector shaft adjuster and shim in slot in end of sector shaft. Insert a feeler gauge between head of adjuster screw and bottom of slot. Adjuster screw must be free to turn and endplay must not exceed .002". Change adjuster shim as necessary (shims furnished .063", .065", .067", .069" thick). Start sector shaft pilot into bushing or bearing in side cover, then using a screwdriver through hole in cover, turn lash adjuster in counterclockwise direction to pull sector shaft pilot into its bushing as far as it will go. Rotate worm shaft by hand until ball nut is at center of travel. Place a new gasket on side cover, then push side cover assembly including sector shaft into place. After making sure there is some play between rack and sector teeth, assemble and tighten side cover bolts. Perform worm bearing preload adjustment (if not already adjusted), then adjust pitman shaft endplay (gear mesh). S *"Adjustments" abov .* Fill steering gear with proper lubricant.

GEMMER WORM & ROLLER

Checker (1961)
Chrysler (1961)
DeSoto (1961)
Dodge & Dodge Dart (1961)
Ford Trucks (Except F-100 & F-250) (1961) ①
Plymouth (1961)
Rambler American (1961)

① – Series F-100 & F-250 use Saginaw Ball Bearing Worm & Nut type.

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 RAMBLER AMERICAN EXCESSIVE STEERING EFFORT CORRECTION:* On early cars, if condition not corrected after the usual steering linkage and gear checks and adjustments, there may be insufficient clearance between nylon bushing at bottom of steering jacket tube and steering shaft. To correct, install new type yellow bushing with larger inside diameter, Part No. 3203276. Install bushing with Power Steering Pump Seal Installer J-5441 using generous amount of lubriplate on both bushing and contact area of steering shaft. Drill a small hole in metal retainer and bushing and install a self-tapping screw to hold bushing in place. *CAUTION – DO NOT l t scr w c ntact st ering shaft.* New type bushing used on later cars.

DESCRIPTION: Similar in design to units used on previous models. Roller shaft adjusting screw is secured in end of roller shaft with a snap ring on some models. Chrysler Corp. cars have flexible coupling between steering gear worm shaft and steering tube.

ADJUSTMENT: *NOTE – Adjustments must be made in the following sequence.*

Worm Bearing: All Except Ford Trucks – Turn steering wheel about one turn from straight ahead position and secure wheel to prevent any movement. Determine endplay by shaking front wheels sideways noting any movement that may be felt between steering wheel hub and steering jacket tube. If endplay is present, adjust worm bearing by loosening the four bottom cover bolts about 1/8", then separate top shim with a knife blade and remove. *CAUTION – Do not mutilate remaining shims or gasket.* Tighten cover and recheck for endplay. *NOTE – Remove only one shim at a time to prevent obtaining too tight an adjustment.*

F rd Trucks (F, B, P S ri s) – Disconnect pitman arm from drag link (or from control valve ball stud on power steering models). Turn steering wheel two complete turns from straight ahead position, then install an inch-pound torque wrench on steering wheel nut and measure torque required to keep wheel moving at a constant rate for at least one complete turn. If torque or preload is not within specifications in table, adjust as indicated below.

Adjustment – Disconnect horn wire at bullet connector just below steering column housing. Remove bolts attaching endplate to steering gear housing, then remove or install one gasket at a time to obtain proper preload. Gaskets are available in thicknesses of .002", .005", .010". *NOTE – R moval of gask t will increase preload and installation of gask t will decrease preload.* To remove a gasket, separate outer gasket from pack by passing a knife blade all around inner face of gasket being careful not to cut or tear remaining gaskets in pack. Install endplate and recheck preload. *NOTE – On P S ri s, st ring g ar and column must be loosen d b for ndplat can b removed for installation of gasket.*

F rd Trucks (C Seri s) – Disconnect pitman arm from drag link (or from control valve ball stud on power steering models). Remove lower universal joint re-

CONTINUED ON NEXT PAGE

GEMMER WORM & ROLLER (Continued)

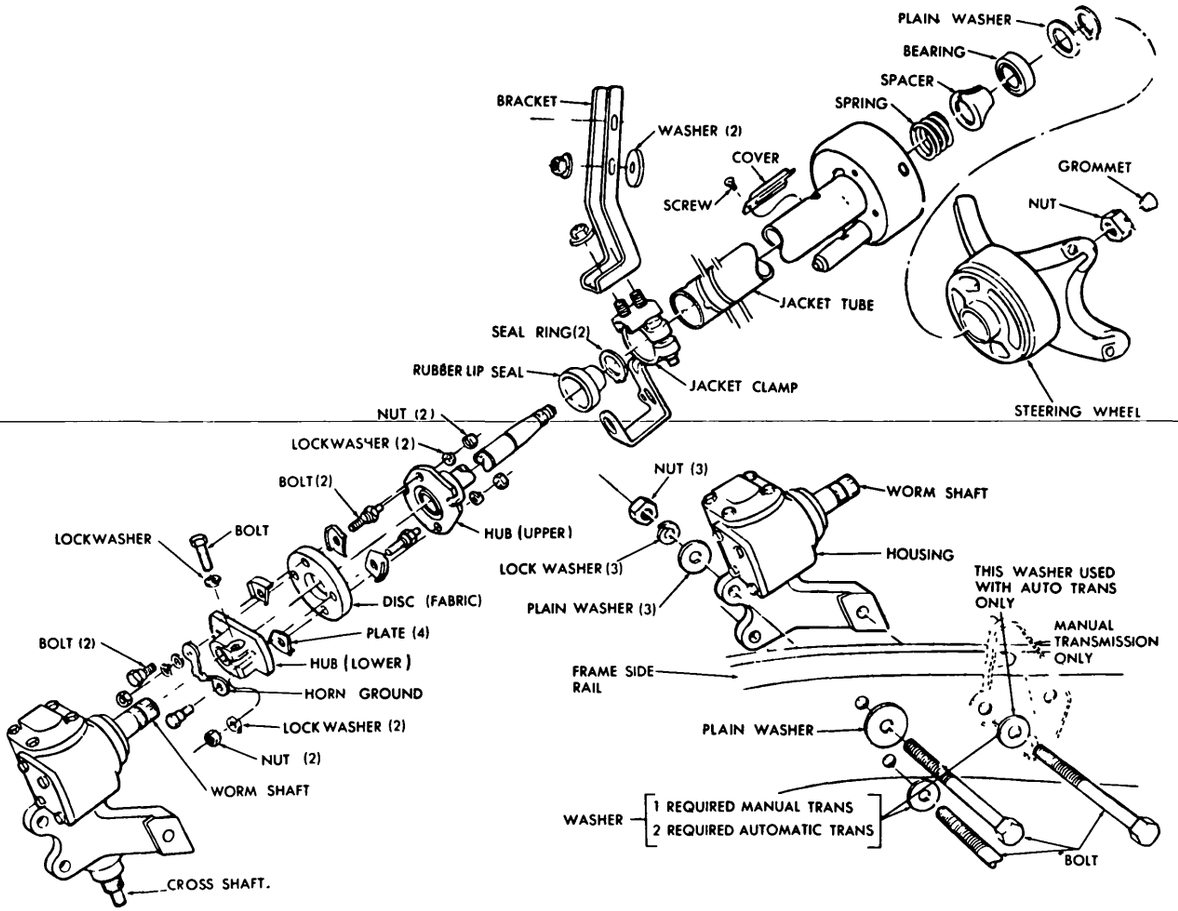
taining bolt and nut and raise steering shaft assembly off steering gear, then install a 4" block of wood between steering wheel and upper steering column tube flange. Bend a piece of light strap iron (10" long) so a 1" section is at right angles to longer section, then use a heater hose clamp and fasten strap iron to worm shaft so longer section of iron forms a lever. Turn worm shaft two complete turns from straight ahead position and measure pull required to keep worm shaft moving at a constant rate for at least one complete turn, using a spring scale hooked to lever at a point 8½" from outer diameter of steering shaft. If pull required to turn shaft not within specifications in table, adjust as indicated below.

Adjustment – *Same as for F, B, P Series above.*

Ford Truck Worm Bearing Preload

Truck Model	Worm Preload
F, B, P Series ①	②4½–9 lbs.
F & B–600 Series ③	②4½–11¼ lbs.
C Series	④9–13½ lbs.

① – Except F & B–600 With 6000 Lb. Front Axle.
② – Inch–lbs. With inch–pound torque wrench on steering wheel nut.
③ – With 6000 Lb. Front Axle.
④ – Pounds pull. With spring scale installed on steering wheel at right angle to spoke.



Cross Shaft Rear & Worm Mesh: Chrysler, DeSoto, Dodge, Dart, Plymouth – Disconnect pitman arm at link, then rotate steering wheel to mid–position and check for backlash by moving pitman arm back and forth. If backlash exists, loosen roller shaft adjustment screw locknut and tighten adjusting screw enough to eliminate freeplay. Rotate steering wheel to one end of its travel and apply a spring scale at rim of steering wheel. A pull of 1–2 lbs. should be required to turn wheel. Tighten adjusting screw locknut while holding adjusting screw from turning.

Ford Trucks (F, B, P Series) – Disconnect drag link from pitman arm, install an inch–pound torque wrench on steering wheel nut and measure torque required to turn wheel through straight ahead (high point) position. If torque not within limits in specification table, adjust as indicated below.

Adjustment – Loosen adjusting screw locknut at engine side of steering gear housing and adjust by turning screw inward (clockwise) to tighten mesh, outward (counterclockwise) to loosen mesh. Hold adjusting screw stationary and tighten locknut.

Ford Trucks (C Series) – Disconnect pitman arm from drag link. Remove lower universal joint retaining bolt and nut and raise steering shaft assembly off steering gear, then install a 4" block of wood between steering wheel and upper steering column tube flange. Bend a piece of light strap iron (10" long) so a 1" section is at right angles to longer section, then use a heater hose clamp and fasten strap iron to worm shaft so longer section of iron forms a lever. Turn worm shaft so it is at straight ahead position and measure pull required to turn worm shaft through straight ahead (high point) position, using a spring scale hooked to lever at a point 8½" from outer diameter of steering shaft. If pull not within limits in specification table, adjust as indicated below.

Adjustment – *Same as for F, B, P Series above.*

CHRYSLER CORP. STEERING COLUMN ASSEMBLY

Ford Truck Worm & Mesh Setting

Truck Model	Worm & Roller Mesh
F, B, P Series ①	②13½–22 lbs.
F & B–600 Series ③	②15¾–24¼ lbs.
C Series	④18½–29¾ lbs.

① – Except F & B–600 With 6000 Lb. Front Axle.
② – Inch–lbs. With inch–pound torque wrench on steering wheel nut.
③ – With 6000 Lb. Front Axle.
④ – Pounds pull. With spring scale installed on steering wheel at right angle to spoke.

Rambler American – With pitman arm disconnected and steering wheel at mid position of turning limits, shake pitman arm sideways to determine worm and cross shaft roller clearance; or hook spring scale to rim of steering wheel and note pull required to pull wheel through center of travel. Pitman arm movement should not exceed 1/32", and pull on steering wheel should be 7/8–1½ lbs. To adjust, loosen locknut on adjusting screw and tighten screw as necessary. DO NOT OVERTIGHTEN.

STEERING WHEEL & HORN BUTTON REMOVAL:

Chrysler & DeSoto: Disconnect battery, then press down on center steering wheel ornament and turn ¼ turn to remove. Disconnect horn wire and remove three screws, bushing, horn blowing ring, rubber insulator, and horn terminal plate. Loosen steering wheel nut three turns and use Puller, C–3428, to loosen steering wheel. Remove tool, wheel nut, and wheel.

CONTINUED ON NEXT PAGE

GEMMER WORM & ROLLER (C ntinu d)

Dodg , Dart, & Plym uth: Disconnect battery ground cable, then remove steering wheel ornament by removing screws from underside of wheel. Remove stationary plate, bushings, horn ring and attaching screws. Disconnect horn wire at stationary plate, then loosen steering wheel nut three turns and use Puller, C–3428, to loosen wheel. Remove tool, steering wheel nut, steering wheel, retainer, and spring.

F rd Trucks: Disconnect horn wire at bullet connector under instrument panel. Remove horn button or ring by pressing down and turning counterclockwise. Remove steering wheel nut. Install a steering wheel puller such as 3600–AA, and remove steering wheel.

Rambler American: Remove horn button or ring and pull steering wheel with Tool J–5290. To replace steering wheel, turn steering shaft until mark on shaft is at top center, then place wheel on shaft with steering wheel spokes equal distance from center.

STEERING GEAR REMOVAL, INSTALLATION & ALIGNMENT: Note the special alignment procedures outlined below.

Chrysler, DeSoto, Dodge, Dart, Plymouth: Removal – Remove pitman arm from sector shaft with Tool C–3646, then remove flexible coupling to steering gear worm shaft attaching bolt and washer. Remove steering gear to frame side rail attaching bolts and slide gear assembly forward to disengage flexible coupling from worm shaft. Raise gear and remove through engine compartment.

Installation – Place steering gear worm shaft on exact center of travel (high point). Mark master spline in outer row of serrations on worm shaft, then install gear in engine compartment. Align index mark on outside of flexible coupling hub with master spline on worm shaft. Slide coupling on worm shaft and install gear housing–to–frame attaching bolts and tighten bolts evenly to 50 ft. lbs. Position flexible coupling bolt hole in line with groove on worm shaft and install bolt and lockwasher and tighten to 30–35 ft. lbs. Install pitman arm and tighten nut to 125 ft. lbs.

Alignment – Check steering tube for alignment in steering column seal. If tube is not centered, proceed as follows: *NOTE – Steering tub must b c nt red in st ering column s al, also lip of s al which contacts tub must be w ll lubricat d with wh l b aring lubricant.* Loosen steering column clamp bolts at instrument panel, then loosen lower column clamp bolt and support bracket at both firewall and at column clamp. Hold steering column so it is centered on tube while aligning column support bracket to firewall and lower column clamp. When properly located, tighten support bracket stud nuts at firewall and at column clamp to 100 inch–pounds. Tighten steering column–to–instrument panel clamp bolts to 15 ft. lbs., then tighten lower steering column clamp bolt to **200 inch–pounds.**

Ford Trucks (F & B Series): Disconnect battery ground cable, then disconnect horn wire from bullet connector below steering gear housing and remove wire from clips on frame and fender apron. Loosen steering column lower clamp and slide clamp down. Disconnect transmission shift control rod or rods at shift levers. Remove steering wheel (see above), then remove steering column upper bushing spring and bushing. Disconnect turn signal wires, and remove from retaining clip at instrument panel bracket. Remove steering column bracket clamps and rubber sleeve. If truck has a floor mounted gear shift lever, pull steering column tube off shaft. On a truck with automatic transmission or a remote type gearshift lever, remove steering column shields from floor pan. If truck has a V8 engine, remove engine oil filter. On a clutch equipped truck, disconnect clutch retracting spring and remove clutch equalizer shaft outer bearing bracket and shaft (do not loosen split bearings). On F–350 with remote type shift, remove inner bearing bracket. Remove pitman arm. Disconnect steering gear from frame side rail. On a model with floor mounted gearshift, remove steering gear assembly from under truck. On models with automatic transmission or a remote type gearshift, remove assembly through passenger compartment. If steering column tube has not been removed, loosen lower clamp and remove tube. To install, reverse removal procedure.

Ford Trucks (C Series): Remove horn wire brush from steering column just below instrument panel bracket. Remove universal joint upper retaining nut and bolt, then turn wheels to right and remove pitman arm. Remove steering gear housing–to–frame bolts and remove steering gear with universal joint attached. Install by reversing removal procedure.

F rd Trucks (P S ri s): Remove steering wheel (see above), then remove steering column bracket bolts from instrument panel. Raise front of truck, install stands, then remove pitman arm. Loosen steering column lower clamp, and disconnect horn wire. Move steering gear to left and remove from beneath truck.

Rambler American: Removal – Remove steering wheel (see above), and pitman arm. Loosen steering jacket tube assembly at support plate and at instrument panel mounting bracket. Remove steering gear attaching bolts and remove gear from beneath car.

Installation – Reverse removal procedure.

Alignment – Loosen housing mounting bolts and align housing at angle determined by height setting of jacket tube bracket. Use shims between housing and mounting surface as necessary. Tighten mounting bolts. Loosen jacket tube bracket and let it match gear column position, then tighten.

OVERHAUL (STEERING GEAR ASSEMBLY): Disassembly – Remove seal from pitman arm end of sector shaft with a suitable puller. Loosen sector shaft adjusting screw locknut, remove sector shaft cover, adjusting screw and sector shaft as an assembly. Remove housing lower cover plate, shims, spring, seal, washer, and lower bearing. Remove worm shaft and upper bearing from housing. Drive sector shaft bushings or bearing from housing with suitable removing tools.

Reassembly: *NOTE – DO NOT lubricat any parts until unit is reassembled.* Install lower sector shaft bushing to within 1/16" of end of counterbore in housing, and upper bushing flush with housing bore face, using suitable tools. Install worm and shaft in housing with both upper and lower bearings properly seated. Install housing lower cover and shims, making sure no bind exists in worm shaft. Check worm bearing preload as follows: *See above for Ford Trucks.* For other cars, temporarily install steering wheel on worm shaft and tighten cover screws so endplay disappears with 3/8 to 3/4 pound pull required to rotate shaft. Remove or install shims between cover and housing as necessary. Install worm shaft upper seal using a protector over shaft spline to prevent seal damage. Install sector shaft and cover with adjusting screw turned all the way out. Make worm and roller mesh adjustment as detailed above. Fill housing with steering gear lubricant and check for leaks.

CHRYSLER CORP. "CONSTANT CONTROL" POWER STEERING

Chrysler & Imperial (1961)
DeSoto (1961)
Dodge & Dodge Dart (1961)
Lancer (1961)
Plymouth (1961)
Valiant (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 CROSS SHAFT OIL SEAL RETAINING RING PRODUCTION CHANGE & REPLACEMENT NOTE:* Later gears with change letter "X" (except Imperial), change letter "C" (Imperial), have a new Tru Arc snap ring, Part No. 2127049, identified by "W-168" stamped on sharp edged side. New snap ring should be installed at time of overhaul on any steering gear which has the old type snap ring. Snap ring must be installed with sharp edge facing outward toward pitman arm end of housing.

►*1961 POWER STEERING OIL LEAK CORRECTION & "O" RING AND SEAL REPLACEMENT CAUTIONS:* Power steering unit ordinarily needs overhaul only at extreme high mileage. Most leaks can be corrected by replacing external seals or "O" rings. Manufacturer recommends that Seal Kits, No. 2279985 (Valve Package), No. 2279986 (Cross Cover Seal Package); and Cross Shaft Outer Oil Seal, No. 1730985 (Except Lancer & Valiant), No. 2027039 (Lancer & Valiant) be installed to correct leaks.

DESCRIPTION & OPERATION: Similar in design and operation to previous 1959-60 models.

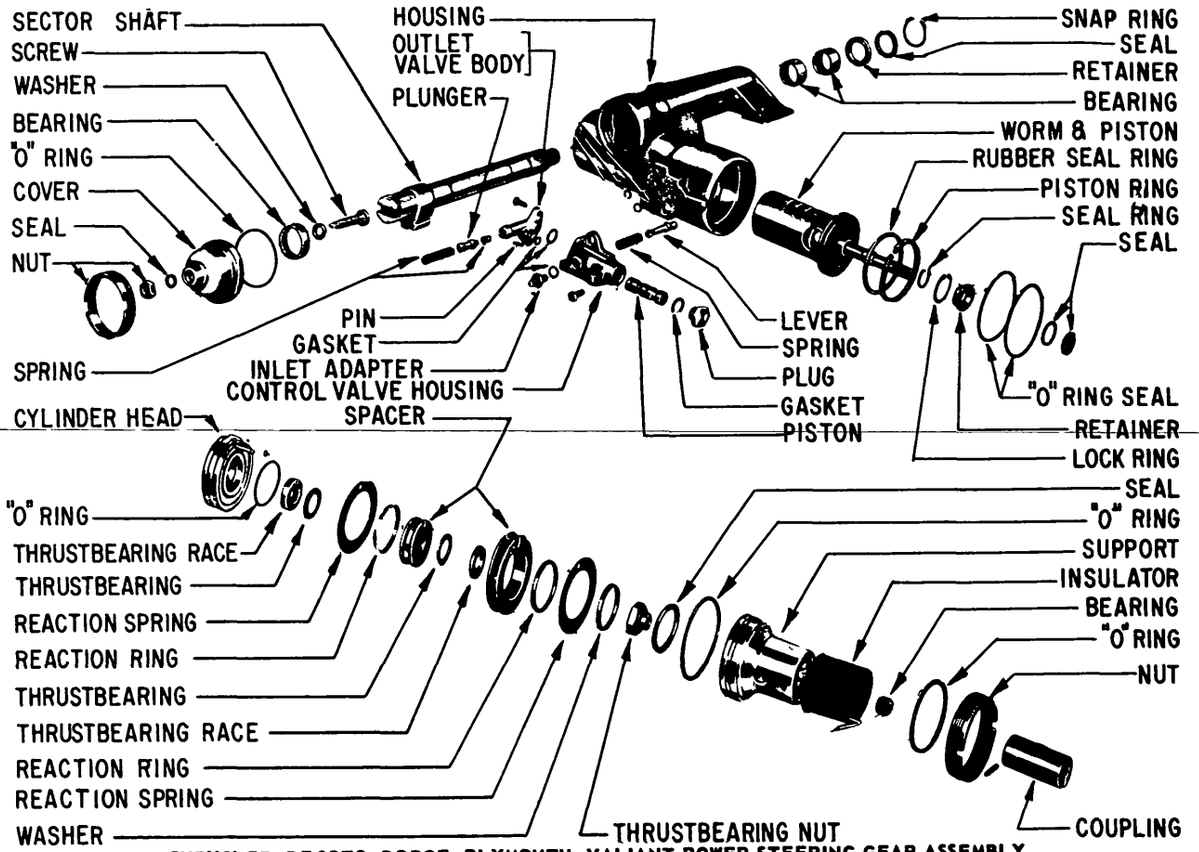
ADJUSTMENTS: *See "Chrysler, DeSoto, Dodge, Plymouth Constant Control Power Steering" in 1958 Final Data or later Manual editions and note the following:*

Pump Belt Adjustment (Pumps With Load Reaction Belt Tensioner): Loosen adjusting bracket bolts and install Adapter C-3832 over edge of mounting bracket as close as possible to outer edge of bracket. Insert torque wrench into adapter and tighten belt until torque wrench reads 45 ft. lbs. Hold tension with wrench, and tighten mounting bracket bolts to 30 ft. lbs. torque.

Pump Belt Adjustment (Pumps Without Load Reaction Belt Tensioner): Torque Method - With a torque wrench in pump mounting bracket, tighten belt to 100 ft. lbs. (new belt), 60 ft. lbs. (used belt).

Deflection Method - There should be 1/16" (new belt), 1/8" (used belt) deflection midway between pulleys under a 5 lb. load.

LUBRICATION: Check fluid level in reservoir every 2000 miles. Fluid level should be at bottom of filler neck when fluid is cold, and should be about half-way up filler neck when fluid is hot. **Use only MoPar Power Steering Fluid, Part No. 2084329.** DO NOT OVERFILL.



BLEEDING SYSTEM: All air can be expelled from unit by turning steering wheel several times from full right to full left and back again.

HYDRAULIC PRESSURE TEST: Disconnect pump-to-steering gear pressure hose at steering pump and connect test hose C-3388 with proper adapters between pump and gauge C-3309-B with shut-off valve between gauge and steering gear. With engine idling at 500 RPM and oil at normal operating temperature (150°-170°F., checked with thermometer in reservoir), pressure should be 55-80 lbs. (Except Lancer & Valiant), 35-80 lbs. (Lancer & Valiant). Increase engine speed to 1000 RPM and slowly close shut-off valve. Pump pressure should be as indicated in table below. *CAUTION - Do not hold valve closed for more than a few seconds.* If pressure is in excess of maximum, check for faulty relief valve. If pressure is less than minimum, power steering pump is defective.

Power Steering Pump Pressure

Car Model	Lbs. Pressure
Imperial	1150-1300 lbs.
Chrysler & DeSoto	1000-1100 lbs.
Dodge V8	1000-1100 lbs.
Dart & Plymouth 6 Cyl.	850-950 lbs.
Dart & Plymouth 318" V8①	850-950 lbs.
Dart & Plymouth 318" V8②	1000-1100 lbs.
Dart & Plymouth 361", 383", 413" V8	1000-1100 lbs.
Lancer & Valiant	850-950 lbs.

① - Without Load Reaction Belt Tensioner.
② - With Load Reaction Belt Tensioner.

CHRYSLER, DESOTO, DODGE, PLYMOUTH, VALIANT POWER STEERING GEAR ASSEMBLY

TROUBLE SHOOTING: *See "Chrysler, DeSoto, Dodge, Plymouth Constant Control Power Steering" in 1958 Final Data or later Manual editions.*

REMOVAL & INSTALLATION: Steering Wheel & Horn Button (Chrysler, Imperial, DeSoto, Dodge, Dart, Plymouth) - *See "Gemmer Worm & Roller" in this section.*

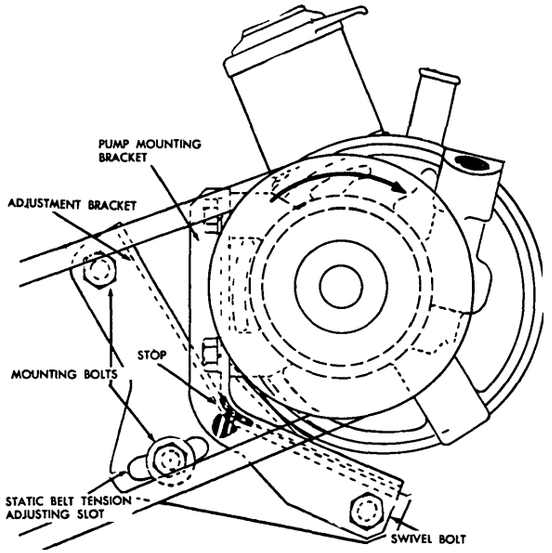
Steering Wheel & Horn Button (Lancer & Valiant): *See "Saginaw Ball Bearing Worm & Nut" in this section.*

Steering Gear Removal (Except Lancer & Valiant): Remove steering wheel and turn signal cancelling mechanism then remove retainer snap rings from groove in steering tube at top of bearing with Tool C-3229. Remove jacket tube shield to allow access to column tube clamp and remove screws attaching steering jacket tube clamp at instrument panel and remove clamp. Raise carpet and move rubber grommet up on jacket column, then remove screws attaching rubber dust boot to firewall. On Imperial models, remove floor inspection panel. Loosen jacket tube clamp at steering gear housing. Remove cotter key and nut at drag link and disconnect link from steering arm, then remove steering arm nut and washer at steering gear shaft. Slide Tool C-3646 up on steering arm and place shoe of puller behind steering arm and pull steering arm from

CONTINUED ON NEXT PAGE

CHRYSLER CORP.
"CONSTANT CONTROL"
POWER STEERING (Cont.)

gear shaft. *CAUTION - Do not remove steering arm by prying with a lever or striking with a hammer.* Disconnect hydraulic brake line at master cylinder and brake tee and remove line, then disconnect pressure and return hoses at steering gear (fasten ends of hoses above reservoir oil level and cap all openings). Slide jacket tube up and off steering gear through drivers compartment, then remove jacket tube upper spring and retainer. Remove steering tube coupling pin, two plastic inserts, horn ground strap, rubber insulator and upper steering tube. Remove gear housing to frame bolts, washers and alignment wedge. Slide steering gear upwards and toward rear of car and at the same time raise lower end of gear and remove gear from engine compartment. *NOTE - On cars with Ram Jet Manifolds, to remove gear, raise lower end of housing in a clockwise motion towards panel until gearshaft end of housing and shaft will clear "A" frame of front suspension, then tilt entire gear assembly towards engine slightly to allow swinging steering gear assembly downward through opening at fender side panel (fender side panel removed). Gearshaft end of housing should go through opening first and the housing should be rolled through opening end-over-end.*



Installation - Reverse removal procedures and note the following: Make sure there is at least 1/16" clearance between bottom face of jacket tube clamp and column support spanner nut. With steering gear completely installed (gear assembly-to-frame bolts not tightened), tighten front upper and lower gear housing to frame attaching bolts to 20 ft. lbs. Install wedge over rear bolt between housing and frame so that tapered surfaces match, tapping it lightly into place, then tighten all three attaching bolts to 50 ft. lbs.

Lancer & Valiant - Remove steering arm from steering gear shaft with Tool C-3646, then disconnect hydraulic lines from steering gear. Remove bolts attaching steering gear to frame and remove bolt from coupling clamp at upper end of steering gear worm shaft. While supporting steering gear, tap coupling upward with a mallet until it is free from worm shaft splines, then lift out steering gear.

Installation - Reverse removal procedures and note the following: Tighten steering gear-to-frame attaching bolts to 75 ft. lbs. and steering arm nut to 85 ft. lbs.

OVERHAUL: *See "Chrysler, DeSoto, Dodge, Plymouth Constant Control Power Steering" in 1958 Final Data or later Manual editions and note the following:*

Power Train Reassembly: With Tool C-3676 held securely in vise, place piston and ring assembly in tool with lower part of piston and ring resting in tool land. Pressing down on piston will cause piston ring to bottom in its groove, forcing open ends of ring upwards for ease of locking the piston ring (ring should be positioned with ring hooks in line with ball guide hole). *NOTE - Positioning hooks in this manner will control internal leakage through the ring.* Wire brush knurled area of worm shaft to remove staking deposits. Lubricate each part with Automatic Transmission Fluid, then place piston on bench in a vertical position (worm shaft up).

LOAD REACTION BELT TENSIONER

Install cylinder head assembly on worm shaft making sure that gap on worm shaft seal is closed to avoid damaging the ring when cylinder head is bottomed against piston top flange. Install lower reaction plate over ferrule on cylinder head, then install lower reaction ring on pressure plate with flange up so that ring protrudes through pressure plate. Lubricate following parts with Automatic Transmission Fluid and slide them over shaft in the following order: Lower (thick) thrust bearing race, lower thrust bearing, center bearing race, upper thrust bearing and upper (thin) thrust bearing race. Install a new worm shaft thrust bearing nut and tighten nut as follows: Grip piston assembly in a soft jawed vise, then turn worm shaft counterclockwise one-half turn and while holding worm shaft in this position, tighten worm shaft nut to 50 ft. lbs. to preset the bearings. *CAUTION - If worm shaft is turned more than one-half turn, the cylinder head sleeve will clear the oil seal ring on worm shaft. Always position worm shaft oil seal ring before bottoming the cylinder head against piston top flange to avoid damaging oil seal ring.* Loosen the adjusting nut and place several rounds of cord around center bearing race, then make a loop in one end of cord and hook the loop of a distributor breaker arm spring scale (Tool MTU-36) in the cord loop. Pulling cord will cause bearing race to rotate. Retighten worm bearing adjusting nut while pulling on the cord with the scale. If adjusting nut is tightened properly, reading on scale should be 8-16 ounces (12 inch ounces preferred) while bearing race is turning. *CAUTION - Place a support under the adjusting nut during the staking operation to avoid brinnelling piston and worm bearings.* Stake the upper part of worm shaft adjusting nut into knurled area of shaft as follows: Hold a ¼" flat end punch on centerline of worm shaft and perpendicular to worm shaft at a slight angle to nut flange. Strike the punch a sharp blow with a hammer and recheck preload. If adjusting nut moved during the staking operation, it can be corrected by striking the nut a glancing blow in direction required to regain proper preload. After proper preload, stake the nut at three more locations 90° apart around upper part of nut. To test staking, torque nut to 20 ft. lbs. in either direction. If nut does not move, the staking operation is satisfactory. Recheck adjustment. Install center bearing spacer assembly over center bearing race and engage dowel pin of spacer in slot of race and slot of spacer entered over cylinder head ferrule. *NOTE - This will align valve lever hole in center bearing race with valve lever hole in center bearing spacer assembly.* Place reaction ring (outer) with flange, down against center bearing spacer. Place reaction ring (inner), without flange, inside of the outer reaction ring, with flange, and install upper reaction pressure plate over both reaction rings and over cylinder head ferrule and "O" ring making sure reaction rings enter circular groove in jacket support. *CAUTION - Form a .0015" feeler into a coil and insert with jacket support to protect seal lip when installing over worm-shaft serrations.* Align parts on power train so that valve lever hole in center bearing spacer assembly is 90° counterclockwise from piston rack teeth and lock all parts in worm shaft by entering a drill rod or suitable drift through jacket support holes and groove in worm shaft. Complete reassembly of steering gear as outlined in 1958 Annual Data or later Manual edition.

Cross Shaft Adjustment (On B nch): With hydraulic power to unit and with gear shaft on center plus or minus 2°, readjust gear shaft backlash. This will require loosening the adjusting screw until backlash is evident. Retighten adjusting screw until backlash just disappears, then continue to tighten for 3/8 or 1/2 turn from this position and tighten locknut to 50 ft. lbs. to maintain this setting. Starting from a point at least one full turn either side of center, the torque at gear shaft required to turn unit through center at 2 RPM in each direction shall not exceed 20 ft. lbs. or vary more than 5 ft. lbs. from left to right. Position steering valve to obtain equal torque and tighten valve body attaching screws to 15 ft. lbs. With unit at or near full turn in either direction, attempt to return the unit to center by applying a torque wrench at steering gear cross shaft. Hold worm shaft until cross shaft torque builds up to 50 ft. lbs. Release worm shaft and maintain a constant steady pull on cross shaft (turning cross shaft slowly). If cross shaft torque does not drop to 25 ft. lbs. maximum as the piston passes through center, check for too much interior drag; binding valve lever, binding valve spool, or cross shaft adjustment is too tight. With unit under power, but with no load, the torque required to rotate the worm shaft through an inclined angle of 180° (90° either side of center) shall be 6-9 inch lbs. Disconnect test equipment and mounting fixture and install unit in car.

POWER STEERING PUMP: *See "Chrysler, D Soto, Dodg , Plymouth, Valiant Slipper Typ Pump" in 1960 Final Data or lat r Manual dition.*

LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING

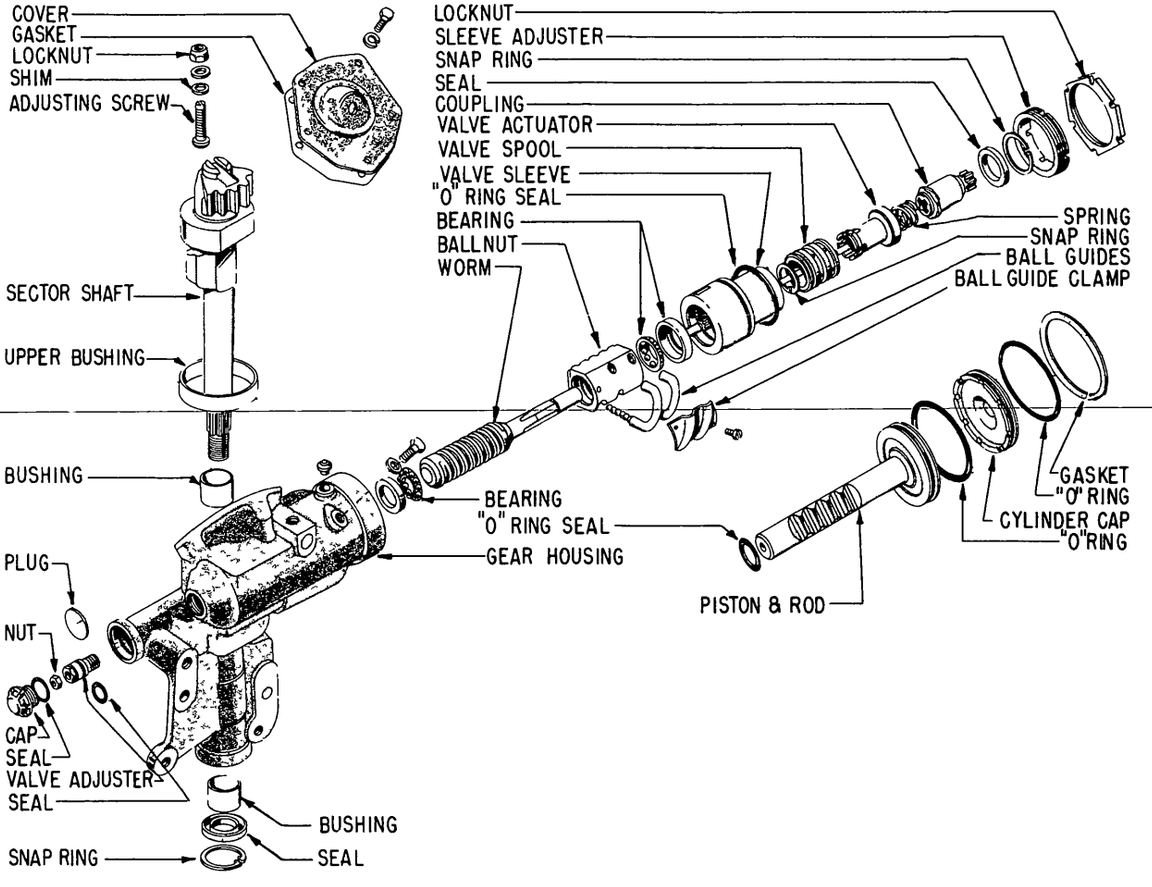
Lincoln Continental (1961)
Thund rbird (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 LINCOLN CONTINENTAL NOISE IN POWER STEERING CORRECTIONS:* **1)** If caused by upper part of flexible coupling loose on steering shaft, loosen setscrew and pry **slightly** up on upper part of coupling and tighten setscrew to 18—22 ft. lbs. *CAUTION – Do not put exc ssiv pr load on steering shaft upper bearing and on fl xible part of coupling.*

2) Reduce sector adjusting screw—to—sector clearance to minimum. Adjust worm bearing preload to high limit of specification, and adjust sector mesh load to 7—10 inch—lbs. greater than worm bearing preload reading. Adjust valve spool centering. Check that power piston backlash does not exceed .0015".

DESCRIPTION: Piston type hydraulic assist power unit having a torsion bar operated control valve combined with a ball nut and worm steering gear enclosed in a single housing. Hydraulic fluid under pressure is supplied to steering gear by a positive displacement type pump. Design and operation are similar to that used on previous models.



PUMP BELT ADJUSTMENT: Lincoln Continental – No adjustment. Pump is mounted on engine front cover and driven by engine crankshaft.

Thund rbird – Adjust pump mounting bracket so pulley slips against belt friction at 19—22 ft. lbs. torque. On new belt, operate engine for 15—30 minutes and recheck tension.

LUBRICATION: Check fluid level in reservoir every 4000 miles (Thunderbird), 6000 miles (Lincoln Continental). Fluid should be at "F" mark on dipstick. Use only Automatic Transmission Fluid Type "A", Suffix "A", or Ford Lubricant C1AZ—19582—A.

BLEEDING SYSTEM: If air is in system due to low oil level in pump reservoir, or to disassembly of gear, fill pump reservoir to proper level, start engine, turn on windshield wipers on Lincoln Continental, and turn steering wheel through its entire travel three or four times to allow air to escape. Recheck fluid level and add fluid as required. *CAUTION – Do not hold wheels against th ir stops when bleeding system.*

HYDRAULIC PRESSURE TEST: Connect a pressure gauge with a hand shut—off valve in pressure line between pump and steering gear (pressure gauge must be between pump and shut—off valve). With shut—off valve on gauge fully open, allow steering fluid to come to operating temperature (cycle gear from stop to stop), then note gauge readings with wheels at full left and full right positions. Pressure should be 700—850 lbs. (Thunderbird), 1120—1250 lbs. (Lincoln Continental). If pressure less than minimum, close gauge valve and note reading. *CAUTION – Do not l av valv clos d for mor than 15 s conds.* If pressure still less than minimum, pump is faulty. If pressure increases, steering gear is at fault.

"TORSION BAR" POWER STEERING ASSEMBLY

ADJUSTMENTS (LINCOLN CONTINENTAL)

Worm Bearing Preload & Sector Mesh Adjustments: 1) Disconnect pitman arm from sector shaft and drain fluid from steering gear housing and from reservoir. *NOTE – Fluid in system will cause incorrect readings.* Remove steering wheel and horn ring. *NOTE – Correct readings cannot be obtained with steering wheel and horn ring installed as segment type horn ring causes assembly to be unbalanced.* Lock two nuts on steering shaft and attach an inch—pound torque wrench to upper nut. Turn shaft to either stop, back off ¼ turn, and measure torque required to keep shaft turning at a constant rate for one complete turn. This is worm bearing preload and should be 3—6 inch—lbs. To adjust, loosen worm bearing adjuster locknut and turn adjuster as necessary. *NOTE – Always make final adjustm nt in tight ning dir ction.*

2) Turn steering shaft so ball nut and sector are centered (approximately two turns from either stop), then note torque required to turn shaft through center position. Torque should be 7—10 inch—lbs. greater than for worm bearing preload (above). To adjust, loosen sector shaft adjusting screw locknut and turn adjusting screw as necessary.

Valve Spool Centering: 1) Place steering gear on a bench near fender and insert a 3/8" drive, 3" extension into flexible coupling and retain extension with setscrew. Remove adjuster cap and install a 7/16" midget socket and a 9/16" offset box end wrench on adjuster. Connect a pressure gauge between pressure line from pump and inlet port (upper hole) of steering gear. Disconnect return line from windshield wiper control valve lower connection and attach line to outlet port of steering gear. Make sure shut—off valve on gauge is fully open.

2) Start engine and bring gear housing to operating temperature (cycle from stop to stop), check and add fluid if necessary. Turn gear coupling to left turn position, attach an inch—pound torque wrench to extension in coupling, then turn torque wrench so pressure gauge reads 300 lbs. Note torque wrench reading. Repeat for right turn position. Torque reading for both posi-

CONTINUED ON NEXT PAGE

LINCOLN & THUNDERBIRD "TORSION BAR" POWER STEERING (Continued)

tions should be equal within 3 inch–lbs. To adjust, loosen adjuster locknut and turn adjuster in direction of low reading. For example, if reading low in left turn position, turn adjuster toward left turn position. *NOTE – Only slight movement of adjuster is necessary to change valve spool position.* Tighten locknut and recheck.

(THUNDERBIRD)

Valv Spool Centering: Install an inch–pound torque wrench on steering shaft (unnecessary to remove steering wheel), bring power steering fluid to normal operating temperature (cycle from stop to stop), and have engine idling. With front wheels straight ahead, measure torque necessary to make a right turn and a left turn. Difference in readings between turns should not be more than 3 inch–lbs. If difference more, remove adjuster cap, loosen locknut and turn adjuster in direction of low reading. For example, if reading low in left turn position, turn adjuster toward left turn position. Tighten locknut and recheck adjustment.

W rm Bearing Preload & Sector Mesh Adjustments: 1) Disconnect pitman arm from steering arm–to–idler arm rod. Loosen sector shaft adjusting screw locknut and back out sector shaft adjusting screw. With an inch–pound torque wrench on steering shaft (unnecessary to remove steering wheel), note torque required to rotate wheel **very slowly** through one complete turn from center position. This is worm bearing preload and should be 2–6 inch–lbs. To adjust, loosen bearing adjuster locknut and turn adjuster as necessary. Tighten locknut and recheck.
2) Center steering wheel and turn sector shaft adjusting screw in until 6–14 inch–lbs. torque is required to turn steering wheel through center position. Turn wheel slowly, no backlash allowed at 30° on either side of center. *NOTE – When adjusting, always turn adjusting screw in one direction to reach adjustment. If screw turned too far, back out one full turn and readjust.*

TROUBLE SHOOTING

S "Edsel & Lincoln (Torsion Bar) Power Steering" in 1958 Final Data or later Manual editions.

STEERING WHEEL & HORN BUTTON REMOVAL & INSTALLATION

Linc ln Continental: To remove cap from steering wheel hub, press down on cap and turn counterclockwise. Remove steering shaft nut, attach a suitable puller to steering wheel, and remove wheel and horn ring assembly. To install, align mark on wheel hub with mark on shaft. Install wheel and horn ring and torque steering shaft nut to 25–35 ft. lbs. Stake the nut.

Thund rbird: Unsnap hub cap from horn ring, remove steering wheel nut, and pull steering wheel and horn ring with a suitable puller. To install, reverse removal procedure, torque not to 25–35 ft. lbs., and stake the nut.

STEERING GEAR REMOVAL & INSTALLATION

Lincoln Continental: Disconnect hoses from steering gear and tie hoses higher than reservoir. Raise car and remove transmission linkage splash shield. Remove left exhaust manifold–to–resonator pipe. Remove pitman arm from sector shaft. Remove transmission linkage rods from equalizer shaft and force shaft outward. Loosen setscrew locking flexible coupling to steering shaft. Remove steering gear attaching bolts and remove steering gear. To install, reverse removal procedure and make sure sector shaft is centered in gear. Torque steering gear attaching bolts to 35–50 ft. lbs., and pitman arm attaching nut to 100–130 ft. lbs.

Thunderbird: Fixed Steering Column – Disconnect fluid lines from steering gear, plug gear openings and cap lines. Drive out tapered pin holding flexible joint flange to steering shaft. Disconnect pitman arm from sector shaft. Remove steering gear housing mounting bolts and remove housing. To install, reverse removal procedure. Torque gear mounting bolts to 28–43 ft. lbs., and pitman arm attaching bolt to 110–150 ft. lbs.

Moveable Column – Disconnect fluid lines from steering gear, plug gear openings and cap lines. Remove pivot bracket clamp bolts, bracket upper mounting nut and flat washer, then remove pivot bracket. Remove cotter pin and steering shaft retainer pin. Disconnect pitman arm from sector shaft. Remove steering gear housing mounting bolts and remove housing. To install, reverse removal procedure. Torque gear mounting bolts to 28–43 ft. lbs., pitman arm attaching bolt to 110–150 ft. lbs., pivot bracket clamp bolts to 19–23 ft. lbs., and pivot bracket stud nut to 9–12 ft. lbs.

OVERHAUL

See "Edsel & Lincoln (Torsion Bar) Power Steering" in 1958 Final Data or later Manual editions and note the following:
1) When installing torsion bar sleeve bearing in sleeve, bearing must be pressed in so there is .095–.105" clearance between upper surface of bearing and seal seat surface of sleeve.
2) During and after reassembly, check worm bearing preload and sector mesh adjustments, and valve spool centering according to "Adjustments" above.

HYDRAULIC PUMP

Lincoln Continental: *See "Eaton Roller (Crankshaft Mounted) Type Pump" in 1960 Final Data or later Manual edition and note the following:*
Pump Pressure – 1120–1250 lbs.
Bleeding System – Turn on windshield wipers in addition to the procedure listed.
Thund rbird: *S e "Eaton Roll r Typ Pump" in 1958 Final Data or lat r Manual editions.*

THUNDERBIRD MOVABLE STEERING GEAR

DESCRIPTION: Consists of a lateral movement mechanism at instrument panel with a flexible steering shaft coupled to steering gear torsion bar. Steering column tube lower end pivots on a bracket fastened to steering gear housing.

OPERATION: With steering column in straight ahead position and transmission selector lever in any position other than "P", column is locked to brake pedal support assembly by a pawl–type lever controlled by selector tube. Two coil springs assist pressure from selector tube and provide positive engagement of pawl in lock plate. When selector lever moved to "P" position, latch type bracket fastened to selector tube disengages pawl from locking plate. Steering column assembly can now be moved about 10" to right. When column is moved over, transmission cannot be shifted. When column moved back to straight ahead position, pawl engages locking plate. Transmission can now be shifted.

ADJUSTMENTS: Track–To–Column Bracket – Track notched edge must be centered under bracket notch for full distance of track travel. To adjust, loosen track–to–pedal support bolts.

Slide Tension: Adjust friction between track and steering column bracket by loosening or tightening nuts on cam type friction adjustment bolts. *Both bolts must b adjusted equally.*

Lock Plate: Adjust engagement of lock pawl in lock plate, by loosening lock plate mountings and adjust cam bolt and screws so lock pin clears bottom of lock plate by no more than 1/32" for the full travel. Pawl must be fully engaged in lock plate when column is locked.

Stops: With selector lever out of "P" position and nylon button of detent spring in its track center notch, position stop bracket against bumper. Pawl pin must engage fully and also clear corner of notch as pin enters or leaves. There should be no lateral movement of column as pawl pin engages or disengages. *NOTE – On air conditioned cars, spring projects to left of its attaching bolt and left notch in track is us d. If right shroud hits air conditioning unit, adjust right stop as necessary.*

TROUBLE SHOOTING: Binding, R ugh, r Rasping Column Movement: Track–to–column bracket misaligned; Lock plate rubbing pawl; Shroud interferes with instrument panel.

Hard Column Movement: Slide tension out of adjustment; Track–to–column bracket misaligned; Lock plate rubbing pawl.

Transmission Shift Into Reverse With C lumn At Extr m Right: Lock plate out of adjustment.

Poor Shift Into or Out of Park: Left stop out of adjustment; Lock pawl arm binding in pivot bushing.

Lateral Looseness In Column Wh n L ck d: Lock pawl arm loose in pivot bushing; Pivot bracket loose at steering gear.

Vertical Looseness In Column Wh n L ck d: Loose track or braces; Pivot bracket loose at steering gear; Slide tension out of adjustment.

Right Shr ud Hits Air C nditi ning Unit: Right stop bolt on track out of adjustment.

SAGINAW ROTARY VALVE POWER STEERING

Buick (1961)
Buick Special (1961)
Cadillac (1961)
Chevrolet Truck (1961)
Oldsmobile (1961)
Oldsmobile F-85 (1961)
Pontiac (Exc. Tempest) (1961)

►CHANGES & CORRECTIONS

►*1961 BUICK (EXC. SPECIAL) POWER STEERING GEAR PRODUCTION CHANGE:* A new snap ring, Part No. 5689364 and a new end plug, Part No. 5689363 is used in later production power steering gears to reduce stress on steering linkage by reducing rack-piston travel. The new snap ring is installed into upper end of housing and decreases piston travel in that direction. It is recommended that these two parts be installed on early type units when piston is removed. Later units identified by letter "S" stamped in center of end plug have the parts installed in production. To install snap ring in early units, compress ring and start in piston bore, then tap into place in upper end of housing. *DO NOT remove snap ring from gear housing when servicing steering gear.*

►*1961 CADILLAC STEERING GEAR BINDING OR POOR RETURN CORRECTION:* This condition may be caused by inner and outer tie rod ball pivots not being centered in their respective housings. Check tie rod by grasping center of rod and rotate it fore and aft. The movement should be equal in both directions. If not, pivot studs are not properly positioned.

DESCRIPTION: All Models Except Chevrolet Truck – Similar to design used on previous models with the following features.

Coupling Flange Assembly (Exc. Oldsmobile) - Coupling flange assembly is positioned on the stub shaft by a new method that eliminates necessity of scribing marks on these two parts during removal.

Adjuster Plug Assembly - Stub shaft seal back-up washer has been replaced by a combination washer and dust seal.

Rack-Piston Nut - A back-up "O" ring seal is used in addition to piston ring in rack-piston nut assembly.

Chevrolet Truck: The control valve assembly of this linkage type power steering unit is located directly on the steering gear and is similar to the control valve assembly used on cars with "integral" type power steering. Service procedures are different. For steering gear overhaul procedures, see *"Saginaw Ball Bearing Worm & Nut".*

HYDRAULIC PUMP BELT ADJUSTMENT: *See 1959 Annual Data, Page 379, or later Manual edition and note the following:*

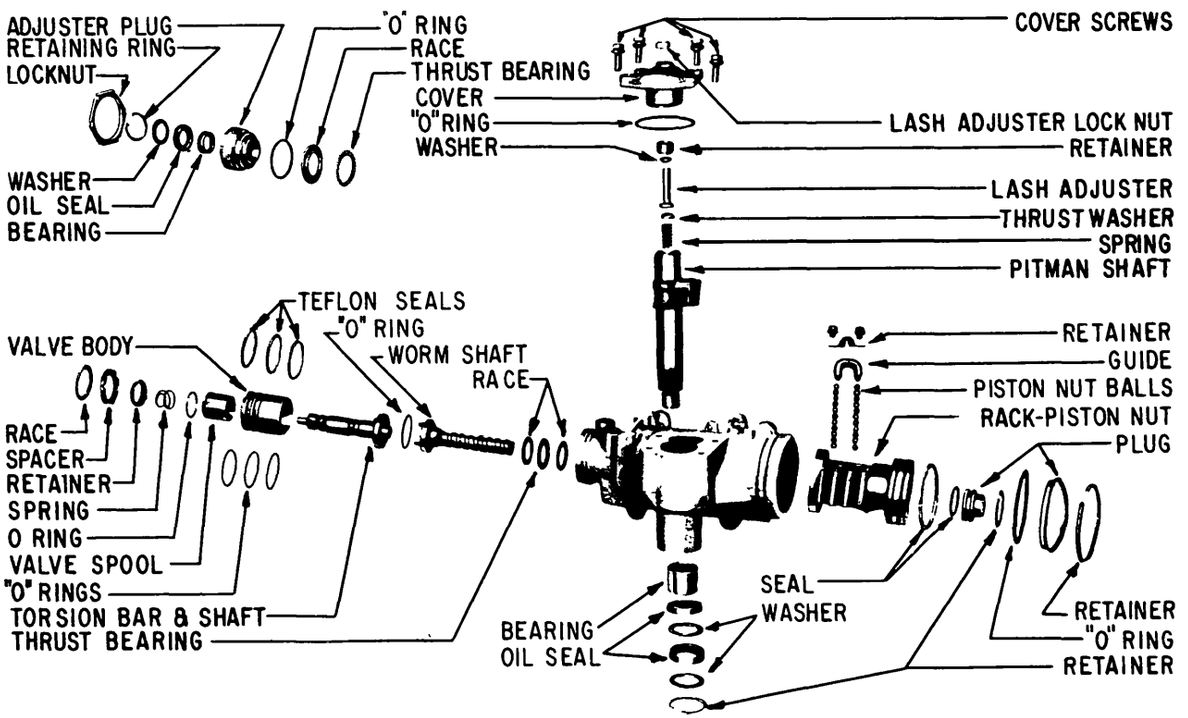
Buick Special – Loosen power steering pump mounting bolts and rotate pump assembly to tighten belt until torque required to slip pulley on belt with a torque wrench applied to pulley nut is 40–45 ft. lbs.

Cadillac – Place a variable reading strand type gauge on drive belt midway between pulleys. Proper belt tension is 45–60 lbs. (used belt); 90 lbs. (new belt). To adjust, loosen bolts securing pump to mounting bracket, then move pump outward by hand to obtain correct gauge reading. *CAUTION – Do not use a pry bar to move pump. Tighten pump mounting bolts to 25–30 ft. lbs.*

Oldsmobile (All Models) – Position Gauge 33–70 on pump belt, then loosen pump attaching bolts and adjust belt tension by moving pump away from engine until pointer on gauge indexes with groove in gauge plunger. Tighten attaching bolts to 20–28 ft. lbs. and recheck adjustment.

Pontiac – Loosen pump mounting bolts, then move pump until belt has ¼" deflection with a 5–6 lbs. load applied midway between fan and steering pump pulleys, or a 70–75 lb. load as indicated on a Burroughs gauge. Tighten mounting bolts to 25–35 ft. lbs.

LUBRICATION: Check fluid level in power steering pump reservoir every 1000 miles (Buick & Chevrolet Truck), 2000 miles (all others) with steering gear and fluid at normal operating temperature. If necessary, add automatic transmission fluid to bring level to mark on reservoir filler neck. If steering gear and fluid are cold, bring fluid level to lower end of filler neck. *NOTE - On Chevrolet Trucks, check lubricant level in gear box and add "Multi-Purpose" lubricant as necessary.*



CHECKING & ADJUSTMENT (ON CAR): Disconnect pitman arm at intermediate arm or drag link (Buick Special, Cadillac, Oldsmobile F-85 & Pontiac). Remove pitman arm from shaft (Buick, Exc. Special & Oldsmobile, Exc. F-85), then proceed as follows:

Buick & Buick Special: Remove horn emblem from steering wheel hub, then turn steering wheel to extreme right or left position and attach a 0–25 inch pound torque wrench to wheel retaining nut and check torque required to turn wheel steadily for 1/8 turn from extreme position (this is where lash exists). Reading on torque wrench should be 1–11 inch pounds. Turn steering wheel ½–¾ turn off "high point" center position and check torque required to turn wheel. The reading should be 1–5 inch pounds (Exc. Buick Special); 2–5 inch pounds (Buick Special) higher than reading taken at extreme right or left position. Check torque required to turn gear through gear "high point". This reading should be 4–8 inch pounds higher than reading taken at ½–¾ turn off "high point". To adjust for proper overcenter torque, loosen lash adjuster locknut and use an Allen wrench to turn lash adjuster.

►*BUICK & BUICK SPECIAL ADJUSTMENT NOTE: Thrust bearing preload and ball nut preload can only be adjusted with steering gear out of car.*

Cadillac: Attach Distributor Point Checking Scale at rim of steering wheel so scale can be pulled at right angle to wheel, then adjust pitman shaft adjuster screw until pull "through center" on steering wheel is 12–16 ounces greater than pull at ½-turn "off center". To check rack piston and nut preload, use scale as for above check and measure pull on steering wheel through an arc not exceeding 1" with gear ½-turn "off center". The reading should be 2–8 ounces in excess of the 2 turns "off center" pull. *NOTE – If "off center" pull is not within specifications, gear*

CONTINUED ON NEXT PAGE

SAGINAW (ROTARY VALVE) POWER STEERING GEAR ASSEMBLY

SAGINAW ROTARY VALVE POWER STEERING (C nt.)

must b r moved fr m car t check rack piston and nut preload and ball nut–to–worm shaft fit. To check thrust bearing preload, turn steering wheel 2 complete turns "off center" and measure the pull on steering wheel through an arc not exceeding 1". The reading should be between 8 and 15 ounces. If not within specifications, loosen adjuster plug locknut and back off adjuster nut 1/8 turn, using spanner wrench J-7624. *NOTE – If position of holes in adjuster plug is such that there is insufficient clearance to install spanner, install a ¾" long No. 10 bolt, in one of the adjuster plug holes and rotate flexible coupling until lower flange contacts bolt, then back out adjuster plug 1/8 turn.* Measure steering wheel pull at 2 turns "off center" to determine total drag of gear, then adjust preload by tightening adjuster plug to obtain 4–6 ounces in excess of total drag. Tighten adjuster plug and recheck preload.

Chevrolet Truck: There are no "On Car" adjustments.

Oldsmobile & Oldsmobile F–85: *NOTE – The over–center adjustment is the only power steering gear adjustment which can be made on the car; however, in order to make this adjustment, it is also necessary to check combined ball and thrust bearing preload.* On Oldsmobile, remove pitman arm from pitman shaft. On Oldsmobile F–85, disconnect pitman arm from relay rod. Loosen pitman shaft adjusting screw locknut and thread adjusting screw out to limit of its travel. Disconnect horn wire at relay, then remove horn button or ornament from steering wheel. Turn steering wheel through its full travel, then locate wheel at its center of travel. Check combined ball and thrust bearing preload with an inch pound torque wrench on steering wheel nut by rotating through center of travel (approximately ¼–turn in each direction) and note the highest reading. Tighten pitman shaft adjusting screw until torque wrench reads 4–8 inch pounds (Oldsmobile), 3–6 inch pounds (Oldsmobile F–85), higher than previous reading. *NOTE – Total preload must not exceed 16 inch pounds (Oldsmobile); 14 inch pounds (Oldsmobile F–85).* Tighten locknut and recheck. Install horn button, horn wire, and reconnect pitman arm.

P ntiac: Remove horn button or ring and install an inch pound torque wrench on steering wheel nut. *NOTE – When taking torque readings, take reading when pulling torque wrench to left and to right, then total both readings and average them out.* To check adjuster plug preload, turn steering wheel one full turn off center "high point" and check torque required to turn wheel. This should not exceed 10 inch pounds. *NOTE – If reading is below 3 inch pounds, there may be some lash in thrust bearing.* To adjust (with unit in car), loosen plug locknut using a drift punch, then move flexible coupling as necessary to install Tool J-7624 (spanner wrench) on plug. Tighten plug as necessary to obtain a bearing preload of 3–5 inch pounds, then tighten adjuster plug locknut. *NOTE – Bearing preload must be measured with spanner removed and locknut tightened.* To check worm preload, turn steering wheel one–half turn off center "high point". This reading should be 0.5–5.0 inch pounds higher than previous reading. *NOTE – Worm pr l ad is controlled by fit f rack–piston balls.* To adjust pitman shaft lash, take reading while turning wheel through center "high point". This reading should be 4–8 inch pounds higher than worm preload reading. If not within specifications, loosen pitman shaft adjuster nut and adjust lash with a 7/32" Allen wrench. Tighten locknut to 25–35 ft. lbs. Reassemble steering wheel and connect pitman arm.

STEERING WHEEL & HORN BUTTON: *See "Saginaw Ball Bearing Worm & Nut" (Manual Type Steering Gear) in this section,* and note the following:

Cadillac: Removal (Horn Button) – Pry cap off steering wheel hub, then remove two screws from underside of wheel rim (one at outer end of each spoke). Remove two Allen head screws retaining hub to steering wheel and remove hub and upper half of spoke with horn bars. Horn switches may be removed from lower section of spoke by removing one screw retaining each switch in spoke.

Installation (Horn Button) – Install horn switch in each spoke and retain with screw. Arrange horn wires so they will not become pinched between upper and lower halves of spoke, and install hub with horn bars. Secure in place with Allen screws. Install a screw in outer end of each spoke on underside of wheel, then install cap over hub.

Removal (Steering Wheel) – Pry cap off steering wheel hub, then disconnect horn wire from steering shaft. Remove upper steering shaft nut and remove two screws securing hub to steering wheel. Scribe an alignment mark on hub and on end of steering shaft for use at reassembly. Install a suitable puller or use puller J–1859–02 to remove wheel from shaft.

Installation: Reverse removal procedure and tighten shaft nut to 45–50 ft. lbs. *NOTE – Make sure marks made at removal are properly lined up when wheel is installed.*

TROUBLE SHOOTING: *See 1959 Annual Data, Page 379, or later Manual edition.*

REMOVAL & INSTALLATION: Buick (Exc. Special) – Removal – Disconnect pressure and return lines at steering gear and elevate ends higher than pump. Disconnect two upper–to–lower flange bolts, then raise car and remove pitman arm with Puller J–5504. *NOTE – On Dual exhaust cars, disconnect left front exhaust pipe at manifold.*

Installation: Reverse removal procedure and note the following: Tighten flange bolts to 15–20 ft. lbs. Tighten pitman arm nut to 90–110 ft. lbs. and gear housing to frame bolts to 60–75 ft. lbs. When installing steering gear, riveted pins on lower flange and flexible coupling must be installed in center of their correct slots in upper flange (small pin in small slot and large pin in large slot). Clip on loose end of horn wire (ground) must be installed on flange bolt between flexible coupling and upper flange.

Buick Special: Removal – *NOTE – Pitman arm cannot be removed or installed with steering gear installed on crossmember. If pitman arm is to be removed from gear, loosen pitman arm nut before disconnecting gear from crossmember. When installing gear, do not tighten pitman nut until after steering gear is installed on crossmember.* Remove lower coupling clamp bolt, then loosen clamp retaining mast jacket to toe pan cover and "U" bolt retaining jacket to instrument panel. Pull mast jacket assembly up far enough so lower coupling can be removed from worm shaft. Raise car and disconnect pitman arm from intermediate rod, then loosen pitman arm nut with tool, J–8987. Remove steering gear–to–crossmember attaching bolts and remove gear assembly. *NOTE – Do not r mov pitman arm from shaft unless pitman shaft ass mbly or s al is to be replaced.*

Installation: Reverse removal procedure and note the following: Tighten gear–to–crossmember attaching bolts to 55 ft. lbs. and pitman arm nut to 95 ft. lbs. Make sure that tang of mast jacket saddle engages slot in jacket and that steering shaft is centered in end of jacket assembly. Align coupling and clamp with groove on worm shaft and install clamp bolt and nut.

Cadillac: Removal – Syphon fluid from reservoir, then disconnect hoses at rear of pump. Raise front of car and support on jack stands near outer ends of lower control arms. Disconnect pitman arm from shaft using puller, J–9172, then remove screw holding flexible coupling to upper steering shaft. Remove screws holding gear to frame side rail and remove gear.

Installation– Reverse removal procedure and note the following: Tighten gear–to–frame attaching bolts to 40–45 ft. lbs. and upper steering shaft retaining screw to 25–30 ft. lbs. Tighten pitman arm nut to 100–125 ft. lbs. *CAUTION – Make sur that upp r steering shaft and steering gear are properly aligned.*

Chevrolet Truck: Removal – Disconnect steering shaft from lower coupling, then remove hoses from valve. Remove pitman arm nut, lockwasher and pitman arm. Remove mounting bolts and steering gear.

Installation – Reverse removal procedure.

Oldsmobile (Exc. F–85): Rem val – Scribe alignment marks on steering shaft flange and coupling flange, remove coupling flange attaching nuts and ground wire from attaching bolts. Disconnect hoses from pump, then raise car on a hoist. Remove pitman arm from shaft using puller J–5504, then remove gear to frame attaching bolts and remove gear.

Installation – Reverse removal procedure and note the following: Apply a soap fine fibre grease to gear mounting pads. Make sure alignment pin on gear housing enters proper hole in frame side rail, and that gear is properly aligned with steering shaft. Tighten gear–to–frame bolts to 60–80 ft. lbs. and pitman shaft nut to 90–120 ft. lbs.

Oldsmobile F–85: Removal – Remove coupling flange attaching nuts and ground wire, then disconnect hose from power steering pump. Remove steering shaft coupling clamp bolt and slide clamp off coupling housing onto steering gear worm shaft. Mark steering shaft in line with slot at coupling clamp surface. Disconnect horn wire from harness and horn shroud from center of steering wheel. Remove steering wheel (see above), then pull horn contact plate up out of recess in actuator assembly for necessary clearance to allow removal of upper bearing–to–actuator assembly retainer clip. Use a small screwdriver and pry upper bearing-to-actuator assembly retaining clip out of actuator housing. Pull steering shaft up out of steering column and block shaft up approximately 2". Raise car and remove pitman arm from relay rod. Disconnect steering gear from crossmember and remove from car.

CONTINUED ON NEXT PAGE

SAGINAW ROTARY VALVE POWER STEERING (Cont.)

Installation – Reverse removal procedure and note the following: Tighten pitman nut to 150–180 ft. lbs. and steering gear–to–crossmember bolts to 45–60 ft. lbs.

Pontiac: Removal – Disconnect pressure and return hoses from housing, then disconnect pitman arm from shaft using puller J–5504. Scribe mark on steering shaft worm and worm shaft flange and disconnect gear lower flange from steering shaft. Remove gear housing–to–frame bolts noting number and location of frame shims (if any), and remove steering gear.

Installation – Reverse removal procedure and note the following: Locate any shims that were removed in their original position between housing and frame. Tighten housing–to–frame bolts to 80–90 ft. lbs., pitman arm nut to 100–125 ft. lbs. and flange attaching nuts to 10–20 ft. lbs.

OVERHAUL: *See "Saginaw Rotary Valve Power Steering" in 1959 Annual Data and note the following:*

Adapter Plug: Removal - On Oldsmobile and Chevrolet Trucks, scribe marks on stub shaft and coupling flange to make sure they are assembled in same position. *NOTE - This is not necessary on other models.* On Oldsmobile and Chevrolet Truck, remove stub shaft to flange retaining screw and remove flange assembly. On other models, remove lower flange pinch bolt and remove flange from shaft. Loosen and remove adjuster plug locknut and remove adjuster plug with Tool J-7624.

Disassembly - Remove thrust bearing retainer with a screwdriver, being careful not to score needle bearing bore. Discard retainer. Remove thrust bearing spacer, thrust bearing, and thrust bearing races. Remove adjuster plug "O" ring and discard, then remove stub shaft seal retaining snap ring. On Chevrolet Truck, remove seal back-up washer. On other cars, remove and discard dust shield. On all models, remove stub shaft seal by prying out with a screwdriver and discard. Inspect needle bearing in adjuster plug, and if rollers are broken or pitted, remove needle bearing from adjuster plug by pressing from thrust bearing end using Bearing & Seal Remover, Tool J-6221 (Buick & Cadillac), J-5254 (Oldsmobile), J-5188 (Pontiac), J-8524-2 & J-7079-2 (Chevrolet Truck), Discard the bearing.

Inspection - Inspect thrust bearing spacer for cracks, then inspect thrust bearing rollers for wear, pitting, scoring or cracking. If any of these conditions are found, replace both thrust bearing races and check thrust bearing spacer. Inspect thrust bearing races for wear, pitting, scoring, cracking, or brinelling. Replace if necessary. Check thrust bearing and thrust bearing spacer.

Reassembly - Install needle bearing by pressing from thrust end of adjuster plug against identification end of bearing using the same tool used for removal. *NOTE - End of bearing must be flush with bottom surface of stub shaft seal bore.* Lubricate stub shaft seal with automatic transmission fluid, then, on Chevrolet Trucks, install seal and back-up washer. On other models, install seal with spring in seal toward adjuster plug. *NOTE - Use Tool J-8524-1 (Chev. Truck), J-5188 (Buick, Cadillac, Pontiac), J-5254 (Oldsmobile) to install seal far enough in plug to provide clearance for retaining ring (Chev. Truck), dust seal and retaining ring (Other Models).* On Chev. Truck, install retaining ring. On other models, install dust shield with lip up in plug, then install retaining ring. Lubricate "O" ring seal with petroleum jelly and install on adjuster plug. Assemble large diameter thrust bearing race, thrust bearing, small thrust bearing race, and thrust bearing spacer on adjusting plug. Press bearing retainer into needle bearing bore with a brass or wooden dowel. *NOTE - Radial position of dimples is not important.*

Installation - Install adjuster plug in end of housing just enough to make certain that all parts are properly seated in gear housing. Back adjuster plug off 1/8 turn and measure valve assembly drag, using a torque wrench. Use a spanner wrench and adjust thrust bearings so that preload of 1–3 inch–pounds in excess of valve assembly drag is obtained. Total thrust bearing preload and valve drag should not exceed 8 inch–pounds (Cadillac, Oldsmobile & Chevrolet Truck); 11 inch–pounds (Buick & Buick Special); 10 inch–pounds (Pontiac). Hold adjuster plug in position and install and tighten locknut. Install coupling shaft assembly on stub shaft (align marks made at disassembly on Oldsmobile & Chevrolet Truck). On all models except Oldsmobile & Chevrolet Truck, align groove in lower flange with pin extending from stub shaft and install flange. On Oldsmobile and Chevrolet Truck, install coupling flange bolt and tighten to 20–25 ft. lbs. On other models, install lower flange pinch bolt and tighten to 30 ft. lbs.

►*VALVE ASSEMBLY NOTE (CHEVROLET TRUCKS):* Overhaul procedures are the same as for other models with power steering except that free length of valve spool spring is 760-.790".

Control Valve Housing Removal & Steering Gear Overhaul (Chevrolet Trucks): *See "Saginaw Ball Bearing Worm & Nut" manual steering gear in this section.*

HYDRAULIC PUMP: All Models – *See "Saginaw Vane Type (Integral Reservoir)" in this section.*

POWER CYLINDER

CHEVROLET TRUCK

POWER CYLINDER: Disassembly - *NOTE - The only repair to make in the field on the power cylinder is to replace piston rod seals.* Before removing piston rod seal parts from rod end of power cylinder, clean the exposed portion of seal cavity with clean solvent, brush and compressed air. Remove snap ring. To dislodge scraper, washer, dust seal, seal back-up washer and "U" cup seal, use air hose and apply pressure to cylinder port (right hand port looking down), and seal the left hand port. Remove seal parts from rod.

Cleaning & Inspection: Clean all parts in solvent and dry with compressed air. *CAUTION - Do not use wast to wipe off spool or inside bore of valve housing.* Protect spool edges and bore of valve housing from damage during disassembly and reassembly. Inspect parts for nicks and burrs and excessive wear. Check cylinder scraper washer for fit on piston rod, which should be .001-.0035". Replace if worn.

Reassembly: Assemble open side of "U" cup seal over the rod and into bearing cavity, seal back-up washer, dust seal (with open side away from seal cavity), and scraper washer. Slide parts in place on rod and lock in place with snap ring.

1961 POWER STEERING PUMPS

SAGINAW VANE TYPE (INTEGRAL RESERVOIR)

Buick & Buick Special (1961)
Cadillac (1961)
Chevrolet Pass. Cars (1961)
Chevrolet Trucks (1961)
Oldsmobile & Oldsmobile F–85 (1961)
Pontiac & Pontiac Tempest (1961)

►CHANGES, CAUTIONS, CORRECTIONS

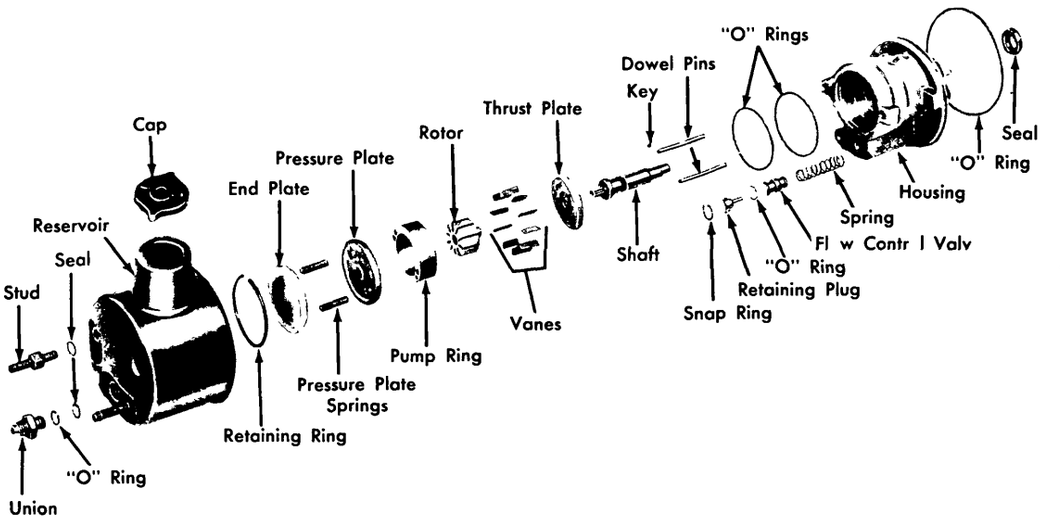
►*1961 BUICK SPECIAL POWER STEERING PUMP PRODUCTION CHANGE & PARTS NON–INTERCHANGEABILITY CAUTION:* Early type pumps have oil return line attached to reservoir filler neck. Later type pumps have return line attached to rear of reservoir. Endplate, pressure plate, and dowel pins are different for each type pump and must not be interchanged between pumps. If early type reservoir is to be replaced, complete Kit, Part No. 5689717, must be installed. *NOTE – Kit converts early type pump to later type. Installation of late type reservoir only on early type pump will cause pump failure.*

►*1961 PONTIAC TEMPEST POWER STEERING NOISE CORRECTION (EARLY CARS):* If noise occurs with wheels against their stops, trouble may be in pump flow control valve. To correct, replace valve.

DESCRIPTION: Vane type pump with integral reservoir and pressure regulator valve. On some pumps, oil return line is in reservoir filler neck. On others, return line is at rear of reservoir. An oil filter for returned fluid is incorporated on some models. Pump is mounted at front of engine and is belt driven by engine crankshaft.

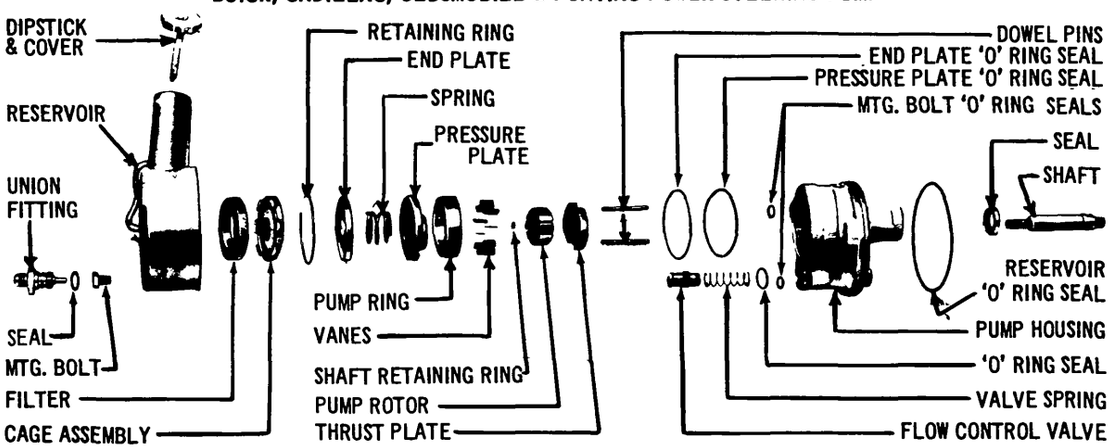
LUBRICATION: Checking Fluid Level – With steering system at normal operating temperature, maintain fluid level at indicated height on reservoir or dipstick. Use only Automatic Transmission Fluid Type "A", Suffix "A".

Bleeding Hydraulic System: Fill reservoir to proper level and let oil remain undisturbed for at least two minutes. Start engine and run at idle speed for a very short time and add necessary oil to maintain fluid at proper level. Raise front wheels off floor, increase engine speed to approximately 1500 RPM and turn wheels full right and left, contacting stops **lightly.** Lower car and turn wheels right and left on the floor. Check oil level and refill as necessary Continue this process as long as necessary to bleed all air from system.



REMOVAL & INSTALLATION: Remove pulley nut, belt, and pulley. Disconnect and cover hoses. Remove pump-to-bracket attaching bolts, then remove pump. *NOTE– On some cars it may be necessary to remove pump rear bracket with pump; or bracket attaching bolts must be loosened for pump removal. Do not loosen bracket attaching bolts too much as they extend into engine water jacket.* To install, reverse removal procedure.

CONTINUED ON NEXT PAGE



SAGINAW VANE TYPE
(INTEGRAL RESERVOIR) (C nt.)

DISASSEMBLY: *CAUTION – When clamping pump in vise, be careful not to exert excessive force on front hub of pump as bushing may be distorted.* Remove union and seal, then remove pump rear mounting bolts. Remove reservoir from housing by turning reservoir counterclockwise or by rocking housing back and forth until reservoir can be lifted freely from housing. Remove filter and filter cage if equipped. Remove endplate retaining ring (depress ring using 1/8" diameter hole in pump housing, then pry out). Remove spring loaded endplate (rock slightly if stuck), then remove pressure plate spring or springs. Remove pump from vise and invert it, allowing flow control valve and spring to drop out. Remove endplate "O" ring, then with pump housing turned over, tap housing on a wooden block until pressure plate drops out. Remove pressure plate, pump rings and vanes, being careful not to drop these parts. Install housing in a vise and use a suitable tool to remove snap ring on end of drive shaft. Remove rotor and thrust plates, then remove shaft through front of housing.

REASSEMBLY: Clean all parts in clean solvent, except "O" ring seals and drive shaft seal. *NOTE – Install new "O" ring seals at all necessary points.* Insert shaft at hub end of housing (spline end entering mounting face side). Install thrust plate on dowel pins with ported face at rear of pump housing, then install rotor, which must be free on splines, on pump shaft over splined end. *NOTE – Assembly rotor with countersunk side toward shaft.* Use a suitable tool and install shaft retaining ring. Install pump ring on dowel pins with direction of rotation arrow to rear of pump housing (rotation is clockwise). Install vanes in rotor slots with radius edge towards outside, then lubricate outside diameter and chamfer of pressure plate with vaseline and install on dowel pins with ported face toward pump ring. Use a 2¾" diameter tube to apply pressure to outer edge only and seat pressure plate by pressure on sleeve (use an arbor press). *CAUTION – Do not press or hammer on center of pressure plate as this will cause permanent distortion.* On pumps with single pressure plate spring, install spring in center groove of pressure plate. On pumps with two pressure plate springs, install a spring over each of the two dowels. Install endplate "O" ring, then lubricate outside diameter and chamfer of endplate with vaseline and install in housing, using an arbor press. While pump is in arbor press, install endplate retaining ring, making sure it is properly seated in groove of housing. Install flow control spring and plunger. *NOTE – End of plunger with hex head screws goes into bore first.* Install filter cage and filter if equipped. Position reservoir so filler tube is 30° counterclockwise of normal position, then drop into place and rotate clockwise to normal position, pressing down until reservoir seats on housing. Install studs, stud seals, union, union seal, and drive shaft key. Support shaft on opposite side of key when installing key.

BUICK, CADILLAC, OLDSMOBILE & PONTIAC POWER STEERING PUMP

BUICK SPECIAL, CHEVROLET, OLDSMOBILE F-85 & PONTIAC TEMPEST POWER STEERING PUMP

PRESSURE TEST: Install pressure gauge J–5176 or equivalent between pump and pressure line at pump. *NOTE – Adapter J–5900 or J–7786 or equivalent may be necessary to install pressure gauge to pump.* With gauge valve open and engine at idle speed, turn wheels against stops a few times to bring power steering fluid to 150–170°F. With wheels against stops, pressure should not be less than specified in table below. If pressure less, slowly close valve and check for pressure increase. Pressure will increase if pump in good condition. If pressure does not increase with valve closed, pump is faulty. *CAUTION – Do not hold gauge valve closed more than 15 seconds.* After removing gauge, bleed hydraulic system (see above).

Pump Pressur Sp cificati ns

Car Model	①Pump Pr ssur
Buick (Except Special)	1000 lbs.
Buick Special	750 lbs.
Cadillac (Before Engine No. 040000)	1150–1250 lbs.
Cadillac (After Engine No. 040000)	1100–1200 lbs.
Chevrolet Pass. Cars	850 lbs.
Chevrolet Trucks	900 lbs.
Oldsmobile (Except F–85)	1100 lbs.
Oldsmobile F–85	800 lbs.
Pontiac (Except Tempest)	925 lbs.
Pontiac Tempest	775 lbs.

①–At engine idle speed and steering oil at 150–170°F.

BENDIX LINKAGE TYPE POWER STEERING

Ch cker (1961)
F rd Pass. Cars, Exc. Thunderbird (1961)
Mercury (1961)
Stud baker (1961)

►CHANGES & CORRECTIONS

►*1961 STUDEBAKER PARTS REPLACEMENT CAUTION:* Do not interchange control valve centering springs or control valves between Lark and Hawk models. Control valve springs and control valve used on Lark models are identified by yellow paint. On Hawk models they are identified by red paint.

►*1961 MERCURY "KNOCKING" NOISE IN STEERING GEAR CORRECTION:* This condition is caused by insufficient lubricant in power steering unit and may be due to a false fluid level indicated on dipstick. Make sure that any air trapped in system is bled out, then bring fluid level to proper mark on dipstick.

DESCRIPTION: Linkage type similar to previous models. Main control valves on Ford & Mercury have a "Reaction Limiting Valve" which limits amount of effort required to turn wheel when parking or making sharp turns at low speed.

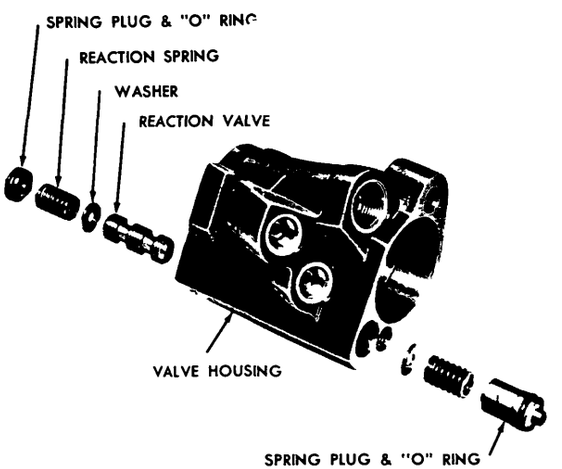
ADJUSTMENT: Pump Drive Belt – *CAUTION – Do not pry or lift against r s rvoir to raise pump assembly.*

F rd (6 Cyl. Eng.): Loosen top pivot bolt on pump adjusting bracket and adjust bolt to obt ain ½" belt deflection.

F rd (292" V8 Eng.): Place a heavy duty "C" clamp on adjusting bracket, then loosen pump adjusting bracket pump support bolts, and pump–to–exhaust manifold so "C" clamp can be tightened. Tighten "C" clamp to obtain 25 ft. lbs. slip torque on belt (torque wrench applied to pump pulley nut). Tighten all bolts to 20–25 ft. lbs.

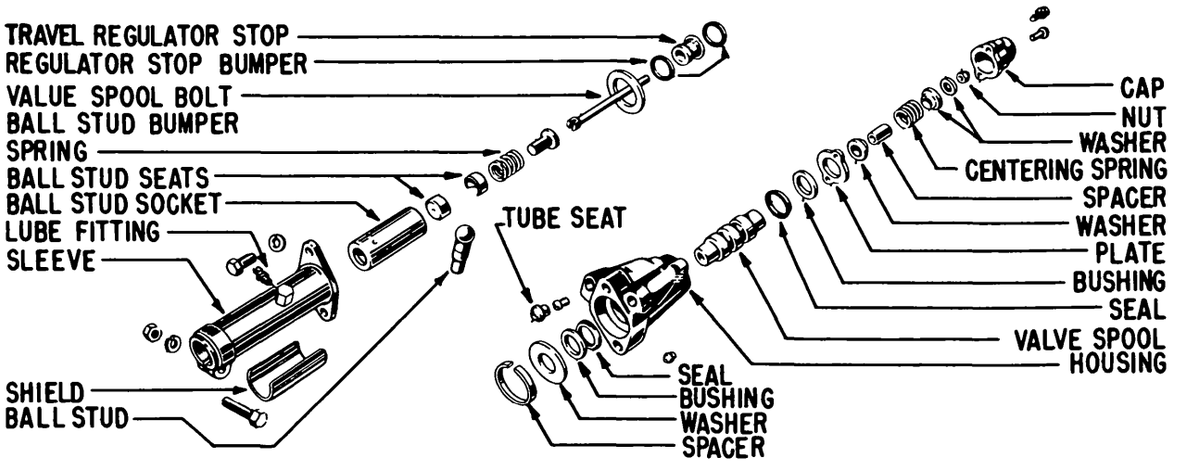
F rd (V8 Exc. 292" Eng.): Loosen bracket adjusting bolt and move pump until pulley slips against belt friction at 25 ft. lbs. Tighten all bolts to 20–25 ft. lbs.

M rcury (All M d ls): Loosen pump pivot and adjusting bolts, then install Tool BT–33–37F (Borroughs Belt Adjusting Gauge) and move pump as required to obtain a reading of 90–120 lbs. on gauge (used belt); 120–150 lbs. (new belt). *NOTE – A new belt is one that has b n us d l ss than 10 minutes.* Tighten bolts to 20–25 ft. lbs.



Studebaker: Belt deflection should be ¼–3/8" with 4 lbs. pull midway between pulleys. To adjust, loosen bracket mounting screws and shift pump body to secure proper belt tension.

LUBRICATION: Check fluid level every 4000 miles (Ford & Mercury), 5000 miles (Checker & Studebaker). Start engine and turn steering wheel right and left a few times, then shut off engine. Add Automatic Transmission Fluid to bring level up to following specifications:



Check r – Bring level to within 1" of top.
Ford & M rcury – Bring level up to "F" mark on dipstick.
Stud baker – Level should be up to filler opening.

TESTING: Turning Eff rt – With wheels properly aligned and tire pressure correct, place car on dry concrete, set parking brake, then proceed as follows: With engine running at normal idle speed, turn wheel to right and left several times to bring fluid to normal operating temperature. Hook a spring scale to steering wheel rim and measure pull required to turn wheel at least one full turn in both directions. The pull should be about equal in both directions as follows: 12 lbs. max. (Ford & Mercury), 11 lbs. max. (Studebaker).

Pump Pressure: Install a suitable pressure gauge between pump hose and pump outlet with pressure gauge between pump and shutoff valve of pressure gauge. Run engine at idle speed (with shutoff valve open) for two minutes to normalize oil temperature. Turn wheels all the way to right and left, noting fluid pressure reading on gauge when wheels are against stop. *CAUTION – Do not hold wheel against stop for more than 30 seconds.* Fluid pressure with wheels against stop should be 950–1100 lbs. (Ford & Mercury); 850 lbs. (Studebaker); 700–900 lbs. (Checker). Close gauge valve and check pressure. If pressure is less than minimum, pump is faulty. If pressure increases but does not reach maximum, inspect pump, control valve, and power cylinder. If pressure is within limits and steering gear does not function properly, trouble is in control valve or power cylinder.

REACTION LIMITING VALVE

EDSEL, FORD & MERCURY POWER STEERING CONTROL VALVE ASSEMBLY

OVERHAUL & TROUBLE SHOOTING: *See 1957 Annual Data, Page 364, or later Manual edition and note the following:*

Control Valve Removal (Studebaker): Disconnect hoses at pump body, pump reservoir, and power cylinder. Drain fluid from hoses, then remove hose retaining clips. Disconnect reach rod from steering bellcrank, then remove pitman arm from steering gear shaft with Puller J-5664. Remove control valve, reach rod, and hoses from car as an assembly. *NOTE - Before removing valve assembly from reach rod, clean assembly to remove dirt and grease from valve body, then loosen clamp on actuator sleeve and screw valve assembly off reach rod, counting the number of turns required to unscrew valve from reach rod. Record the number of turns for use at installation to maintain proper reach rod length.*

Valve Sleeve Mounting Bolt Tightening Torque: Tighten the two bolts to 15–20 ft. lbs. (Ford & Mercury), 140–170 inch pounds (Studebaker).

Control Valve Installation Measurement

Car	①Dimensi n
Ford & Mercury	11 15/16"
Studebaker	See Note Below

℄ - This measurement is the distance between center of pitman arm ball stud and tie rod ball stud.

►*STUDEBAKER INSTALLATION NOTE:* With control valve reinstalled and control valve assembly screwed into reach rod the same number of turns (recorded at time of removal), set wheels in straight ahead position and center wheel in the high spot. Slip pitman arm on steering gear shaft, aligning marks on arm and shaft, then check distance between center of pitman arm ball

CONTINUED ON NEXT PAGE

BENDIX LINKAGE TYPE POWER STEERING (Cont.)

and reach rod ball by holding end of reach rod in position at bellcrank. Adjust length of reach rod so that reach rod ball stud will slip into bellcrank without moving front wheels from straight ahead position. *NOTE - It is necessary to remove unit from car to make adjustments.*

Reaction Limiting Valve (Ford & Mercury): Disassembly – After disassembly of control valve, remove aluminum plug and "O" ring assembly from each end of control valve body, then remove springs, washers, and reaction valve.

Reassembly – Insert washer, spring, and longest plug and "O" ring assembly into valve housing from sleeve end. Carefully insert reaction valve into bore of valve housing from spring cap end, then insert washer, spring and short plug into housing.

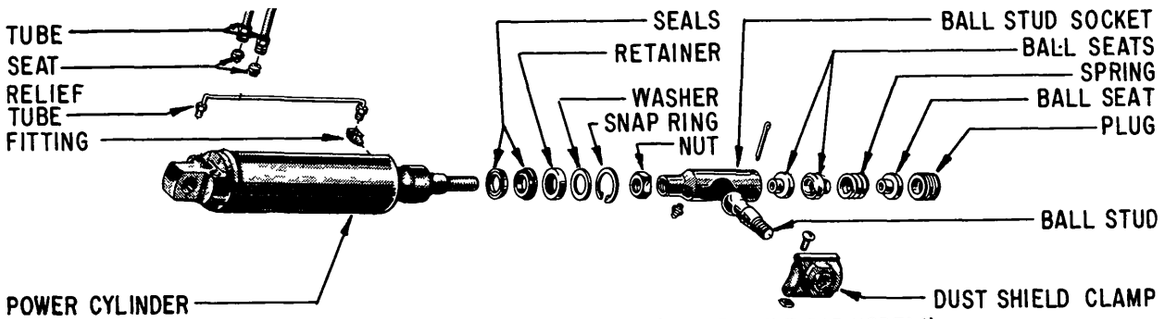
Cylinder Rod Tightening Torque: With outer insulator, washer and nut installed on piston rod, tighten nut to 18—24 ft.lbs. (Ford & Mercury); 45—50 ft.lbs. (Studebaker).

POWER STEERING PUMP: Eaton Roll er Type. *See 1958 Annual Data, Page 398, or later Manual edition.*

FORD TRUCK LINKAGE TYPE POWER STEERING

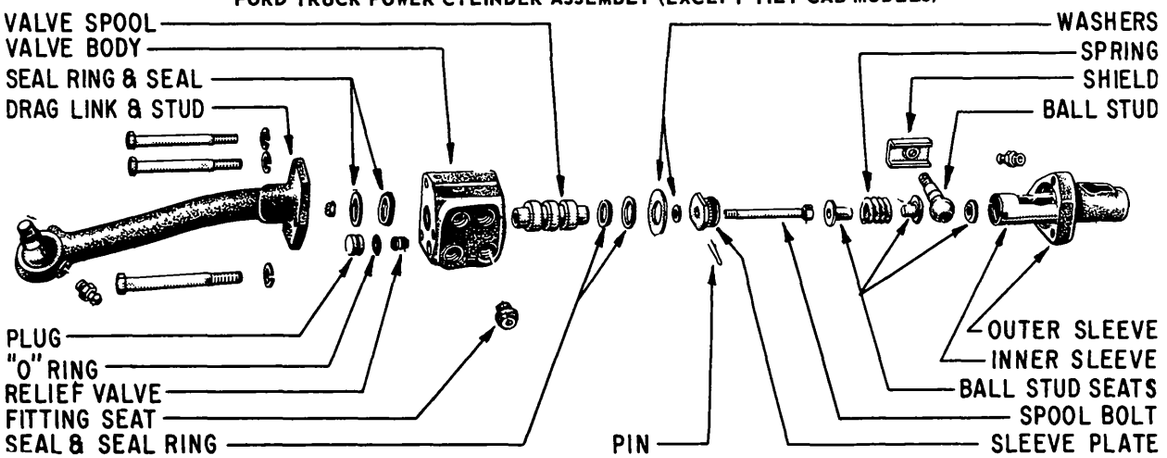
Ford Trucks, Except Tilt Cab Models (1961) ①
Ford Trucks, Tilt Cab Models (1961) ②

① – Power cylinder used.
② – Booster (rack & piston) cylinder used.



DESCRIPTION: Linkage type with control valve assembly connected directly to steering gear pitman arm. On Tilt Cab Models, the operating cylinder is a "rack & piston" booster type cylinder connected between pitman arm and wheel spindle. On other models, the hydraulic power cylinder is anchored to left side of front axle with the piston rod connected to center of spindle connecting rod. The only basic differences between the two units is in the construction of the operating cylinders.

LUBRICATION: Check fluid level in reservoir every 4000 miles (On Highway), 500 miles (Off Highway). Fluid should be at "F" mark on dipstick or within 1" of top of reservoir. Check fluid at normal operating temperature. Use only Automatic Transmission Fluid Type "A", Suffix "A"; or Ford Lubricant C1AZ-19582-A.



ADJUSTMENT: Pump Drive Belt – ¼" belt deflection midway between pulleys. Tighten belt adjusting bolt to 30—35 ft. lbs.

TESTING: Turning Effort – With front wheels properly aligned and tire pressure correct, place car on dry concrete, set brakes, then proceed as follows: With engine at normal idle speed, turn wheel to right and left several times to bring fluid to normal operating temperature. Hook a spring scale to rim of steering wheel and measure pull required to turn wheel at least one complete turn in both directions. Pull should be 35—65 lbs., and about equal in both directions.

Pump Pressure: Install pressure gauge, Tool T56L—33610—D, between pump hose and pump outlet with pressure gauge between pump and shut—off valve of tool. Run engine at idle speed (with shut—off valve open) for two minutes to normalize oil temperature. With wheels in straight ahead position, pressure should be no higher than 700 lbs. with engine at 900 RPM. If pressure higher, check for faulty pump or control valve. Increase engine speed to 3000 RPM and slowly close shut—off valve of gauge. Pressure should be about 1150 lbs. when shut—off valve fully closed. *CAUTION—Do not leave shut—off valve closed for more than 15 seconds.* If the pressure is less, then the pump is faulty. If pressure increases but does not reach maximum, inspect pump, control valve, and power cylinder. If pressure is within limits and power steering is not satisfactory, trouble is in control valve or power cylinder.

FORD TRUCK POWER CYLINDER ASSEMBLY (EXCEPT TILT CAB MODELS)

FORD TRUCK POWER STEERING CONTROL VALVE ASSEMBLY (TILT CAB MODELS)

TROUBLE SHOOTING: *See "Ford Truck Linkage Type Power Steering" in 1959 Final Data or later Manual edition.*

REMOVAL & INSTALLATION: Power Steering Pump – Remove as much fluid as possible through reservoir filler opening. Disconnect pressure hose from pump and return line from cooler, and tie hoses to prevent fluid loss. *NOTE – It is easier on Tilt Cab Models to disconnect hoses after pump mover from mounting bracket.* Loosen adjusting bracket bolt and pivot bolt and remove pump belt. Remove pump attaching bolts and remove pump and reservoir as an assembly. To install, reverse removal procedure.

Control Valve (Except Tilt Cab): Drain reservoir, disconnect hoses from control valve, then disconnect ball studs and piston mounting bolts. Remove control valve. To install, reverse removal procedure.

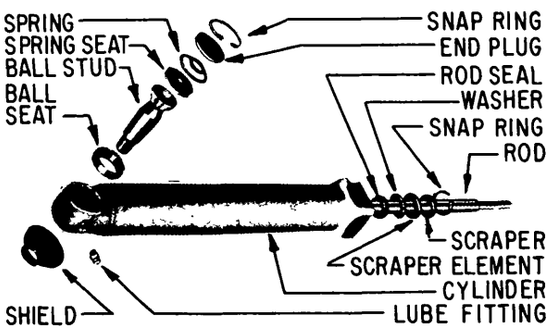
Control Valve (Tilt Cab): Remove hoses from valve, then disconnect studs from idler arm and sector shaft arm. Remove control valve and drag link. To install, reverse removal procedure.

OVERHAUL: *See "Ford Truck Linkage Type Power Steering" in 1959 Final Data or later Manual edition.*

POWER STEERING PUMP: *See "Eaton Roller Type" in 1958 Final Data or later Manual editions.*

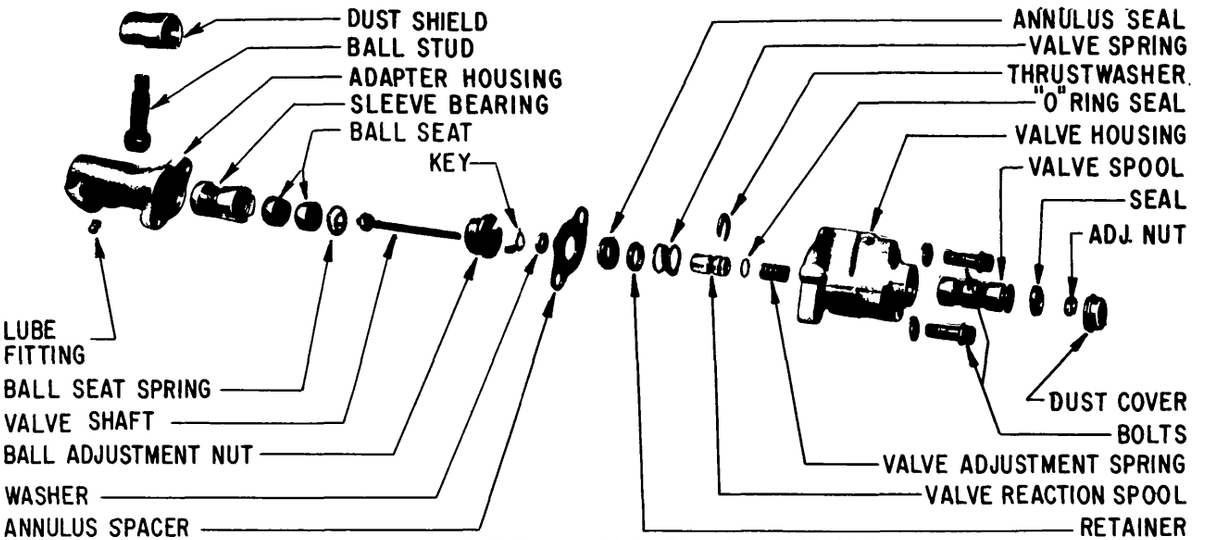
CHEVROLET & PONTIAC TEMPEST LINKAGE TYPE

Chevrolet Passenger Cars (1961)
Pontiac Tempest (1961)



►CHANGES, CAUTIONS, CORRECTIONS

►*1961 TEMPEST POWER STEERING NOISE CORRECTION (EARLY CARS):* A noise heard when steering wheel is turned full right or full left so wheels are against stops can be eliminated by installing a new flow control valve.



DESCRIPTION: Linkage type with power cylinder mounted between steering relay rod and bracket on frame side rail. Control valve assembly is mounted on left side relay rod and is operated by pitman arm acting on spool valve assembly. The new control valve assembly is adjustable to provide greater uniformity of operation and faster response. The new power steering pump is mounted on engine and is driven by a belt from crankshaft pulley.

ADJUSTMENT: Power Steering Pump Belt - Loosen power steering pump-to-bracket attaching bolts and move pump, with belt in place, until belt is tensioned so that a 15 lbs. force applied at midpoint between fan pulley and pump pulley will cause a ½" to ¾" belt deflection, then tighten mounting bolts.

Control Valve Balancing: *NOTE - If a hard steering effort is required (in one direction), balance control valve as follows:* With car on a hoist, engine running, and power cylinder rod disconnected from frame bracket, piston rod will be fully retracted or fully extended (if valve is out of balance). If piston rod remains retracted, turn adjusting nut clockwise until rod begins to move out, then turn nut counterclockwise until rod begins to move in. Now turn nut clockwise to exactly one-half the rotation needed to change direction of shaft movement. If rod remains extended, move nut counterclockwise until rod begins to retract, then clockwise until rod begins to move out. Now position nut to exactly one-half the rotation needed to change direction of shaft movement. *CAUTION - Do not turn nut back and forth more than is absolutely necessary to balance valve.* With valve properly balanced, it should be possible to move rod in and out manually. Stop engine and connect cylinder rod to frame bracket, then restart engine. If front wheels (still on hoist) do not turn in either direction from center the valve is properly balanced. With valve properly adjusted, install dust cap.

POWER CYLINDER ASSEMBLY

CHEVROLET POWER STEERING CONTROL VALVE ASSEMBLY

Pontiac Tempest – Loosen pump mounting bolts and tighten belt so a 5–6 lb. force applied midway between pulleys will deflect belt ¼". *NOTE – If a Borroughs Gauge is used, a reading of 70–75 lbs. should be obtained.*

LUBRICATION: Checking Fluid Level – With oil at normal operating temperature, check fluid level on dipstick. Fill to indicated level with Automatic Transmission Fluid.

Bleeding Hydraulic System: Fill reservoir to proper level and let oil remain undisturbed for at least two minutes, then start engine and run at idle speed for two minutes. Add oil if necessary, then raise front of car so wheels are off ground. Increase engine speed to 1500 RPM (Chevrolet), 1000 RPM (Pontiac), and turn wheels from full right to full left, contacting stops lightly. Lower car and turn wheels right and left on ground. Check oil level and refill as necessary. Continue this process as long as required to bleed all air from system.

REMOVAL, INSTALLATION & OVERHAUL: *See 1960 Annual Data, Page 398, or later Manual edition.*

POWER STEERING PUMP: *See "Saginaw Vane Type (Integral Reservoir)" in this section.*

MONROE LINKAGE TYPE

Rambler, All Models (1961)

►*1961 SERIES 6180 WATER ENTERING POWER STEERING CYLINDER CORRECTION:* On early cars before Car Code No. W–132800, clean and apply a heavy coat of Pliobond around lower section of pressure and return line fittings on power cylinder section of unit. Later cars have been coated with Pliobond in production.

DESCRIPTION: Linkage type of same design used on previous models.

ADJUSTMENT, TROUBLE SHOOTING, OVERHAUL: *See 1959 Annual Data, Page 390, or later Manual edition.*

POWER STEERING PUMP: Series 6120, 6180 – Eaton Roller Type. *See 1959 Annual Data, Page 398, or later Manual edition.*

Series 6101, 6110: Rambler Slipper Type. *See 1960 Annual Data, Page 403, or later Manual edition.*

PRESSURE TEST: With fluid level in reservoir correct, install oil pressure gauge J–5548–A in main oil line at control valve assembly, then start engine and bring oil to normal operating temperature. Turn wheels against curbing or other obstacle and hold tension on wheel. Oil pressure should be 800–900 lbs. (Roller Type Pump); 850–950 lbs. (Slipper Type Pump). Turn wheel in opposite direction and note pressure. If there is a variation between right and left turn, internal leakage is indicated. If pressure is low, stop engine and disconnect gauge from cylinder and valve assembly and cap pressure line. Restart engine and note pressure. If pressure is within specifications, pump is operating properly. If pressure is low (belt tension correct), trouble exists in pump. *CAUTION – Do not hold wheels at maximum pressure longer than is necessary to obtain a steady pressure reading.*

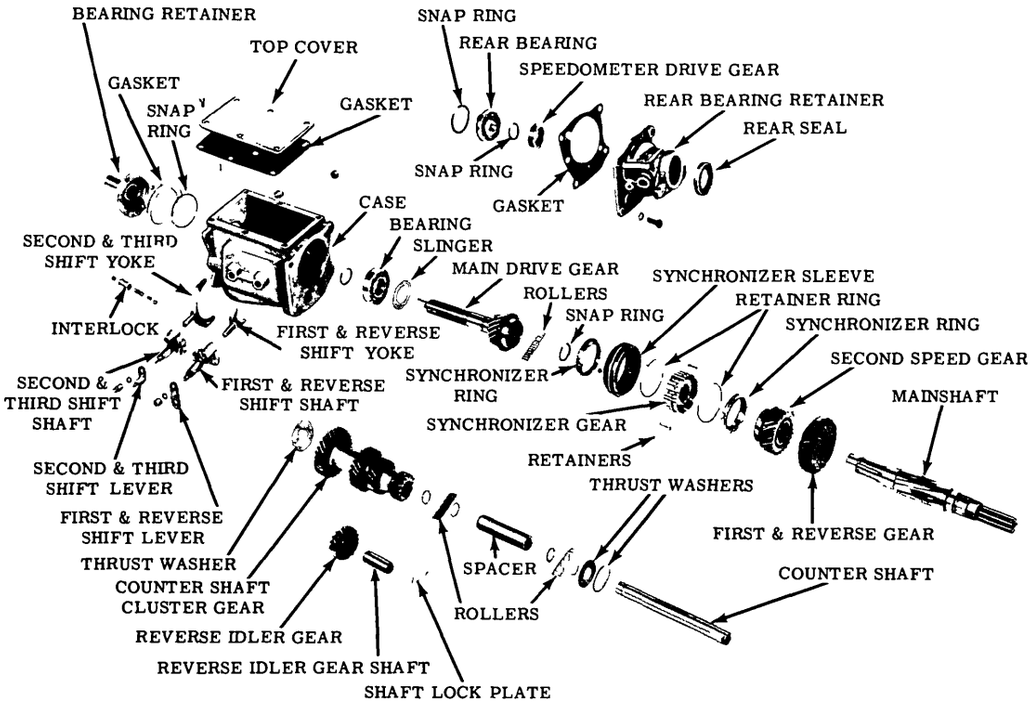
BUICK & OLDSMOBILE F-85 3-SPEED SYNCHRO-MESH

Buick Special (1961)
Oldsmobile F-85 (1961)

DESCRIPTION: Three speed, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse), all helical gear type.

REMOVAL OF TRANSMISSION: Mark front universal and companion flange for installation at same location, then disconnect joint and slide propeller shaft to rear. Disconnect shift linkage from transmission (disengage spring from equalizer, slide equalizer to left and disengage from second–third shift lever, then slide equalizer to right off support pin). Remove first–reverse shift lever from transmission shift shaft, then disconnect speedometer cable. On Buick, loosen all three exhaust pipe ball joints, then remove bolts attaching transmission mounting pad to transmission support. On all models, support rear of engine with a jack and raise engine slightly, then remove transmission support and lower engine for clearance. Remove upper transmission attaching bolts and install suitable guide pins. Remove remaining attaching bolts and slide transmission straight back until input shaft clears clutch assembly and remove from car.

DISASSEMBLY: **1)** Remove top cover and gasket, then remove speedometer driven gear from rear bearing retainer, Remove companion flange using Tool J–8614–1–2 if necessary. Remove rear bearing retainer (extension housing) and front bearing retainer. Drive countershaft and reverse idler gear shaft lock plate out of shaft grooves with a punch.



2) Use Tool J–8965 (Loading Tool) and drive countershaft out rear of transmission case. *CAUTION–Countershaft must be driven out rear of case as rear of shaft is a larger diameter.* During countershaft removal, hold loading tool in close contact with countershaft to prevent any thrust washers from falling out of position and drive loading tool only until countergear will drop into bottom of case with tool in position.

3) Pull main drive gear and bearing out front of case. *NOTE – Use a brass drift if necessary to tap gear out.* Pull mainshaft rearward enough to move rear bearing out of case, allowing shaft assembly to be tipped away from second and third shifting yoke, then remove second and third shifting yoke.

4) Remove synchronizer assembly–to–mainshaft retainer ring and remove synchronizer assembly and second speed gear together to prevent synchronizer coming apart. Remove first and reverse shifter yoke, then remove mainshaft from case.

5) Remove first and reverse gear from inside case, then use a long brass drift and drive reverse idler gear shaft out rear of transmission case and remove reverse idler gear. Lift countergear and loading tool out of case, noting position of thrust washers.

6) Remove the two shift lever shaft retaining pins by driving them out of case with a drift. *NOTE – These pins are tapered and will come out from the top only.* Pull shift lever shafts toward outside of case to allow interlock balls to fall into bottom of case, then remove outer shift levers, and remove shaft assemblies from case. Remove shift lever interlock sleeve, spring and pin.

BUICK & OLDSMOBILE F-85 3-SPEED SYNCHRO-MESH TRANSMISSION (EXPLODED)

7) Remove countergear bearing rollers (22 at each end), bearing retainer washers (2 at each end), and spacer from gear. Remove brass synchronizer rings from each end of synchronizer assembly. *NOTE – One of the rings may have to remain on main drive gear cone.*

8) Remove snap ring retainers from each end of synchronizer gear noting their position. Slide synchronizer sleeve off from synchronizer gear and remove the three synchronizer retaining plates.

INSPECTION: Wash all parts in clean solvent and inspect for damage and abnormal wear. If thrust washers are worn or scored, install new washers.

REASSEMBLY: **1)** Install interlock pin and spring in bore of interlock sleeve and install sleeve in case. Install first and reverse shift lever and shaft assembly in case. *NOTE – Notches are far apart.* Install second and third shift lever and shaft assembly in case, then install two interlock balls in interlock sleeve and retain with shift levers. With one lever in neutral detent, and the other in a gear detent, hold interlock sleeve against one lever. Clearance between sleeve and other shaft must be .001 – .007". *NOTE – Selective fit sleeves are available.* Install shift lever retaining pins.

2) Center countershaft bearing spacer in bore of countergear, then place one bearing retaining washer against each end of tubular spacer. Insert Tool J–8965 (loading tool) in bore of countergear and spacer. Load 22 bearing rollers in each end of countershaft using synthetic seal lubricant on bearings. Install the two outer bearing roller retainer washers.

3) Lubricate smaller bronze faced steel thrust washer with petroleum jelly and position on small end of countergear with tangs in slots of gear. Place small steel thrust washer on bronze faced washer with sufficient lubricant to hold in position, tang up. Coat larger bronze face thrust washer with petroleum jelly and place in position on large end of countergear with bronze face toward rear. Tang must be up to align with recess in case.

4) Position two pieces of wire (14 gauge electrical) in bottom of case for use later to lift countergear assembly into position for installation of countershaft. Hold tool in countergear flush with washers at each end, and lower assembly (large end to front) into case. *NOTE – Tangs of thrust washers must be in their proper positions in case.*

5) Position reverse idler gear in case with relieved end of gear teeth toward front of transmission. Install reverse idler gear shaft into case, then use the lock plate as a guide to position slot in shaft towards countershaft hole in case. Drive shaft in until inner edge of slot is nearly flush with case.

6) Install first and reverse gear shift yoke in first and reverse gear shift lever. Place three synchronizer retaining plates on synchronizer and install in sleeve, then install wire retaining rings. Place mainshaft and bearing assembly into case, then place first and reverse gear (yoke groove toward front), on shaft and engage gear with yoke. Place second speed gear on shaft, then install synchronizer assembly and rear synchronizer ring (yoke groove in synchronizer toward rear) and install snap ring retainer on mainshaft.

7) Position mainshaft and bearing assembly in case so

CONTINUED ON NEXT PAGE

BUICK & OLDSMOBILE F-85 3-SPEED SYNCHRO-MESH (Cont.)

both shifting yokes are engaged with grooves in low and reverse gear and in synchronizer, then place front synchronizer ring in synchronizer, aligning notches with three retainer plates. Install 14 roller bearings in main drive gear and retain in position with petroleum jelly, then install main drive gear into front of case. *CAUTION – Mak sure brass synchronizer ring is prop rly ngag d in synchronizer, and that main driv gear snap ring is tight against case.*

8) Install main drive gear bearing retainer and gasket and seal retaining bolts with Permatex No. 2 to prevent leakage. Tighten bolts to 17–20 ft. lbs. With synchronizer hub and second gear pressed forward against snap ring, clearance between second speed gear and front facing of first–reverse gear splines should be .003 – .016".

9) Use previously positioned wires and carefully raise countergear assembly so countershaft can be installed. Install countershaft through rear of case with lockplate groove to rear and turned so groove is toward reverse idler gear shaft. Hold countershaft and loading tool tightly together while tapping countershaft into case until lockplate groove is just short of being flush with case. Position lockplate into shaft grooves and tap into place, then tap shafts into case until lockplate is tight against case.

10) Remove wire used to raise countergear, then install rear bearing retainer and gasket and tighten bolts to 28–33 ft. lbs. Install shift lever shaft seals, outer shift levers, washers, and attaching nuts, then check shift levers for correct operation. Install speedometer gear, companion flange, top cover and gasket. Tighten top cover bolts to 10–12 ft. lbs.

MAIN DRIVE GEAR BEARING REPLACEMENT: With main drive gear removed from transmission, remove snap ring from shaft, then jar bearing off shaft, using a brass drift if necessary. To install bearing, install oil slinger on shaft next to gear, then install bearing and drive into position with Tool J–6133. Install bearing outer snap ring and thickest shaft snap ring that will fit in snap ring groove. *NOTE – Snap ring is available in three thicknesses.*

MAINSHAFT BEARING REPLACEMENT: With mainshaft assembly removed from transmission, remove bearing snap ring, then with first–reverse gear on shaft, bounce shaft on a wooden block and drive bearing off shaft. Press new bearing on shaft with Tool J–6133–A or equivalent and install snap ring.

REAR OIL SEAL REPLACEMENT: Disconnect propeller shaft and remove companion flange, then use an awl and pry seal out of housing. Coat a new seal with Permatex No. 2 or equivalent and drive seal into bore with Tool J–8864 (Buick), J–5154 (Oldsmobile). Install companion flange and tighten bolt to 30–45 ft. lbs., then connect propeller shaft and tighten "U" bolt nuts to 14–18 ft. lbs.

SHIFT LEVER SHAFT SEAL REPLACEMENT: Disconnect linkage from lever, then remove lever. Puncture metal edge of seal with a prick punch and pry seal out of case. Coat outer diameter of new seal with Permatex No. 2 or equivalent, and inner lip of seal with a synthetic seal lubricant. Drive seal into place with an 11/16" socket.

TRANSMISSION CONTROL ADJUSTMENT: Buick – Place both shift levers on transmission in neutral position, then loosen shift rod adjusting clamps at lower end of steering column and place both levers in a horizontal position. *NOTE – Levers must be exactly parallel.* Tighten second–third shift rod adjusting clamp, then lift selector lever toward steering wheel into first–reverse range several times to align first–reverse lower control shaft lever, and tighten first–reverse rod adjusting clamp. Check for smooth and easy operation.

Oldsmobile: Loosen trunnion nuts at bottom of steering column–to–equalizer and shift lever rods, then place selector lever in neutral position. Install Tool J–8992 on lower end of steering column and place both shift levers (at lower end of column) in a horizontal position, and in alignment, then tighten trunnion nuts.

CHEVROLET & PONTIAC 3-SPEED SYNCHRO-MESH

Ch vr l t Pass. Cars (1961)
Ch vr l t Trucks, ½ & ¾–Ton (1961) Light Duty
P ntiac (1961)

DESCRIPTION: Same design used on previous models.

TRANSMISSION REMOVAL: Drain transmission and remove propeller shaft. *NOTE – On Pontiac and Ch vrol t Trucks, disconnect rear universal and slide shaft to r ar. On Ch vrolet Pass. Cars, remove bolts attaching cent r support to frame, then disconnect rear prop ll r shaft and slide shaft assembly to rear to dis ngag from transmission.* Disconnect speedometer at transmission and shifter rods at transmission levers. Support rear of engine (Chev. Pass. Cars & Pontiac) with a floor jack, then remove transmission support crossmember (Chev. Pass. Cars); disconnect at transmission bracket (Pontiac). *NOTE – On Chev. Pass. Cars, r tain shims found between transmission mounting block and support for installation in same location.* Remove upper transmission attaching bolts and install guide pins, J–1126, then remove lower attaching bolts. *NOTE – If vehicle is equipped with overdriv , disconn ct overdrive wires and controls.* Slide transmission straight back on guide pins (on Pontiac, tilt rear of extension upward to disengage bracket studs from crossmember support) until transmission shaft clears clutch assembly, and remove from vehicle.

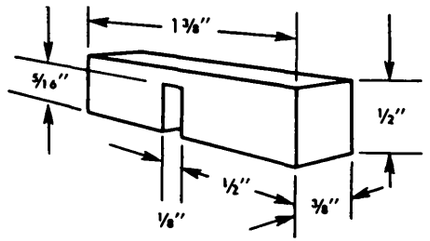
OVERHAUL: *See 1955 Annual Data, Pag 376, or later Manual editions and note the following:*

Side Cover Disassembly & Reassembly: Remove side cover from transmission case, then remove outer shift lever clamp bolts and pull levers from shafts. Remove nuts and locks and remove shifter interlock retainer. This will allow removal of shifter shaft and fork assembly and cam assembly, or interlock from cover. To reassemble, install shifter interlock retainer, then install outer shift levers on shafts and install clamp bolts. With transmission gears in neutral, and shifter forks in neutral, install cover on transmission, using a new gasket. Tighten retaining screws tightly. *NOTE – Hump on first and reverse shifter fork must be toward rear of transmission.* Attach control rods to shift levers, then refill transmission.

TRANSMISSION CONTROL ADJUSTMENT: Chevrolet Pass. Cars – With transmission control rods disconnected at lower end of steering column, move both transmission levers to neutral position. Move transmission selector lever to neutral position and engage second–third shift lever at lower end of steering column with relay lever. Center levers in mast jacket by measuring from edge of slot in jacket to edge of slot in spacer at each side of lever, then adjust swivel of second–third shift rod for free entry in hole in lever and install retainer. Move first–reverse lever on tube until lug on lever lines up with slot in relay lever (pull relay lever to make sure lug mates with slot), then adjust swivel of first–reverse shift control rod for free entry into hole in lever and install retainer. Check shifts in all positions for smooth action and for overtravel.

Chevrolet Truck: Check clearance between lower edge of gearshift lever and upper edge of support. If clearance not 3/32" to 1/8", remove upper control shaft assembly from steering column and screw upper support up or down as necessary for proper clearance, then replace upper control shaft assembly. Measure clearance between end of gearshift lever and underside of steering wheel rim which should be 3¾" ± 1/8". If not within limits, loosen gearshift control shaft and housing assembly clamp bolts and move housing assembly (with upper and lower control shafts and gearshift lever) as necessary for proper clearance, then tighten clamp bolts. Loosen second–third speed control rod swivel clamp at housing outer lever and adjust swivel so gearshift lever is in horizontal plane. Remove housing cover to make sure shift gates in inner levers are aligned. If necessary to adjust, loosen first–reverse control rod swivel clamp at housing and adjust swivel until shifter gates are aligned.

Pontiac: Position selector lever in neutral, then disconnect shift rods at transmission. Line up shift levers at lower end of steering column so they move freely back and forth (neutral position with slots lined up). With shift levers on transmission in neutral detent, adjust trunnion at idler lever (second–third), and at shift lever (first–reverse) for free entry into shift levers, then tighten trunnion locknuts to 5–10 ft. lbs. Move selector lever into first gear and check key at first–reverse shift lever at lower end of steering column. Key should just clear lower side of opening in steering column. Shift selector lever to third gear and check key at second–third shift lever. Key should again just clear lower side of opening. Lubricate linkage joints and check shift pattern.



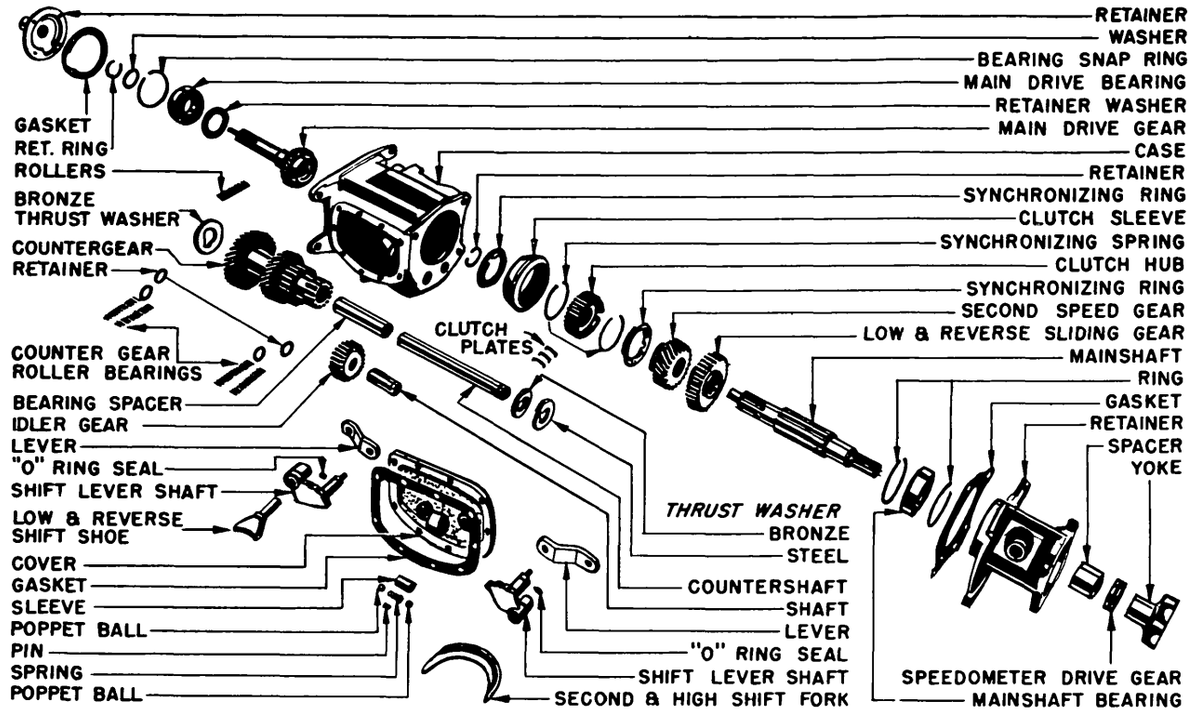
CHEVROLET, CORVETTE, PONTIAC & STUDEBAKER 4-SPEED

Chevrolet Pass. Cars (1961)
Chevrolet Corvette (1961)
Pontiac (1961)
Studebaker (1961)

DESCRIPTION: 4-speed "close ratio" helical gear type (except reverse), with constant mesh, synchro-mesh in all forward speeds. Sliding gear (reverse). Transmission is same design as used previously.

TRANSMISSION REMOVAL: Chevrolet & Corvette: Disconnect speedometer cable at transmission, then disconnect shift rods at shift levers and remove shift assembly. On all models except Corvette, remove bolts attaching center support to frame member, then remove "U" clamps on rear universal joint and remove propeller shaft and bearing assembly by moving it rearward and to the left under axle housing. On Corvette, disconnect propeller shaft at rear universal and remove it from transmission splines. Support rear of engine and remove transmission support crossmember. Remove two top transmission attaching screws and insert guide pins, J–1126, then remove lower attaching screws and slide transmission straight back on pins until shaft is clear of clutch assembly and remove transmission.

Pontiac: Remove gearshift lever boot, then drain transmission. Disconnect speedometer cable and back–up light leads at transmission. Disconnect shift rods from transmission levers and remove manual shift lever and bracket. Disconnect propeller shaft and slide the assembly to rear to disengage from transmission. Support rear of engine and remove transmission extension bracket–to–crossmember retaining nuts, then remove two top transmission attaching bolts and insert guide studs in these holes. Remove lower attaching bolts and tilt extension upward to disengage bracket studs from support, then remove transmission. *NOTE– On long wheelbase models, remove crossmember support before removing transmission.*



SHIFT LINKAGE GAUGE BLOCK

Studebaker: Drain transmission, then disconnect and remove shifting assembly. Disconnect crossmember under transmission and slide it to rear along exhaust pipes for clearance. Disconnect propeller shaft at rear universal and remove from transmission. Remove speedometer and drive pinion from case, then remove transmission attaching capscrews. Pull transmission to rear until shaft clears clutch assembly, and remove unit from car.

SHIFT LINKAGE ADJUSTMENT: *NOTE - The gauge block illustrated below will facilitate adjustment, however, the adjustments can be made by having an assistant hold manual shift lever in neutral position.* Remove transmission gearshift lever seal from floor pan, then place transmission in neutral and install gauge block (see illustration). Remove cotter pin, anti-rattle washer and clevis pin at each shift lever. On each shift rod, adjust threaded clevis to permit free entry of clevis pin into hole in transmission shift lever. Reconnect clevises to shift levers, then remove gauge block and check shifts. If any roughness still exists, determine rod and clevis requiring adjustment by sighting along the slot where gauge block was used.

TRANSMISSION OVERHAUL: *See 1957 Annual Data, Page 373, or later Manual editions and note the following:*

►*COUNTERGEAR NEEDLE BEARING SPACERS:* Countergear bearing assembly consists of six .050" spacers, 80 roller bearings, and a roller bearing spacer.

CHEVROLET & PONTIAC 3-SPEED (HEAVY DUTY) SYNCHRO-MESH TRANSMISSION

CHEVROLET TRUCK & PONTIAC 3-SPEED HEAVY DUTY

Chevrolet Trucks, ½, ¾, 1–Ton (1961) Heavy Duty
Pontiac Taxi, Police & Heavy Duty (1961)

DESCRIPTION: Same design as used on previous models.

REMOVAL OF TRANSMISSION: *See "Chevrolet & Pontiac 3–Speed Transmission" in this section.*

OVERHAUL: *See 1958 Annual Data, Page 406, or later Manual editions.*

CHEVROLET TRUCK 4-SPEED SYNCHRO-MESH

Chevrolet Trucks ½, ¾, 1, 1½–Ton (1961)

DESCRIPTION: Four speed, constant mesh, synchro–mesh (second, third & fourth), sliding gear (low reverse), of same design as used on previous models.

REMOVAL OF TRANSMISSION: Drain lubricant, then remove parking brake lever. *NOTE – Not necessary to remove parking brake lever on Series 10 Trucks.* Remove propeller shaft. Slide open end of Tool J–8109 over shift lever and engage lugs of tool in open slot of retainer, then press down on tool and turn it to left to disengage lugs on retainer and remove shift lever. Remove screws and slide steering column jacket grommet up jacket, then remove accelerator pedal and floor mat. Remove transmission cover. On Forward Control models, remove front and rear floor pans. On all models, remove speedometer cable at transmission. Remove two upper transmission attaching bolts and install guide pins, J–1126, then remove flywheel lower pan and lower transmission attaching bolts. Slide transstraight back on guide pins until clear of clutch assembly and remove transmission.

OVERHAUL: *See "Chevrolet Truck 4–Speed Transmission" in Transmission Section of Manual.*

CHEVROLET TRANSFER CASE

Ch vrolet ½ & ¾-T n 4-Whe l Driv Trucks (1961)

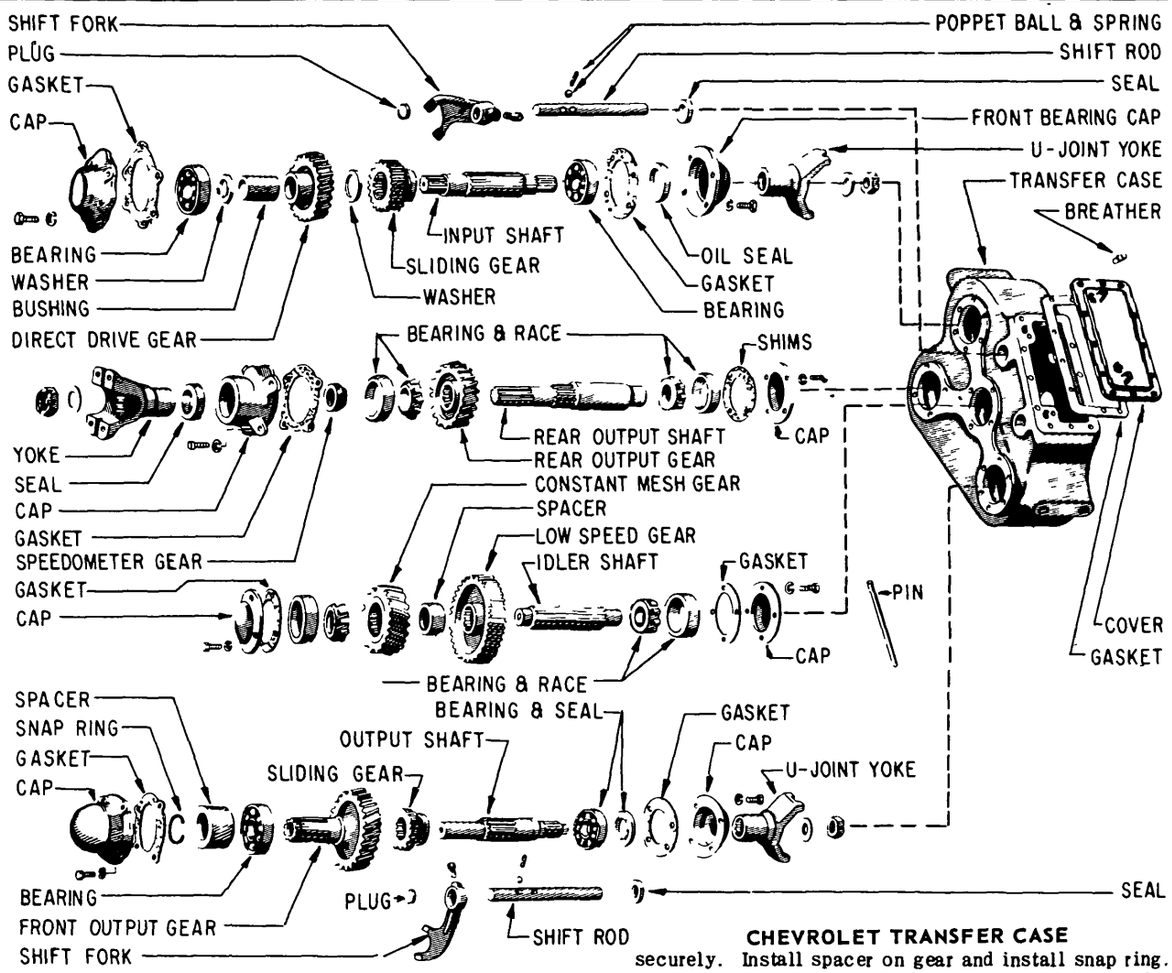
DESCRIPTION: Manual shift two-speed transfer case used on Four-Wheel Drive models to transmit power from engine to rear and front axle assemblies through a four speed transmission. A single control lever is used to shift transfer case from direct drive to low (four-wheel drive) at a ratio of 1.94-1.

DISASSEMBLY: Shift R ds - Remove transfer case cover and slide out interlock pin. Remove shift rod poppet balls and springs, then cut lock wires and remove shift fork setscrews from fork. Pull shift rods from case and remove forks from inside as rods removed.

Prop ll r Shaft Y ke and Deflector: Remove cotter pin, nut and washer at each of the three universal joints and remove yokes using a suitable puller.

Idler Shaft: Remove front and rear idler shaft bearing caps and adjusting shims. *NOTE - Tie shims to cap for use at r ass mbly.* Press or drive idler shaft out of case, then remove input shaft constant mesh gear, spacer, and low speed gear from case. If inspection indicates wear, remove bearing cone from shaft and bearing cup from case.

Front Output Shaft: Remove front bearing cap and gasket from case, then pull front output shaft and bearing assembly from case. If necessary, remove bearing from shaft. Remove front sliding gear from case. Remove rear bearing cap and gasket from case, then remove snap ring from front output gear and slide spacer from gear. Drive gear inward out of bearing and remove from case, then remove bearing from case.



R ar Output Shaft: Remove front and rear bearing caps, gaskets and shims. *NOTE - Tag shims under front cap for use at reass mbly.* Press or drive output shaft toward front of case until shaft and bearing are removed, then remove shaft gear and bearing from case. If necessary, remove bearing cone and cup from shaft or case.

Input Shaft: Remove front bearing cap, then remove assembly and shims. *NOTE - Tag shims for use at reassembly.* Remove rear bearing cap and gasket, then press or drive shaft toward front of case until removed. Remove direct drive gear, sliding gear, and thrust washer from inside case. Remove bearing and washer.

INSPECTION: Wash all parts thoroughly in solvent and blow dry with air. Inspect all bearings for chips, cracks or worn spots. Replace bearings if damaged. Inspect splines and gears for chips or excessive wear and replace as necessary.

REASSEMBLY: *NOTE - Make sure all parts are clean, then lubricate with proper transmission fluid before reassembly. Use new gaskets and lockwashers.*

Input Shaft: Press front bearing onto shaft with shielded side of bearing toward shoulder on shaft, then insert shaft through opening in front of case. As shaft is being moved into position, install sliding gear, washer, direct drive gear and washer. Install rear bearing on shaft with shielded side toward inside, then install rear bearing cap and gasket and tighten attaching bolts securely. Install front bearing cap using same shims as removed at disassembly. Check shaft endplay with a dial indicator. In endplay exceeds .015", change shim pack as necessary to obtain proper endplay. Install universal joint yoke, washer and nut, then tighten nut securely and install cotter pin.

Rear Output Shaft: If removed, press bearing cone onto rear output shaft. Locate rear output shaft gear inside case as shaft is installed through front of case and pressed into gear. Press or drive front bearing cup into case, then install bearing cap with adjusting shims. Install cap bolts and lockwasher and tighten securely. At rear of shaft, press bearing cone onto shaft, and bearing cup into case, then install speedometer drive gear. Install oil seal and bearing cap assembly and tighten capscrews securely. Install universal joint yoke, washer and nut and tighten nut securely. Check endplay of shaft with a dial indicator and remove or add adjusting shims at front bearing cap until endplay is as near "zero" as possible

Front Output Shaft: Locate front output gear inside case, then install bearing over gear hub and into position in case. If removed, press bearing onto output shaft. Output shaft is installed through opening in front of case and sliding gear must be located on shaft as shaft is pushed in to proper location. Install oil seal and bearing cap at front of case and tighten bolts

securely. Install spacer on gear and install snap ring. Install rear bearing cap and gasket and tighten bolts

Idler Shaft: If removed, press bearing cone on front end of idler shaft. Start shaft into front side of case and install constant mesh gear, spacer, and low speed gear as shaft is pushed into position. Press front and rear bearing cups into case and over bearing cones. Install rear bearing cap and gasket and tighten bolts securely. Install front bearing cap and adjusting shims and tighten bolts securely. Check shaft endplay with a dial indicator, then add or remove shims as necessary until endplay is as near "zero" as possible.

Propeller Shaft Yoke & Deflector: Install yoke on shaft, then install washer and nut and tighten securely.

Shift Rods: If removed, install shift rod oil seals in case, then push rods into case being careful not to damage seals. Install shift forks on rods, then install and tighten setscrews. Thread a lock wire through setscrews to prevent loosening. Install poppet balls and spring into holes in case, then slide interlock pin into bosses on inner surface of cover and install cover and gasket. Tighten screws securely.

CHRYSLER CORP. HEAVY DUTY

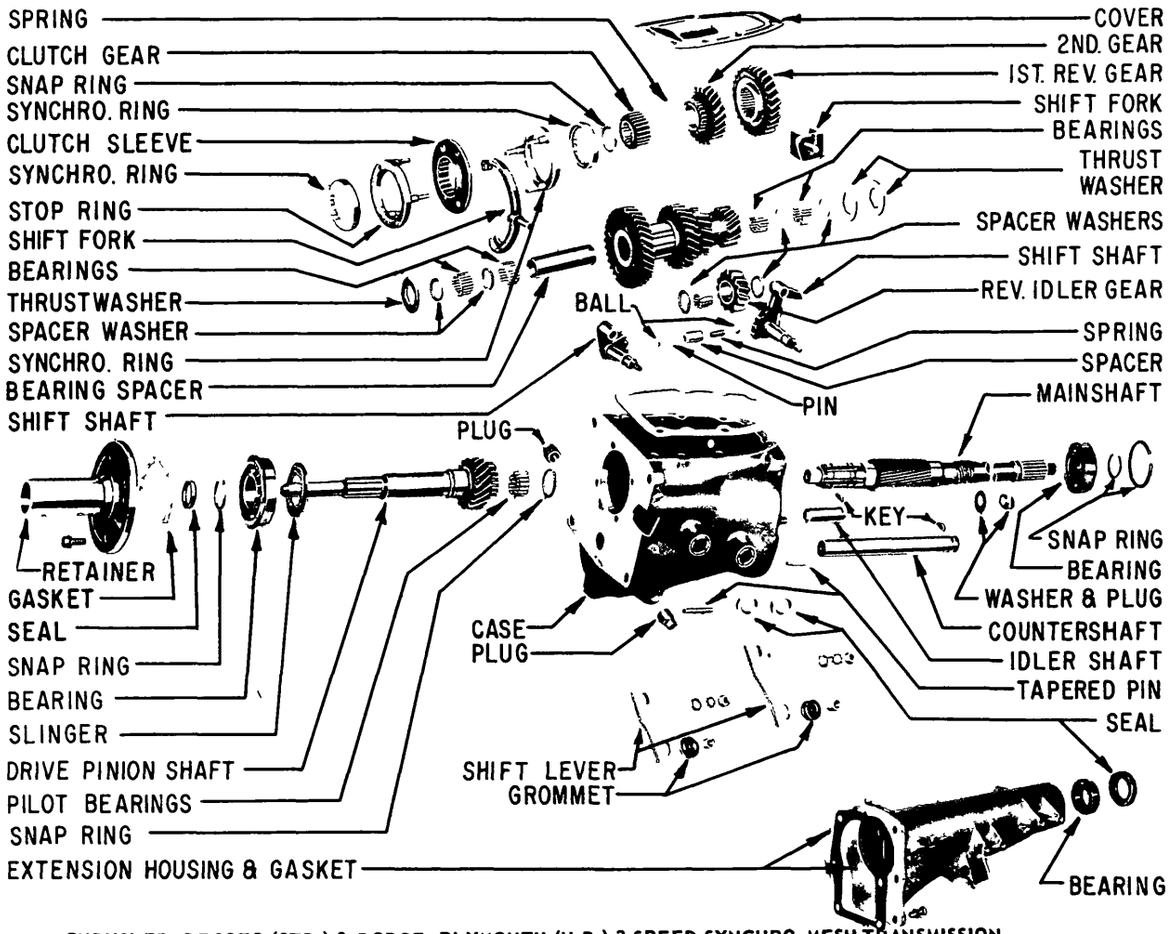
Chrysler (1961) Std.
Dodge (1961) Std.
Dodge & Plymouth (1961) Hvy. Duty

► *TRANSMISSION LUBRICATION NOTE: SAE 80 Multi-Purpose Gear Lubricant or Automatic Transmission Fluid Type "A" (Suffix "A") may be used.*

DESCRIPTION: Own. Three speed, constant mesh, Synchro-mesh (second & high), sliding gear (low & reverse). All helical gear type.

► *TRANSMISSION IDENTIFICATION NOTE (DODGE & PLYMOUTH):* This heavy duty transmission is identified by the breather at top of transmission case where extension housing bolts to case, and by a raised hump at front of transmission cover.

GEARSHIFT LINKAGE ADJUSTMENT (ALL MODELS): *See "Dodge, Plymouth, Lancer, Valiant Synchro-mesh Transmission".*



REMOVAL OF TRANSMISSION: Drain lubricant, then remove propeller shaft. Disconnect speedometer cable, pinion assembly sleeve, shift rods, and parking brake cable from transmission. On Dodge & Plymouth, support engine with a suitable fixture and remove engine rear mount bolts. On all models, remove transmission attaching bolts and pull transmission back until input shaft clears clutch assembly, then remove from car.

DISASSEMBLY: Extension Housing – Use flange holding tool C-3281 and remove companion flange nut and washer, then attach Puller C-452 and remove drum and flange assembly. Remove parking brake assembly, then remove five bolts and one nut and remove extension housing. Remove seal from rear of extension housing with Tool C-748 and remove mainshaft rear bearing (if it did not remain on mainshaft).

Drive Pinion: Remove transmission case cover and drive pinion bearing retainer. Remove drive pinion through front of case, sliding synchronizer front inner stop ring from short splines on pinion while the assembly is being removed. Remove snap ring locking main drive pinion bearing on shaft, then press bearing off pinion shaft and remove oil slinger. Remove pilot bearing snap ring from cavity in end of drive pinion gear and remove 15 roller bearings. Remove seal from drive pinion bearing retainer.

Mainshaft: Remove mainshaft rear bearing snap ring from groove in case, then slide mainshaft and rear bearing assembly to rear until rear bearing is out of case. Remove synchronizer assembly and second-third speed shift fork. Remove synchronizer clutch rear snap ring with Tool C-484 and remove synchronizer clutch gear, second speed gear and first-reverse gear from mainshaft. *NOTE – If synchronizer clutch gear cannot be removed easily, position low-reverse fork and sliding gear to rear of case and gently tap mainshaft back out of clutch gear with a plastic hammer.* Remove mainshaft and bearing through rear of case, then remove synchronizer clutch gear, second speed gear, low-reverse sliding gear, and low-reverse shift fork from case.

Countershaft: *CAUTION – Do not drive countershaft toward front of case.* Use countershaft bearing arbor, Tool C-3834 and drive countershaft toward rear of case until small key can be removed from countershaft, then drive countershaft completely out of case, keeping arbor tight against end of countershaft to prevent loss of roller bearings. Remove cluster gear, thrust washers and arbor from case and remove 88 rollers, spacer rings, and center spacer from cluster gear.

CHRYSLER, DESOTO (STD.) & DODGE, PLYMOUTH (H.D.) 3-SPEED SYNCHRO-MESH TRANSMISSION

Reverse Idler Gear: Use a blunt drift and drive reverse idler shaft toward rear of case until key can be removed, then completely drive idler shaft out of case and remove reverse idler gear. Remove thrust washers and 22 needle bearings.

Gearshift Assemblies: Use a small punch and drive tapered lock pins in both shift shafts toward top of case, then remove shafts from case, being careful not to lose spring-loaded detent balls. Remove interlock sleeve, spring, pin and detent balls. Remove both lever shaft seals and discard.

INSPECTION: Wash all parts in clean solvent and blow dry with air. Check all parts for proper fit in their respective bores, and inspect for chipped gear teeth, cracks, excessive wear or damage. Replace all necessary parts.

REASSEMBLY: Countershaft & Cluster Gear – Place bearing spacer in center of bore in cluster gear, then insert arbor, Tool C-3834 into cluster gear through spacer. Install a row of 22 needle bearings next to one end of spacer, using heavy grease to retain them in position. Place a bearing spacer ring next to needle bearings and install another row of 22 needle bearings next to spacer ring. Repeat this procedure at opposite end of cluster gear, then install one bearing spacer ring next to outside end of second row of needle bearings at each end of cluster gear. Use a small amount of grease to hold it in place and install front thrust washer on arbor at front of cluster gear, with tabs outward. Install tabbed rear thrust washer on arbor against rear of cluster gear with tabs positioned in grooves provided in gear. Install remaining rear thrust washer plate on rear of gear and arbor with step in washer facing upward as viewed from rear. *CAUTION – Rear thrust washer must be installed with step on outer diameter facing clockwise as viewed from rear in order to engage lug on inside of case, thus preventing rotation of the thrust washer.* Align tabs of front thrust washer vertically to index with notches in transmission

CONTINUED ON NEXT PAGE

CHRYSLER CORP. HEAVY DUTY SYNCHRO-MESH (C nt.)

case, and with step in rear thrust washer positioned upward. Position cluster gear and arbor assembly in transmission case, making sure thrust washers are not dislodged, and engage thrust washer tabs in case grooves. Insert countershaft into rear bore of case and drive arbor forward out of cluster gear and case. Before driving countershaft all the way into case, be sure keyway is positioned in line with key recess in case, then insert key and drive countershaft all the way into case until key is bottomed in recess.

R v rs Idl r Gear: Insert arbor, Tool C–464, in reverse idler gear and install 22 needle bearings using heavy grease to hold them in position. Place front and rear thrust washers at each end of reverse idler gear and position the assembly in transmission case with chamfered end of gear teeth toward front Insert reverse idler shaft into bore at rear of case with keyway toward rear, pushing arbor toward front of case. Align keyway in shaft with recess in case, then install key and drive shaft in until key is bottomed in recess.

G arshift Ass mbli s: Install two new shift shaft seals in transmission case with Tool C–3650, then install second–third speed shift lever shaft in transmission bore and install tapered shaft retaining pin from top of boss on case. *NOTE – Drive pin in firmly to prevent it working out of hol .* Place interlock parts in position in following order: Ball, sleeve, spring, pin, and ball, then enter low–reverse shift shaft in case bore while using detent ball installer, Tool C–3765 to depress detent ball against spring tension and push shift shaft into position so it prevents detent ball from coming out. Install low–reverse shift shaft tapered pin in case, driving it down firmly from top of boss. Place low–reverse fork in lever shaft with offset toward rear of transmission.

Mainshaft: While holding low–reverse sliding gear in position in fork, with hub extension to rear, insert mainshaft with rear bearing through rear of case and into sliding gear. Place synchronizer stop ring spring and rear stop ring on synchronizer splines of second speed gear on mainshaft, then install synchronizer clutch gear on mainshaft with shoulder to front. Select thickest synchronizer clutch gear snap ring that can be used, and install it in mainshaft groove, making sure it is bottomed all the way around groove. *NOTE– Snap rings are available in four thicknesses.* Check clearance between clutch gear and second speed gear which should be .004" – .011". Hold synchronizer clutch gear sleeve and two outer rings together with pins properly entered in holes in clutch gear sleeve and with clutch gear sleeve engaged in groove of second–third speed shift fork, and position fork in second–third speed shift shaft. While holding synchronizer parts and fork in position, slide mainshaft forward, entering synchronizer clutch gear into clutch gear sleeve and at same time entering mainshaft bearing in case. *CAUTION – If synchronizer parts not properly positioned during installation, it will not be possible to place them in position after mainshaft is is fully in position.* While continuing to hold synchronizer parts in position, tap mainshaft forward until rear bearing bottoms in case. Install rear bearing snap ring in groove in case bore.

Drive Pinion: Place oil slinger on drive pinion with offset outer portion next to drive pinion teeth, then place bearing on shaft with outer snap ring away from gear. Press bearing into position so it is seated firmly against oil slinger and pinion gear. Install bearing snap ring on shaft, making sure it is seated in groove. Coat pilot rollers (15) with heavy grease and install them in cavity of drive gear, then install snap ring. Install a new seal in drive pinion bearing retainer with Tool C–3789 until it bottoms on seat of counterbore, then place synchronizer front inner ring in position in front outer ring, and enter drive pinion through case. Engage splines on rear of pinion with inner stop ring and tap drive pinion into transmission case until outer snap ring on pinion bearing is against transmission case. *NOTE – If synchronizer front inner ring is n t positioned as indicated above, it will not clear count r-shaft drive gear teeth.* Place drive pinion bearing retainer (without gasket) over pinion shaft and against transmission case. While holding retainer with hand pressure against case, measure clearance between retainer and case with a feeler gauge. Select a gasket .003" – .005" thicker than the clearance at this point. Install proper gasket and retainer and tighten bolts to 200 inch pounds.

Extension Housing: Install a new seal in housing with Tool C–3837, then install extension housing and tighten mounting bolts and nuts to 50 ft. lbs. Install parking brake assembly, then install parking brake drum and flange assembly and tighten nut to 175 ft. lbs. Install gearshift operating levers and tighten nuts to 180 inch pounds. Install plug or back–up light switch and tighten securely. Install speedometer cable and drive pinion gear.

CHRYSLER CORP. 6 & V8 STD. SYNCHRO-MESH

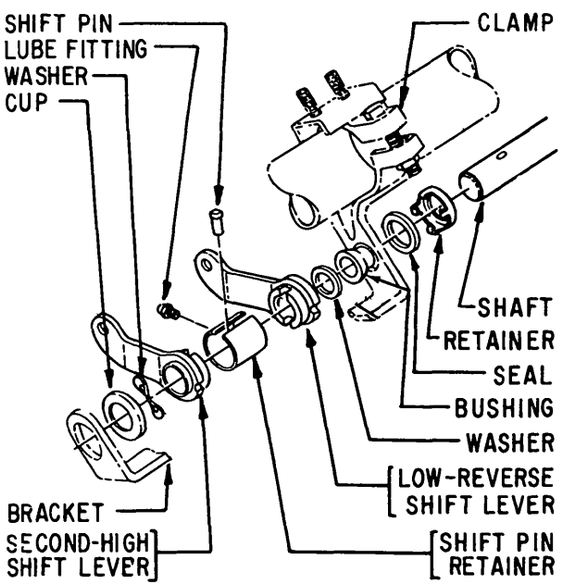
D dge & Plym uth 6 & V8 (1961)
Lanc r & Valiant (1961)

►*TRANSMISSION LUBRICATION NOTE:* SAE 80 Multi–Purpose Gear Lubricant or Automatic Transmission Fluid Type "A" (Suffix "A") may be used.

REMOVAL OF TRANSMISSION: Drain lubricant, disconnect propeller shaft, speedometer housing and cable, then disconnect parking brake cable and back–up light switch wires. Install a suitable engine support and raise engine slightly, then disconnect rear support. On 6 Cyl. models, remove crossmember. On all cars, support transmission and remove transmission attaching bolts. Slide transmission to rear until input shaft clears clutch assembly and remove transmission *NOTE – Crossmember is removed with transmission on V8 mod ls.*

DESCRIPTION: Own. Three speed, constant mesh, synchro–mesh (second & high), sliding gear (low & reverse). All helical gear type.

►*OPTIONAL SYNCHRO–MESH TRANSMISSION NOTE:* An optional heavy duty transmission identified by the breather being located at top of transmission case where extension housing bolts to case, and by a raised hump at front of cover, is used on some models. *See "Chrysler & DeSoto (Standard) & Dodge & Plymouth (H avy Duty) Transmission".*



GEARSHIFT LINKAGE ADJUSTMENT: Lancer & Valiant – *See "Valiant Transmission Control Adjustment" in 1960 Annual Data, Pag 409, or lat r Manual ditions.*

Chrysl r, D S t , D dg & Plym uth: 1) Place transmission in neutral, then remove gearshift control rod swivels from both steering column shift levers (at lower end of steering column) by removing retainer clips.

2) Loosen clamp bolts securing shift lever assembly to lower end of steering column. Loosen nuts securing support bracket to firewall and nuts attaching support bracket to steering column clamp. Rotate clamp at lower end of steering column as required until support bracket–to–steering column clamp bolts are at twelve o'clock position, then tighten bolts securing clamp to steering column to 200 inch pounds.

3) Hold steering column housing so it is centered on steering column tube while aligning column support bracket to firewall and to lower column clamp. Tighten stud nuts attaching bracket to firewall and to steering column clamp. *CAUTION – When properly adjusted and tightened, this bracket must hold column centered on steering tube.*

4) Remove lube fitting located between shift levers at end of steering column and rotate retainer sleeve slot to 12 o'clock position exposing cross–over pin and slots in shift levers. Place gearshift selector lever in in neutral position. *NOTE – On cars with heavy duty transmission, a special "interlock pin" attached t steering column clamp engages hole in low–revers shift lever. Mak sur interl ck pin engag s lever on* cars with heavy duty transmission. On other cars, insert a ¼" rod through holes of support bracket and low–reverse shift lever.

1961 DODGE, LANCER, VALIANT SHIFT LEVER ASSEMBLY

CONTINUED ON NEXT PAGE

CHRYSLER CORP. 6 & V8 STD. SYNCHRO-MESH (C nt.)

5) Note position of cross–over pin in slot of retainer between shift levers and align second–high shift lever hub slot with slot in low–reverse shift lever. Move selector lever up and down and make sure cross–over pin moves full length of hub slots. If not, loosen support bracket stud nuts at clamp and one of the column clamp bolts and tap clamp up or down on column as necessary to obtain full travel of pin in hub slots, then tighten clamp and bracket.

6) Locate inter–lock pin (heavy duty transmission), or ¼" rod (standard transmission) so pin or rod is located at center of hole in low–reverse lever, then hold low–reverse lever at this position and adjust control rod swivel until swivel stud enters hole in low–reverse lever. Make sure there is no interference between transmission–to–shift lever low–reverse control rod and clutch linkage, then tighten swivel adjusting nuts (or lock stud as used on some models). Install swivel in low–reverse lever and secure in position with clip.

7) Raise selector lever in neutral position to full upward travel and hold there, then align second–high shift lever hub slot with low–reverse hub slot. While holding second–high lever at neutral position, adjust control rod swivel as required until swivel stud enters hole in second–high shift lever, then install retaining clip.

8) On standard transmission cars, remove ¼" rod from support bracket and low–reverse lever. Start engine and check operation of shift linkage through all gears. Make sure cross–over from low to second is smooth. Rotate retainer sleeve between levers so slot is over lube fitting hole and install lube fitting. Lubricate with chassis lubricant.

OVERHAUL: *See 1960 Annual Data, Page 449, or later Manual edition and note the following:*
Second Speed Gear Endplay – .002 – .011"

COMET & FALCON SYNCHRO-MESH

Comet (1961)
Falcon (1961)

►*1961 TRANSMISSION GRINDING NOISE CORRECTION (EARLY CARS):* This noise which occurs in high gear may be caused by, interference between second and high synchronizer hub and the large gear on forward end of cluster gear. If the noise is aggravated by downward pressure on gearshift lever and disappears with upward pressure, replace second and high shift cam and shaft assembly, Part No. CODR–7280–A, with later type, Part No. C1DR–7280–B. The new cam and shaft assembly has a stop that prevents shifter fork from moving synchronizer hub forward into contact with cluster gear.

DESCRIPTION: Three speed, constant mesh, synchro–mesh (second & high), sliding gear (low & reverse). All helical gear type of same design used on previous models.

REMOVAL OF TRANSMISSION: Remove propeller shaft, then disconnect speedometer cable and gearshift rods at transmission. Remove extension housing to support bolt (on Falcon Station Wagon, remove nuts from insulator retaining bolts and remove brake cable support). Place a jack under flywheel housing and raise rear of engine slightly. *NOTE – On Falcon Station Wagon, loosen two engine rear support bolts on right side and remove bolts from left side.* Remove transmission mounting bolts and install two guide pins in lower holes, then move transmission to rear to clear input shaft and guide pins and remove from car. *NOTE – To prevent oil leakage after propeller shaft removal, install Tool T60K–7657–A (Falcon), 7657–G (Comet). Tool must be removed before transmission can be removed from car.*

OVERHAUL: *See 1960 Annual Data, Page 406, or later Manual edition.*

FORD & MERCURY SYNCHRO-MESH

Ford Pass. Cars (1961)
Mercury (1961)

►*1961 MERCURY TRANSMISSION LOW & REVERSE INTERLOCK LINKAGE PRODUCTION CHANGE:* This new linkage which prevents partial low and reverse gear engagement is installed between clutch release rod and the external low and reverse shift lever on transmission. With the new linkage, it is necessary to fully depress clutch pedal before any movement of low and reverse lever is possible. To adjust linkage, disconnect interlock shift rod at interlock shift lever on transmission, then adjust clutch pedal total travel and freeplay. *CAUTION – Clutch total travel and freeplay must be within specifications before making any interlock adjustments.* With transmission selector lever in neutral position, loosen two bolts attaching interlock wedge to lever, then position wedge so that it freely enters notch of low and reverse shift lever and tighten attaching bolts. Attach interlock shiftrod to shift lever. Make sure clutch pedal is fully released (clutch engaged), and tighten interlock shift rod adjusting nut at interlock shift lever.

►*1961 TRANSMISSION "CLICKING" NOISE CORRECTION:* A clicking noise which centers in area of shift tube may be caused by burrs in low & reverse gear shift fork groove. To correct, file burrs from groove.

►*1961 MERCURY DRIVELINE "THUMP" CORRECTION:* Use a special purpose molybdenum base lubricant on transmission output shaft and driveline splines.

REMOVAL OF TRANSMISSION: Drain transmission and disconnect propeller shaft at rear universal, then slide propeller shaft to rear and remove. Disconnect speedometer cable, and shift rods at transmission. On cars with overdrive, disconnect overdrive wires and control cable. Disconnect parking brake cable and support engine with a jack, then remove engine rear support and crossmember as a unit. Remove transmission–to–flywheel housing attaching bolts and install two guide pins in lower bolt holes. Move transmission to rear until it clears clutch assembly and remove from car.

OVERHAUL: *See 1960 Annual Data, Page 410, or later Manual edition and note the following:*

Bolt Torque Specifications: As follows:

Location	Ft. Lbs. Torque Ford	Mercury
Extension Housing–to–Case	37–42	42–50
Shift Cover–to–Case	12–15	14–19
Shift Lever–to–Shaft	12–15	14–19
Front Bearing Retainer	12–15	19–25

TRANSMISSION CONTROL ADJUSTMENT: With selector lever in neutral and transmission shift levers in neutral detent, disconnect shift control rods at lower end of steering column. Center both shift levers at lower end of steering column in steering column tube slot, then rotate each shift rod clevis as necessary for clevis pin to freely enter holes in their respective shift levers. Install shift rod clevis on shift lever. When properly adjusted, transmission selector lever should move freely forward and backward in neutral without binding. Tighten locknut on shift rod ends.

FORD TRUCK 3-SPEED SYNCHRO-MESH

Ford Trucks (1961)

DESCRIPTION: Same design as used on previous models.

REMOVAL OF TRANSMISSION: Drain lubricant, disconnect speedometer cable, propeller shaft, and gearshift linkage at transmission. On propeller shaft type parking brake, disconnect cable clevis at cam and remove cable conduit clamp. On models with overdrive transmission, disconnect wires and control cable at transmission. On 4–Wheel Drive models, remove transfer case shift lever bracket from transmission. On all models, remove transmission attaching bolts and install guide studs, then pull transmission rearward until input shaft clears clutch assembly and remove transmission.

OVERHAUL: *See "Ford Truck 3–Speed Light & Medium Duty" or "Ford Truck 3–Speed Heavy–Duty" in Transmission Section of Manual.*

FORD TRUCK 4-SPEED SYNCHRO-MESH

Ford Trucks (1961)

DESCRIPTION: Same design as used on previous models.

REMOVAL OF TRANSMISSION: On all models except Tilt–Cab, remove floor mat and accelerator pedal, then remove transmission cover plate. Disconnect parking brake and remove gearshift housing. On Tilt–Cab models, disconnect parking brake rod at transmission and remove rear cross–shaft housing. On all models, disconnect drive shaft and speedometer cable, then remove two upper transmission attaching bolts and secure jack to transmission. Remove remaining transmission attaching bolts and slide transmission rearward to clear clutch assembly and remove from truck.

OVERHAUL: *See "Ford Truck 4–Speed (Synchro–mesh)" in Transmission Section of Manual.*

FORD ECONOLINE TRUCK 3-SPEED SYNCHRO-MESH

F rd Ec n lin Trucks (1961)

DESCRIPTION: Three speed, constant mesh, synchro–mesh (second & high), sliding gear (low & reverse), all helical gear type. Transmission gearshift levers and assemblies are integral with transmission side cover.

REMOVAL OF TRANSMISSION: Drain transmission and remove propeller shaft, then disconnect speedometer cable and shift rods at transmission. Support engine with a jack and remove rear support anchor bolt and nut, then lower engine to clear support. Remove transmission attaching bolts and move transmission to rear to clear clutch assembly and remove from truck.

DISASSEMBLY: 1) Mount transmission in a holding fixture and drain lubricant, then remove gearshift housing and gasket from transmission. Remove shift forks from collars on gears.

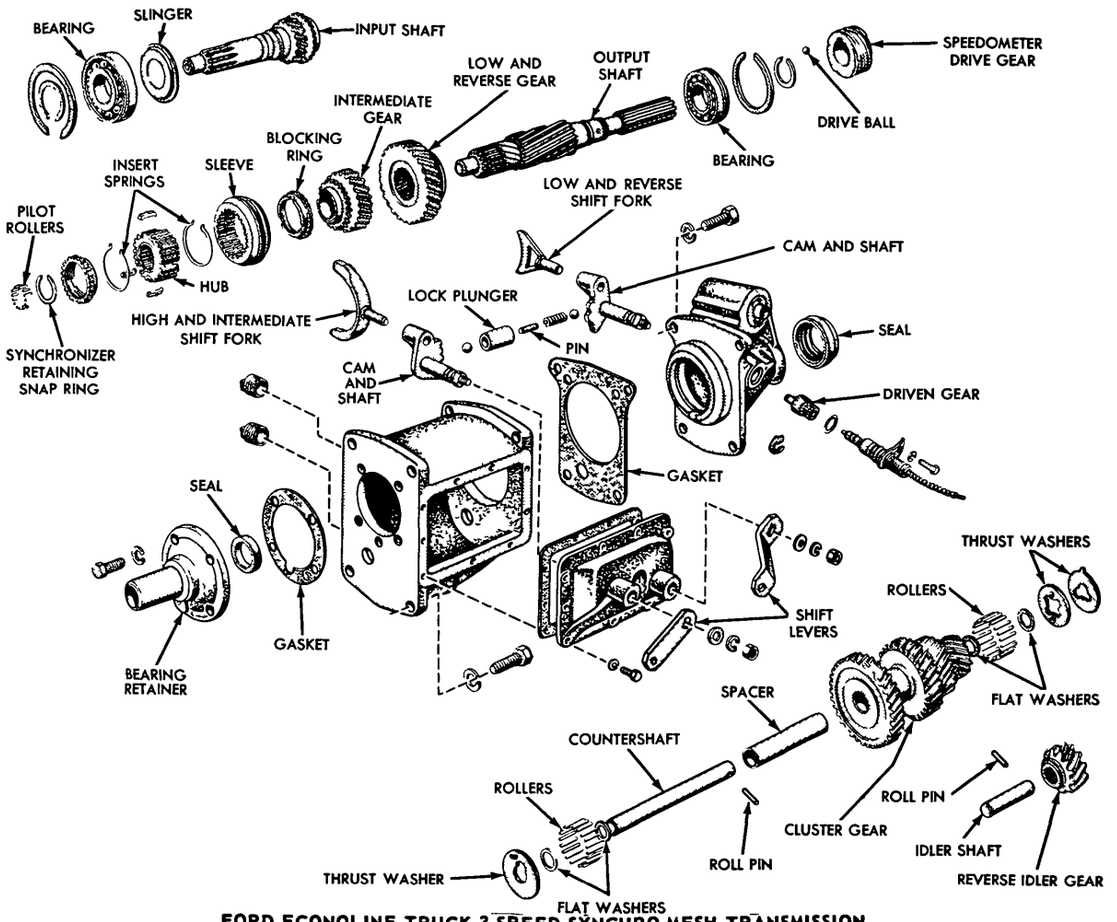
2) Remove extension housing retaining bolts, then remove input shaft bearing retainer from front of case. Slide input shaft assembly slightly forward to disengage shaft assembly fron synchronizer, then slide synchronizer and intermediate gear forward on output shaft sufficiently to disengage intermediate gear from cluster gear. Remove extension housing and output shaft as an assembly from case.

3) Remove synchronizer hub snap ring from output shaft, then remove synchronizer assembly, intermediate gear, and low–reverse sliding gear from output shaft. Remove output shaft bearing snap ring from extension housing and remove housing from output shaft.

4) Remove speedometer gear snap ring, speedometer drive gear, and speedometer drive gear ball from output shaft. Use a brass drift and drive reverse idler shaft and roll pin out of transmission case, then remove reverse idler gear.

5) Drive countershaft rearward out of cluster gear and transmission case with Tool T55P–7111–A. *NOTE – Ke p tool in contact with countershaft during removal op ration to pr v nt roller bearings and washers falling out of plac .* Allow cluster gear and countershaft removing tool to drop to bottom of transmission case.

6) Remove input shaft, bearing and drive gear from transmission case, then remove cluster gear and tool assembly from bottom of case. Remove washers, rollers, spacer and tool from cluster gear.



INSPECTION: Wash all parts, except ball bearings in solvent and blow dry with air. Use clean solvent and clean all lubricant from ball bearings, then hold bearing from rotating and blow dry with air. Lubricate bearings with transmission lubricant and cover with a clean cloth until ready for installation. Inspect all parts for damage or wear and replace as necessary. Inspect reverse idler bushing for wear. If bushing is worn, a new reverse idler gear must be installed. Check fit of low–reverse sliding gear on splines of output shaft and replace either or both parts if wear is excessive. Check endplay between cluster gear and thrust washers of transmission case and replace thrust washers if clearance is not within limits of .0045–.0185".

Input Shaft B aring R plac m nt: Remove inner snap ring retaining bearing to input shaft and outer snap ring retaining bearing to case, then position input shaft and bearing assembly on an arbor press and press shaft from oil slinger and bearing. To install, position new bearing and oil slinger on input shaft (snap ring groove in outer bearing race toward front end of shaft), then place Tool T53T–4621–B on input shaft and install the assembly in an arbor press and press shaft into bearing and slinger. *NOTE – Use a block between press ram and synchronizing cone of input shaft to prevent damage to shaft.* Install inner retaining snap ring on shaft, then transfer bearing–to–case snap ring to new input shaft bearing.

Output Shaft Bearing Replacement: Remove bearing retainer snap ring, then install Tool T57L–4621–A over large diameter end of shaft against bearing. Install shaft assembly in an arbor press (with large diameter of shaft downward) and press shaft through bearing. To install, position new bearing on shaft, then install Tool T53T–4621–B against bearing and position the assembly in an arbor press (with small diameter of shaft downward) and press shaft into bearing. Install bearing retaining snap ring.

Oil Seal R plac ment: Input Shaft – Remove seal with Puller T58L–101–A and a slide hammer, then install seal with Tool T60K–77047–A and an arbor press.

Output Shaft – Remove oil seal from extension housing with Puller 1175AE and a slide hammer, then install new seal with Tool 61L–7657–C.

FORD ECONOLINE TRUCK 3-SPEED SYNCHRO-MESH TRANSMISSION

TRANSMISSION REASSEMBLY: 1) Insert spacer and Tool T55P–7111–A into cluster gear assembly, then position one flat washer at each end of spacer. Apply grease to needle bearings, and assembly fifteen needle bearings against flat washer and around Tool T55P–7111–A at each end of cluster gear. Grease the other two flat washers and the three flat washers. Assemble a flat washer against outer end of needle bearings at each end of cluster gear, then assemble front thrust washer and inner rear thrust washer at front and rear ends of cluster gear. *CAUTION – Note positi n of tangs on thrust washers.*

2) Position cluster gear and countershaft tool assembly in bottom of case, then install outer rear thrust washer. Assemble thirteen needle bearings in input shaft assembly and retain in place with grease, then install front synchronizer blocking ring on input shaft and install shaft in front of case.

CONTINUED ON NEXT PAGE

ECONOLINE TRUCK 3-SPEED SYNCHRO-MESH (Cont.)

3) Slightly raise cluster gear assembly so that countershaft tool will be in alignment with countershaft holes in case, position countershaft against tool in cluster gear and drive countershaft forward into cluster gear and case. *CAUTION – As countershaft is being driven in, make sure roll pin in shaft is aligned with retaining slot in case.*

4) Position and hold reverse idler gear in case, and insert idler shaft through rear of case and reverse idler gear bore. Drive shaft into position, making sure that roll pin is aligned with retaining slot in case. Place speedometer gear retaining ball in detent in output shaft, and install speedometer drive gear and retaining snap ring.

5) Position output shaft and bearing assembly in extension housing, and install output shaft bearing–to–extension housing snap ring. Assemble low–reverse sliding gear and intermediate gear on output shaft. Assemble the three inserts in synchronizer hub and secure them in place with the two insert springs, then slide hub assembly into intermediate and high sleeve. Install one synchronizer blocking ring into rear side of hub assembly (rear side of hub assembly has shortest length of hub protruding).

6) Place sleeve and hub assembly on output shaft with blocking ring end of assembly butted against intermediate gear. Install snap ring that retains synchronizer hub to output shaft.

7) Coat a new extension housing gasket with sealer and install on extension housing. Position forward end of output shaft into opening of input shaft and tap end of shafts slightly to seat them in place. *CAUTION – Be careful not to dislodge any of the roller bearings in end of input shaft.* Install extension housing bolts (coat lower left hand bolt threads with sealer), then tighten to 37–42 ft. lbs. (7/16" – 14), 28–38 ft. lbs. (3/8" – 16).

8) Install input shaft bearing retainer and tighten bolts to 12–15 ft. lbs. Place low–reverse shift fork in collar of low–reverse sliding gear, making sure that offset of shaft is positioned toward front of transmission, then place first–intermediate shift fork in collar of intermediate and high sleeve.

9) Fill transmission, then coat gearshift housing gasket with sealer and install on shift housing. Install shift housing and make sure that shift forks index with shift shaft assemblies. Tighten housing–to–case bolts to 10–13 ft. lbs.

GEAR SHIFT HOUSING: Disassembly – Remove shift levers from shaft assemblies, then pull shifter fork and shafts out of gear shift housing. As shafts are removed, interlock balls, retainer, and spring will fall out of housing.

Reassembly: Install new seal rings in grooves in shift shafts, then lubricate shaft bores in housing, install one shaft assembly. Assemble interlock spring and one ball in interlock and install interlock assembly in gear shift housing. Install other ball in position, then install other shift shaft in housing. Place a new gasket on transmission case and retain in place with sealing compound. Shift high–intermediate sleeve and low–reverse gear to neutral positions, then place shifting forks in neutral position. Install gear shift housing on transmission and tighten bolts to 10–13 ft. lbs.

TRANSMISSION CONTROL: Adjustment – Loosen trunnion nuts at transmission shift levers enough to allow rods to slide in trunnions. Insert a ¼" drill rod through pilot hole in shift tube floor mounted bracket until it enters adjustment hole of both upper and lower shift lever, then place transmission shift levers in neutral position and tighten trunnion nuts. Remove ¼" rod and check operation in all shift positions.

Willys 4 Cyl. 2–Wheel Drive	T–96
Willys 6 Cyl. 2–Wheel Drive	T–86

► *NOTE: Transmission model number is cast in side of transmission case.*

► *1961 RAMBLER GEARSHIFT LEVER BIND CORRECTION (DOUGLAS TYPE LINKAGE):* If this condition occurs when shifting from low to second gear, adjust shift linkage *(see "Rambler Transmission Control" in 1960 Annual Data or later Manual edition).* If the binding condition still exists, proceed as follows Remove pivot pin from gearshift lever and remove lever, then enlarge pivot pin holes in gearshift housing to .201" (No. 7 drill). *NOTE – Pivot pin should rotate in housing and be tight in shift lever.*

► *1961 RAMBLER "T–96" TRANSMISSION PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* Later transmissions have been changed in some details. Do not install a later type mainshaft (output shaft) in an early transmission. Later shafts are identified by a 1/32" groove at front spline of shaft, approximately ½" to rear of synchro–clutch snap ring groove. This groove is visible after synchro–clutch removed.

► *1961 STUDEBAKER SYNCHRO–MESH TRANSMISSION (EXC. V8 TAXI & OVERDRIVE) REAR BEARING RETAINER SNAP RING PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION.* A new tubular steel snap ring retainer, Part No. 1554136(T–96 Trans.), No. 1554137 (T–86 & T–90 Trans.) is used in production and should be installed on all previous 1958–61 transmissions to prevent snap rings from coming out of grooves. When installing a tubular snap ring retainer, install new snap rings behind rear bearing and in front of speedometer gear. The rear bearing snap ring is a selective fit and the thickest snap ring that will seat in groove must be used (do not over expand or distort ring). On T–86 and T–90 transmissions a spacer washer, Part No. 1554138 must be installed in front side of extension housing adapter plate. Install tubular snap ring retainer over rear bearing snap ring and speedometer gear front snap ring, then install speedometer drive gear ball and drive gear and complete reassembly of transmission.

DESCRIPTION: Same design as used on previous models.

TRANSMISSION REMOVAL: Rambler – On Rambler American, disconnect rear spring front brackets from floor pan, brake hose bracket, and brake cable at equalizer. On other models, disconnect brake tube bracket from floor pan, parking brake cable at equalizer, and cable housing at torque tube bracket, then disconnect torque tube from transmission. On all models, disconnect shock absorber at lower mounting and move rear axle assembly to rear, disengaging drive line from transmission. Disconnect shift levers, speedometer cable (and overdrive cable and wires if so equipped). Remove transmission attaching bolts and install two guide pins, Tool J–1434, in upper bolt holes, then slide transmission back to clear clutch assembly

Studebaker: Disconnect propeller shaft at rear joint flange and slide it out of transmission housing. Disconnect rods at transmission levers, and speedometer cable at transmission housing, then remove speedometer pinion. Remove clutch operating shaft, bracket, and bearing at transmission, then support transmission and remove attaching bolts. Move transmission back to clear clutch assembly and remove from car.

Willys (2–Wheel Drive): Disconnect shift rods at transmission levers, and speedometer cable at transmission (and overdrive cable and wires if so equipped). Disconnect propeller shaft at front universal. Remove support at rear of overdrive and take out overdrive governor. Position jack under engine for support and remove frame crossmember with insulators attached. Back out transmission attaching screws as far as possible yet support transmission, then pull transmission back to provide an opening between it and bell housing. Insert a long screwdriver through opening in side of bell housing and pry clutch release fork from engagement with release bearing carrier. Remove transmission attaching screws and pull transmission back to clear bell housing, then remove from car.

Willys (4–Wheel Drive): Drain transmission and transfer cases, then remove access cover from floor pan and remove gearshift housing (Exc. models with remote control). On Remote control models, disconnect shift linkage at transmission. On all models, remove transfer case shift lever pivot pin, shift levers and springs. *NOTE – If equipped with power take–off, remove shift lever plate and lever.* Disconnect propeller shafts at transfer case (disconnect end of power take–off shaft at transfer case if so equipped). Disconnect speedometer cable at case, then disconnect hand brake cable. On Forward Control models, disconnect clutch release cable at bellcrank. On all models, place jacks under transmission and engine and remove nuts attaching rear mounting to frame crossmember, then remove transfer case snubbing rubber bolt at crossmember. Remove engine rear support crossmember, then remove transmission attaching bolts. Force transmission to right side to disengage clutch control lever tube ball joint, then lower jacks under engine and transmission and slide transmission and transfer case toward rear until clutch shaft clears bell housing.

OVERHAUL: *See 1959 Annual Data, Page 398, or later Manual editions and note the following*

Rambler Series 6110 Heavy Duty (Warner T–86): Overhaul procedures same for Model T–86 trans on Series 6120

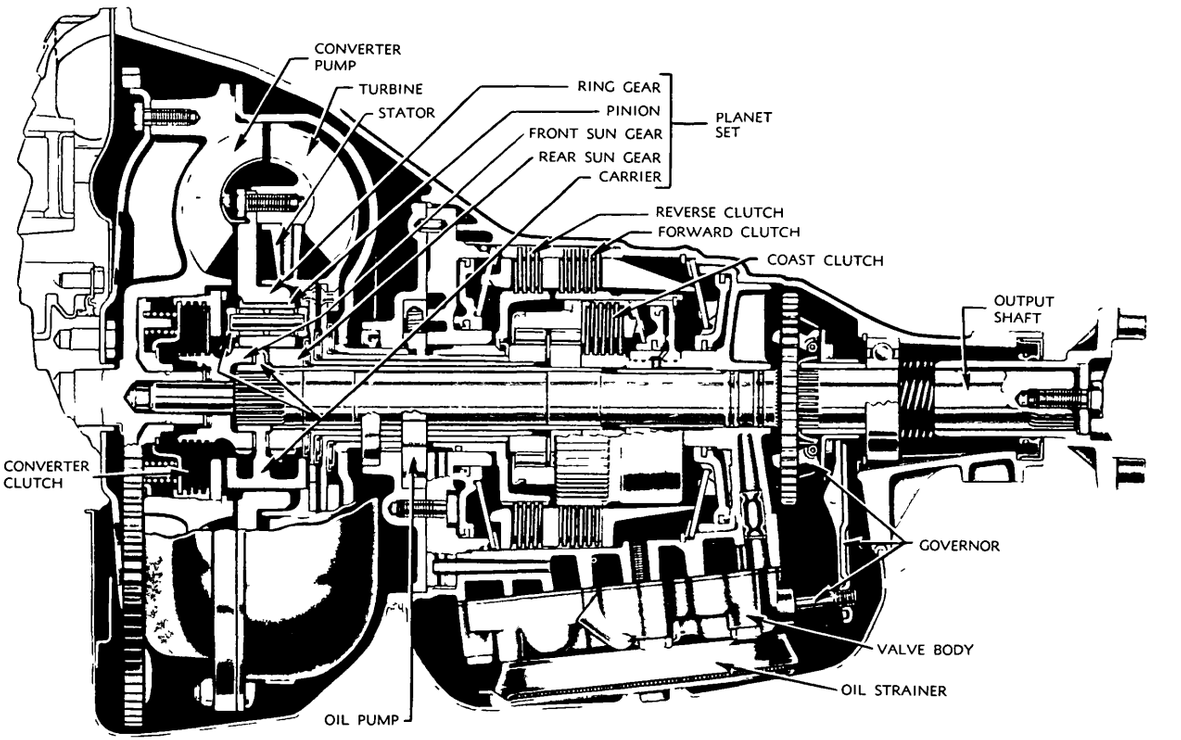
BUICK SPECIAL AUTOMATIC TRANSMISSION

Buick Special, Series 4000 & 4100 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR: The engine cannot be started by pushing (or pulling) car. If necessary, a "booster" battery must be used.*

►*TOWING BUICK AUTOMATIC TRANSMISSION CARS:* Cars may be towed (or pushed) for short distances with transmission in "N" (Neutral) and at a speed not to exceed 25 MPH. If cars are to be moved any extended distance, rear wheels should be raised off ground or the drive line should be disconnected at the rear. *CAUTION - When drive line is disconnected, it must be suitably supported to prevent damage to center universal joint.*



►*1961 BUICK SPECIAL TRANSMISSION OUTPUT SHAFT CHANGE (To Prevent Torque Converter Slipping Out of Transmission During Handling):* A groove has been added to output shaft for a retaining ring which will prevent torque converter slipping out of transmission. When changing an early transmission output shaft to a later type shaft, the Front Sun Gear must also be changed.

►*1961 BUICK SPECIAL TRANSMISSION COMPANION FLANGE REMOVAL OR SEAL REPLACEMENT NOTE:* When companion flange is removed or companion flange seal is installed, fill space between lips of seal with a good grade wheel bearing grease to prevent entrance of moisture.

►*1961 BUICK SPECIAL AUTOMATIC TRANSMISSION VENT PRODUCTION CHANGE & SERVICE REPLACEMENT ON EARLIER CARS NOTE:* Beginning with approximately Nov. 15, 1960 production, a new vent, Part No. 1389690, consisting of a pipe and captive nylon float was installed. The new vent prevents entry of water into transmission should car be driven through water. The new type vent can be installed on earlier cars by removing early vent and pressing new vent into place and installing retainer clip under filler pipe retaining bolt.

►*1961 BUICK SPECIAL COMPANION FLANGE & SPEEDOMETER DRIVE GEAR PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* Starting with Transmission Code No. C-074, a shorter companion flange, Part No. 5676065 (2.48" from inner end to flange shoulder) and a longer speedometer drive gear, Part No. 1349889 (.800" overall length) were used in production replacing the former companion flange (2.60" from inner end to flange shoulder) and speedometer drive gear (.675" overall length). As the early type parts will not be furnished for service replacement, it will be necessary to install both the later type companion flange and speedometer drive gear if it is necessary to install either of these parts on early cars.

►*1961 BUICK SPECIAL REVERSE CLUTCH PISTON HOUSING PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* A new reverse clutch piston housing, Part No. 1348645 is being used in production beginning with Transmission Code No. C-177. When installing this new assembly, the new larger assembly ring, Part No. 1348648 must also be installed. DO NOT use the earlier (smaller) assembly ring with the new housing.

BUICK SPECIAL AUTOMATIC TRANSMISSION SECTIONAL VIEW

►*1961 BUICK SPECIAL AUTOMATIC TRANSMISSION PRODUCTION CHANGES & SERVICE REPLACEMENT CAUTIONS:* Starting with Transmission Code No. C-091, one or more of the following changes will be made during production.

Production Change No. 1 (Converter Pump & Attaching Bolts) - A new Converter Pump, Part No. 1388552 which provides more space between front sun gear and converter pump center stool will be used in production and for service replacement on earlier models. The new converter pump requires the use of an extra one or two select fit bearing races forward of the needle bearing to obtain .010" loose to .005" tight fit required (see "Converter Clearance Check" below). 1¼" long flywheel-to-converter pump attaching bolts are used with the new converter pump. *CAUTION - Do not use earlier (¾" long) bolts with later type converter pump or use later (1¼" long) bolts with early converter pump.*

Production Change No. 2 (Front Sun Gear) - A new Front Sun Gear, Part No. 1348813, having a larger inside diameter counterbore will be used in production and for service replacement on earlier models. This later sun gear will accommodate either needle thrust bearing (see "Production Change No. 3" below) and adjustment for converter pump-to-sun gear clearance is made by using one or two extra races as noted in "Production Change No. 1" above. *NOTE - For identification, early sun gear has a "stepped" inside diameter while the later sun gear is counterbored to its full depth.* If a later type converter pump is being installed in an early transmission (before C-091), then front sun gear may be changed to the later type and thus permit installation of a heavier needle thrust bearing (see "Production Change No. 3" below).

Production Change No. 3 (Needle Thrust Bearing) - A new Needle Thrust Bearing, Part No. 1348816 will be used between later type converter pump and later type sun gear (see "Production Changes No. 1 & 2" above). This later thrust bearing has a larger outer diameter and is thicker than the early type and will require use of only one select fit bearing race forward of the bearing. *(NOTE - A .032" thick race is always used to rear (sun gear side) of new thrust bearing). INSTALLATION NOTE - To permit installation of this new larger needle thrust bearing, front sun gear must be the later type having the larger counterbore.*

►*SERVICE REPLACEMENT CONVERTER PUMP BALANCING NOTE:* These units are balanced, however, when installed, unbalance in pump housing may cause vibration. If vibration is objectionable, see "Balancing" below.

DESCRIPTION: Two-speed hydraulically controlled transmission and air cooled torque converter assembly which provides automatic upshifting and downshifting

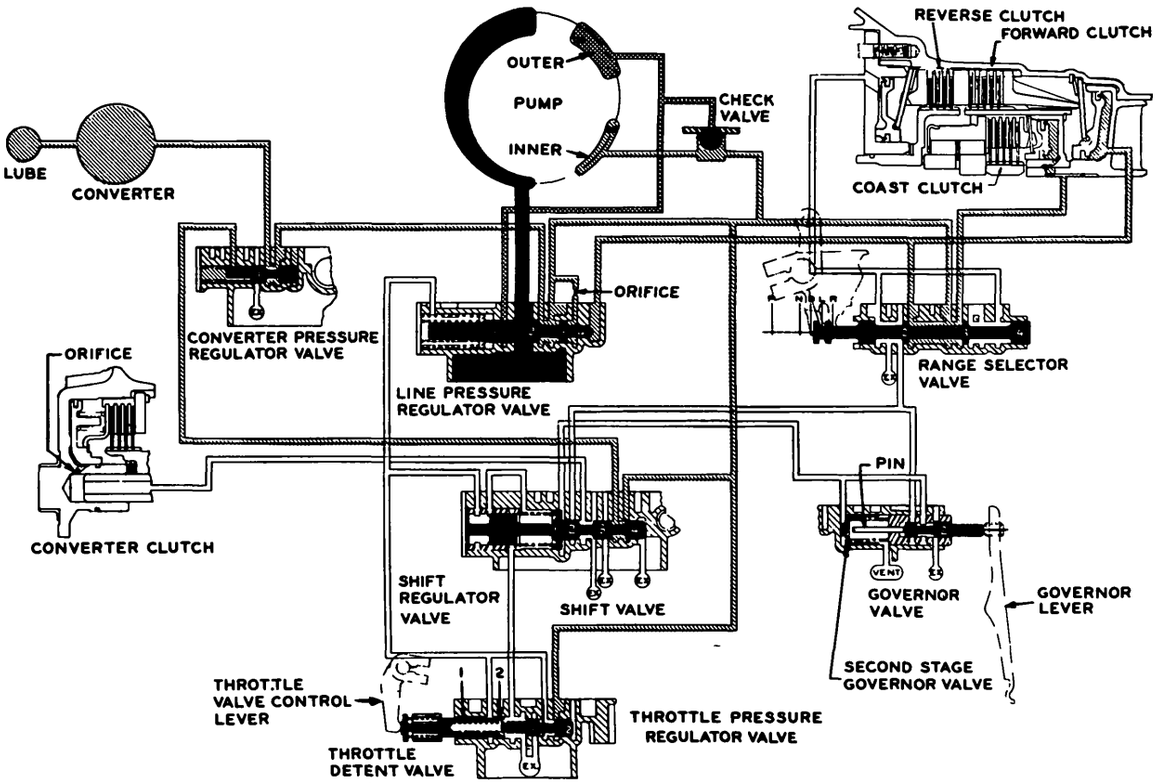
CONTINUED ON NEXT PAGE

BUICK SPECIAL AUTOMATIC TRANSMISSION (C nt.)

between "low" and "direct" when transmission selector lever is in "D" (Drive) range. The torque converter assembly is integral with the transmission, and contains, in addition to a converter pump, turbine, and stator, a planetary gear set and a converte r clutch. Other transmission components are as follows:

C nverter Clutch: Multiple disc type housed in the center of converter pump assembly, and when engaged, couples engine driven converter pump to front sun gear (part of engine torque is transmitted directly to planetary gear set, bypassing the torque converter). Engagement of converter clutch is controlled by car speed and throttle opening. During light throttle acceleration, converter clutch will engage at approximately 16 MPH and under full throttle at approximately 64 MPH.

F rward Clutch: Multiple disc type. When engaged ("D" and "L" ranges) locks cam of stator and sun gear overrunning clutches to transmission case. During operation in "L" range, the forward and coast clutches are engaged, coupling rear sun gear through coast clutch housing to the forward clutch and transmission case.



Coast Clutch: Multiple disc type. When engaged, the clutch couples rear sun gear to overrunning clutch cam. The externally splined clutch plates in the clutch pack are splined to coast clutch housing which also engages the internally splined plates of forward clutch pack. Coast clutch is engaged in all operating ranges except "D" (Drive).

R verse Clutch: Multiple disc type. When engaged, the clutch couples converter turbine and planet set ring gear to transmission case. Reverse clutch is engaged in "R" (Reverse) range only.

Overrunning Clutches: Stator and sun gear are connected by coaxial shafts to overrunning clutches that allow rotation of these parts in relation to the clutch cam in one direction only (with the engine). The overrunning clutch cam is attached to forward clutch internally splined and the coast clutch externally splined plates so the cam may be locked to transmission case (in "D" or "L" range) or coupled to rear sun gear shaft through the coast clutch (all ranges except "D").

OPERATION: Drive Range - With engine idling, the forward clutch is engaged and all other clutches are disengaged. As throttle is opened and car speed increases, governor increases pressure in hydraulic circuit and and tends to engage converter clutch. A counter hydraulic circuit controlled by throttle opening also affects engagement of converter clutch (light throttle allows converter clutch to engage at low speeds while heavy throttle delays engagement until higher speeds are reached). With converter clutch engaged, converter pump hub is connected to front sun gear and approximately 36% of engine torque is transmitted mechanically to the gear set through front sun gear, while converter turbine continues to transmit torque to gear set through the ring gear.

Revers Range: With engine running, the reverse and coast clutches are engaged and all other clutches are disengaged. Engagement of reverse clutch locks turbine to transmission case, while coast clutch engagement couples overrunning clutch cam to rear sun gear.

BUICK SPECIAL AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

As engine speed is increased, converter oil passes through turbine and is discharged at its center, spinning opposite engine rotation. The oil then strikes the stator blades and causes the stator to turn opposite engine rotation. The stator overrunning clutch transmits torque to overrunning clutch cam and coast clutch; and from coast clutch to rear sun gear through rear sun gear shaft. Rotation of rear sun gear shaft opposite engine rotation causes planet pinions to rotate around ring gear and transmit torque to planet carrier which is splined to output shaft.

Low Range: With engine idling, forward and coast clutches are engaged; reverse and converter clutches are disengaged. Engine torque is transmitted to output shaft through the gear set in same manner as in "D" range before engagement. In "L" range, however, converter clutch remains disengaged regardless of throttle opening or car speed. Also, the rear sun gear is prevented from free wheeling even on deceleration (allowing the use of "L" range to slow the car as when decending steep grades).

N utral & Park Ranges: Coast clutch is engaged and all other clutches ar e disengaged. In "P" range, the parking lock pawl is engaged with ratchet wheel on output shaft. Engagement of coast clutch couples rear sun gear to overrunning clutch cam, preventing relative motion between sun gear and clutch cam. With ring gear turning with engine and rear sun gear turning opposite engine rotation, planet pinions are turning at relatively high speed (no engine torque is transmitted to planet carrier and output shaft).

LUBRICATION

LUBRICATION: Check fluid level every 1000 miles, drain and refill every 25,000 miles.

Checking Fluid Level: Check level with transmission at normal operating temperature. With engine idling and transmission selector lever in "P" (Park) position, transmission oil level should be at "Full" mark on dipstick (dipstick located under right side of hood in engine compartment). If oil level is below "Add" mark, add sufficient Automatic Transmission Fluid Type "A" (Suffix "A") to bring level to "Full" mark. *CAUTION - Do not fill transmission abov "Full" mark.*

Draining & Refilling: *CAUTION - Accurate foot pound and inch pound reading torque wr nch s must be us d.* Remove single bolt and seal attaching oil pan to transmission case and drain transmission, then remove oil pan and seal. Remove two oil strainer strap bolts and remove strainer and "O" ring seal. Install a new strainer and "O" ring seal and tighten strainer strap bolts to

CONTINUED ON NEXT PAGE

BUICK SPECIAL AUTOMATIC TRANSMISSION (C nt.)

100 inch p unds xactly. DO NOT OVERTIGHTEN. Clean oil pan and install a new seal on oil pan being careful not to stretch seal, then install oil pan and seal, oil pan bolt and seal, and tighten oil pan to case bolt to 15-20 ft. lbs. DO NOT OVERTIGHTEN. Add 5 pints of oil to transmission, then start engine and allow to idle in neutral. Immediately add oil to bring level up to ½" below full mark. With engine at normal operating temperature, add oil to bring level up to full mark on dipstick.

Capacity - Approximately 6 qts.

LINKAGE ADJUSTMENT

ADJUSTMENTS: Thr ttl Linkage - *See CARBURETOR on Car Mod l pag .*

Manual Linkage: Loosen adjusting swivel on selector lever bellcrank and place transmission selector lever in neutral detent. Move shift lever against neutral stop and tighten adjusting swivel clamp nut.

TESTING

TESTING: R ad T st - With throttle and manual linkage properly adjusted and engine at normal operating temperature, accelerate from a stop with accelerator pressed just to detent. Upshift should occur smoothly at 40-45 MPH. If upshift occurs at speeds other than those specified, see "Trouble Shooting & Diagnosis" below.

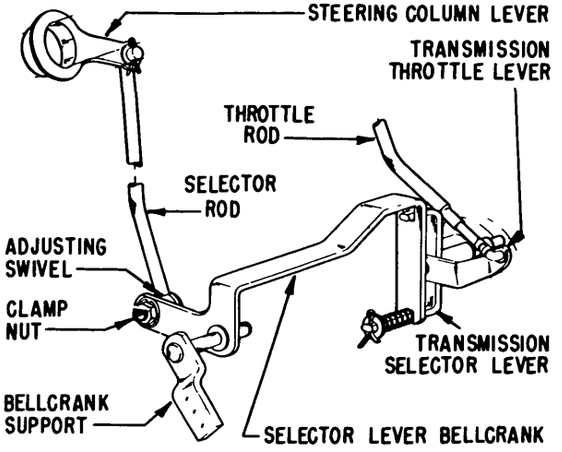
TROUBLE SHOOTING & DIAGNOSIS

TROUBLE SHOOTING & DIAGNOSIS: Upshift At Too Low Sp d - Governor valve not adjusted properly or is sticking. Shift valve or shift valve regulator sticking. Throttle valve pressure too low (worn or broken spring or valve sticking).

Upshift At T High Sp ed: Governor valve not adjusted properly or is sticking. Shift valve or shift valve regulator sticking. Throttle valve pressure too high (valve sticking).

Sl w Engag m nt f C nv rter Clutch: Converter pressure regulator valve sticking (lowering converter pressure too slowly).

Fast Engag m nt f Conv rt r Clutch: Converter charging pressure too low. Converter pressure regulator valve sticking.



REMOVAL & INSTALLATION

►*1961 BUICK SPECIAL TRANSMISSION SUPPORT PRODUCTION CHANGE & SERVICE INSTALLATION NOTE:* In later production cars, .060" shims, Part No. 1349321 are being installed between right end of support and side rail to fill a gap and prevent misalignment of engine front mounts. When installing a transmission support, if a gap exists between right end of support and side rail, fill space with the above shims.

R m val: 1) Raise car and support front and rear, then disconnect exhaust crossover pipe at both ends and at transmission, then remove pipe.

2) Remove universal joint "U" bolts and slide front propeller shaft rearward to separate universal joint at transmission. Support weight of propeller shaft.

3) Place a jack under transmission and fasten securely to transmission, then remove transmission mounting pad to crossmember bolts. Remove transmission support crossmember to frame rail bolts and remove crossmember.

MANUAL SELECTOR LINKAGE

4) Disconnect speedometer cable, then remove shift linkage equalizer from transmission range selector outer lever. Remove transmission filler pipe, then support engine at oil pan and remove transmission converter housing cover.

5) Mark flywheel and converter for reassembly in same position, and remove three converter pump to flywheel bolts. Remove transmission case to engine block bolts.

6) Move transmission to rear for clearance between converter pump and engine crankshaft, then lower transmission out of car. *CAUTION - Wire converter assembly to transmission case to prevent it falling out if transmission is tilted forward (early cars). See "Output Shaft Change" above.*

Installation: *CAUTION - Before installing transmission assembly in car, wire converter assembly to transmission case to prevent it falling out if transmission is tilted forward (early cars). See "Output Shaft Change" above.*

1) Install transmission on a suitable jack and raise transmission into position for installation on engine block. Remove wire holding converter to transmission, then rotate converter to align it with marks made on flywheel and converter when removed.

2) Install transmission case to engine block bolts and tighten to 30-35 ft. lbs. *CAUTION - Do not overtighten.* Install flywheel to converter pump bolts and tighten to 18-25 ft. lbs.

3) Install transmission support crossmember and install transmission to mounting pad bolts, then remove transmission jack and engine support. Install transmission converter housing cover.

4) Install filler pipe and clamp using a new "O" ring seal. Reconnect speedometer cable, then connect front propeller shaft to transmission companion flange and install "U" bolts. Reinstall exhaust crossover pipe and refill transmission. *See "Draining & Refilling" above.*

TORQUE CONVERTER & GEAR SET REMOVAL & INSTALLATION

REMOVAL & DISASSEMBLY: 1) Assemble transmission to a suitable holding fixture, then remove converter pump to housing bolts and nuts. Raise transmission horizontal position (catch oil as it drains out), then pry converter pump away from housing using a screwdriver in slots provided.

2) Remove converter pump and converter clutch assembly and allow to drain. Remove front sun gear, needle thrust bearing, and two select fit needle bearing races. Slide planet carrier out of ring gear and set on a clean working surface.

3) Separate front and rear tanged thrust washers from planet carrier assembly and examine washers for scoring or wear. Check planet pinions for scoring, imbedded metal or looseness on shaft. *NOTE - If pinions are loose, replace carrier assembly. Pick out imbedded metal with a small screwdriver.*

4) With transmission vertical, remove rear sun gear and needle thrust bearing. Check gear for scoring or imbedded metal (pick out imbedded metal with a small screwdriver). Check babbitted inner surfaces of gear shaft for chipping or flaking. If either of these conditions exist, rear sun gear must be replaced. Check needle thrust bearing for looseness and wear.

5) Lift turbine and stator assembly and turbine needle thrust bearing out of housing, then lift converter pump housing out of transmission and set housing hub through hole in bench.

6) *NOTE - For convenience, it is advisable to set turbine and stator assembly in pump housing before proceeding with further disassembly.* Use a ½" socket wrench to remove three bolts attaching ring gear to turbine, then lift out ring gear and examine for wear, scoring, or imbedded metal (pick out imbedded metal with a small screwdriver).

7) Lift stator and needle bearing out of turbine and check for chipped, cracked, or broken vanes. Check babbitted inner surface of stator shaft. If babbitt is scored or flaked, stator must be replaced. Check needle thrust bearing for wear or looseness.

8) Lift turbine and needle thrust bearing out of converter pump cover and examine turbine for chipped, cracked, or broken vanes. Examine babbitted inner surfaces of turbine shaft. If babbitt is chipped or flaked, the turbine must be replaced. Examine converter pump hub for scoring, burrs or roughness that might damage pump seal or pump bushing when reinstalled.

9) Pry converter clutch housing retaining ring out of groove in converter pump, then lift converter clutch housing out of pump. Examine clutch plate contact surface for wear or scoring. Remove converter clutch pack and examine for scoring warping or excessive wear.

10) Remove converter clutch piston and apply plate with a pair of pliers. Examine plate for scoring or excessive wear. Check piston bore in converter pump for pitting or scoring. Check inner bore of piston for wear or scoring. *NOTE - Piston and apply plate are serviced as an assembly only.*

11) Unhook, expand and remove converter clutch piston inner ring and examine it for wear or scoring. Remove

CONTINUED ON NEXT PAGE

BUICK SPECIAL AUTOMATIC TRANSMISSION (C nt.)

and examine converter clutch outer piston rings for cracks or excessive wear.

CONVERTER CLEARANCE CHECK: 1) Set converter pump housing hub throug hole in bench, then place turbine and needle thrust bearing that will be used at final assembly in pump housing. Set stator and needle thrust bearing that will be used at final assembly in turbine.

2) Set ring gear in place on turbine. *NOTE - Bolt holes are spaced unevenly so gear can be installed in one position only.* Install and tighten bolts to 25-30 ft. lbs. Install sun gear and needle thrust bearing that will be used at final assembly, then install tanged thrust washers in front and rear planet carrier (tangs on washers must engage drilled holes in carrier). Set carrier assembly with tanged thrust washers in place on rear sun gear hub. *NOTE - Deep side of carrier as s mbly toward rear sun gear.*

3) Examine front sun gear for wear, scoring or imbedded metal (pick out imbedded metal with a small screwdriver). Make sure tanged thrust washer is in place on forward side of planet carrier, then set front sun gear in place on planet carrier. Set needle thrust bearing that will be used at final assembly and two select fit needle thrust bearing races in place on top of front sun gear.

4) Set converter clearance gauge J-9157 on pump housing with **longer legs down** on housing. Loosen thumb screw and push plunger down to bear on needle thrust bearing and races, then tighten thumb screw.

5) Turn gauge J-9157 over **(short legs down)** and set in place on converter pump. Assemble dial indicator to post with indicator bearing on plunger, then "zero" the indicator. Loosen plunger thumb screw and note indicator reading. *NOTE - If when gauge is set in place n converter pump, the plunger holds the gauge up so legs do not rest on pump rim, indicator reading when thumb screw is released will be in compression, not cl arance. If plunger drops when thumb screw is re l ased, indicator reading will be in clearance, not compression.* Select needle thrust bearing races to provide .010" clearance to .005" compression. *NOTE - Disassemble converter pump housing after checking clearance. It is not necessary to remove planet ring g ar assembly from turbine. For reassembly and installation of torque converter, see below.*

TRANSMISSION OVERHAUL
REMOVAL & DISASSEMBLY OF COMPONENTS

►*NOTE: To disassemble transmission, remove all components in the following order.*

PUMP UNIT: Removal - Remove attaching bolts and sealing type lockwashers, then grasp pump body with pliers and hand and lift assembly clear of case. *NOTE - R verse clutch hub will usually be removed with pump. A tanged thrust washer which may remain on top of stator overrunning clutch race should be placed in r ar f reverse clutch hub.*

Disassembly: Use air pressure to remove reverse clutch piston from reverse clutch housing (cover the assembly to prevent oil splashing). Examine reverse clutch piston inner and outer seals for nicks, cuts or wear. If necessary to replace, remove seals from piston. Remove and discard oil pump body to case seal, then remove reverse clutch piston housing to pump body bolts. Lift reverse clutch piston housing off pump (lift straight up to avoid damage to dowel pins). *NOTE - Slipper sealing pins may stick to reverse clutch piston housing and be removed with housing.* Mount a dial indicator on base and "zero" indicator on pump body. Move indicator plunger to bear on oil pump slippers one at a time. Slippers should be from .001" to .0028" below surface of pump body. Move indicator plunger to rest on rotor (checking it in several places). Rotor should be .001" to .0028" below pump body. Examine bushing; if worn or scored, remove rotor, slippers, springs, and pins and drive out bushing and seal with remover J-9154.

Reassembly: Install new bushing with installer J-9155, then apply Permatex to outer diameter of new seal and install seal with installer J-9152. Examine pump parts for wear, scoring or pitting and replace as necessary. Install rotor with driving tangs up, then install slippers and springs. Install sealing pins and lubricate assembly with automatic transmission fluid. Set reverse clutch piston housing squarely in place on pump body (dowel pins are unevenly placed so assembly can be made only in one position). Install reverse clutch piston housing to pump body bolts and tighten to 15-20 ft. lbs. Install a new oil pump body to transmission case sealing ring, then install reverse clutch piston inner and outer seals with lip of seals toward front of piston. Lubricate seals and install piston housing using a loop of smooth wire to start lips of seals into bore (a satisfactory tool can be made by crimping a loop of .020" music wire in a short length of copper tubing). *NOTE - Inner seal lip should be started first.*

REVERSE CLUTCH: Removal - Remove lever assembly ring and apply levers, then check levers for wear or bending. Lift out reverse clutch hub, select fit thrust washer on front side and tanged thrust washer on the rear. *NOTE - Reverse clutch hub and thrust washers may have been removed with pump.* Unhook and expand clutch hub oil ring and remove from hub (examine ring for wear). Remove select fit thrust washer and examine hub and washer for indications of wear or scoring. Remove tanged thrust washer at rear of clutch hub and check for wear. Remove Belleville reverse clutch release spring and check spring for cracks or wear. Remove reverse clutch pressure plate and examine for wear, then remove reverse clutch pack. Check plates for wear, flaking, burring or scoring. Measure reverse clutch friction plates. *NOTE - New plates should measure .079-.084". Plates worn thinner than .074" should be replaced.*

►*REASSEMBLY NOTE: See "Transmission Reassembly" below.*

COAST CLUTCH, OVERRUNNING CLUTCH & FORWARD CLUTCH: Removal - 1) Remove forward and reverse clutch anchor, then rotate forward and reverse clutch backing plate to disengage lugs from slots in case. Remove backing plate and examine for wear or scoring.

2) Grasp overrunning clutch cam and roller retainer and lift complete coast clutch, overrunning clutch and forward clutch pack out of transmission. *NOTE - R ar xternally splined clutch plate will remain in transmission on forward clutch pr ssur plat . R mov remaining plat and plac with forward clutch pack.* Lift forward clutch pack off coast clutch housing and examine plates for wear, scoring, flaking or warping.

3) Measure forward clutch friction plates. *NOTE - New plates should measure .079-.084". Plat s worn thinner than .074" should be r plac d.* Remove forward clutch pressure plate and check for cracks or for worn spots where levers contact plate. Pry forward clutch release spring retaining ring out of groove in case and remove retaining ring. Remove Belleville forward clutch release spring and check for cracks or wear. Remove forward clutch apply levers and check for wear or bending.

Disassembly: Coast & Overrunning Clutch s - 1) Assemble coast and overrunning clutch assembly in Tool J-2590 and provide support so assembly rests on lower edge of coast clutch housing. Tighten wing nut to relieve pressure on coast clutch cylinder-to-housing retaining ring, then pry ring out of groove in housing. Remove wing nut and spacer, then lift coast clutch piston and cylinder out of housing. Use pliers to remove piston from cylinder and check cylinder for dirt or scoring. Check piston inner and outer seals for nicks, wear or cuts (remove if damaged).

2) Remove coast clutch hub-to-coast clutch support thrust washer and check washer for wear or scoring. Remove coast clutch apply levers and check for wear or bending, then remove coast clutch release spring and check spring for wear or cracks. Remove coast clutch pressure plate and check for wear or scoring.

3) Tip coast clutch housing to remove clutch pack and hub. Examine hub for chips or scoring and clutch plates for wear, scoring, burning, flaking or warping, then measure friction plates. *NOTE - N w plat s should measure .079-.084". Plat s w rn thinn r than .074" should be replaced.*

4) Pry retaining ring out of groove in backing plate, then tilt coast clutch housing to remove coast clutch backing plate and overrunning clutch assembly. Check backing plate for wear or scoring.

5) Pull rear sun gear race out of cam assembly (rollers and spring will fall out). Check race for wear, scoring, denting or damage to splines and rollers for wear or scoring. Remove roller thrust washer and check for wear or scoring. Pull stator race out of cam (rollers and springs will fall out). Examine race for wear, scoring, denting or damage to splines and rollers for wear or scoring. Check cam for wear, scoring, or denting. *NOTE - If cam must be replaced, driv off roll r r tainer and stake in place on a new cam.*

Reassembly: Coast & Overrunning Clutch s - 1) Lubricate and install thrust washer on stator race, then set rear sun gear in place on thrust washer and assemble rollers and springs (place rollers at narrow end and springs at wide end of roller cam slots in race assembly). Install cam and race assembly in coast clutch housing, rotating cam assembly so lugs on cam engage notches in coast clutch housing.

2) Place assembly on block or otherwise support on lower edge of coast clutch housing, then install coast clutch backing plate on cam and race assembly. With assembly still resting on lower edge of coast clutch housing, install retaining ring solidly in groove in coast clutch housing above backing plate. Set coast clutch hub in place on rear sun gear face.

CONTINUED ON NEXT PAGE

BUICK SPECIAL AUTOMATIC TRANSMISSION (C nt.)

3) Lubricate a coast clutch friction plate with automatic transmission fluid and install on backing plate with splines engaged with coast clutch splines. Check a separator plate for "dish" by holding a straightedge firmly against plate, then install separator plate (all separator plates must be installed with "dish" in same direction). Continue alternately installing a lubricated friction plate and a separator plate until five friction plates and four separator plates have been installed.

4) Install pressure plate on top of last friction plate and engage lugs in notches of coast clutch housing. Install Belleville clutch release spring pressure plate with inner edge of spring upward. Install apply levers (concave edge in) between lugs of pressure plate and flat on release spring. Apply a daub of chassis lubricant on each lever to hold it in place.

5) Place thrust washer on top of coast clutch hub, then install piston inner seal and outer seal with lip of seals toward rear of piston. Lubricate seals and install piston in bore of coast clutch cylinder by using a loop of smooth wire to start lips of seals into bore. *NOTE - Start inner seal first.*

6) Make sure thrust washer and all apply levers are in place, then install cylinder and piston assembly squarely in bore of coast clutch housing. Assemble tool J-2590 to clutch assembly, then tighten wing nut until clearance is provided for installation of retaining ring above piston cylinder. Make sure ring is installed solidly in groove, then remove tool.

7) Insert rear sun gear in sun gear race. *NOTE - Turn gear in race and ch ck for drag on coast clutch. Excessive drag indicat s clutch separator plates are not all dished the same way, or foreign material is present. Sun gear ov rrunning clutch should permit rotation in only one direction.*

OIL PAN & VALVE BODY: Removal - Remove oil pan and seal, then remove oil strainer strap bolts, strap, strainer and strainer "O" ring (discard "O" ring). Use needle nose pliers to remove parking lock pawl disengaging spring. Remove remaining valve body attaching bolts and remove valve body assembly. *NOTE - Be careful when removing valve body as some of the valves may fall ut.*

Disassembly: 1) Remove range selector and governor valve, then tilt valve body to remove governor valve pin. Remove throttle detent valve and throttle pressure regulator valve spring. Remove two screws attaching valve body plate and gaskets to valve body (detent poppet may slide out when screws are removed). Remove plate and gasket and check for evidence of leakage or improper installation.

2) Remove selector lever detent poppet and spring, then remove check ball. Remove pressure regulator valve stop, then tilt valve body and remove throttle pressure regulator valve. Press in on governor valve sleeve to release spring pressure on retainer and invert valve body to allow removal of retainer. Remove sleeve, second stage governor valve spring, and governor valve.

3) Remove two screws attaching oil gauge rod guide to valve body and remove guide, then firmly hold valve retaining plate and remove two screws attaching plate to valve body. Release plate carefully against pressure of three springs behind plate.

4) Tilt valve body and remove valves, sleeves and springs. Wash all parts in solvent and inspect for wear or damage. *NOTE - Make sure small holes in converter pressure regulator, governor and throttle pressure regulator valves are clear. The small .032" hole in valve body must also be clear.* Dry all parts with air, then check each valve in its bore. All valves must move freely of their own weight.

Reassembly: 1) Install pressure regulator, shift, and main line pressure regulator valves, sleeves, and springs. Use new valve retaining plate-to-valve body gasket, then install plate and oil gauge rod guide and tighten screws. Install throttle pressure regulator valve, then, with valve at bottom of its bore, install throttle pressure regulator valve stop, making sure it is in the correct opening.

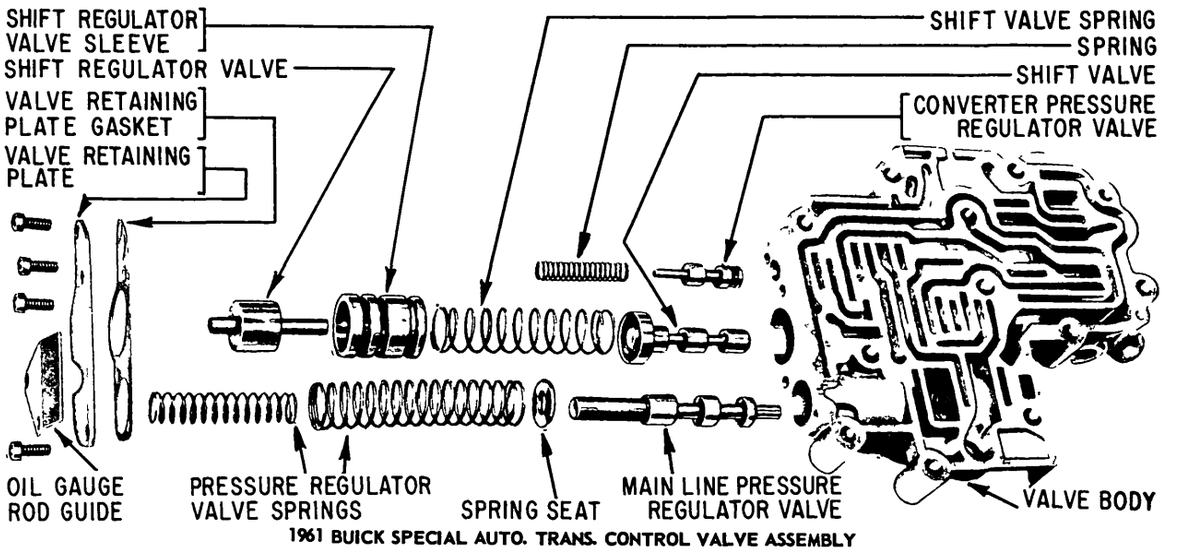
2) Install second stage governor valve, spring, sleeve, and retainer. *NOTE - Press in on sleeve against spring pressure and install retainer through valve body in wide spot of sleeve.* Install check ball, then install detent poppet and spring. Use a new gasket on each side of valve body plate and position plate and gaskets on valve body. *NOTE - Service type inner and outer plate gaskets are the same (production type gaskets are not).*

3) Make sure detent poppet is properly placed, then install and tighten screws. *CAUTION - Do not overtighten.* Install throttle detent valve and throttle pressure regulator valve spring. Install range selector valve, governor valve and pin. *NOTE - It may be necessary to shake valve body to start governor valve pin through hole in second stage governor valve.*

COMPANION FLANGE & SEAL: *NOTE - This operation may b p rform d with transmission in th car.*

Removal: Engage parking lock pawl and remove companion flange attaching bolt and tap flange off output shaft, then pry seal out of transmission case.

Installati n: Install a new seal with tool J-8864. Engage parking pawl, then lubricate companion flange and install on shaft. Tighten bolt to 45-55 ft. lbs.



OUTPUT SHAFT, COAST CLUTCH SUPPORT, FORWARD CLUTCH PISTON, PARKING LOCK RATCHET WHEEL & GOVERNOR ASSEMBLY: Removal - 1) Remove companion flange, then use tool J-6586 to pull three adapter sleeves and retainer out of transmission case and coast clutch support. Examine "O" rings for nicks and cuts.

2) Pull output shaft forward to remove shaft, coast clutch support, parking lock ratchet wheel and governor as an assembly. *NOTE - Speedometer gear will b pulled off shaft and can be removed through compani n flange seal.*

Disassembly: Slide governor lever actuating sleeve, needle thrust bearing, thrust bearing race and parking lock ratchet wheel spacer off rear of output shaft. Check needle thrust bearing, race and sleeve for wear or scoring. Slide governor weight and retainer assembly off rear of output shaft and check roll pins for looseness in weights. Slide coast clutch support and forward clutch piston assembly off forward end of output shaft. Examine two hooked oil rings on output shaft (just forward of parking lock ratchet wheel). If worn or scored, unhook, expand and remove rings. If parking If parking lock ratchet wheel is worn or broken, expand and remove retaining ring on output shaft forward of wheel. Slide parking lock ratchet wheel off forward end of output shaft. Check output shaft for damaged splines, scored bearings, broken ring lands and other damage. To assemble parking lock ratchet wheel and output shaft, install parking lock ratchet wheel with spline chamfer toward rear of output shaft, then position ratchet wheel on output shaft splines. Expand and install retaining ring solidly in groove of output shaft. Expand and install two hooked oil rings in grooves of output shaft.

Disass mbly (Coast Clutch Supp rt & F rward Clutch Pist n): Cover assembly with a cloth and direct air

CONTINUED ON NEXT PAGE

1961 BUICK SPECIAL AUTO. TRANS. CONTROL VALVE ASSEMBLY

BUICK SPECIAL AUTOMATIC TRANSMISSION (C nt.)

pressure into center oil transfer sleeve hole to remove forward clutch piston from coast clutch support. Examine two hooked oil rings on coast clutch support. If worn or scored, unhook, expand, and remove rings. Check inner bore of support (where output shaft oil rings contact support) for wear or scoring. Check forward clutch inner and outer seal. If nicked, worn or torn, remove seal.

R assembly (Coast Clutch Support & Forward Clutch Piston): Install and hook rings on coast clutch support, then install forward clutch piston outer seal and inner seal on piston. *NOTE - Lips of seals must be toward rear of piston.* Lubricate seals and install forward clutch piston in coast clutch support using a loop of smooth wire to start seal lip into piston bore. *NOTE - Start inner seal lip first.*

R assembly: Lubricate oil rings and slide coast clutch support and forward clutch piston assembly on output shaft. Slide governor weight retainer and governor weight assembly on rear of output shaft. *NOTE - Inner tangs of retainer must be inside openings of parking lock ratchet wheel and forward end of weights must also b inside openings of wheel.* Lubricate needle thrust bearings and slide spacer, sleeve, needle thrust bearing and race on rear of output shaft. Position against governor weights.

GOVERNOR LEVER & PIN: Replacement - If lever is damaged or pin hole is badly worn, remove pin retaining plug in side of transmission case. Slide pin out of case and lever. Replace parts as necessary, then install pin through case and lever and install plug.

TRANSMISSION REAR BEARING: Removal - Remove governor lever and pin. If bearing is defective, pry bearing lock out of groove in case. Drive bearing out of case with a drift inserted from rear.

Installation: Drive new bearing squarely into case with Installer J-9164. Start one end of bearing lock into groove above bearing, then form a ramp with a screwdriver inserted between case and lock. Push lock down ramp with a second screwdriver until it is properly seated.

RANGE SELECTOR LEVERS & SHAFT, THROTTLE VALVE CONTROL LEVERS & SHAFT, & PARKING LOCK ACTUATOR: Removal - Use a "clutch head" screwdriver (Tool 10-167-3) and a wrench to remove inner throttle valve control lever attaching screw and nut, then slide inner lever off shaft and remove. Slide outer lever and shaft out of range selector shaft. If "O" ring is worn or torn, remove "O" ring. Use the same screwdriver and wrench to remove range selector inner lever to shaft attaching screw and nut, then slide inner lever off shaft. Remove inner lever and parking lock actuator assembly. *NOTE - If actuator or inner l ver requires replacement, snap off actuator retainer and assemble new parts as necessary.* Check shaft "O" ring and remove if worn, nicked, or cut.

Installation: Install and lubricate "O" ring, then slide range selector shaft through case and carefully align splines on shaft with splines in inner lever. Hold outer lever and shaft "in" against case and push inner lever completely on shaft. Install and tighten screw and nut. Assemble special washer and "O" ring on throttle control lever shaft, then lubricate "O" ring and slide shaft into range selector shaft. Engage splines on shaft with splines in inner lever and press lever on shaft completely. Install and tighten screw and nut.

TRANSMISSION REASSEMBLY & INSTALLATION OF COMPONENTS

OUTPUT SHAFT, COAST CLUTCH SUPPORT, FORWARD CLUTCH PISTON, PARKING LOCK RATCHET WHEEL & GOVERNOR ASSEMBLY: Installation - Lubricate coast clutch support outer diameter and position support so oil transfer holes are upward. Hold governor assembly in position against parking lock wheel and start rear of shaft through bearing. Ease assembly into position. If parking lock pawl is installed, hold it up out of way to allow assembly to move fully into case. *NOTE - When correctly positioned in case, coast clutch support oil transfer holes will line up with oil transfer holes in case. If necessary to rotate support, insert smooth punch through oil transfer holes in case to rotate support. Be careful not to nick or dent either support or case.* With oil holes in case and support lined up, lubricate and install oil transfer sleeves and "O" rings, and retainers. *NOTE - Retainers should be positioned flat against sleeves.* Lubricate liberally with chassis lubricant to avoid damage to seal, and install speedometer driving gear on output shaft, then install companion flange.

COAST & OVERRUNNING CLUTCH, FORWARD CLUTCH PACK, RELEASE SPRING & APPLY LEVERS: Installation - 1) With transmission case in a vertical position, install forward clutch levers, then install forward clutch release spring flat on levers with inner edge of spring down. Install release spring retainer solidly in groove of case. *NOTE - Release spring may move to one side and prevent easy installation of retaining ring. Center spring as necessary to install ring fully into groove. Make sure ring is in groove all the way around.*

2) Set forward clutch pressure plate in place on apply levers, positioning it so wide space between lugs is toward top of case (for installation of anchor). Set coast and overrunning clutch assembly in place on coast clutch support.

3) Check a separator plate (no notches on lugs) for "dish" by holding a straightedge firmly against plate, then install plate on forward clutch pressure plate with wide space between lugs toward top of case (all separator plates must be installed with "dish" in same direction). Lubricate a forward clutch friction plate with automatic transmission fluid, then install over coast clutch housing by engaging splines of plate with splines on housing. Continue alternately installing a separator plate and a lubricated friction plate until five separator plates (all "dished" same way and with wide space between lugs toward top of case), and five friction plates have been installed.

4) Install forward and reverse clutch backing plate on top of forward clutch pack, then rotate backing plate so lugs on backing plate engage lugs in case. *NOTE - Backing plate should require no force to install if forward clutch pack is installed correctly.* Install forward and reverse clutch anchor in slot at top of case.

►*FORWARD & REVERSE CLUTCH ANCHOR INSTALLATION CAUTION: B v l d edg_ of anchor must be installed toward outside f transmission. If anch r is installed t ward insid f transmission, it will b very difficult to r mov for installation in correct mann r.*

REVERSE CLUTCH COMPONENTS & OIL PUMP: Installati n - 1) Position reverse clutch hub on overrunning clutch assembly. *NOTE - Be sure tanged thrust washer is in place at rear of reverse clutch hub.* Lubricate and install a friction plate on forward and reverse clutch backing plate by engaging splines on hub with splines on plate. Check a reverse clutch separator plate (notch in tangs) for "dish" and install separator plate above friction plate (all separator plates must be installed with "dish" in same direction and with wide space between lugs toward top of transmission to clear anchor). Continue clutch pack build-up by alternately installing a lubricated friction plate and a separator plate until four friction plates and three separator plates have been installed.

2) *NOTE - Reverse clutch pressure plates are supplied in three thicknesses. If a new pressure plate is being installed, measure old plate in an unworm area nedr end of a lug. The new plate to be installed must be same thickness as old plate or reverse clutch pack clearance will be affected.* Install pressure plate over top friction plate with wide space between lugs toward top of transmission to clear anchor. Install release spring and assembling ring over pressure plate. *NOTE - Center edge of release spring upward.*

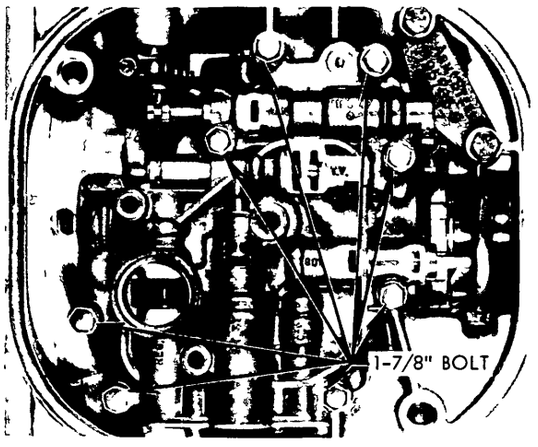
3) Lubricate thrust washer and oil pump body-to-case seal, then line up bolt holes with guide pins and lower pump into position. Install and tighten at least three oil pump body-to-case bolts. Insert a .020" feeler gauge through case between a reverse clutch friction plate and a separator plate. A .029" feeler should GO and a ,051" feeler should NOT GO. If pack clearance is less than .030" it may be due to incorrect pressure plate, separator plates not all "dished" in same direction, or apply levers incorrectly installed and binding on piston. If pack clearance is more than .050" it may be due to incorrect pressure plate, or excessively worn friction or separator plates.

4) If reverse clutch pack clearance is within specifications, remove guide pins, install remaining special bolts and captive sealing lock washers and tighten to 20-24 ft. lbs.

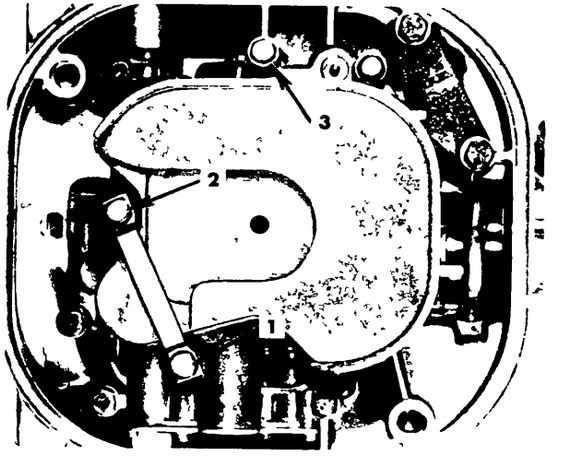
VALVE BODY: Installation - With surfaces of case and valve body clean, set valve body assembly in position and engage pin of range selector inner lever with groove of selector valve, then install parking lock pawl disengaging spring. Install valve body attaching bolts and tighten to 100 inch pounds in sequence indicated in illustration. Insert a .025" feeler (tool J-9153) between forward edge of rear land of governor valve and valve sleeve. Hold governor lever rearward and valve forward against feeler. Adjust screw so screw just touches end of valve with valve held inward against feeler, then remove feeler. Install a new "O" ring on oil strainer and place strainer in position on valve body, then install strainer strap and bolts and tighten to 100 inch pounds in sequence indicated in illustration.

PARKING LOCK PAWL: Replac m nt - *NOTE - This operation can be performed with transmission in the car.* Remove oil pan and seal, then remove parking pawl disengaging spring. Remove parking lock bracket-to-case bolts and remove bracket. Use a small punch or drift to drive parking lock pawl shaft pin out of case, then pull parking lock shaft and "O" ring out of case. Remove parking pawl. *NOTE - It may b n c ssary to*

CONTINUED ON NEXT PAGE



BUICK SPECIAL AUTOMATIC TRANSMISSION (Cont.)



start shaft out of cas using needle nose pliers to grip shaft insid cas . To install, place a lubricated "O" ring on lock pawl shaft and align pawl with shaft, then install shaft with slot lined up with hole in case and install roll pin. Install parking lock bracket but do not tighten bolts. Shift transmission to park position, then turn output shaft so pawl engages wheel and tighten bracket bolts. Move selector to neutral and back to park position. Check for freedom of movement between park and neutral ranges. If bind exists, use a .001" shim stock under one or both bracket bolts. Tighten bolts to 15-20 ft. lbs., then install parking lock pawl disengaging spring.

OIL PAN & SEAL: Installation - Install new seal in position and set oil pan in place. *NOTE - Use car to avoid stretching s al wh n installing it on oil pan. If d sir d, plac s al in position in case groove around valv body and set pan on seal. Rap pan sharply with palm f hand to install s al on pan.* Install a new seal on bolt and install bolt and tighten to 15-20 ft. lbs.

ENGINE BALANCING

AUTOMATIC TRANSMISSION BALANCING: *NOTE - Servic replacement converter pumps and converter pumps and conv rter pump housings are balanced s parat ly and not as an assembly.* If an unbalanced condition exists after installation of either or both of these units, proceed as follows: Connect a tachometer to engine, then raise car enough to allow lower flywheel housing to be removed. Screw largest of three trial weights, Tool J-9367 on portion of converter pump-to-housing bolt extending through nut (use any of the 18 bolts as a starting point), then mark the location with crayon or chalk for later reference. Start engine, then place transmission in "P" (Park) position and run at exactly 1500 RPM. Note the amount of vibration, then remove trial weight from starting point and reinstall it directly across (180°) from starting point and again note amount of vibration. Move trial weight to third position (halfway between first and second positions) and note amount of vibration. Move trial weight to fourth position (directly across from third position) and again note amount of vibration. At the point in the above trials where greatest improvement was noted, use a smaller trial weight or combination of weights in the adjacent area to reduce vibration the greatest amount. After determining the weight or weights that provide greatest improvement, move weight or weights to right or left to determine if vibration can be further reduced. When location is found that provides greatest improvement, remove trial weights and install permanent weights in their place, using attaching bolt, Part No. 1195069 in place of standard converter pump-to-housing attaching bolt to retain weight, Part No. 1195094 in place (standard production bolt is used to retain weight, Part No. 1195092). Permanent weights are furnished .135" thick (Part No. 1195094); .0345" (Part No. 1195092). *NOTE - Permanent weights are quival nt to trial weights as follows: Two Part No. 1195094 (on larg trial w ight); One Part No. 1195094 (one m dium trial w ight; One Part No. 1195092 (one small trial w ight). Wh n two w ights ar r quired at sam location, install on adjac nt b lts.*

VALVE BODY BOLT TIGHTENING SEQUENCE

TORQUE CONVERTER & GEAR SET REASSEMBLY & INSTALLATION

REASSEMBLY & INSTALLATION: 1) Examine converter pump for chipped, cracked or broken vanes and check for damaged or loose pump ring, then expand and install converter clutch inner piston ring and hook the ends. Position converter clutch outer piston ring squarely in lower part of bore (about ¼" from bottom) and check ring gap with a feeler gauge. Gap should be .002" to .007". *NOTE - If gap is less than .002", file end of ring. If gap is greater than .007", install a new ring.*

2) Install outer piston ring on converter clutch piston and apply plate assembly, then lubricate liberally and push piston and apply plate assembly into bore of converter pump. *NOTE - A chamfer in bore serves to compress outer piston ring; however, if difficulty is encountered, a thin feeler gauge may be used to start ring ends over the chamfer.*

3) Examine converter clutch friction plates for excessive wear, burning or flaking, and measure any questionable plate. Plates worn thinner than .074" should be replaced. *NOTE - New plates are .079-.084" thick.* Lubricate a friction plate and install in converter clutch housing. Check a separator plate for "dish" by holding a straightedge firmly against plate, then install separator plate (all separator plates must be installed with "dish" in same direction). Continue alternately installing a lubricated friction plate and a separator plate until four friction plates and three separator plates have been installed.

4) Rotate piston apply plate so tangs of apply plate are centered in openings, then lower converter clutch housing and clutch pack assembly into converter pump. Retain clutch plates with fingers until assembly is properly aligned. *NOTE - Long tangs of housing must engage openings in converter pump.*

5) Install housing retainer ring over converter clutch housing in groove of converter pump and tap ring solidly into groove with drift.

6) Place converter pump housing assembly tool J-9199 over output shaft (to center converter pump housing so housing hub does not damage seal during installation), then lubricate hub of pump housing and install converter on output shaft. Remove tool J-9199.

7) Install caged needle thrust bearing on rear of turbine and retain in place with chassis lubricant. *NOTE - Oil exit holes in bearing should be placed toward rear.* Set stator and turbine assembly into pump housing carefully to avoid damage to splines, then rotate turbine to engage splines (stator and turbine will drop into place when splines are lined up).

8) Assemble caged needle thrust bearing to rear of sun gear (oil exit holes to rear), then lubricate sun gear shaft inside and out and slide it carefully into place. *NOTE - Two sets of splines must be engaged (Sun gear race and coast clutch hub). Do not force gear as spline damage may result.*

9) Place planet carrier over rear sun gear with tanged thrust washers in place at front and rear. *NOTE - Deeper pocket of carrier "down" toward rear sun gear and splined portion "up".* Assemble new converter pump oil seal to pump (do not twist square seal). Lubricate and install needle thrust bearing and two select fit bearing races into front sun gear. Retain in place with chassis lube.

10) Engage splines on sun gear hub with splines of converter clutch friction plates, then rotate gear while pressing down very lightly until all splines are engaged. Hold front sun gear with long screwdriver while positioning converter pump against pump housing, then remove screwdriver. Rotate assembly very slightly to mesh front sun gear with planet pinions. With gears in mesh, push converter pump into converter housing and pull housing toward pump.

11) Before installing pump housing to converter pump bolts, check locating hole through housing and matching hole part way through converter pump flange. *CAUTION - These holes must line up to retain balanc of conv rt r ass mbly.* With transmission in a vertical position, install and tighten special nuts and bolts alternately and evenly to 15-20 ft. lbs. *CAUTION - B sur and wir conv rt r ass mbly to transmission cas bef re r moving transmissi n from h lding fixture.*

BUICK TWIN TURBINE DYNAFLOW

Buick L Sabr , Invicta, El ctra (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1961 TWIN TURBINE TRANSMISSION CODE NUMBER NOTE:* A code number consisting of a letter followed by a number is stamped on lower edge of reaction shaft flange directly to rear of high (left) accumulator. This number should be used as identification when ordering parts or for service procedure changes.

DESCRIPTION: Twin turbine torque converter and transmission of same design used on previous models.

LUBRICATION

Check oil level at 1000 miles intervals and add oil as required. Drain and refill at 25,000 mile intervals.

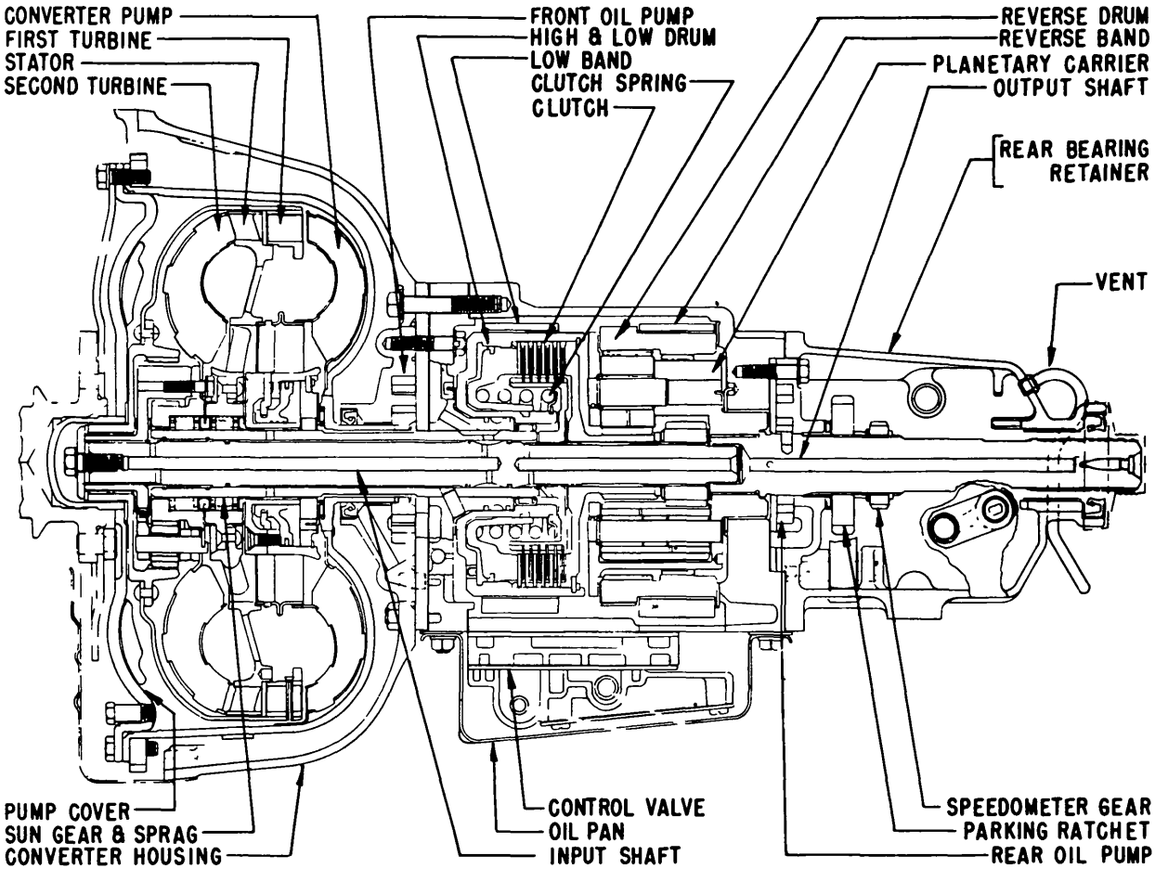
►*CAUTION: Oil must be warm and engine must be idling wh n checking oil level. Warm up engine before draining.*

Checking Oil Level: With oil warm and engine idling with control lever in "P" (Parking), position. check oil level as indicated on dipstick in filler tube in engine compartment (on right side between battery and engine). If level is more than 1" below FULL mark on rod, add recommended oil to bring level up to FULL mark *(CAUTION - Do not fill above FULL mark).* Distance between ADD OIL and FULL marks on dipstick is equal to approximately 1 pint of oil.

►*CAUTION: If oil level is consistently low when checkd (indicating loss of 1 pint or more per 1000 miles), ch ck transmission thoroughly for oil leaks.*

Draining & Refilling: With oil warm, drain transmission case by removing drain plug in oil pan, drain torque converter, after removing bellhousing cover for access to drain plug, by loosening one plug and turning converter until second plug is downward, and removing this plug. Re-install and tighten all drain plugs. Install three quarts of recommended oil through filler opening in case. Start engine and allow it to idle with control lever in "P" (Parking) position, add additional oil to bring level up to FULL mark on dipstick. Recheck oil level after transmission warmed up. Oil level should be at FULL mark on dipstick.

►*CAUTION: DO NOT FLUSH transmission when changing oil.*

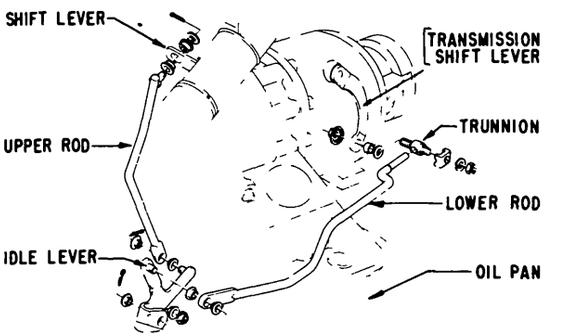


Capacity - Approximately 12 qts. (refilling after draining). Install an additional 1¾ qts. (after overhaul).

R commended Oil - Use only "Special Buick Oil for Dynaflow Drive" or Automatic Transmission Fluid, Type "A", with AQ-ATF number embossed on can.

LINKAGE ADJUSTMENT

Thr ttle Linkage & Stator Control Linkage Adjustment: *Se CARBURETOR on Car Model pages.*



Manual Shift Control Linkage Adjustment: With manual control lever in "P" (Park) position, raise car, then loosen clamp nut at rear of lower rod and move lever several times to make sure it is in "P" (Park) detent. *NOTE - If necessary, adjust positive park stop so no more than 1/8" overtravel of lever beyond park detent is possible.* Gently pull lower shift rod toward rear of car to take up slack in linkage, then tighten clamp nut to 10-15 ft. lbs. Check the adjustment (distance from drive detent to drive stop should be approximately equal to distance from low stop to low detent). With transmission at normal operating temperature, idle engine at 600 RPM, then slowly move selector lever from "N" (Neutral) to "D" (Drive) position. Clutch should engage, as indicated by an immediate decrease in engine speed when center of dial sight ring is midway between "N" and "D" on speed ratio dial. Slowly move indicator lever from "D" (Drive) to "N" (Neutral) position. Clutch should disengage, as indicated by an immediate increase in engine speed, when center of speed ratio pointer is midway between "D" and "N" on dial.

BUICK AUTOMATIC TRANSMISSION (TWIN TURBINE)

Control Dial Pointer Position Adjustment: Shift manual control to "D" (Drive), then loosen cross recess screw attaching indicator to shift lever housing and move indicator to center "D" in sight ring. Tighten screw.

Neutral Safety Switch Adjustm nt: Check and adjust shift control linkage. Place shift control lever in "N" (Neutral) position. Insert a 3/32" drill through gauging hole in operating lever and through gauging hole in switch body *(CAUTION - B careful not to move shift control lever out of neutral position).* If gauging drill is now parallel with centerline of steering column jacket,

BUICK LINKAGE

CONTINUED ON NEXT PAGE

TWIN TURBINE DYNAFLOW (C nt.)

switch timing is correct. If gauging drill will not go through holes or is not parallel, loosen two switch mounting screws and move switch sideways until gauge is parallel. Tighten screws. To check adjustment, turn on ignition switch, place shift control lever in "R" (Reverse) position, and make sure back-up lights are lit. Then set parking brake, place shift lever in "N" (Neutral) and make sure engine will start.

BAND ADJUSTMENT

►*BAND ADJUSTMENT NOTE: Bands cannot be adjusted with transmission installed in car. Adjustment is ordinarily requir d only at time of overhaul.*

L w & R v rs Band Adjustment: Remove band adjusting cover, then loosen locknut and turn adjusting screw clockwise until considerable resistance is felt indicating that band is in full contact with drum (low) or ring gear (reverse). Back off screw until just a trace of play can be felt by prying up on locknut with a screwdriver. From that point, back off screw **6 complete turns** and tighten locknut finger tight. Note position of adjusting screw slot, then tighten locknut to 20-25 ft. lbs. Remove torque wrench and check to make sure that adjusting screw did not turn. Install band adjusting cover with a new gasket.

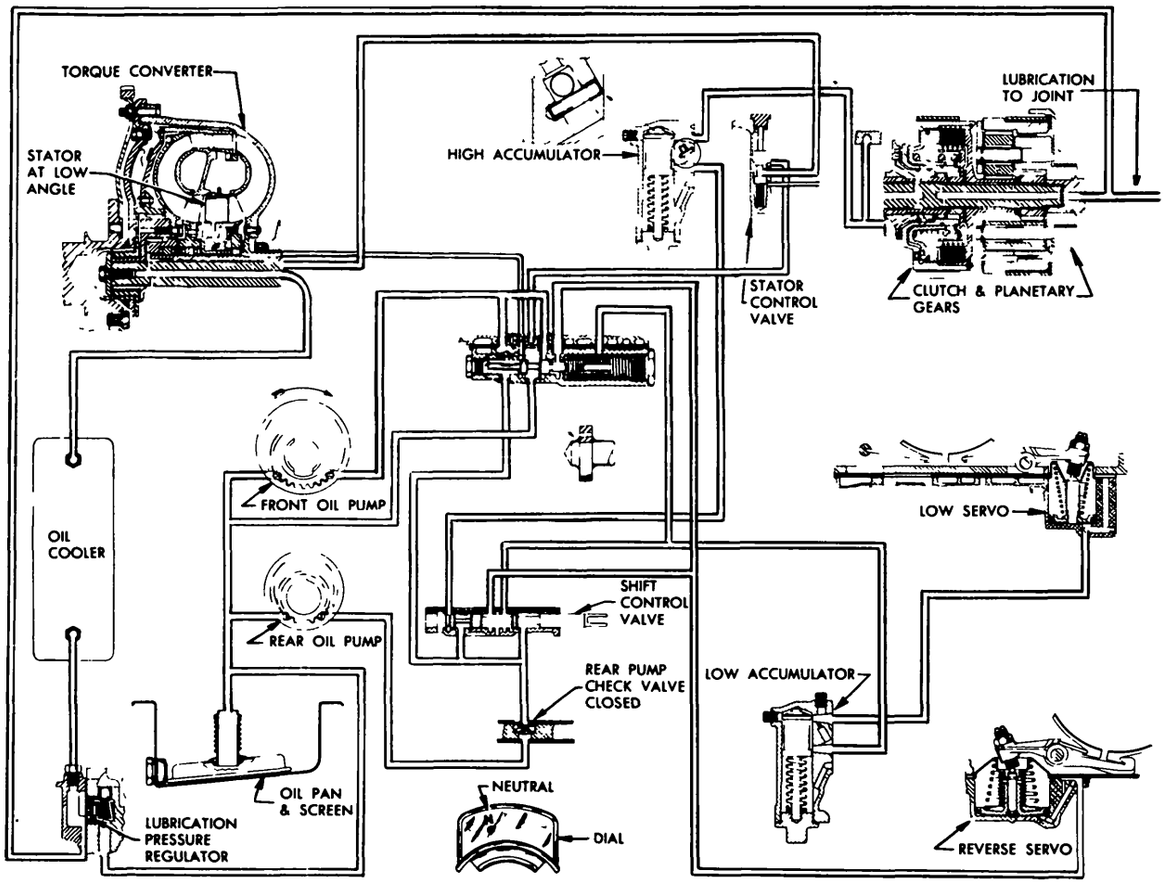
TESTING

If performance not satisfactory, make following tests **with transmissi n thor ughly warmed up and at operating t mp ratur :**

Oil Level: Check oil level, add fluid as necessary to bring level up to FULL mark on dipstick, recheck performance with correct oil level. If car has been losing oil at rate of 1 pint or more each 1000 miles, make thorough check for oil leaks.

Manual C ntr l Linkag : Check and adjust manual control linkage. See Linkage Adjustment.

Hydraulic C ntrol Syst m Pressures: Use Transmission Oil Pressure Gauge J-2575. Support rear end of car solidly with wheels off floor so that transmission can be operated. Remove transmission cover in floor pan for access to pressure take-off points.



Connect gauge and make tests as follows:

Fr nt Oil Pump - Connect pressure gauge at pipe plug opening on left side of transmission case. Run engine at 500 RPM, check pressure with selector lever in **Low, Driv , and R vers rang s.** Repeat tests at 1000 RPM, and at 1800 RPM **in L w and Reverse only.** See table below for correct pressures. Low or erratic pump pressures indicate air leaks in suction lines, improper pressure regulator valve action. or excessive pump clearances.

Fr nt Oil Pump Pressures

Sel ct r L v r–	Low	Drive	Reverse
500 RPM	120 lbs.	90 lbs.	120 lbs.
1000 RPM	180 lbs.	90 lbs.	
1800 RPM	180 lbs.	90 lbs.	

High & L w Accumulat r - Connect pressure gauge at pipe plug opening on top of accumulator body (**High**–left side of car); (**Low**–right side of car). Place selector lever in **Driv Rang** (High Accumulator Test); **L w Range** (Low Accumulator Test). Run engine and check pressures at speeds indicated in tables below. Low accumulator pressure may be caused by leakage past accumulator body gasket. If accumulator pressure more than 10 lbs. lower than front pump pressure, check for leakage between accumulator and multiple disc clutch and for restricted or plugged metering orifice in accumulator dump valve.

TWIN TURBINE DYNAFLOW HYDRAULIC CIRCUITS

Accumulator Pressures

Selector Lever–	Low	Drive
500 RPM	115 lbs.	80 lbs.
1000 RPM	175 lbs.	85 lbs.
1800 RPM	175 lbs.	85 lbs.

Stator - Connect pressure gauge at pipe plug opening on left end of reaction shaft flange. Test pressure in **Drive Range** at 500 RPM, 1000 RPM, and 1800 RPM.

Stator Pressures

Sel ct r L v r	Driv
500 RPM	10 lbs.
1000 RPM	65 lbs.
1800 RPM	75 lbs.

TROUBLE SHOOTING & DIAGNOSIS

►*EXCESSIVE DYNAFLOW WHINE CORRECTION: (This condition is usually the result of excessive cl arance between input shaft and bearing in the reaction shaft).* If transmission is to be disassembled to correct whine, perform the following:

1) Remove converter cover, twin turbine assembly, and sun gear, then mount dial indicator on end of input shaft with indicator button contacting reaction shaft. Position indicator button 90° to left of top center (facing end of shaft) then move input shaft away from and toward indicator while noting the gauge reading. Repeat this check at 45° to left of top center. If dial reading exceeds .005", excessive clearance exists between input shaft and bearing in reaction flange.

2) Before replacing bearing, remove reaction flange assembly and input shaft and observe the following: (a) Inspect bearing surface on input shaft. If surface appears abnormally rough or scored, replace input shaft; if not, polish journal area with crocus

CONTINUED ON NEXT PAGE

TWIN TURBINE DYNAFLOW (C nt.)

cloth. (b) Inspect the two oil seal rings toward rear of input shaft and the mating surface in the reaction shaft for scoring or other damage. If reaction shaft or input shaft shows evidence of scoring or other damage, replace worn or damaged parts.

3) If inspection reveals that condition of reaction shaft and input shaft are satisfactory, replace only the input shaft bearing (see Overhaul data).

4) If input shaft, reaction flange, or the bearing requires replacement, it will be necessary to replace the converter sun gear and planet pinions. *NOTE* - When installing reaction flange service bushing, be sure the assembly is supported on rear end of reaction shaft to prevent distortion of aluminum reaction flange.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With selector in any Range (rear wheels free). If car will not move for 1-8 minutes after standing over night - Check front pump oil pressure (see Testing) after allowing car to stand for several hours. If zero pressure noted, check pump for excessive clearances allowing pump to lose its prime. Check alignment of of bell housing and converter primary pump hub.

►*CAUTION: If this condition found, inspect Clutch and Bands for excessive wear due to slippage caused by low oil pressure.*

If car will not move after extended operation in Reverse - Check for air leaks in pump suction line (at rear oil pump gaskets), or excessive clearance in front pump (at pump gears and covers). Check alignment of bell housing and converter primary pump hub.

2) With selector in any Range (rear wheels locked). Parking lock engaged. Broken parts in transmission or rear axle. Parking brake applied.

3) With selector in Drive Range. Check front oil pump pressure and High Accumulator pressure. If OK, check for sticking Low Band Anchor Piston, remove and inspect Clutch for worn or sticking clutch plates, leaking clutch seal rings. If High Accumulator pressure pressure low, also check rear pump Check Valve for correct installation and proper seating, check for leaks at accumulator body gasket, reaction flange gasket, clutch piston outer seal and clutch ball check valve, and leaks at sealing rings on reaction shaft flange and low drum.

4) With selector in Reverse Range. Check reverse band for displaced operating strut caused by too loose adjustment, improper installation, or broken band anchor (indicated by free up and down movement of band operating lever). If band assembly OK (no free movement of lever), check servo operation by running engine and shifting into Reverse. Remove Valve & Servo Body and check for reverse servo piston seal leaks.

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, or poor acceleration).

1) In all Speed Ranges. Low oil level. Incorrect manual control linkage adjustment. Air leak in oil pump suction pipe at oil screen sealing ring. Low front oil pump pressure caused by wear or excessive clearances in in pump. Leaks at front pump cover or reaction shaft flange, pressure regulator valve. Valve & Servo Body gasket. Pressure regulator valve defective.

2) In Driv Rang . Incorrect manual control linkage adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, check for leaking clutch sealing rings, sticking clutch piston, worn or sticking clutch plates.

3) In L w Rang . Incorrect manual control linkage adjustment. Incorrect low band adjustment. Low band and drum worn or scored. If Low Accumulator pressure If Low Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, remove Valve & Servo Body and check for gasket leaks or leaks at low servo piston seal.

4) In Reverse Range. Incorrect manual control linkage adjustment. Reverse band out of adjustment, strut out of place, or anchor broken. If front oil pump pressure low, remove Valve & Servo Body and check for gasket leaks and leaking reverse servo piston seal.

CAR CREEPS (Forward or Backward).

1) Creeps forward with selector in Neutral. Incorrect manual control linkage adjustment. Sticking low servo piston (check by removing low band adjustment cover), Sticking clutch caused by warped, binding, or incorrectly assembled clutch plates (not stacked properly with "dish" in same direction).

If Car Creeps only when engine accelerated to 2500 RPM - Check clutch vent ball checks in clutch piston and reaction shaft flange.

2) Creeps forward with selector in Reverse or backward with selector in Low. Incorrect manual control linkage adjustment.

SHIFTS ARE ROUGH

1) Low-to-Drive Shift. Incorrect Low Band adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket and for dump valve or accumulator piston sticking down (top land of piston should be visible through top port in body). Sticking low band anchor piston (remove Valve & Servo Body to check), or incorrect piston location (see piston shimming data in Valve & Servo Body Reassembly). Valve & Servo Body gasket leaks. Clutch plates worn or binding.

EXCESSIVE CHATTER OR CLUNK ON STARTING

►*CAUTION: Slight "clunk" when shifting into Low or Reverse is normal, and slight chatter when car starting to move in reverse (disappearing as soon as car in motion) is also normal.*

1) In Low & Reverse Range. Incorrect Low or Reverse Band adjustment. Engine and transmission mountings loose or incorrectly adjusted, thrust pad at transmission mounting broken (see Engine Mountings in Buick Special Data). Clutch plates warped, sticking, or incorrectly assembled (not stacked properly with "dish" in same direction). Reverse ring gear bushing worn. Planet pinion needle bearing rough.

NOISE IN TRANSMISSION.

►*CAUTION: Hum or low whine in Neutral or Parking is normal (due to free rotation of all planetary gears) and slight hum in Low and Reverse may be expected.*

1) Buzzing Noise. Low oil level. Front pump check valve hanging up on edge of gasket between valve and servo bodies. If noise noticed in Parking or Neutral, pressure regulator valve clearance in body may be excessive or orifice in valve land oversize (correct by replacing valve and body).

2) Clicking N is . If noticed in all ranges, may be caused by foreign material in converter. If noticed only when car in motion, may be caused by parking lock pawl contacting ratchet wheel due to incorrect manual control linkage adjustment.

3) Abn rmal Hum r Whin (see Caution above). If noted in all ranges, may be caused by worn parts or excessive front pump clearances (front pump noise will increase in Low and decrease at car speeds above 45 MPH. in Direct Drive). Check front pump for excessive clearances by testing for low pump pressure. If noise noted in all ranges except Direct Drive, may be caused by trouble in planetary gears (gears locked out in Direct Drive).

4) Squealing or Screeching f ll wing installation of of Front Oil Pump. Pump driving gear installed backward.

►*CAUTION: Above condition must be corrected WITHOUT FURTHER OPERATION OF TRANSMISSION or sever damage will result.*

REMOVAL & INSTALLATION

Transmission Assembly: Removal - **1)** Raise car and place on jack stands, then disconnect exhaust pipes. Remove converter housing cover and drain converter, then remove oil filler pipe and drain transmission. Disconnect cooler lines. *NOTE - If transmission is being removed to correct clutch or band troubles, cool r and lines must be flushed with air and oil to remove residue.*

2) Remove flywheel-to-converter bolts and disconnect speedometer cable, stator control rod (at accumulator), and lower shift rod at lever. Disconnect propeller shaft at rear companion flange. *NOTE - Mark shaft and flange so parts can be reassembled in sam position. Support shaft up out of way to prevent damag to center joint caused by weight of shaft.*

3) Place transmission jack or hoist in position and adjust it to securely support transmission, then remove center bearing support bolts and slide propeller shaft rearward and disengage it from transmission. Remove bolts attaching rear mounting pad to rear bearing retainer, then raise engine and transmission assembly just enough to take load off transmission support (crossmember) and remove support. *CAUTION - If shims are used between support and frame side rails, note number of shims and location, so they may be reinstalled in same position.*

4) Place a jack under rear of engine lower crankcase and lower transmission just enough so converter housing bolts can be reached, then with engine and transmission supported by separate jacks, disconnect converter housing from engine. Move transmission rearward and disengage hub of converter pump cover from crankshaft and remove transmission from under car.

Installation: Reverse removal procedure and note the following: Turn flywheel so one converter attaching bolt hole is straight up, then install transmission, aligning converter bolt holes with holes in flywheel. Install and tighten all converter housing-to-engine bolts to 45-55 ft. lbs. Tighten flywheel-to-ring gear bolts to 30 ft. lbs. Tighten rear bearing-to-mounting pad bolts to 50-60 ft. lbs.

OVERHAUL

OVERHAUL: *See "Buick Twin Turbin Dynaflow Drive" in 1960 Annual Data or Later Manual edition and not the following*

Reaction Shaft Flange, Oil Pump, Accumulat rs & Clutch: Removal - Compress low band with Tool J-9478 to remove band from case.

R ar B aring R tainer, Rear Bushing, Parking L ck, and Speed meter Driv G ar: R m val - *NOTE - Th se units can b removed with transmission in car by re-*

CONTINUED ON NEXT PAGE

TWIN TURBINE DYNAFLOW (C nt.)

moving oil pan and disconnecting propeller shaft. Disconnect valve operating rod from upper operating rod (if not previously done), then remove retainer-to-case bolts, retainer and gasket. Remove speedometer gear and ratchet wheel retaining ring with snap ring pliers and remove speedometer drive gear, shims and spacer.

Disassembly - Remove spring from detent roller lever and support, then remove nut at adjusting lever. Pull roller lever and support assembly into bearing retainer and remove. *NOTE - Inspect "0" ring on support shaft and replace it damaged.* Remove cotter pin and clip from valve operating rod. *NOTE - If valve operating rod does not have a hole for installation of cotter pin, install later type valve operating rod and parking lock operating rod.* Thread parking lock operating rod ball stud out of lever. Thread a ¼" - 20 bolt into pawl shaft and withdraw shaft from retainer. Pull lever shaft from retainer in same manner, then remove parking lock pawl and lever assembly from retainer. Drive roll pin out of cross shaft and remove cross shaft and lever assembly and cross sleeve and lever. *NOTE - Inspect cross shaft s al and lever and replace if seal is worn or damaged. If bearing is worn so excessive freeplay xists between it and cross shaft, mark position of bearing in retainer and drive out bearing with a drift. Press a new bearing into place to same position as original bearing. Inspect output shaft bushing and if necessary, drive it out with Tools J-7273-7 and J-7013-1.*

R ass mbly - If new output shaft bushing is to be installed, drive bushing into position (flush with counterbore) with Tools J-7273-7 and J-7013-1. Coat outer diameter of new seal with Permatex and install with Tool J-8864. Lubricate cross shaft seal and position it in recess over cross shaft bearing with lip inward. Hold valve operating lever and shaft in position inside retainer and slide cross shaft through bushing and seal inside valve operating lever and sleeve. Line up holes and install roll pin. Install detent roller lever and support, then assemble linkage adjusting lever on support shaft and install nut and lockwasher. Install detent spring, then assemble parking lock operating rod to operating lever assembly using a lockwasher under ball end hex. *NOTE - Full pivoting ball end of rod must be assembled to operating lever.* Position pawl levers and rod assembly in retainer and slide pawl and lever shafts into place making sure that tapped holes are outward. Attach parking lock operating ball end to upper lever using a lockwasher under ball end hex. Assemble valve operating rod to valve operating lever with a clip and cotter pin. *NOTE - If rod does not have a cotter pin hol , replace rod with later type.*

Rear Oil Pump & Lubrication Oil Pr ssur R gulator Valv : R m val - Do not remove lube oil pressure regulator valve. Use compressed air and solvent to clean valve.

Valve & Servo Bodies: Disassembly (Valve Body) - Remove lower valve operating lever and linkage adjusting lever-to-upper lever shaft and remove levers. Remove safety nuts and washers from studs and lift valve body and gasket from servo body, then remove shift control valve from valve body. Remove rear pump delivery check valve and spring from servo body. Cover large pressure regulator valve plug with a wadded cloth and pull plug retaining pin out of valve body. *CAUTION - Use care when removing retaining pin as there is heavy spring pressure behind plug.* Remove two springs and spring seat. Remove small plug retaining pin, then thread a ¼" - 20 capscrew into plug and remove plug from valve body. Remove pressure regulator valve. Remove valve body plate and gasket, then remove front pump delivery check valve and spring.

Reassembly (Valve Body) - Place front pump delivery check valve spring in body with large end down and place check valve on spring with ridged side up. Install valve body plate and a new gasket, making sure that check valve is seated against plate and not caught under gasket. Check oil orifice in pressure regulator valve and land to make sure it is clear, then install valve with land outward. Assemble "0" ring on small plug and install plug with tapped hole outward and install short retaining pin with shoulder of pin toward valve body plate side of body. Assemble spring seat on inner spring and install springs and seat into valve body through large plug opening. Clamp a drift or dowel in a vise and position a 1" inside diameter pipe nipple over the dowel. Position plug and "0" ring over spring ends and against dowel. Slide pipe nipple over plug so that when pressure is exerted to compress springs into valve body, plug will not slip off dowel. Push valve body toward dowel to push plug into valve body. Install long retaining pin with shoulder toward valve body plate side of valve. Install shift control valve with slotted end on same end of valve as large pressure regulator plug. Install rear pump delivery check valve in its seat in servo body, ridged face inward, and place valve spring on valve with large end up. Install a new gasket and the valve body on servo body, using care to keep pump delivery check valve spring below gasket, then install lock washers and safety nuts on two studs adjacent to control valve and tighten nuts evenly to 11-15 ft. lbs. Insert valve operating upper lever shaft through bearing in servo body, then with upper lever pointing toward reverse servo, place lower lever with linkage adjusting lever on shaft so that forked end of lower lever engages shift valve pin, then install lockwasher and nut.

Planetary Gear Set: Installation - Install reverse ring gear thrust washer and planet carrier rear thrust washer in case, then compress ends of reverse band with band installing clip, Tool J-2595, and install in case. *NOTE - When installing band, make sure that h avy side of band is in correct position so that it will attach to reverse anchor and not to strut.* Remove clip, then rotate servo band toward servo opening. Insert anchor through opening and engage with hooked end of band, then rotate band and anchor back to normal position. Hold band operating lever (with offset end) in place with strut shoulder toward inside of case and insert anchor shaft through case, anchor, and lever. *NOTE - Tapped end of shaft must be outward. If adjustment screw is not centered in servo opening, th low band operating lever has been installed by mistake.* Install reverse ring gear slipper in case, then install assembled planetary gearset.

Low Band, Clutch & Input Shaft: Installation - To install low band, compress ends with Tool J-9478.

Reaction Shaft Flange, Front Oil Pump & Accumulator: Installation - To check endplay, assemble a suitable dial indicator support to transmission case. *NOTE - A 3/8" - 16 bolt with a .312" rod welded to head mak s good arrangement.* Assemble dial indicator so plunger bears on end of output shaft. Push shaft forward with some force and rotate a few turns to squeeze grease from thrust surfaces. Set dial indicator at zero, then pull output shaft rearward and check indicator reading. If reading is more than .040", select a thicker washer for installation forward of needle thrust bearing and recheck endplay. If reading is less than .020", select a thinner washer and recheck. Endplay should be between .020" and .040".

Valve & Servo Body Assembly & Oil Pan: Installati n - To adjust control valve, check position of groove in first land of valve which should be flush with boss of valve body. If edge of groove is not flush, loosen bolt and nut on adjustment lever and move to position valve correctly, then tighten nut and recheck valve position.

Speedometer Driven Gear & Positive Park Stop: Installation - Check "0" ring seal on speedometer driven gear and replace if necessary. Lubricate "0" ring and gear and install in case, then install driven gear retainer and lever stop *(see "Manual Linkage Adjustment" above). NOTE - If transmission not originally equipped with lever stop to prevent over travel in "P" (Park) position, install a new stop.*

CHEVROLET POWERGLIDE

Chevrolet Pass. Cars (1961)
Chevrolet Corvett (1961)
Chevrolet Trucks, Series C10 & C20 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR (Pushing recommended rather than towing)*· Place selector lever in Neutral "N" position. When car reaches speed of approximately 16 MPH. (20 MPH if road wet or icy with resultant poor traction), move selector lever to Low "L" position to crank engine. After engine is started, move lever to "N" for engine warm-up.

►*TORQUE CONVERTER NOTE*· *Both "Welded" and "Bolted" type converters are used in production "Welded" type converters cannot be disassembled for overhaul*

DESCRIPTION

DESCRIPTION: Design is the same as for previous models except for the following changes:

High Clutch Drive Plates: Clutch drive (faced) plates are waved and the reaction plates (steel) are flat.

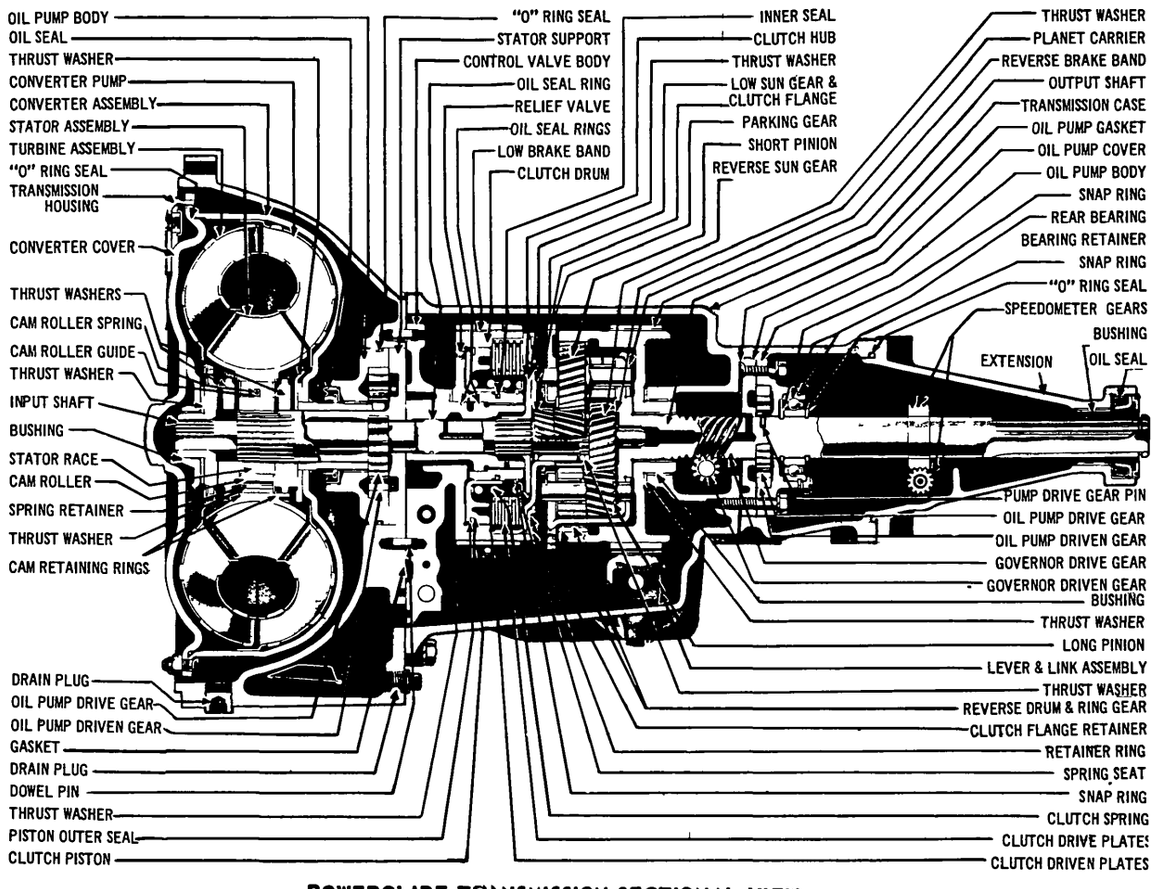
Clutch Hub Thrust Washer: A new thrust washer, Part No. 3783286, is used to provide a more positive locating pilot. This new thrust washer has an extruded center section which projects into a counterbored low sun gear.

Low Sun Gear & Clutch Flange Assembly: This new unit is counterbored for use with the new clutch hub thrust washer.

LUBRICATION

Checking Fluid Level: Check every 1000 miles *NOTE - No periodic draining of transmission is required, see "Draining & Refilling" below*

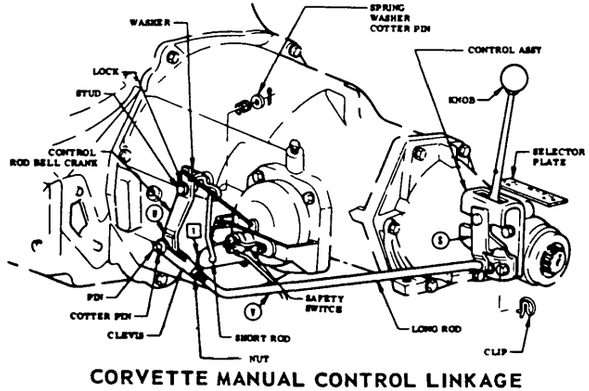
Recommended Fluid - Use only Automatic Transmission Fluid Type "A" (Suffix "A"), as furnished in containers bearing "AG-ATF" number



Capacity - Approximately 4½ qts (refill after transmission case drained) 10½ qts (Pass Cars), 10 qts (Trucks) after overhaul with transmission and converter dry

Draining & Refilling: *NOTE - Draining & refilling of transmission is not recommended other than for transmission repairs* Remove transmission oil pan drain plug (no drain plug on converter) To refill transmission, install drain plug and install 3½ quarts of Automatic Transmission Fluid Type "A" Operate engine with transmission in "N" (Neutral) until oil warms up, then add oil to raise fluid level to FULL mark on dipstick DO NOT OVERFILL *If converter was emptied, follow procedure above and add approximately 7½ qts of fluid after transmission fluid is warm*

LINKAGE ADJUSTMENT



►*THROTTLE LINKAGE ADJUSTMENT NOTE: See CARBURETOR on car model pages.*

Manual Control Linkage (Except Corvette): Place gearshift control lever in "D" (Drive) position, then loosen clamp nut on shift control rod at its attachment to shift control lever on mast jacket. Place transmission shift lever in "D" (Drive), then adjust position of clamp on shift control rod for free entry into shift lever on mast jacket. Secure clamp nut attachment to mast jacket shift lever, then test transmission shifts in all ranges.

POWERGLIDE TRANSMISSION SECTIONAL VIEW

Manual Control Linkage (Corvette): Place control rod bellcrank (U) in "Park" position, then set control shaft lever (S) in "Park" position With both bellcrank and lever held in "Park" position, assemble control rod (V) to lever (S), then adjust clevis on rod (V) for easy entry into lever (U)

CORVETTE MANUAL CONTROL LINKAGE

Neutral Safety Switch (Exc pt C rv tt): Located on steering column mast jacket under instrument panel Place selector lever in "N" (Neutral) position and loosen two screws securing neutral safety switch retainer While holding ignition switch in "Start", adjust position of neutral switch until engine starts cranking Hold switch in this position and tighten retaining screws Check adjustment by testing for cranking with selector lever in "N" and in "P" positions

Neutral Safety Switch (Corvett): Located on left side of transmission case and linked to transmission manual control lever Adjust switch so engine will start only with transmission selector lever in "N" or "P"

BAND ADJUSTMENT

►*BAND ADJUSTING NOTE Band adjustm nt not ordinarily required in service (bands adjusted when reassembling transmission). Rev rse band adjustment requires r moval of Servo Cov r Assembly (see Disassembly data).*

C NTINUED ON NEXT PAGE

POWERGLIDE (C ntinued)

L w Serv Band: Adjusting screw located on left side of transmission under adjusting screw cover To adjust band, remove adjusting screw cover and tighten low servo adjusting screw to 5-7 ft lbs , using a torque wrench, Tool J-5853. *NOTE - Rotate input and output shafts simultaneously to properly center low band on clutch drum* Back adjusting screw off **4 turns,** then tighten locknut securely and install adjusting screw cover *CAUTION - The amount the adjusting screw should b backed off after torqueing to 5-7 ft lbs is not an approximate figure, it MUST be exactly as specified*

Rev rs S rv Band (R verse Piston Linkage): *CAUTION - Band adjustment must be verified by actual measur m nt of reverse piston travel* Rotate reverse drum to center it in reverse band, then using Tool J-4277, tighten adjusting screw to 5-7 ft lbs torque, **th n back screw off 2½ turns.** Check for proper adjustment as follows Measure distance from face of re-erse piston outward to side of case with the piston in its retracted (inboard) position with a small scale, then record this dimension Pull reverse piston outward its full travel by grasping its hub with a pair of pliers, then again measure the distance from face of piston to outboard side of case The difference between the two measurements should be 3/32-5/32" If travel is too great, tighten adjusting screw If too little, loosen adjusting screw Recheck piston travel after adjustment Tighten adjusting screw locknut to 20-25 ft lbs

TR UBLE SHOOTING

CLOSE THROTTLE DOWNSHIFT "CLUNK": May be caused by: High engine idle speed. Faulty downshift timing valve (replace valve). High mainline pressure caused by Vacuum Hose to modulator leaking or disconnected. Modulator diaphragm ruptured. Sticking valve (pressure regulator booster valve, pressure regulator valve, or modulator valve).

MOMENTARY RUN AWAY IN LOW UP TO 30 MPH (WIDE OPEN THROTTLE ACCELERATION): May be caused by a broken forced throttle cushion valve spring retainer. Check mainline pressure which will be lower just prior to shift, and the stall pressure will be low if the faulty transmission operation is caused by a broken retainer. *See "Closed & Forced Throttl Valve Spring R tainer Production Change" ab v .*

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, poor acceleration, or engine runs away on turns).

1) In all Spe d Rang s - Low oil level. Incorrect control linkage adjustment Air leak in oil pump suction pipe. Low front oil pump pressure.

2) In Driv Rang - Incorrect control linkage adjustment. Damaged or leaking clutch piston seal (worn or burned clutch plates resulting from partially engaged clutch).

3) In L w Rang - Incorrect control linkage adjustment. Low Band out of adjustment. Sticking accumulator valve, modulator lever, or modulator valve. Damaged or worn Low Servo Piston Ring resulting in poor band application or excessive oil leakage into clutch apply circuit causing partial clutch application and possibly burned clutch plates (check by connecting pressure gauges to Low Servo Apply and to High Clutch test points - there should be no pressure indicated at High Clutch point with selector lever in "L").

CAR CREEPS (Forward or Backward):

1) With Control Lever in Neutral - Incorrect control linkage adjustment. Clutch piston vent valve stuck closed. Clutch plates sticking or incorrectly assembled (not "stacked" in correct order).

2) Creeps forward with Control Lever in Reverse or backward with Lever in Low - Incorrect control linkage adjustment.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With Control Lever in any range (rear wheels free). If this occurs at other times than after reversing car, see causes listed under EXCESSIVE SLIPPAGE above. If this occurs only after reversing car (indicating loss of front pump pressure) check: Rear pump air leakage into front pump suction line (causing front pump to lose its prime). Rear pump gasket leakage. Front pump clearance excessive.

2) With Control Lever in any range (rear wheels locked). Parking pawl lock engaged. Broken parts in transmission- Parking brake applied.

3) With Control Lever in Drive Range (rear wheels free). If engine runs away and transmission is hot, check for: Low radiator water level, clogged oil cooler, sticking thermostatic valve, or dragging Low Range Band (causing over-expansion of clutch parts due to excessive heat).

SHIFTS ARE ROUGH:

1) Low-to-Drive Shift (car in motion). Incorrect Low Band adjustment. Clutch plates worn or binding. Modulator control lever or piston sticking (will cause excessive pressures). Accumulator dump valve orifice plugged.

If engine speeds up during this shift.- Check for incorrect low band adjustment and worn or binding clutch plates.

2) Drive-to-Low Shift. Incorrect Low Band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

3) Neutral-to-Reverse. Incorrect reverse band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

CHATTERS WHEN STARTING:

1) In Low Range. Incorrect Low Band adjustment Worn or rough band, scored drum. Clutch not disengaging properly due to distorted or binding plates, sticking clutch piston, sticking piston vent valve, or damaged or worn Low Servo Piston Ring allowing oil leakage into clutch apply circuit and causing partial clutch application (see tests for Excessive Slippage in Low Range above).

2) In Drive Range. Incorrect Low Band or Reverse Band Adjustment. Bands worn or rough, drums scored.

3) In Reverse Range. Incorrect Reverse Band adjustment. Worn or rough band, scored drum. Reverse ring gear and drum bushing worn or damaged.

REVERSE OPERATION JERKY OR DRAGGING.

1) Clutch plates are incorrectly assembled (not "stacked" properly) or sticking. Clutch piston vent valve stuck closed.

REVERSE CANNOT BE ENGAGED WITH ENGINE RUNNING: If reverse can only be engaged when engine not running, check for accumulator snap ring being out of place (allowing accumulator valve and body to be forced against clamp nut on parking lock lever shaft and apply spring assembly, blocking shift into reverse). *NOTE* - Above condition will not prevent shift into Low Range).

DRIVE-TO-LOW or LOW-TO-DRIVE SHIFT DIFFICULT: May be caused by improperly drilled high clutch feed orifice in valve body resulting in slow clutch application in Drive Range and slow clutch release when shifting from Drive to Low (restricted orifice will cause slow oil flow). Check by connecting pressure gauges to Low Servo Apply and to High Clutch (low servo release side) and noting pressures as follows:

1) Move selector from Neutral to Drive with engine idling. If pressure builds up much more rapidly on Low Servo Apply gauge than on High Clutch gauge, a restriction in the passage (undersized orifice) is indicated.

2) Move selector from Drive to Low. Pressure in High Clutch gauge drops slowly,oil drainage from clutch is restricted. *NOTE* - This will result in slow Low Band application and clutch drag (may cause burned clutch plates).

HIGH CLUTCH PLATES BURNED OR CLUTCH FAILURE:

►*CAUTION: When High Clutch failure noted, following tests should be made before transmission removed, and transmission should also be carefully examined after removal and disassembly.*

1) Connect pressure gauges to Low Servo Apply, High High Clutch (low servo release side), and to Reverse Servo points. Operate engine to supply oil pressure.

2) Place selector lever in Drive position and note pressure build-up in High Clutch gauge. Slow build-up indicates restriction in high clutch apply orifice resulting in clutch slippage and burned plates.

3) Place selector lever in Low position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage past Low Servo Piston Ring resulting in partial clutch application and burned clutch plates.

4) Place selector lever in Reverse position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage between the converter "out" and low servo "release" channels in valve body or damaged Housing-to-Valve Body gasket. This condition will cause partial clutch application and burned clutch plates.

NOISE IN TRANSMISSION:

1) Buzzing Noise (All Ranges). Low oil level. Pump gear interference with crescent in pump. Pump check valve not seating.

2) Ringing Noise in Converter. Low oil level. Air leak in pump suction line (pump not seated properly) resulting in low oil level in converter. Pressure regulator valve stuck (closing converter inlet port). Leakage in oil line between front pump and regulator valve.

3) Clicking Noise. Incorrect manual linkage adjustment (causing interference between parking lock pawl and gear).

CONTINUED ON NEXT PA E

POWERGLIDE (C ntinu d)

4) Whining N is . Transmission gear teeth worn. Pump gear clearance excessive or pump gear bushings worn.

FUEL CONSUMPTION EXCESSIVE:

1) Transmission Causes. Converter stator freewheeling cams and roller incorrectly assembled. Clutch piston vent valve stuck open.

TRANSMISSION OIL BEING FORCED OUT OF FILLER PIPE: Caused by aeration and foaming of the oil due to ne or more of the following:

NOTE - This condition may also cause Loss of Power and Lower Stall Speed (due to converter turbulence and lower pressures in control circuits).

1) Oil level too high allowing planet carrier to revolve in oil and aerate it. Correct by lowering oil level to correct point (see LUBRICATION) and driving car for 5 miles to work out air bubbles.

2) Oil suction pipe split, seal damaged, bore for suction pipe in housing too deep, or suction pipe retainer ears bent (preventing proper compression of the seal) resulting in air leaks in oil suction line.

3) Sand hole in suction bore of transmission case or housing or in suction cavity in valve body resulting in air leaks in oil suction.

TESTING

►*TESTING CAUTION*—Transmission oil level must be checked and corrected (see LUBRICATION) and *transmission must be warmed up before tests made.*

Warming Transmission: Transmission must be warmed by road driving or in the shop as follows before checking for oil leakage or other trouble

Road Warm-Up - Drive car for approximately 5 minutes with frequent stops and starts (to approximate heavy-traffic conditions)

Shop Warm-Up - Set hand brake tightly, place selector lever in "D" (Drive) range, start engine and run for 2 minutes at 750 RPM

►*CAUTION Recheck oil level after warm-up and before making following tests*

ROAD TEST: Road test car to determine transmission shift points as indicated in table

POWERGLIDE TURBINE HOUSING & FRONT OIL PUMP

283" & 348" V8 Engine ②

Throttle Position	Upshift	Downshift
Light Throttle	13-16 MPH	11-14 MPH
To Detent	40-55 MPH	14-19 MPH
Through Detent	55-61 MPH	51-58 MPH

348" V8 Police Engine

Throttle Position	Upshift	Downshift
Light Throttle	14-18 MPH	12-15 MPH
To Detent	44-60 MPH	15-20 MPH
Through Detent	60-66 MPH	56-63 MPH

① - 3 36-1 axle ratio ② 3 08-1 axle ratio

TRANSMISSION SHIFT POINTS ① (TRUCKS)

½-Ton, 6 Cyl. ③

Throttle Position	Upshift	Downshift
Light Throttle ②	11-14 MPH	9-12 MPH
To Detent	25-40 MPH	12-16 MPH
Through Detent	40-45 MPH	38-44 MPH

½-Ton V8 ③

Throttle Position	Upshift	Downshift
Light Throttle ②	11-14 MPH	9-12 MPH
To Detent	34-44 MPH	12 16 MPH
Through Detent	46-52 MPH	43 49 MPH

¾-Ton 6 Cyl ④

Throttle Position	Upshift	Downshift
Light Throttle ②	11 14 MPH	9 12 MPH
To Detent	25-40 MPH	12 15 MPH
Through Detent	40 45 MPH	37-44 MPH

¾-T n V8 ④

Thr ttl Positi n	Upshift	D wnshift
Light Throttle ②	11 14 MPH	9-12 MPH
To Detent	34-44 MPH	12-15 MPH
Through Detent	46-51 MPH	43-48 MPH

① - Shift speeds given in table will vary slightly for tire sizes other than indicated

② - Closed throttle position for "downshift" speeds

③ 6 70-15 tires ④ - 7 00-17 & 7 50-17 tires

►*STALL TEST NOTE Stall testing of transmission is not recommended*

PRESSUR E TESTS: Install pressure gauge hose connections at low servo apply (main line), clutch (release side of low servo), throttle valve, governor test points on transmission (see illustration) Gauge lines should be run into driving compartment by pushing aside steering column mast jacket seal, and connected to Gauge Set J-4872-A

Wide Open Throttle Upshift Pr ssur : This shift should occur at 82-90 lbs pressure (V8 Eng), 68-74 lbs pressure (6 Cyl Eng) as indicated on low servo (main line) gauge After shift is completed, pressures on both low servo apply and high clutch gauges should indicate similar readings If pressures are correct and clutch slippage is felt, mechanical trouble in clutch is indicated If high clutch pressure is more than 5 lbs lower, check for leak in high pressure line between low and drive valve body and high clutch

Idle Pressure in "Drive" Rang : *NOTE - In addition to oil pressure gauges, a vacuum gaug is r quired for this test* With parking brake applied and shift selector lever in "D" (Drive) range, adjust engine speed until a steady 16" of vacuum is indicated on vacuum gauge Low servo apply (Main line) pressure should be 60-70 lbs (V8 Eng), or 55-65 lbs (6 Cyl Eng) If pressures not within this range, check the following Pressure regulator valve, Vacuum modulator valve, or Booster valve stuck Leak at low servo piston ring (between

CONTINUED ON NEXT PAGE

POWERGLIDE (C ntinued)

ring and bore) or at low servo piston rod (between rod and bore). Leakage at valve body-to-cas gasket. L ak between valve body and housing. Front pump clearances not correct. Leak at low drive valve body (check gasket and shifter valve). Check passages in transmission housing for porosity. Loose suction screen connection.

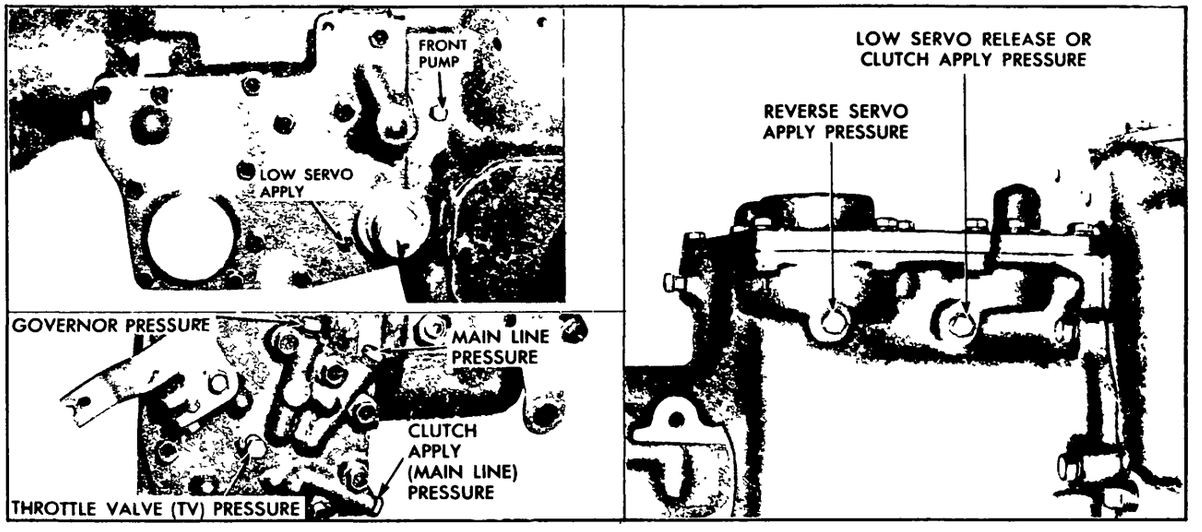
Manual L w Rang Pr ssur : Connect a tachometer, place s lector lever in "L" (Low) range, and adjust engine speed to 1000 RPM with car stationary. Low servo apply (main line) pressure should be 114-127 lbs. (V8 Eng.), 70-80 lbs. (6 Cyl. Eng.). Pressures not within this range indicate the following possibilities: Partially plugged oil suction screen. Broken or damaged ring in low servo. Pressure regulator valve stuck. Leak at valve body-to-case gasket. Leak between valve body and housing. Leak at servo center. Front pump clearances not correct

Drive Rang Overrun (C ast) Pressure: With car coasting in "D" (Drive) range at 20-25 MPH and engine vacuum at approximately 20", low servo (main line) pressure should be 47-53 lbs. (V8 & 6 Cyl. Engs.).

Throttl Valv Pr ssur : Pressures will range from 0-63 lbs. (V8 Eng.), 0-50 lbs. (6 Cyl. Eng.), depending on accelerator positi n. Improper throttle valve pressure is usually the result of trouble in low and drive valve body providing throttle valve linkage is properly adjusted.

Gov rnor Pressure: Governor pressure is relative to transmission output shaft speed and can be checked in terms of MPH by referring to following table.

G v rn r Pressure ℂ



Car Sp d (MPH)	Pr ssur	Car Speed (MPH)	Pressure
5	2-4 lbs.	35	47½-53½ lbs.
10	8½-13 lbs.	40	55-62 lbs.
15	21-27½ lbs.	45	63½-71½ lbs.
20	31½-34½ lbs.	50	73½-82 lbs.
25	35½-40 lbs.	55	84-93½ lbs.
30	41-46 lbs.	60	95½-106 lbs.

ℂ - *NOTE* - Governor pressures for cars with 3.08-1 rear axle ratio will be approximately 2 lbs. lower than specified in table.

R v rs Pr ssur : With parking brake applied, place selector lever in "R" (Reverse) position. With engine at idle speed, pressure reading on reverse servo should be 80-115 lbs. (6 Cyl. & V8). With engine running at 1250 RPM, pressure reading should be 240-260 lbs. (V8), 170-190 lbs. (6 Cyl.), with vacuum modulator hose disconnected. If pressures are within limits but operation is faulty, reverse band requires either adjustment or replacement. If pressure is below limits, the following should be checked: Partially plugged oil suction screen. Broken or damaged reverse servo piston ring. Pressure regulator valve or booster valve is stuck. Leak at valve body-to-case gasket. Leak between valve body and housing. Front pump clearances not correct. Leak between piston rod and bore.

REMOVAL FROM CAR (EXCEPT CORVETTE)

Transmission & Torque Converter are removed as an assembly. *CAUTION—Torque converter is not retained in housing as on previous transmission and special holding tool must be used to prevent converter falling out when transmission assembly removed.*

POWERGLIDE PRESSURE TEST POINTS

TRANSMISSION ASSEMBLY REMOVAL: Raise car on hoist (see "Jacking & Hoisting" in Suspension & Wheel Alignment Section), then proceed as follows:

1) Drain transmission case, then remove transmission filler pipe. Disconnect oil cooler lines, vacuum modulator hose. and speedometer drive cable fitting at transmission. Disconnect body ground strap.

2) Disconnect manual and throttle valve control lever rods from transmission, then disconnect propeller shaft at transmission. Install suitable transmission lift to jack or other lifting device and attach to transmission.

3) Disconnect engine rear mount on transmission extension, then remove transmission support crossmember. *CAUTION - Use care to remove any shims which may be installed between extension mounting boss and crossmember. The same number of shims must be installed as these affect drive line angle.*

4) Remove flywheel cover, then using a jumper to turn the engine, remove flywheel-to-converter attaching bolts. Lower rear of ttansmission slightly so that the three upper transmission housing-to-engine attaching bolts can be reached (use a universal socket and approximately a 39" extension). Remove upper bolts. *CAUTION - Rear of transmission must not be lowered too far as distributor housing on engine may be forced against dash board.*

5) Support engine at oil pan rail with a jack, then remove remainder of transmission housing-to-engine attaching bolts. Remove transmission by moving slightly to the rear and downward. Install converter housing holding tool, J-5384, then remove transmission from beneath car. *CAUTION - Do n t tilt front f transmission downward prior t installing Tool J-5384, as converter may fall out f transmissi n.*

OVERHAUL

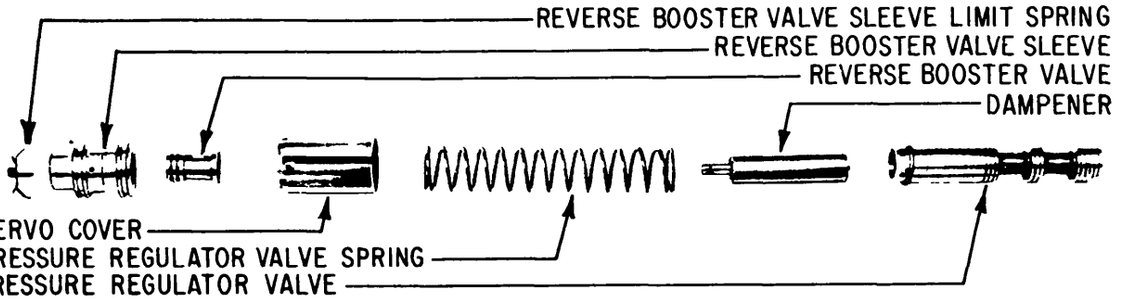
OVERHAUL: *See "Chevrolet Powerglide Transmission" in 1958 Annual Data or later Manual edition and n t the following:*

►*1961 POWERGLIDE DISASSEMBLY CAUTION:* To prevent bending manual valve and manual valve inner lever, the manual valve should be moved into the position that places it as far as possible into its bore. Before separating the two case sections, place manual valve selector lever in "L" (Low). *NOTE - Previous model transmissions required that the valve b positioned in "R" (Reverse).*

►*1961 POWERGLIDE DISASSEMBLY & REASSEMBLY CAUTION:* Before removing converter assembly from flywheel, scribe a mark on both units so they may be installed in the same position. All flywheels are marked with a stripe of white paint to indicate "heavy" side of engine and all transmission have a stripe of blue paint across ends of both converter cover and housing to indicate "light" side. These paint markings must be aligned as closely as possible during assembly to obtain best balance conditions. Flywheel assemblies used with automatic transmissions have six transmissions attaching holes instead of three. The additional holes are used to permit more accurate indexing of converter to flywheel. Only three of the bolt holes will be used for actual attachment.

Sun Gear Thrust Washer Installation: *Procedures for installation of this washer are different than for former models.* Install input shaft to clutch unit, then install low sun gear bushing on input shaft spline, bottoming bushing against shoulder on shaft. *NOTE - Wire typ snap ring formerly used on output shaft with former splined thrust washer, is not used with this design.* Assemble low sun gear thrust washer into planet carrier by tilting washer slightly to permit flange to enter behind the short planet pinions, then hold in position with

CONTINUED ON NEXT PAGE



POWERGLIDE (C ntinu d)

petroleum jelly Install clutch and input shaft assembly into case, aligning thrust washer on input shaft and indexing low sun gear with pinions in planet carrier

R verse Booster Valve Positioning: *CAUTION - To prevent excessively high oil pressure, reverse booster valve must be assembled into servo cover, and servo cover installed on case as follows* Place new limit spring in servo cover bore with wide tabs seating on bottom of bore Install "O" rings on booster valve sleeve and push into bore so that end of sleeve is 13/32" (40625") below face of servo cover (19/32" on transmissions with a pressure regulator dampener) Install reverse booster valve, then install servo cover locating sleeve in bore of cover until it just contacts booster valve sleeve *CAUTION - Do not exert any downward force on reverse booster valve sleeve* Install pressure regulator valve, damper valve assembly and spring, then install reverse servo spring. Use guide pins to assemble servo cover to transmission case. *CAUTION - Make sure locating sleeve is in alignment with pressure regulator valve bore.* Check alignment of vacuum modulator hole in servo cover with hole in case.

Pressure Regulator Damper: When removing the pressure regulator valve, note a small damper in inner end of valve. When assembling, this damper must be placed so that plunger stem is outside the valve.

Clutch Drum Thrust Washer Selection: *NOTE - To use the later gauging procedure it will be necessary to rework Tool J-4260 as follows: Press low sun gear pilot pins from the tool bar, then remove spring and spring retainer from gauge rod. Install a steel ball (similar to Rochester Carburetor pump outlet check ball) under end of gauge rod setscrew in tool bar Slide gauge collar (Tool J-4260-15) onto gauge rod, between tool bar and knurled end of rod.* To gauge correct thickness of selective washer, proceed as follows Hold tool bar solidly across face of transmission case and push gauge rod into firm contact with front face of input sun gear Tighten setscrew in tool bar to lock gauge rod. Slide gauging collar down rod until it seats on tool bar, then securely tighten collar thumb screw against rod. Remove tool with setting retained. *NOTE - The above tool setting was obtained without low sun gear thrust washer positioned against input sun gear.* Place transmission main valve body assembly on a sheet of glass or a smooth table top, then install a clutch drum thrust washer on valve body and lower clutch assembly onto the stack Center low sun gear thrust washer on top of low sun gear. *NOTE - If sun gear thrust washer is flanged type, insert flanged washer on top of low sun gear.* Use Tool J-4260, pre-set at dimension obtained earlier and place tool on top of low sun gear thrust washer, with gauge rod down through center of clutch and valve body so rod rests on glass or table top Loosen setscrew in tool bar and allow bar to drop onto low sun gear thrust washer Use a feeler gauge and measure clearance between top side of bar and bottom face of gauging collar. This dimension represents clearance in transmission, and should be between .025-.050". If clearance is not within this limit, substitute a thicker or thinner clutch drum thrust washer to bring clearance within limits

PRESSURE REGULATOR VALVE ASSEMBLY

Low Servo Piston: Place low servo piston in an arbor press and support notched end of piston rod on a wood block. Use Tool J-3377 and compress piston spring and remove rod retainer. *CAUTION - This spring is under 150 lbs. pressure.* Remove piston spring and washer from piston rod. Remove piston ring from piston and install in low piston bore. Check ring gap which should be .005-.010". Assemble piston ring to piston and insert feeler gauge between side of ring and one wall of ring groove. Ring clearance should be .0005-.005". Assemble washer, spring and piston on piston rod Place assembly in an arbor press and compress spring with Tool J-3377. Install retainer, making sure it is properly seated in piston rod groove.

INSTALLATION IN CAR (EXCEPT CORVETTE)

TRANSMISSION ASSEMBLY INSTALLATION: Mount transmission on lifting device, then remove Converter Holding Tool J-5384 Proceed as follows

1) Raise transmission into place and install transmission case-to-engine upper mounting bolts, then install lower and side bolts *CAUTION - Be careful that converter does not move forward causing disengagement of pump hub drive slots from lugs of front pump drive gear*

2) Remove support from beneath engine, then raise transmission to final position Connect body ground strap With flywheel cover removed, align flywheel bolt holes on converter and install converter-to-flywheel attaching bolts using a jumper to turn engine

3) Reinstall transmission support crossmember *NOTE - Two sets of holes are provided for attachment of crossmember to frame as follows Lower holes ar to be used with Powerglide, Upper holes used with Turboglide* Be sure to reinstall exactly the same number (and thickness) of shims between extension mounting boss and crossmember as were removed *NOTE - These shims maintain correct drive line angle*

4) Remove transmission lift equipment and support, then connect propeller shaft to transmission Connect manual and throttle valve control linkage to transmission Connect oil cooler lines, vacuum modulator hose, speedometer drive cable to transmission Reinstall transmission oil filler tube and fill transmission *See LUBRICATION above*

5) Adjust all transmission linkage *See LINKAGE ADJUSTMENT above*

CHEVROLET TURBOGLIDE TRANSMISSION

Chevrolet (1961)

►CHANGES, CAUTIONS, CORRECTIONS

1961 TURBOGLIDE REVERSE CLUTCH PLATE REPLACEMENT CAUTION: It is important that when a reverse clutch plate is installed, a new reverse clutch piston return spring be installed at the same time. *NOTE - Th ld spring may appear to be normal but will be "dish d" in the opposite direction to a new spring. This conditi n will result in clutch failures.*

►*STARTING ENGINE BY PUSHING CAR:* Place control lever in "N" (Neutral) range until car reaches 25-30 MPH. Turn key on and move control lever to "GR" (Grade Retarder) position. After engine starts, move control lever to "N" (Neutral) for engine warm-up. Towing is not recommended to start car.

►*TOWING TURBOGLIDE CARS:* Cars must not be towed with rear wheels on ground except with transmission in "N" (Neutral) position and must not be towed in excess of 30 MPH. If car is to be towed a long distance, drive shaft should be removed. *NOTE* - If car has been damaged and transmission cannot be placed in "N" with selector lever, disconnect long rod from idler lever on left side below mast jacket, then pull lever on transmission toward front of car as far as it will go. Move lever toward rear of car from the forward position to the third detent which is "N" (Neutral) position.

DESCRIPTION: Design is similar to previous transmissions having the following features:

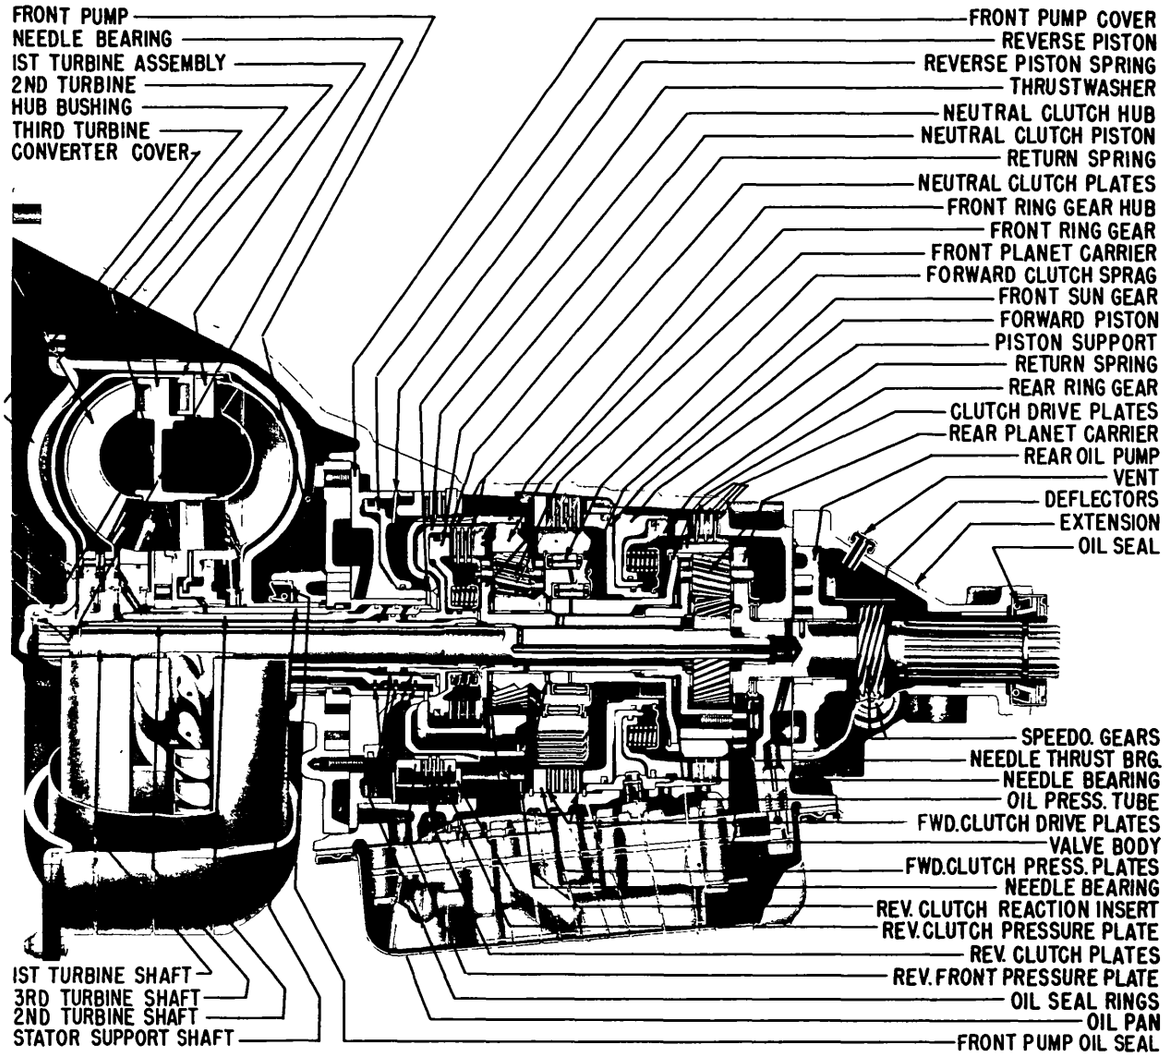
Vacuum Accumulat r (In Hydraulic Modulator Valve Body): Vacuum accumulator piston, spring, retainer and rings have been eliminated.

First Turbin Hub Bearing: The former needle bearings and races have been replaced by a solid bearing.

Clutch s: Multiple plate type clutches have replaced the former "cone" type clutches at the forward and reverse clutch locations.

Sec nd Turbine: A five spoke second turbine is being used. The second turbine shaft is heavier and a bushing has been added to prevent interference between second turbine shaft and the stator shaft bore.

Main Valv B dy: Valve body reinforcing strap, accumulator passage plug, and the two check valves in modulated oil circuit have been eliminated. A second spring and a spring cap between the pressure regulator valve and the hydraulic modulator valve have been added.



Fr nt Planetary G ars t: Six planet gears replace the three formerly used. *NOTE - Because of pinion alignment, th front planetary set is serviced only as a unit. DO NOT attempt disass mbly.*

LUBRICATION

Check oil level every 1000 miles. *NOTE - Draining and refilling f transmission is not recommended other than f r transmission r pairs.*

Capacity - 2 qts. (refill), 9½ qts. (after overhaul).

Rec mmended Oil - Use Automatic Transmission Fluid Type "A" (Suffix "A"). If this type fluid not available, use Automatic Transmission Fluid Type "A".

CHEVROLET TURBOGLIDE TRANSMISSION (SECTIONAL VIEW)

Checking Fluid Level: With transmission at normal operating temperature, transmission selector lever in "N" (neutral) and engine running at 800-1000 RPM, check fluid level on dipstick located in engine compartment.

Draining & Refilling: *NOTE - Draining & refilling of transmission is not recommended other than for transmission repairs.* To drain transmission, remove filler tube. To refill, run engine at 800-1000 RPM and install 2 qts. of recommended fluid, then bring transmission to normal operating temperature and recheck oil level. If necessary, add fluid to bring level up to "Full" mark on dipstick. *NOTE - Approximately 9½ qts. of fluid will b r quired if both transmission and torqu conv rt r hav been drained.*

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See CARBURETOR on car model pages.*

Manual Control Linkage: Place selector lever in "D" (Drive) position, then disconnect swivel on shift control rod at its attachment to shift control lever on mast jacket in engine compartment. Position shift lever on transmission in "D" (Drive) position (first detent forward from full rear position). Adjust swivel on shift control rod for free entry into shift lever on on mast jacket. Secure swivel nut attachment to mast jacket shift lever, then test transmission in all shift ranges.

CONTINUED ON NEXT PAGE

CHEVROLET TURBOGLIDE (C nt.)

N utral Safety Switch: Place selector lever in "N" (Neutral) and loosen screws attaching neutral safety switch retainer. While holding ignition switch in "START" position, adjust position of switch until engine turns over. Hold switch in this position and tighten retainer screws. Check adjustment by testing for cranking in both "N" (Neutral) and "P" (Park).

TROUBLE SHOOTING

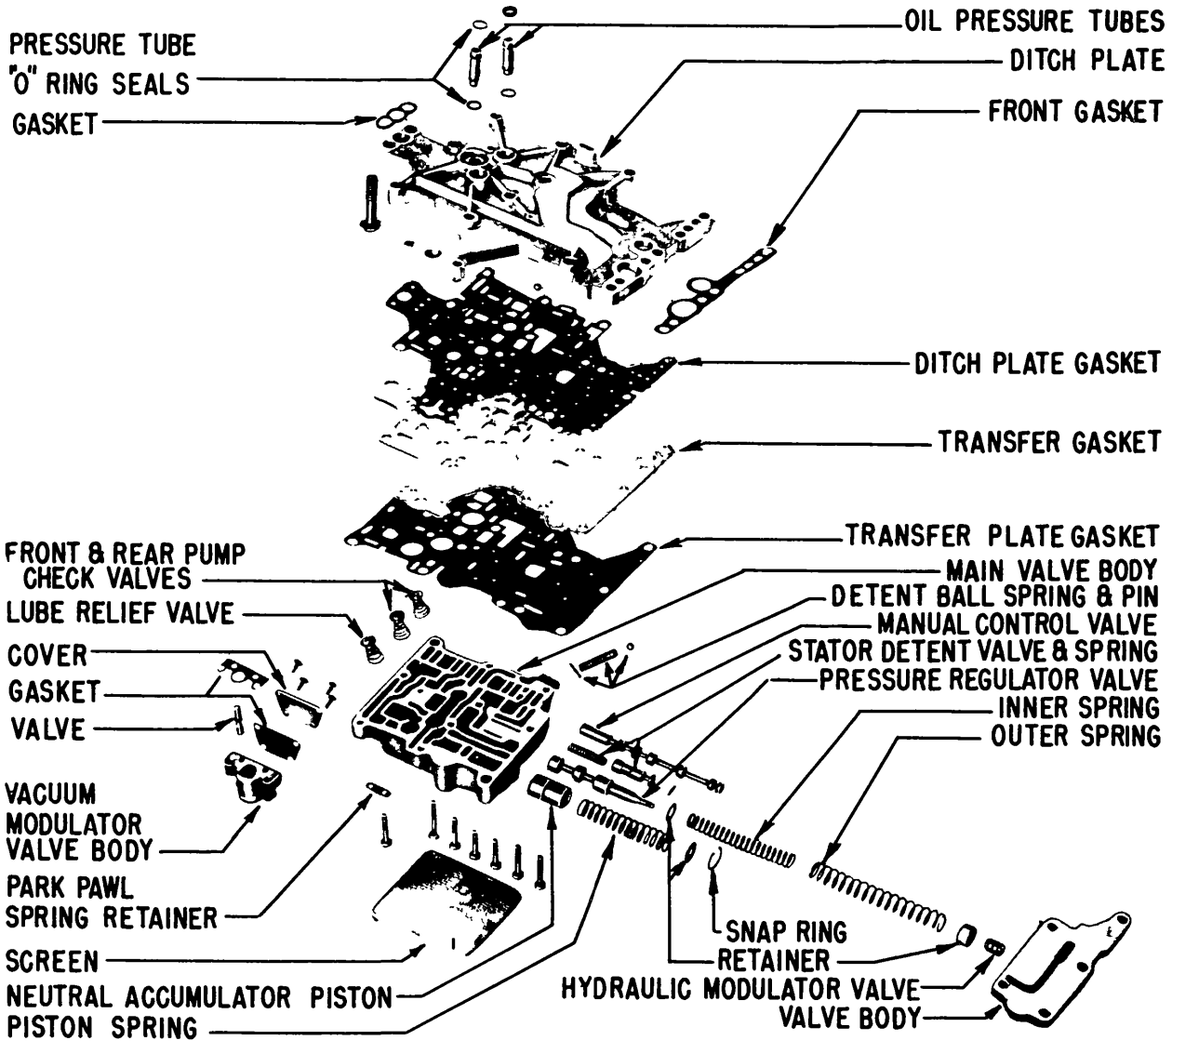
DRIVE POOR AT LOW SPEEDS (NO REVERSE, GRADE RETARD NORMAL): Inner overrun clutch assembled backwards.

NO DRIVE EXCEPT IN GRADE RETARD: Both overrun clutches assembled backwards.

NO DRIVE EXCEPT IN GRADE RETARD AND REVERSE: Outer overrun clutch assembled backwards. Forward and neutral clutch not applied due to severe leakage in forward clutch hydraulic circuit.

CAR DRIVES VERY SLIGHTLY IN NEUTRAL (REVERSE NORMAL): Neutral clutch not released.

CAR DRIVES NORMAL IN NEUTRAL AND DRIVE AT LOW SPEEDS (NO REVERSE): Forward clutch not released.



TRANSMISSION WILL NOT SHIFT TO HIGH STATOR ANGLE: Stator control linkage out of adjustment. Converter charging pressure low for one of the following reasons: (a) Leakage which will reduce line pressure enough to cause pressure regulator valve to shut off converter in line. (b) Leakage in converter circuit. (c) Stator control pressure leaking to converter out across front oil seal ring or second oil seal ring on second turbine shaft.

UNABLE TO PUSH START: Rear oil pump drive pin broken or missing.

CLUTCH SLIPPAGE ON WIDE OPEN THROTTLE STARTS: Low oil pressure due to leakage (especially check forward pressure tube "O" ring). Mechanical interference which will prevent forward or neutral piston to fully apply. Neutral or forward clutch facing bond failure.

SECOND TURBINE SEAL RING LANDS INTERFERING WITH I.D. OF STATOR SHAFT: Case locating dowels, on engine or dowel holes in case misaligned. Check by indicating front pump bore in case from crankshaft.

GRADE RETARD SLOW TO APPLY. Control linkage out of adjustment, preventing manual valve getting into grade retard position. Leakage to grade retard clutch (check pressure tube "O" ring seal and other sources). Mechanical interference in grade retard piston. Glazed grade retard plates (check neutral clutch for release).

1961 TURBOGLIDE CONTROL VALVE ASSEMBLY

If neutral clutch does not release during grade retard, grade retard plates can be damaged.

NO DRIVE, REVERSE NORMAL, NO GRADE RETARD: Reverse clutch not disengaged.

GRADE RETARD BRAKES VIOLENTLY, STATOR PRESSURE READS HIGH ON CHECKING: Vacuum hose disconnected.

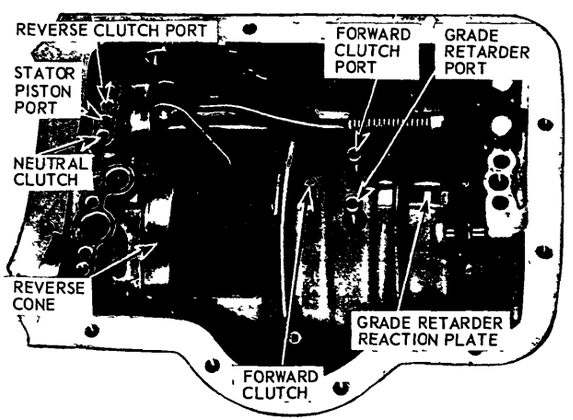
SHIFTS FROM STANDSTILL VERY SLOW: Check linkage to ascertain that shift lever is positioned by transmission detents. Accumulator control valve stuck closed. Leakage in hydraulic system (Check pressure tube "O" rings and other seals and gaskets).

SHIFTS FROM STANDSTILL VERY FAST AND HARSH: Accumulator control valve spring too strong or valve stuck open.

TESTING

►TESTING CAUTION: Before t sting transmission, ch ck oil level and bring it to the "FULL" mark on dipstick (See LUBRICATION above). Warm transmission t normal operating temperatur us utlined below. Adjust engine idle speed to 425 RPM with transmissi n se- l ctor l v r in "D" (Drive) rang . Adjust throttl link- ag (s e CARBURETOR n car m d l pages).

CONTINUED ON NEXT PAGE



CHEVROLET TURBOGLIDE (C nt.)

►*TESTING CAUTION: Do not stall-test Turboglide Transmission.*

TRANSMISSION WARM-UP: (In Shop) – Connect tachometer to engine, set parking brake and start engine. Place selector lever in "D" (Drive) range and adjust carburetor idle speed to approximately 750 RPM. Operate engine at this speed for 15 minutes, then readjust engine idle speed to 425 RPM with transmission selector lever in "D" (Drive) range.

On Road – Drive car for approximately 5 minutes with frequent starts and stops. Make sure engine idle speed is 425 RPM with transmission selector lever in "D" (Drive) range. Check fluid level (see LUBRICATION above). *CAUTION* – If fluid level too high, lower the level to "FULL" mark, then drive car five minutes to work bubbles out of fluid.

PRESSURE TEST: Road - Connect pressure gauge to test point on left side of transmission case and connect a tachometer and a vacuum gauge to engine. With engine and transmission at normal operating temperature and oil level in transmission at "FULL" mark, proceed as follows: Place selector lever in "D" (Drive) position and bring car speed to approximately 30 MPH. Push accelerator to wide open position. Engine speed should increase to 700-900 RPM if stator is functioning and the pressure should rise to 190-210 lbs. at 3" manifold pressure. *NOTE - At any car speed, with foot off throttle, pressure gauge should read 80-90 lbs. with 18-25" of engine vacuum (pressures in "R", reverse, should be the same as in "D", drive).* With selector lever in "D" (Drive) and at a road speed of 45 MPH, foot off throttle, pressure gauge should read 80-90 lbs. Place selector lever in "GR" (Grade Retarder) range at 45 MPH, and pressure should drop to zero. *NOTE - Engine speed may drop momentarily (during manual shift from "D" to "GR") and then the Grade Retarder clutch will apply and the engine speed will increase.*

TRANSMISSION AIR TEST POINTS

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Drain oil from transmission and remove converter cover pan, transmission oil pan, and main valve body. Install oil pressure tubes in Forward Clutch and Grade Retarder apply ports (see illustration). Use Tool J-4353-1 and an air source of 100 lbs. pressure. Proceed as follows for the five air pressure checks:

Reverse Clutch: Apply pressure to reverse clutch port (see illustration) and visually check that reverse cone moves rearward. Listen for air leaks. If reverse cone does not move, determine whether front pump-to-transmission case gasket is incorrectly installed and blocking oil passages, or if reverse piston is cocked or bound. If air leaks are heard, check for damaged front pump-to-transmission case gasket or for damaged seals in reverse piston.

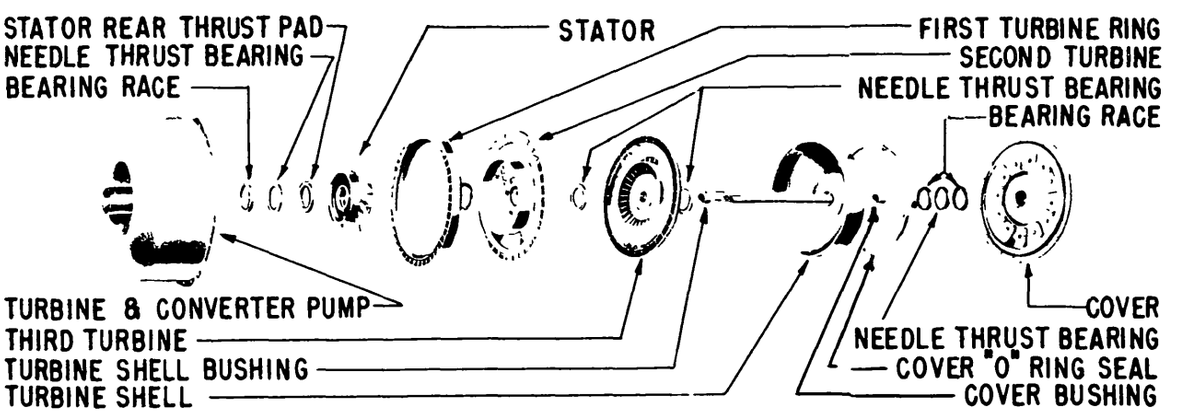
Stator Piston: Apply air to stator piston port (see illustration), and listen for air leaks. If air leaks are detected, check for a mispositioned or damaged front pump-to-transmission case gasket, broken or warped seal rings on second turbine shaft, defective stator piston seal, or damaged or worn brass seal in the inside diameter of stator support. Should it be determined that stator support brass seal is at fault, the stator support must be replaced as brass seal cannot be replaced separately.

Neutral Clutch: With air applied to neutral clutch port (see illustration), listen for application of clutch and air leaks. If no clutch application is heard, determine if the front pump-to-transmission case gasket is incorrectly positioned and blocking oil passages; otherwise disassemble neutral clutch and check for a locked-up or binding condition. If air leaks are heard, possible causes are a torn or distorted front pump-to-transmission case gasket, warped or broken oil seal rings on second or third turbine shafts, defective brass seal in the inside diameter of second turbine shaft. If brass seal is faulty, replace front ring gear hub and shaft assembly.

Forward Clutch: With oil transfer tube installed, apply air pressure to tube and observe that forward clutch applies. Listen for air leaks. Failure of clutch to apply can be the result of a wedged forward piston or Grade Retarder piston, probably caused by cocked piston "O" rings. A blockage of oil feed orifice in forward and brake piston support could also prevent clutch application. The first place to check if air leaks are found is the "O" ring seals on oil pressure tube in forward clutch port; otherwise, check forward piston-to-support seals.

Grade Retarder Piston: Apply air to grade retarder piston port with oil pressure tube installed (see illustration). Check Grade Retarder application by watching for movement of grade retarder reaction plate which will occur as the brake plates are forced against it by piston moving backward. If grade retarder piston does not move, check for cocked "O" ring seals in both the grade retarder and forward pistons or check for blocked orifice in piston support. Leakage could only occur at either the oil pressure tube "O" ring seal or brake piston "O" ring seal.

REMOVAL & INSTALLATION



See "Chevrolet Turboglide Transmission" in 1959 Annual Data or later Manual edition.

OVERHAUL

See "Chevrolet Turboglide Transmission" in 1959 Annual Data or later Manual edition and note the following:

►*THRUST BEARING NOTE:* Torrington thrust washers are no longer used between stator and third turbine; third turbine and second turbine. The Torrington bearing and race at forward end of sprag and at rear end of sprag; and the Torrington bearing and two races forward of rear planetary gear set have also been eliminated.

First Turbine Hub Bushing Replacement: Remove solid bearing, then remove byshing with a sharp cape chisel, being careful not to damage turbine hub. Use Tool J-6561 and pilot the bushing on end of tool, then press into hub of first turbine. *NOTE* - Bushing is precision type and reaming is not required. Install a new bearing with Tool J-6561 (end opposite that used for bushing). *CAUTION - Do not cock bearing during installation.*

TURBOGLIDE TORQUE CONVERTER ASSEMBLY

CORVAIR TRANSAXLE

Corvair (1961)
Corvair 1200 Series Trucks (1961)

►*PUSHING CAR TO START ENGINE (AUTOMATIC TRANS.):* Place transmission selector lever in "N" (Neutral) until car reaches 25 MPH, then move selector lever to "L" (Low) until engine starts.

►*TOWING AUTOMATIC TRANSMISSION CARS:* With transmission selector lever in "N" (Neutral), car may be towed at speeds not to exceed 30 MPH.

DESCRIPTION: The Transaxle consists of either an integral differential (rear axle) assembly and synchro-mesh transmission; or a differential (rear axle) assembly and a Powerglide transmission as follows:

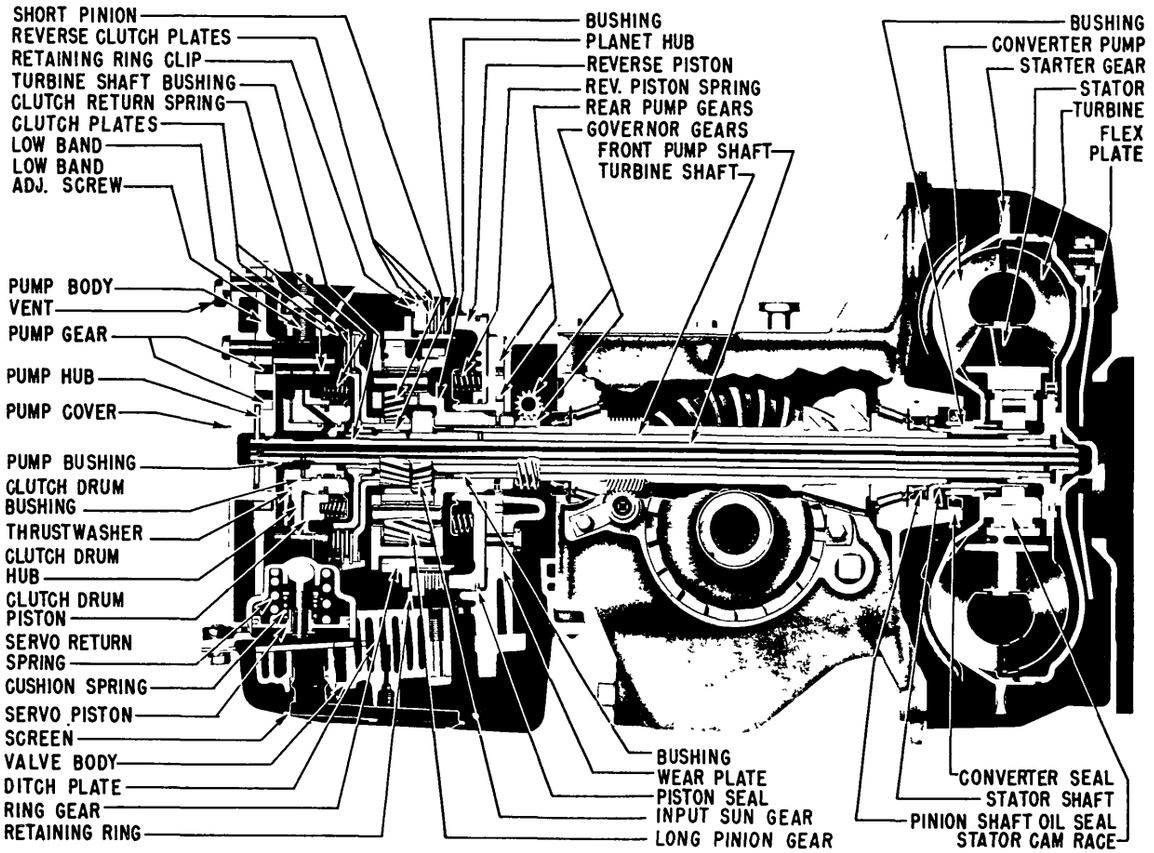
Differential (Rear Axle) Assembly: Straddle mounted hypoid gear type of new design with transmission input & output shafts running axially through differential pinion shaft. This unit which is contained in a separate carrier housing is located between transmission (either Synchro-mesh or Powerglide) and the engine assembly.

Ratios - 3.27-1, 3.55-1 & 3.89-1. *NOTE - 3.27-1 ratio not used on models with Super Turbo-Air engine. 3.89-1 ratio is standard on 1200 Series (3-Spd. & Powerglide); 3.27-1 (4-Speed).*

Synchro-mesh Transmission: Three-speed and Four-speed Synchro-mesh types integral with rear axle differential carrier. Because of attachment to differential carrier, a hollow mainshaft is used to permit passage of the clutch shaft to front of transmission for engagement of clutch gear with countergear. *NOTE - On three-speed transmission, all transmission gears are interchangeable with conventional Chevrolet 3-Speed Synchro-mesh, except for clutch gear and countergear.*

Transmission Ratios (3-Speed) - 3.50-1 (1st Speed), 1.99-1 (2nd Speed), 1.0-1 (3rd Speed), 3.97-1 (Reverse).

Transmission Ratios (4-Speed, Exc. 1200 Series) - 3.65-1 (1st Speed), 2.35-1 (2nd Speed), 1.44-1 (3rd Speed), 1.0-1 (4th Speed), 3.66-1 (Reverse).



Transmission Ratios (4-Speed, 1200 Series) - 4.26-1 (1st Speed), 2.55-1 (2nd Speed), 1.68-1 (3rd Speed), 1.0-1 (4th Speed), 4.27-1 (Reverse).

Powerglide Transmission: Three element torque converter and a hydraulically operated two-speed type automatic shift transmission integral with rear axle differential carrier. Converter torque from the welded type torque converter assembly located between differential carrier and engine is transmitted to transmission through two hollow shafts running through the hollow differential pinion shaft. One shaft runs from converter cover hub to transmission front pump and the other from the turbine to transmission input sun gear.

LUBRICATION

Check fluid level in all units every 1000 miles. Drain and refill every 10,000 miles (Rear Axle & Synchro-mesh Trans.). *NOTE - Draining and refilling of Powerglide Trans. not recommended except at time of overhaul.*

Recommended Oil (Rear Axle & Synchro-mesh Transmission) - SAE 80 "Multi-Purpose" gear lubricant or SAE 80-90 Multi-Viscosity "Multi-Purpose" gear lubricant. *CAUTION - SAE 90 Viscosity lubricants are not recommended. DO NOT use "Mineral Oil" gear lubricants or any "active sulphur soap" lubricants.* Differential carrier and transmission are connected by internal passages.

CORVAIR POWERGLIDE TRANSMISSION SECTIONAL VIEW

Powerglide Trans. - Automatic Transmission Fluid Type "A" (Suffix "A"). *NOTE - Automatic transmission is sealed off from differential carrier.*

Checking Fluid Level: Rear Axle & Synchro-mesh Trans. - With unit at normal operating temperature, check fluid in differential carrier first (plug is adjacent to rear axle universal joint on left side of transmission case). If level is low in differential carrier, also check level in transmission. *NOTE - Fluid should be level with bottom of filler plug hole under operating condition.*

Powerglide Transmission - With transmission at normal operating temperature and transmission selector lever in "N" position, engine idling, check fluid level on dipstick in filler tube at right side of engine near firewall. Add fluid as necessary to bring level to "Full" mark on dipstick, using recommended fluid.

Draining & Refilling: Rear Axle - Drain carrier housing and replace drain plug. Refill housing with 3.1 pints of recommended fluid.

Rear Axle & Synchro-mesh Trans. - Remove drain plug in transmission housing and in differential carrier housing. *NOTE - Transmission drain plug is on left side adjacent to idler arm on side of transmission case.* Refill by adding lubricant to both units (5 pints total).

Powerglide Trans. - *NOTE - Not required except at time of transmission overhaul.* Drain oil by loosening filler tube attaching nut in oil pan. Tighten filler tube nut and add 4 pints of recommended fluid using filler tube and funnel J-4264. Start engine and allow to idle 3-5 minutes in "N", then add sufficient fluid to bring level to "Full" mark. Capacity is 6 pints (approximately) for normal refill. 13 pints (approximately) with transmission and torque converter dry.

ADJUSTMENT

Transmission Shift Linkage (Synchro-mesh Trans.): Loosen universal joint clamp nut at transmission end of shift shaft, then move manual shift shaft on transmission so transmission is in first speed position. Hold selector lever and tighten universal joint clamp bolt.

Clutch Linkage (Synchro-mesh Trans.): *See "Borg & Beck Clutch" in Clutch Section.*

Transmission Throttle Linkage (Powerglide Trans.): *See "Accelerator Control Linkage Adjustment" under CARBURETOR on car model page.*

Manual Linkage (Powerglide Trans.): Drain transmission oil and remove oil pan. Place transmission selector

CONTINUED ON NEXT PAGE

CORVAIR TRANSAXLE (Cont.)

lever in "D" (Drive) range, then insert Tool J-8365 into manual valve bore (end opposite linkage) with tab of gauge upward so it engages forward port of valve body. With tool in place, push forward on manual valve levers. If valve is properly adjusted, tool will be held in place horizontally without being supported. If adjustment is necessary, loosen lockscrew in manual valve linkage (inside transmission) and push manual valve levers forward so Tool J-8365 is held in a horizontal position. Recheck adjustment. Install oil pan and fill transmission with fluid.

Neutral Start Switch Adjustment (Powerglide Trans.): Loosen two switch mounting screws and place transmission selector lever in "N" (Neutral) position. Turn ignition switch to "Start" position, then move Neutral Switch fore and aft until engine cranking begins. Secure switch in that position. Recheck to make sure engine will not start with transmission selector lever in any position other than "N" (Neutral).

Low Band: Remove parcel shelf behind rear seat and remove plug covering access hole in floor. Loosen locknut and tighten the square head adjusting screw to 40±5 inch pounds, **then back off adjusting screw 4 full turns exactly.** Hold adjusting screw stationary and tighten locknut.

►*ADJUSTING TOOL NOTE:* A wrench for turning the adjusting screw locknut can be made by welding two ¾" tubular steel spark plug wrenches together (end-to-end) so wrench can be installed over adjusting screw locknut. A square socket wrench can be inserted through this tool to engage adjusting screw.

TROUBLE SHOOTING (AUTOMATIC TRANSMISSION)

NO DRIVE IN ANY SELECTOR LEVER POSITION (CANNOT LOAD ENGINE): Low oil level. Clogged oil suction pipe screen. Broken or disconnected manual cable. Defective pressure regulator valve. Defective line pressure limit valve. Defective front pump. Rear pump check valve and rear pump priming ball not seating (both must occur for possible malfunction). Front pump shaft disengaged at either converter or pump gear. Front pump priming ball not seating.

ENGINE SPEED FLARES ON STANDSTILL STARTS BUT ACCELERATION LAGS: Low band only partially applied caused by one or more of the following conditions: Low oil pressure. Clogged pickup pipe screen. Improper band adjustment. Servo piston apply passage blocked. Servo piston ring broken or leaking. Band facing worn. Low band apply linkage disengaged or broken. Converter stator not holding.

ENGINE SPEED FLARES ON UPSHIFT: Low oil level. Clogged oil suction screen or pipe. High clutch partially applied (blocked feed orifice). Clutch plates worn. Clutch seals leaking. Clutch piston hung up. Clutch drum relief ball not seating. Vacuum modulator hose collapsed.

TRANSMISSION WILL NOT UPSHIFT: Low band not releasing due to one of the following conditions: Stuck low-drive valve. Defective governor. No rear pump output (stuck priming ball, drive pins not engaged, or defective pump). Throttle valve stuck or improperly adjusted. Improperly adjusted manual valve lever.

HARSH UPSHIFT: Incorrect carburetor-to-transmission throttle valve rod adjustment. Improper low band adjustment. Vacuum modulator hose broken or disconnected. Vacuum modulator diaphragm leaks. Vacuum modulator valve stuck. Hydraulic modulator valve stuck.

CLOSED THROTTLE HARSH DOWNSHIFT: Improper low band adjustment. Vacuum modulator hose disconnected or broken. Vacuum modulator diaphragm ruptured. Vacuum modulator valve stuck. Engine idle speed too high. Sticking pressure regulator or hydraulic modulator valves in valve body.

CAR CREEPS EXCESSIVELY IN DRIVE: Idle speed too high.

CAR CREEPS IN NEUTRAL: Incorrect manual valve lever adjustment. High clutch or low band not released.

NO DRIVE IN REVERSE: Manual valve lever adjustment not correct. Cable linkage adjustment not correct. Reverse clutch piston stuck. Reverse clutch plates worn out. Reverse clutch leaking excessively. Blocked reverse clutch apply orifice.

IMPROPER SHIFT POINTS (see "Shift Speed" table below): Incorrect accelerator control linkage adjustment. Throttle valve incorrectly adjusted. Governor defective. Rear pump priming ball stuck.

OIL FORCED OUT OF FILLER TUBE: Oil level too high. Oil pickup pipe split or not sealed causing air entrainment.

UNABLE TO PUSH START: Rear pump drive gear not engaged with drive pins on planet carrier hub. Rear pump defective. Rear pump priming ball not seating.

TESTING

►*TESTING NOTE: Transmission must be at normal operating temperature, fluid level at "F" mark on dipstick, and manual and throttle linkage adjustments must be correct.*

ROAD TEST: Road test car to determine transmission shift points as indicated in table below.

Transmission Shift Speeds

	MPH
UPSHIFTS:	
Minimum Throttle	10–12½
Full Throttle	41–47
Part Throttle (Detent Touch)	34–41
DOWNSHIFTS:	**MPH**
Closed Throttle	8–12
Full Throttle	38–44
Part Throttle (Detent Touch)	23–30
Manual Low (Inhibited)	41–46

PRESSURE TESTS: *NOTE – Pressure tests can be made by raising rear wheels 3–5" off floor on jack stands.*

Front Pump: Remove plug located at "6 o'clock" position in front pump cover (accessible through engine front mount) and connect pressure gauge. With engine at idle speed (approx. 16" of vacuum), pressures should be as follows with selector lever in the indicated range: 81–98 lbs. (Reverse); 47–57 lbs. (Neutral & Drive); 71–82 lbs. (Low). Disconnect vacuum hose at balance tube, then with engine at idle speed, check pressure which should be: 140–157 lbs. (Reverse); 71–82 lbs. (Neutral, Drive & Low). If there is no pressure in front pump, check for stuck pressure regulator, broken or disengaged front pump shaft, or missing plug from front end of front pump shaft. Moderately low front pump pressures in all ranges indicate a restricted front pump inlet. Failure of pressure to raise when vacuum hose disconnected (or high pressures with vacuum hose connected) indicates a stuck vacuum modulator valve, defective vacuum modulator, or a collapsed hose.

Rear Pump: With gauge connected as for "Front Pump" (rear wheels raised), place selector lever in "D" (Drive) and accelerate engine. Front pump pressure should drop to approximately 0–5 lbs. at 20 MPH. If pressure does not drop, rear pump is disengaged or clogged or rear pump check ball is not seating.

Throttle Valve: Remove plug located at "8 o'clock" position in front pump cover (accessible through engine front mount) and connect pressure gauge. Disconnect throttle valve rod at carburetor and vacuum hose at balance tube, then with engine at idle speed, depress accelerator to wide open position. *NOTE – By disconnecting throttle valve rod at carburetor, engine remains at idle speed throughout test.* Pressures should be as follows with selector lever in the indicated range: 0 lbs. (Reverse & Neutral); 52–54 lbs. (Drive); 66–77 lbs. (Low). If pressures not as specified, they can be corrected by adjusting the position of the jam nut located on end of detent valve assembly (part of throttle valve assembly inside transmission case). Insert an Allen wrench in end of adjusting screw and hold screw from turning, then turn jam nut as necessary. To raise pressure, back off jam nut (one full turn is equal to 3 psi). Tightening the nut lowers pressure.

REMOVAL & INSTALLATION

POWER TRAIN (ENGINE, TRANSMISSION & REAR AXLE): This complete assembly must be removed as a unit. *See "Engine" in Corvair Special Data.*

SYNCHRO-MESH TRANSMISSION: Removal - With "Power Train" removed from car, support Transaxle assembly with a chain fall or suitable lift and sling, then drain transmission and differential carrier. Remove starter and the two screws securing clutch pull rod dust seal assembly, then remove pin attaching pull rod to clutch fork. Separate Transaxle from engine by removing attaching bolts securing differential carrier to clutch housing. Pull Transaxle away horizontally to prevent damage to clutch fork. Remove clutch shaft (transmission input shaft). Remove clutch fork and clutch release bearing from differential carrier. *NOTE - Fork is attached to carrier by a ball and socket and spring retainer.* Separate three-speed transmission from differential carrier by removing the four attaching bolts and disengaging transmission output shaft from splines in differential carrier.

Installation: Use a new gasket (hold in place with petrolatum), then couple transmission to differential carrier, being sure to engage splines of transmission mainshaft to internal splines of pinion in differential carrier. Secure transmission to carrier with four bolts (install two bolts on right side from transmission end and the two on left side from carrier end). Tighten bolts to 24-32 ft. lbs. Install clutch release bearing and clutch fork on differential carrier. *NOTE - Clutch release bearing slips over shaft and the fork has a spring retainer and socket which attaches to ball stud on carrier.* Install clutch shaft in Transaxle, then check distance from end of clutch release bearing shaft to end of clutch shaft. If fully engaged, the dimension should be 2 9/16"±1/32". Support Transaxle with a chain fall or other suitable lift and sling, then align attaching bolt holes in carrier and clutch housing. Pilot clutch shaft splines into clutch, then install attaching bolts and tighten securely. Connect clutch pushrod to clutch fork with pin, then position and secure clutch pushrod dust seal assembly. Install starter and fill transmission and differential carrier.

POWERGLIDE TRANSMISSION: Removal - With "Power Train" removed from car, drain transmission, then disconnect hose connecting modulator tube to carburetor

CONTINUED ON NEXT PAGE

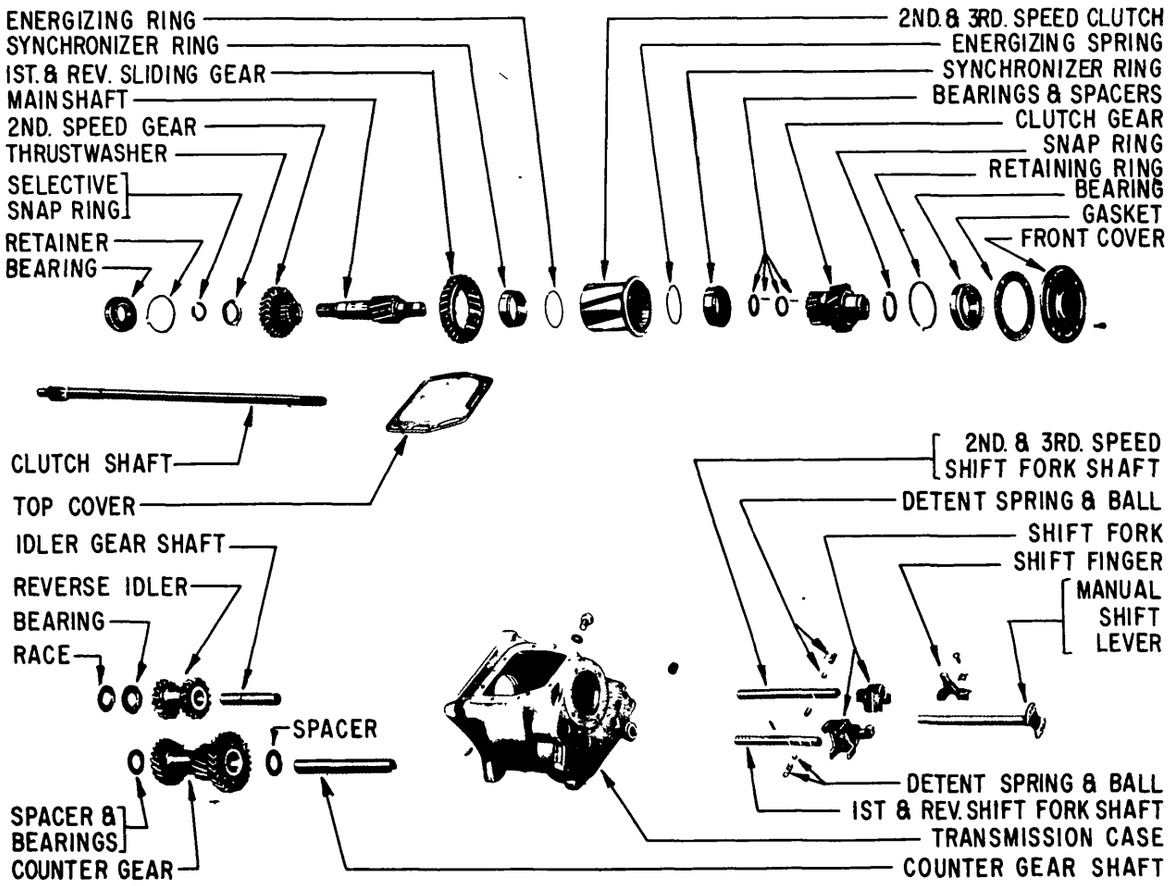
CORVAIR TRANSAXLE (Cont.)

balance tube. Remove engine front shield and remove starter. Disconnect converter from engine flex plate by removing the three attaching bolts through the access hole (at 12 o'clock position) in converter housing. Support Transaxle with a chain fall or suitable lift and sling, then remove attaching bolts and lockwashers securing differential carrier to converter housing. Pull Transaxle away from engine and remove converter assembly. Pull turbine shaft out of Transaxle assembly. Place Transaxle on a flat surface and remove screws securing governor assembly and remove governor. Remove three bolts securing transmission to carrier, then carefully pull transmission straight away from carrier to prevent pump shaft from damaging bushings in transmission and pinion shaft. Remove gasket from carrier, then remove governor gear and selective spacers from pinion shaft of carrier.

Installation: *CAUTION - Before connecting Powerglide transmission and differential carrier, determine thickness of thrust washers required at front face of governor gear. See "Rear Selective Thrust Washer" below.* After determining proper size thrust washer, install a new gasket to either carrier or rear face of transmission (hold in place with petrolatum). Align carrier and transmission on a flat surface and carefully guide the pump shaft through differential carrier so as not to damage bushing in pinion, then engage splines of pinion shaft with planet carrier internal splines in transmission. Install governor, then secure the transmission-to-carrier with four bolts. Drive the two bolts from carrier side first (to minimize chance of cocking mating surfaces), then tighten bolts to 24-32 ft. lbs. Install turbine shaft, being careful not to damage its bushings as it is inserted over pump shaft splines. *NOTE - Be sure to engage the two sets of splines (forward splines engage clutch drum and the rear set engage into sun gear in planet gearset).* DO NOT tip rear of Transaxle downward after installation unless converter holding plates are used. Position Transaxle adjacent to engine on a chain fall or similar lift, then remove converter holding plates if installed. Align converter with flex plate, then pilot converter hub onto crankshaft. Align mounting holes in differential carrier and converter housing, then secure top left bolt (11 o'clock position). Install flex plate to converter bolt accessible at the "1 o'clock" position to prevent accidental turning of converter or flex plate and loss of attaching hole alignment. Drive remaining converter housing-to-differential carrier mounting bolts, then install starter. Drive the two remaining converter-to-flex plate bolts through the access hole in converter housing. Install engine front shield, then reinsert filler tube through front shield and connect it to oil pan. Connect vacuum modulator to carburetor balance tube with a short length of hose. Refill transmission. *(See "Draining & Refilling" above).*

Rear Selective Thrust Washer: *CAUTION - Any time repairs are made that require the separation of Powerglide transmission and differential carrier, the proper thickness of thrust washer that must be used at front face of governor gear must be determined as follows:* Install dial indicator on Support J-8364 and install a 3" indicator extension. Without gasket, place support on rear pump cavity surface of transmission case (transmission front end down) so that dial indicator tip rests on planet carrier hub. Adjust indicator as required to permit maximum indicator travel, then set dial to zero. *NOTE - Transmission must face downward when indicator is zeroed.* Slowly lift indicator and support off rear pump cavity and note its range of needle deflection from zero position. *NOTE - If indicator is properly positioned on support, indicator should not deflect more than .050" (one-half turn) when removed; otherwise raise or lower dial indicator on support post as required and again "zero" gauge.* Place support and dial indicator on governor gear on differential carrier pinion shaft (support J-8364 will fit over pinion shaft), then slowly lower support (indicator tip of dial indicator against machined face of differential carrier housing) so that revolutions of dial indicator can be counted. *NOTE - Measurement starts once the indicator needle reaches "zero".* Fully depress support on governor gear and note indicator reading, then refer to following table for thickness of spacers to be installed on governor gear.

►*NOTE: After selected spacers are installed on governor gear, recheck measurement. If spacer stack is correct, indicator reading will now be between .025-.045". If not add or remove spacers until reading is within this range.*



Thrust Spacer Chart

Indicator Reading	No. Required	② Spacer Thickness
.025-.046" ①	None	
.047-.062"	1	.016" ± .001"
.063-.078"	2	.032" ± .002"
.079-.094"	3	.048" ± .003"
.095-.110"	4	.064" ± .004"
.111-.126"	5	.080" ± .005"
.127-.142"	6	.096" ± .006"
.143-.155"	7	.112" ± .007"

① - If initial indicator reading is below .025", replace thrust washer at clutch hub (front pump) with a .050" thrust washer, then repeat entire rear thrust spacer selection procedure.

② - Spacer, Part No. 6256827 (.016" thick) furnished. Use number indicated.

CONTINUED ON NEXT PAGE

CORVAIR SYNCHRO-MESH TRANSMISSION (EXPLODED)

CORVAIR TRANSAXLE (C ntinu d)

OVERHAUL

OVERHAUL: *See "Corvair Transaxle" in 1960 Annual Data or Lat r Manual edition and note the following:*

DIFFERENTIAL CARRIER

Differential case has been redesigned to accommodate side gears of equal length. Because of this change, universal joint trunnions are unequal in length and the differential pinion shaft has flats on both sides to clear longer universal joint trunnions. A new "pressed on" speedometer gear replaces the former integral gear.

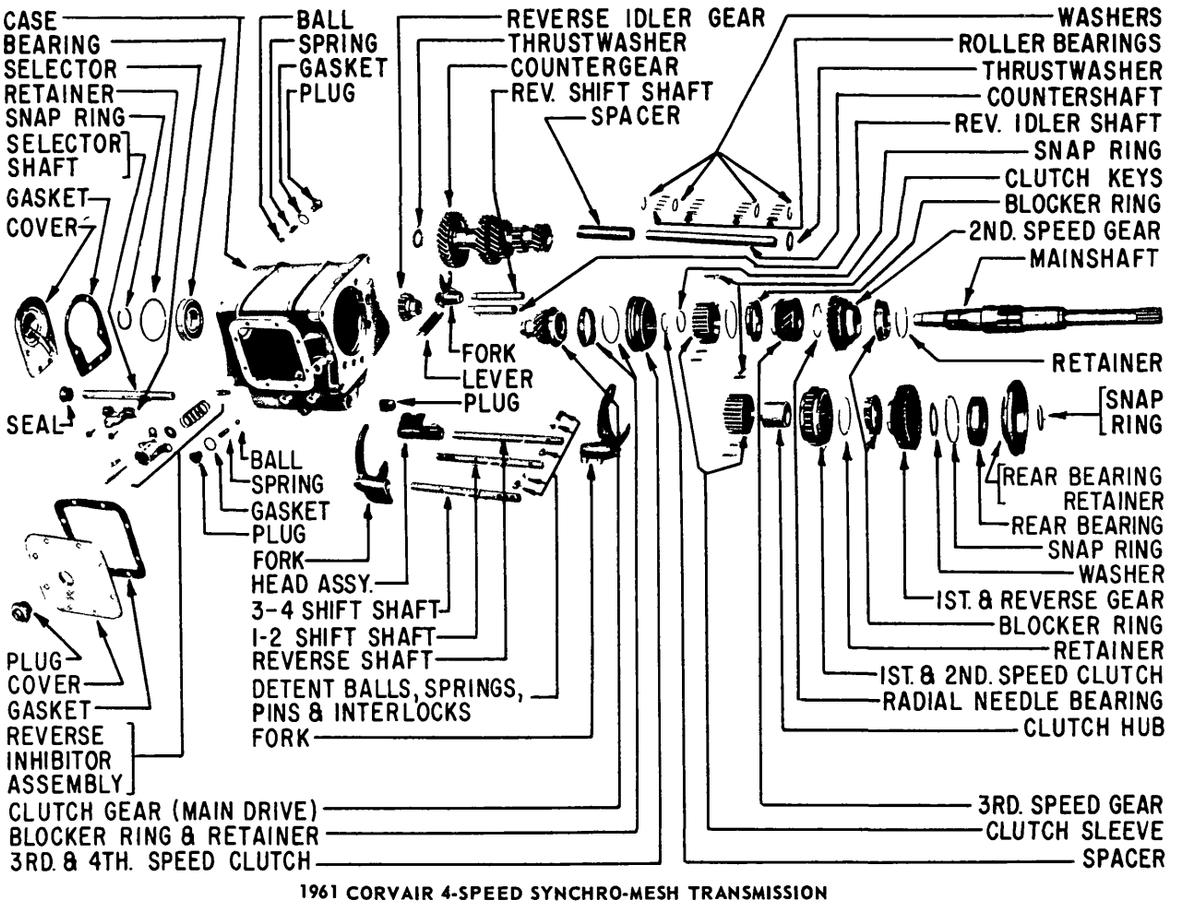
Diff r ntial Sid B aring Installation - Use Tool J-8359 to install side bearings on differential case and cover.

►*DRIVE PINION DEPTH SETTING NOTE (When Installing Service Replacement Drive Pinion):* Ring gear and drive pinion sets manufactured after February 1, 1961 and date coded 2-61 and later will not be marked for pinion mounting distance. On these later service replacement units, select shims using pinion code "14" as indicated in "Pinion Setting Shim Chart" under "Corvair Transaxle" in 1960 Annual Data or later Manual edition.

3-SPEED SYNCHRO-MESH TRANS.

Transmission case has been redesigned to provide piloting on differential carrier pinion front adjusting sleeve. In addition, a cast iron transmission case is used and the transmission mainshaft has been lengthened at output end.

POWERGLIDE TRANSMISSION



Line pressure limiting valve has been eliminated and facing material is no longer used on reverse clutch thick reaction ring. On 1200 Series Trucks, transmission oil is cooled by circulating it through a cooler located in left wheel house compartment. On these models, a bypass valve located in front pump body allows oil to circulate within the transmission case in the event of any restriction creating a pressure build-up of more than 15 lbs.

4-SPEED SYNCHRO-MESH TRANS.

DISASSEMBLY: Transmission Case - 1) Remove front bearing retainer and side cover, then remove plug, detent spring and ball from 3-4 detent channel at left rear of case. Place 3-4 shift fork into fourth gear (fully forward), then drive roll pin from shift fork with a pin punch. Remove 3-4 shift shaft with a drift and remove fork. *NOTE - Shaft can be driven out of case in either direction.*

2) Remove plug, spring and detent ball from 1-2 detent channel at front of case, then place shift fork in second gear (fully forward). Remove pin, fork and shaft in same manner as for 3-4 shift fork assembly.

3) Remove snap rings located in clutch gear bore (between clutch gear and bearing, and between clutch gear bearing and case). Install clutch bearing puller J-8880 as follows: Assemble puller plates J-8880-1 onto clutch gear bearing by inserting plates into bearing groove, then secure puller plates together with two screws. Insert adapter plug J-8880-2 into bore of clutch gear, then attach body J-8111-3 to puller plates with two ½"-13 x 2½" screws and two flat washers. Remove clutch gear bearing.

1961 CORVAIR 4-SPEED SYNCHRO-MESH TRANSMISSION

4) Remove mainshaft with assembled gears and rear bearing retainer through rear of case. *NOTE - It may necessary to jiggle output shaft, making sure that clutch gear does not separate from mainshaft.* After removal of mainshaft assembly from transmission, shift synchronizer sleeves to neutral.

5) Drive roll pin from reverse shifter head with a pin punch, then remove shifter head and shaft from case by tapping shaft out in either direction. Drive out reverse idler gear and reverse shifter fork shafts from case by driving rearward with a drift (do not lose woodruff key used in reverse idler gear shaft). Remove idler gear and reverse shifter fork from case. Lift reverse shifter lever off its pin in case.

6) To remove countergear, improvise a dummy shaft by cutting a piece of 5/8" diameter roll stock 7" long. then drive countershaft rearward, using the dummy shaft, until countershaft is removed and dummy shaft is within countergear. Remove countergear and dummy shaft from case being careful not to allow dummy shaft to slip out of gear. Remove countergear thrust washers from case.

7) Remove two interlocks, ball and spring from 3-4 detent channel (use a magnet or tip case). Remove shift finger from selector shaft by first flattening lock tabs securing retainer screws, then remove shifter shaft plug in rear of case. Tap shaft rearward out through case. Remove screws securing reverse inhibitor to case and remove inhibitor.

Mainshaft: Place clutch gear downward against bench top, then lift mainshaft out of clutch gear to prevent disturbing clutch gear roller bearings. Remove special snap ring from front of mainshaft, then slide 3-4 synchronizer unit with blocker rings, third speed gear, radial needle bearing and second speed gear from mainshaft. Remove rear bearing selective snap ring and remove rear bearing and retainer as an assembly. Remove first speed gear thrust washer, first speed gear, and 1-2 blocker rings. Press mainshaft out of 1-2 synchronizer unit and first speed gear sleeve. *CAUTION - Clutch hubs and sliding synchronizer sleeves are a matched assembly and must be kept together.*

INSPECTION: Wash all parts in solvent and blow dry with air. Inspect transmission case for cracks and check for burrs on rear face of case. If necessary dress off any burrs on machined surfaces with a flat file. Check condition of shifter shaft oil seal and re-

CONTINUED ON NEXT PAGE

CORVAIR TRANSAXLE (Continu d)

place if necessary. Make sure all bearings are clean, then lubricate with light engine oil and check for roughness. Replace all worn clutch gear and countergear bearings and spacers. Replace any gears or thrust washers that are worn or damaged.

►*SYNCHRONIZER CLUTCH SLEEVE & HUB KEY & SPRING REPLACEMENT:* If necessary to replace keys and springs, push hub from sliding sleeves and remove springs. To install, place two springs in position (one on each side of hub), so a tanged end of each spring falls into same keyway in hub. Hold keys in position and align etched marks in sleeve and hub, then slide hub into sleeve (be sure etched marks are aligned after assembly).

►*REAR BEARING RACE REPLACEMENT:* If necessary to replace rear bearing, place bearing and retainer in a press, then expand retainer ring and press out bearing. Reverse procedure to install bearing.

REASSEMBLY: Mainshaft - Install 1-2 synchronizer hub onto mainshaft with shift fork groove of hub downward, then place first gear sleeve on mainshaft. Press both first gear sleeve and synchronizer hub onto mainshaft until they bottom, using Tool J-5590 or other suitable tool. Install blocker ring in rear of 1-2 synchronizer, being sure that notches in blocker ring engage keys in synchronizer unit. *NOTE - Blocker rings used in 1-2 synchronizer have slightly longer hubs than those used in 3-4 synchronizer.* Slide first speed gear and its thrust washer onto mainshaft, then install rear bearing retainer assembly onto mainshaft and secure with selective fit snap ring. *CAUTION* - With proper snap ring installed (available in three sizes), maximum play between rear face of rear bearing and snap ring will be .005". Invert mainshaft, then install second blocker ring (long hub) in front side of 1-2 synchronizer, being sure that blocker ring notches are engaged with keys in synchronizer unit. Install second gear speed gear with clutch teeth toward 1-2 synchronizer, and place radial needle bearing on second speed gear. Install third speed gear, clutch teeth upward, onto mainshaft and seat it against radial needle bearing. Place 3-4 blocker ring on cone surface of third speed gear, then slide 3-4 synchronizer unit onto blocker ring, being sure that notches in blocker ring engage clutch keys in synchronizer unit. Install second blocker ring onto 3-4 synchronizer unit. *NOTE - If clutch gear roller bearings have been displaced, load 33 bearings into innermost diameter and 37 needle bearings into outermost diameter, using a generous amount of petroleum jelly to prevent rollers dropping out.* Carefully slide clutch gear onto mainshaft, then set the assembly aside for later installation.

Transmission: 1) Position reverse inhibitor body in transmission case on its dowel pin and secure with screws and lockwashers. *NOTE - Be sure to install plunger in inhibitor body.* Coat selector shaft with grease, then insert through seal from inside case. *CAUTION - Do not install shaft from front of case as notches in shaft will damage seal.* Attach shift finger to selector shaft with bolts and lock tabs. Bend tabs onto bolt heads after tightening bolts, then install plug at rear of shaft. Install countergear thrust washers in case and retain in place with petroleum jelly, making sure that thrust washer tabs engage grooves in case.

2) Insert countergear with its roller bearings and dummy shaft into case through rear bearing hole, then lift countergear into alignment with countershaft holes and tap countershaft into gear from rear of case. *CAUTION - Be careful to keep dummy shaft tightly against countershaft during installation to prevent roller bearing dropping out of place.* Tap countershaft in until it is flush with rear face of case. *NOTE - Countershaft is a slight press fit at front of case.*

3) Place reverse shifter lever on pin in case with tapered end away from reverse inhibitor. Place reverse idler gear shift fork in case with its pin toward the front and engage fork pin with reverse shift lever, then insert shift fork shaft.

4) With reverse idler gear shift fork fully rearward, engage reverse idler gear to shift fork, then align woodruff key groove in idler gear shaft with keyway in rear face of case and slide shaft almost fully into case. Install woodruff key in shaft and fully bottom shaft in case. Tap both reverse idler and shift fork shaft to insure full seating, then stake each shaft bore in two places below rear face of case adjacent to shaft chamfer. *CAUTION - Be sure stakes do not protrude above rear face as this will disrupt mating surface for axle.*

5) Insert a detent spring and ball in 3-4 detent channel, checking to make sure spring goes fully to bottom of channel and that detent ball does not roll out the reverse shifter head shaft hole in detent channel.

►*SHIFTER SHAFT IDENTIFICATION NOTE:* With interlock notches aligned (lay shafts out in this manner) shafts can be identified as follows:

Reverse Shifter Head Shaft - 8 3/32" overall length, and roll pin hole is approximately centered on shaft.

1-2 Shift Fork Shaft - 7 19/32" overall length, with two interlock notches in shaft and these notches are connected by a drilled hole which houses interlock pin.

3-4 Shift Fork Shaft - 7 19/32" overall length, and roll pin hole is closest to end of shaft opposite detent notched end.

6) Depress detent ball and spring in 3-4 detent channel slightly with a small drift and insert reverse shifter head shaft partially into case to compress detent, then engage pin of reverse shifter head with yoke of reverse shift lever. Check that shaft pin hole is aligned with pin hole in shifter head and push shaft through until pin holes in head and shaft align. Secure shifter head to shaft with a roll pin.

7) To install assembled mainshaft in case, shift synchronizers into second and fourth simultaneously (both forward fully) to provide clearance to pass the countergear. Insert mainshaft through rear bearing bore into case. Align rear bearing retainer portion of clearance hole with portion of clearance hole located at 2 o'clock position on rear face of case, then tap rear bearing retainer into case until flush with rear face. With large snap ring installed in outer diameter of front bearing, tap bearing into front of case and over clutch hub until large snap ring seats against front face of case. Install proper snap ring to retain clutch gear in bearing so that maximum clearance between snap ring and bearing is .005", then install small snap ring in inner diameter of clutch gear (this snap ring acts as a bottoming stop for clutch shaft).

8) Before installation of 1-2 shift fork shaft, shift the 1-2 synchronizer and the 3-4 synchronizer to neutral, then install one interlock in 3-4 detent channel. With interlock pin in hole in interlock notch end, push 1-2 shift fork shaft partially into case. *NOTE - The interlock end (two opposite notches) of the shaft goes to rear of case.* Engage 1-2 shift fork (identified by through gate at shift location) with 1-2 synchronizer. Align pin holes in shaft and fork, then tap shaft rearward until it engages interlock, and secure fork to shaft with a roll pin. Install detent ball, spring, gasket and cap in 1-2 detent channel. *NOTE - Cap used at this location has the longer shank.*

9) Drop remaining interlock into 3-4 detent channel, then push 3-4 shift fork shaft partially through hole in front of case. Engage 3-4 shift fork in 3-4 synchronizer, align pin hole in shift fork and shaft, then push shaft fully into rear of case until it engages interlock. Secure shift fork shaft with a roll pin. Install remaining detent ball, spring, nylon washer, and cap in 3-4 detent channel at left rear of case.

10) Before installing front bearing retainer and side cover, test operation of shift forks by actuating shift selector lever with a small pin punch inserted in hole in shifter shaft. If transmission shifts satisfactorily, install front bearing retainer using a new gasket. Install bolts and tighten to 15-20 ft. lbs. Install side cover and tighten bolts to 3-4 ft. lbs.

CHRYSLER CORP. TORQUEFLITE SIX

Dodge Dart 6 Cyl. (1961)
Lancer (1961)
Plymouth 6 Cyl. (1961)
Valiant (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*1960-61 TORQUEFLITE SIX "NO DRIVE" CORRECTION NOTE:* If this condition occurs after making the first stop when car is cold, the cause may be that front pump has lost its prime due to low oil level. If oil level is found to be low and is corrected, recheck operation before making any additional corrections.

►*1961 TORQUEFLITE SIX FRONT PUMP HOUSING SEAL PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* Beginning with Transmission, Serial No. 278039, a new Front Pump Housing, Part No. 2204712, having a .125" deep seal groove, and a new Front Pump Housing Seal, Part No. 2204709, with a rectangular cross section (approx. 1/8" x 3/32"), entered production. Later type parts cannot be intermixed with the former Front Pump Housing, Part No. 1942381 (.075" deep seal groove), and Front Pump Housing Seal, Part No. 1942384 (3/32" square seal). If a new front pump housing is to be installed, use later type seal and housing. If only the seal is to be installed on early transmissions, make sure early type (3/32" square) seal is used.

DESCRIPTION: Transmission design is same as used on corresponding previous models.

LUBRICATION

Checking Fluid Level: Check fluid level every 1000 miles with transmission at normal operating temperature. Apply parking brake and idle engine, then depress each button, returning to "N" (Neutral) after button is pushed in. Oil level should be between "Full" mark and "Add 1 Pint" mark. *NOTE - If transmission is cold, fluid level should be at "Add 1 Pint" mark.* Add or remove transmission fluid as necessary.

Recommended Fluid - Automatic Transmission Fluid Type "A" (Suffix "A").

►*CHECKING FLUID LEVEL NOTE:* The above specifications are new and supersede previous specifications.

Draining & Refilling: Drain transmission every 10,000 miles. To drain, remove oil filler tube from transmission oil pan, then remove access plate at flywheel cover and drain torque converter by removing plug. After draining, replace converter plug and oil filler tube and add ten pints (5 qts.) of Automatic Transmission Fluid Type "A" (Suffix "A") through transmission oil filler tube. Start engine and add approximately three more pints with engine idling. Allow engine to idle for two minutes, then operate all pushbuttons, pausing momentarily in each position, and ending with the "N" (Neutral) button pushed in. Check fluid level and add sufficient fluid to bring level to "F" mark on dipstick.

Fluid Capacity: Approximately 14 pints (all models).

►*TRANSMISSION MAINTENANCE NOTE: It is recommended that when transmission is drained, oil pan should be removed and cleaned, oil screen cleaned, and transmission bands and linkage be adjusted.*

LINKAGE ADJUSTMENT

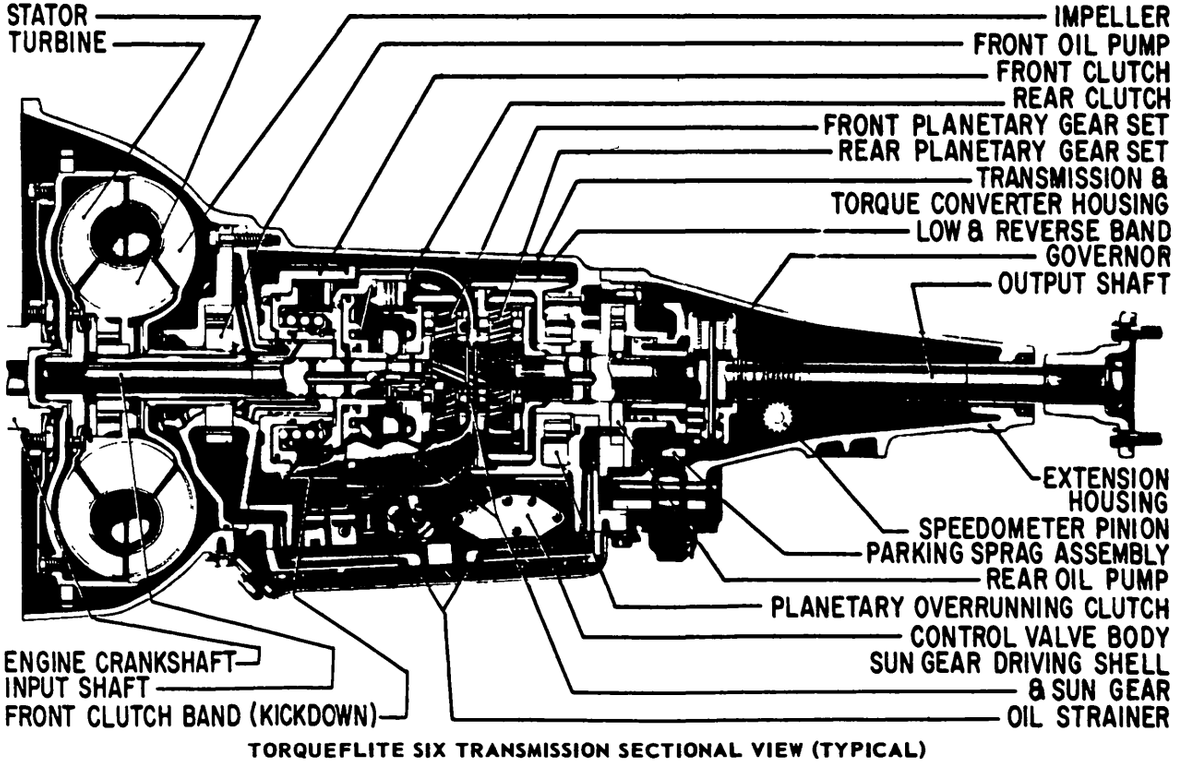
Throttle Linkage Adjustment: *See "Carburetor" on car model pages.*

Manual Control Cable Adjustment: 1) With car raised on a hoist, have an assistant fully depress "R" (Reverse) pushbutton and hold it down. Remove pushbutton control cable adjustment wheel lockscrew at left side of transmission case.

2) Back adjustment wheel off on cable guide (turn counterclockwise) until only three or four threads are showing behind wheel on the guide. *CAUTION – Check wheel for free turning on guide and remove any burrs in threads that might interfere. Lubricate threads with a few drops of transmission fluid.*

3) Hold cable guide centered in hole in transmission case and apply only enough inward pressure to bottom the assembly at reverse detent. While holding cable bottomed, rotate adjustment wheel clockwise until it just contacts case. Turn wheel just enough clockwise to make next adjustment hole in wheel line up with screw hole in case.

4) Counting this hole as number one, continue turning the wheel clockwise until the fifth hole lines up with screw hole in case. Install lockscrew and tighten to 30–50 inch pounds.



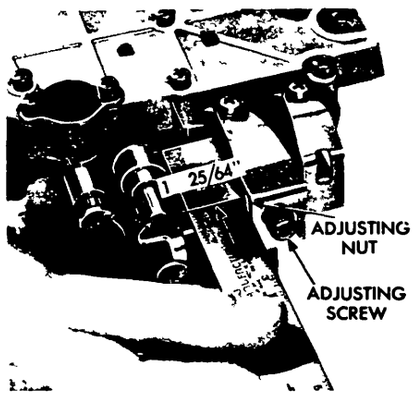
Neutral Safety Switch Adjustment: Raise car and drain approximately two quarts of fluid from transmission, then unscrew neutral safety switch and check to see that switch operating lever is aligned with center of switch opening in case. Place cupped washer and "O" ring over threads of switch, then screw switch into transmission case a few turns. Connect one lead of a test lamp to battery current and the other lead to switch terminal. Screw switch into transmission case until lamp lights, then tighten switch an additional 1/3–½ turn. *NOTE* – Switch must be tight enough to prevent oil leakage. If not, add a thin washer and readjust the switch. Remove test lamp and connect wire to switch. Add fluid to transmission to bring up to proper level.

BAND ADJUSTMENT

Kickdown (Front) Band: Kickdown band adjusting screw is located on left side of transmission case near throttle shaft lever. Loosen locknut and back off approximately five turns. Check adjusting screw for freeness in transmission case, then tighten adjusting screw to a reading of **47–50 inch pounds** using Tool C–3380 with Adaptor Tool C–3790. Using a reference mark of chalk or colored pencil on corner of adjusting screw square and transmission case, back the adjusting screw out **exactly 2 1/8 turns (Dodge & Plymouth), 2 5/8 turns (Lancer & Valiant). While holding adjusting screw stationary, tighten locknut to 20-25 ft. lbs.**

Low-Reverse Band: Drain transmission and remove oil pan, then loosen the adjusting screw locknut and back locknut off approximately five turns. *NOTE – Adjusting screw is located in low-reverse band lever.* Check adjusting screw for free turning in lever, then tighten adjusting screw to a reading of **47–50 inch pounds** using Tool C–3380 and Adaptor Tool C–3790. Back off adjusting screw exactly 5¼ turns (all models) and tighten locknut to 20–25 ft. lbs. *NOTE – Hold adjusting screw from turning while tightening locknut.*

CONTINUED ON NEXT PAGE



TORQUEFLITE SIX TRANSMISSION SECTIONAL VIEW (TYPICAL)

TORQUEFLITE SIX (C ntinu d)

TESTING

HYDRAULIC CONTROL PRESSURE TESTS: All of the following pressure tests must be made with the transmission at normal operating temperature.

Line Pressure & Front Servo Release Pressure: Install a tachometer on engine, then raise car and position the tachometer so it can be read under the car. Connect two 0—100 psi pressure gauges, Tool C—3292, to pressure takeoff points at top of accumulator and at front servo release (see illustration). With transmission selector lever in "D" (Drive) position, and wheels free to turn, speed up engine slightly until transmission shifts into direct drive. Reduce engine speed slowly to 800 RPM. Line pressure at this time must be 52—60 lbs., and front servo release pressure should be 45 lbs. or higher. Disconnect throttle linkage at transmission lever and hold transmission throttle lever at detent position. Increase engine speed to 3500 RPM with transmission in direct drive. At this point, line pressure should be 90—96 lbs. and front servo release pressure should be 80 lbs. or greater. *NOTE — Open transmission throttle lever when operating engine at speeds in excess of 1500 RPM.* If line pressure is not 52—60 lbs. at 800 RPM, adjust pressure (see below). *CAUTION — Do not adjust line pressure to correct reading at 3500 RPM.*

LINE PRESSURE ADJUSTMENT

Line Pressure Adjustment: Remove valve body assembly from transmission and adjust the "Allen" type screw in end of pressure regulator spring bracket so the measurement between valve body and inner edge of adjusting nut on end of spring is 1 25/64" (see illustration). *NOTE — The above adjustment can be varied to obtain specified line pressure. Turning screw counterclockwise increases pressure.*

Lubrication Pressure: Install a "tee" fitting between cooler return line fitting and fitting hole in transmission case at rear left side of transmission case. Connect a 0—100 psi pressure gauge, Tool C—3292, to "tee" fitting. At 800 RPM, with throttle lever in closed position and transmission in direct drive, pressure should be 5—25 lbs.

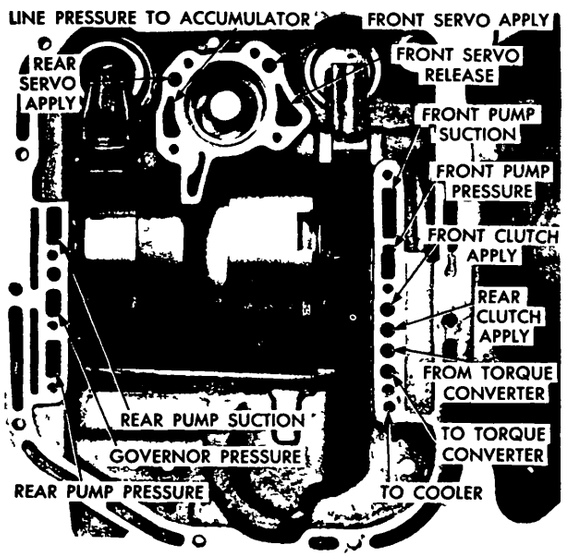
R ar Serv Apply Pr ssur : Connect a 0—300 psi pressure gauge, Tool C-3293, to apply pressure takeoff point at rear servo, then with transmission selector lever in "R" (Reverse) and engine speed at 1600 RPM, the reverse servo pressure should be 230—280 lbs. Not adjustable.

Govern r Pressure: Connect a pressure gauge (Tool C-3292 or equivalent) to governor pressure takeoff point located on lower left side of extension housing just back of extension housing mounting flange. Governor pressure should be within limits indicated in table below. If pressure not correct, governor valve or weights are sticking.

Governor Pressure (Dodge & Plymouth)
(3.31-1 Axle Ratio)

Governor Pressure	Car Speed 750x14 Tires	800x14 Tires
15 Lbs.	17-18 MPH	17-19 MPH
45 Lbs.	28-37 MPH	29-37 MPH
60 Lbs.	58-66 MPH	59-68 MPH

Governor Pressure (Lancer & Valiant)



Governor Pressure	Car Speed 3.23-1 Ratio	3.55-1 Ratio
15 Lbs.	16-17 MPH	14-15 MPH
45 Lbs.	29-39 MPH	27-35 MPH
60 Lbs.	59-66 MPH	54-60 MPH

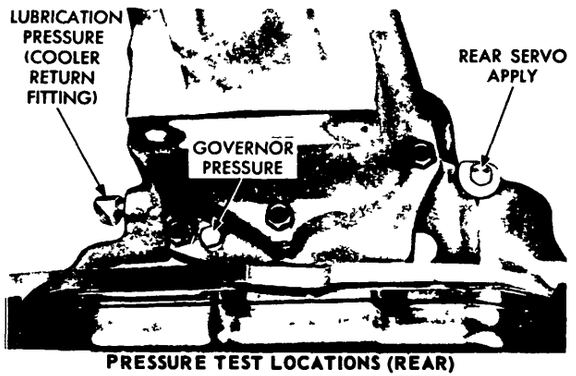
Dodge & Plymouth
Transmission Shift Speed (MPH)
(3.31-1 Axle Ratio & 750x14 Tires)

Throttle Position	1-2 Upshift	2-3 Upshift	Downshift
Closed	7-12	11-15	5-11
Wide Open	27-38	57-69	
3-2 Kickdown			45-61
3-1 Kickdown			26-32

Throttle Pressure: *NOTE — No provision is made to check throttle pressure. However, if pressure adjustment is made correctly, as indicated below, pressure is assumed to be correct.*

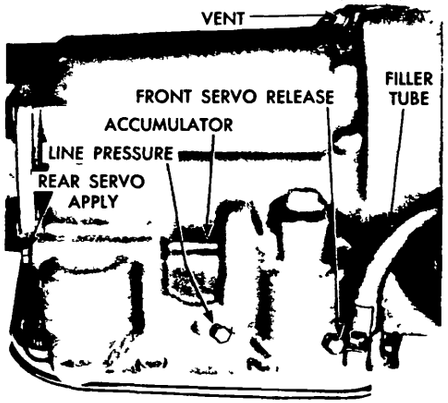
Throttle Pressure Adjustment — Remove valve body assembly from transmission, then loosen throttle lever stop screw locknut and back off screw approximately five turns. Insert gauge pin of Tool C—3763 between throttle lever cam and kickdown valve. By pushing in on tool, compress kickdown valve against its spring so throttle valve is completely bottomed inside the valve body. As force is being exerted to compress the spring, tighten throttle lever stop screw finger tight against throttle lever tang with throttle lever cam touching the tool and throttle valve bottomed. *CAUTION — Be sure the adjustm nt is mad with spring fully compressed and valv b ttom d in valv body.* Remove tool and tighten stop screw locknut securely.

AIR PRESSURE CHECKS



AIR PRESSURE TESTS: Front clutch, rear clutch, kickdown servo, and low-reverse servo may be checked by applying air pressure to their respective passages after valve body assembly is removed. See illustration for location of passages.

Front Clutch: Apply air pressure to front clutch passage and listen for a dull "thud" indicating that front clutch is operating. Hold air pressure on for a few seconds and check system for excessive oil leakage.



Rear Clutch: Apply air pressure to rear clutch passage and listen for dull "thud" indicating that rear clutch is operating. Hold pressure on for a few seconds and check system for excessive oil leakage.

►*NOTE: If a dull "thud" cannot b h ard in th clutches, place finger tips on clutch housing and again apply air pressure. Piston movement can be f lt as clutch is appli d.*

Kickdown Serv : Direct air pressure into kickdown servo "apply" passage. Operation of servo is indicated by a tightening of front band. Spring tension on servo piston should release the band.

PRESSURE TEST LOCATIONS (REAR)

PRESSURE TEST LOCATIONS (RIGHT SIDE)

CONTINUED ON NEXT PAGE

TORQUEFLITE SIX (C ntinued)

L w-R v rs S rv : Direct air pressure into low-reverse servo "apply" passage. Operation of servo is indicated by a tightening of rear band. Spring tension on servo piston should release band.

►*AIR PRESSURE TEST NOTE: If all the above units op rate prop rly, "n driv ", "erratic" and "no upshift" conditions are caus d by trouble in the control valve ass mbly.*

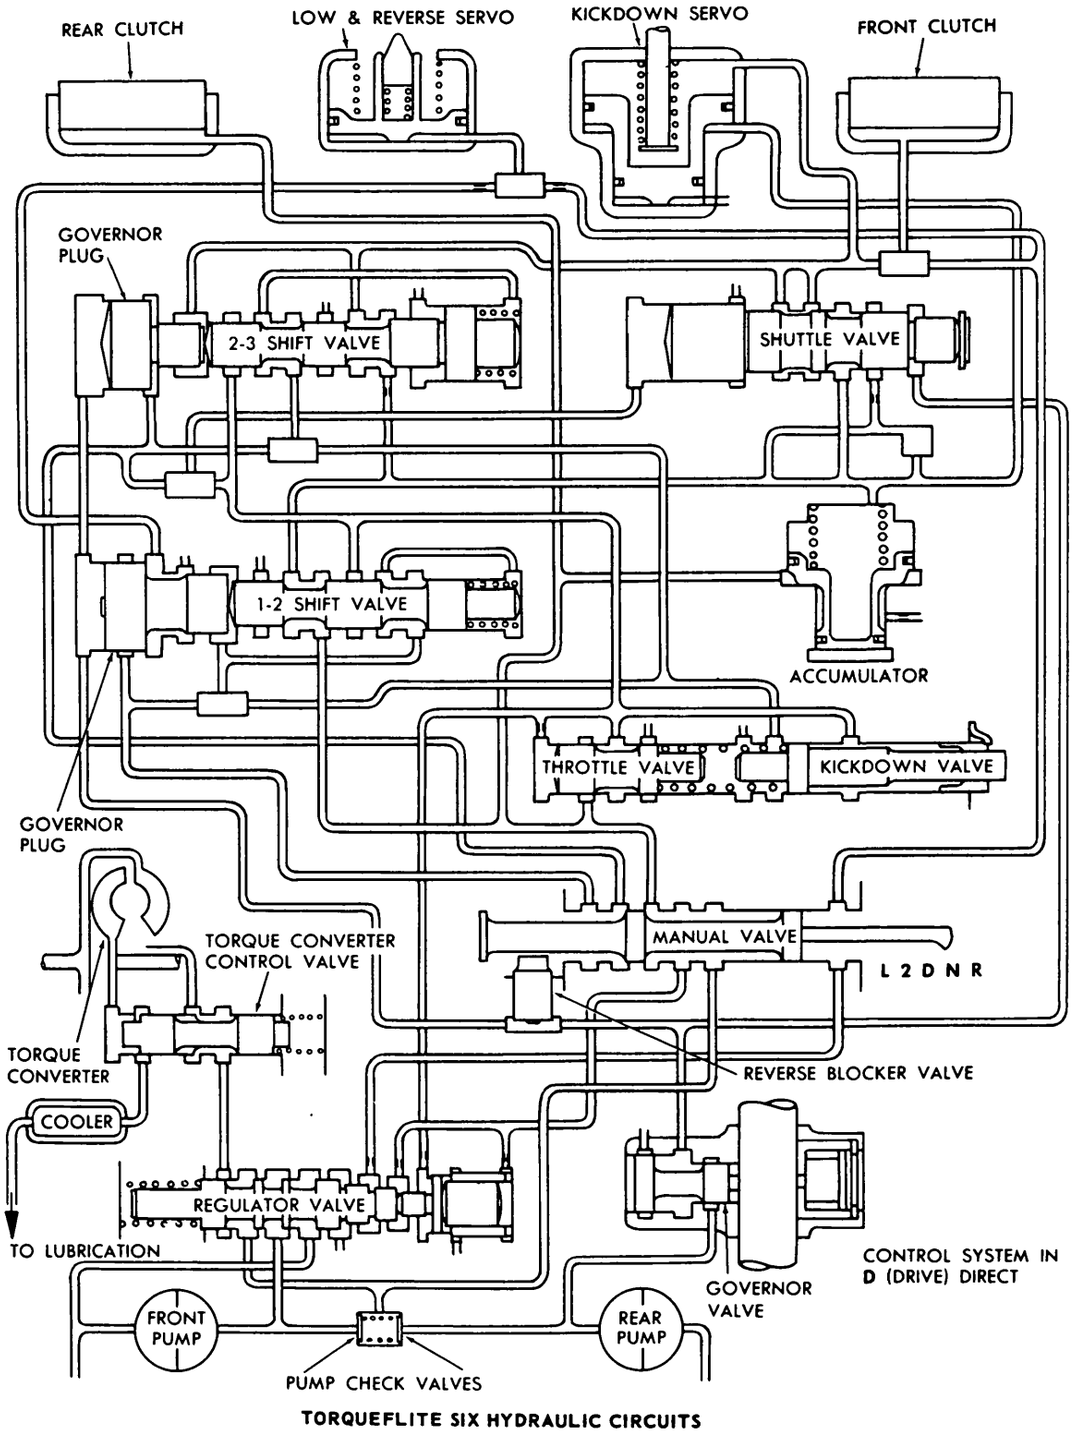
GEARSHIFT CONTROL UNIT



PUSH BUTTON CONTROL UNIT: Removal - Procedures are different for the various models as indicated below.

Dodg Dart & Plym uth (6 Cyl.): Disconnect one battery cable, then disconnect back-up light switch and illuminating lamp leads at rear of instrument panel. Remove screws of push button face plate and remove push buttons by pulling them off slides. Remove lamp bulb, then remove control housing stud nuts that are accessible. Remove control cable from rear of instrument panel, then remove hairpin clip securing cable to actuator and screws holding bracket to control housing.

Valiant: Disconnect negative (ground) cable from battery, then disconnect back-up lamp switch wire at push button control. Remove two screws from face plate and remove face plate and gasket. Remove parking brake handle from lever, then remove three screws securing control assembly to instrument cluster. Carefully work assembly rearward out of cluster. Remove push buttons by pulling them off slides, then remove mounting bracket from assembly. Remove hairpin lock securing control cable to actuator and screws holding cable bracket to control. Remove control cable, then disconnect parking brake cable and remove parking brake arm from control unit.

Installati n: Reverse removal procedures and adjust cable.

CONTINUED ON NEXT PAGE

TORQUEFLITE SIX HYDRAULIC CIRCUITS

TORQUEFLITE SIX (C ntinued)

MANUAL CONTROL CABLE: R m val - Drain 2 quarts f fluid from transmission, then depress "L" (Low) push button. Remove neutral starting switch and remove control cable-to-adjusting wheel lock screw. Insert screwdriver through neutral starting switch opening, then push screwdriver gently against upper projecting portion of cable lock spring and pull outward on cable to remove cable from adapter and transmission case.

Installation: Have an assistant hold the "R" (Reverse) button fully depressed, then back adjusting wheel off until two or three threads are showing behind wheel on guide. Lubricate cable guide with transmission lubricant, insert cable in transmission case, push inward on cable making sure lock-spring engages cable. Adjust control cable *(see "Adjustment" above)*, then fill transmission with recommended fluid.

LAMP BULB REPLACEMENT: Dodge Dart & Plymouth - Remove push button face plate and remove one or more of the center push buttons.

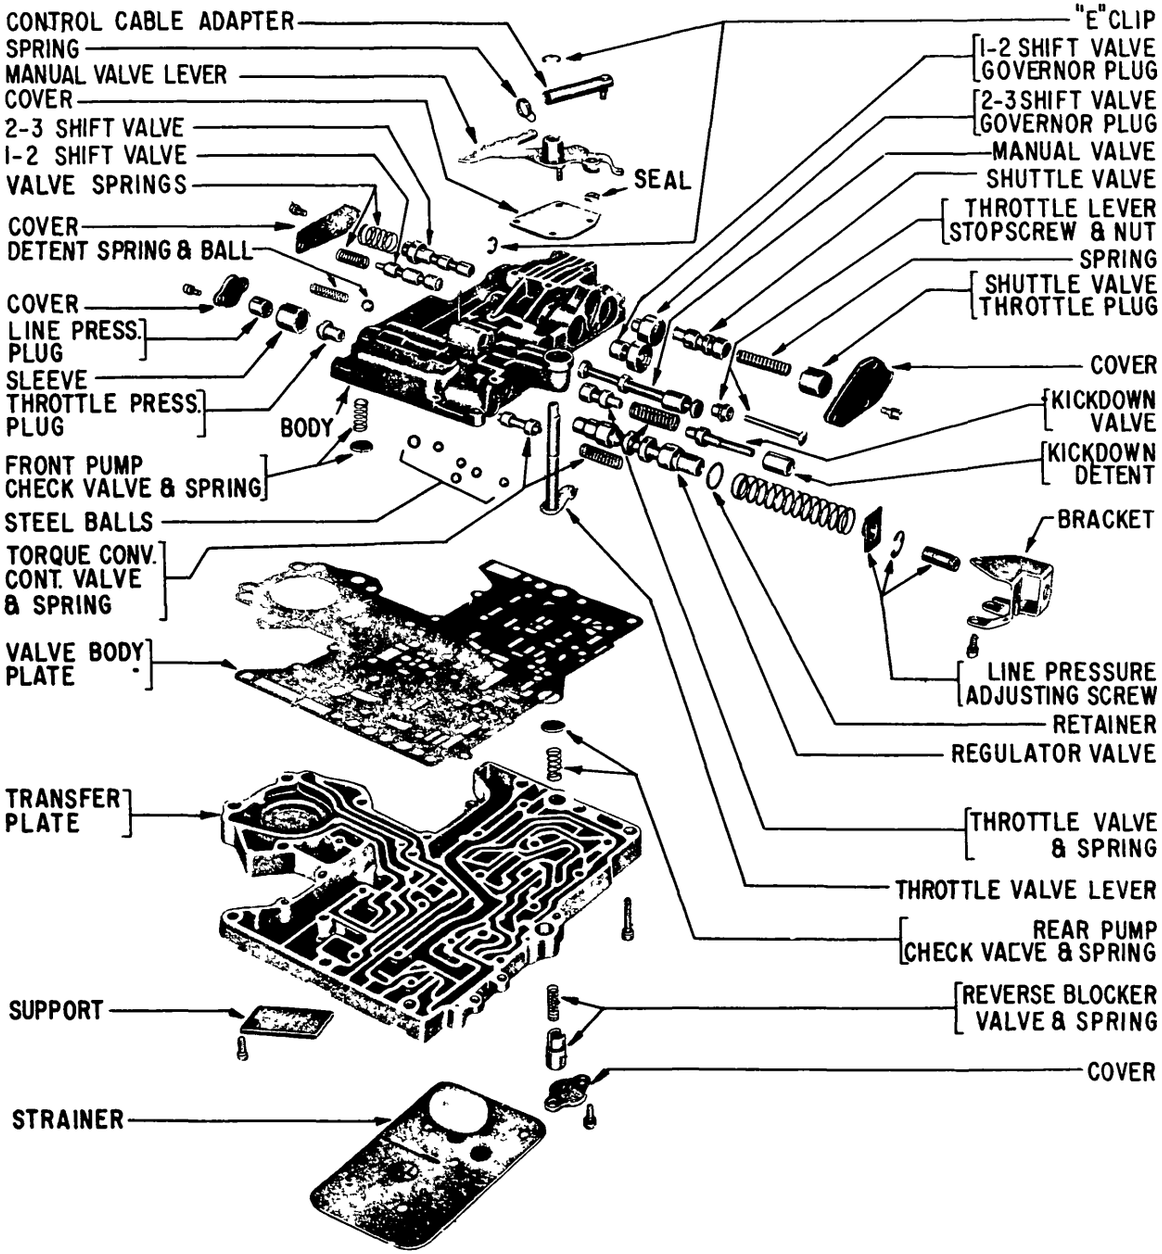
Valiant: Lamp is located between speedometer and control unit and can be replaced by pulling it out of socket from rear of speedometer housing.

BACK-UP LIGHT SWITCH REPLACEMENT: All Models - Remove push button control housing assembly, then straighten tabs securing switch to housing. Install switch and bend tabs to retain it in place. Install housing and connect switch and lamp wires.

TORQUE CONVERTER

►*TORQUE CONVERTER NOTE: This is a sealed unit and cannot be disassembled for overhaul. In the event of parts failure in transmission, the torque converter should be flushed as described below*

FLUSHING TORQUE CONVERTER: With torque converter assembly removed from engine, place it in an upright position and pour two quarts of clean solvent or kerosene into converter through impeller hub. Turn and shake converter so as to swirl solvent through internal parts. *NOTE - Turning turbine and stator with transmission input and reaction shafts will help to dislodge foreign material.* Position converter in its normal operating position with drain plug at lowest point, then drain solvent. Rotate turbine and stator, and shake converter while draining. Repeat the above operation at least once, or as many times as required until solvent is drained out clean. After flushing, shake and rotate converter several times with drain plug out to remove all solvent and dirt. Reinstall drain plug and tighten to 20 ft. lbs.



TRANSMISSION
REMOVAL & INSTALLATION

►*TRANSMISSION & TORQUE CONVEF.TER REMOVAL CAUTION:* Transmission and torque converter must be removed and installed as an assembly to prevent damage to converter drive plate, front pump bushing, and oil seal. *DO NOT allow weight of transmission to rest on plate during removal or installation.*

REMOVAL: 1) Connect a suitable Remote Control Starter Switch (Tool C-763 or equivalent) so engine can be rotated from under car, then disconnect high tension lead from distributor. Raise car on a hoist or support on stands and drain converter and transmission.

2) Mark converter and drive plate for use at reassembly. *NOTE - Crankshaft flang bolt circl , inn r and uter circle of holes in drive plate, and the four tapped h l s in front face of converter all hav n hol offs t so th s parts will be install d in riginal position.*

3) Rotate engine to locate two converter-to-drive plate bolts at "4" and "7" o'clock positions and remove bolts, then rotate engine and remove remaining two bolts.

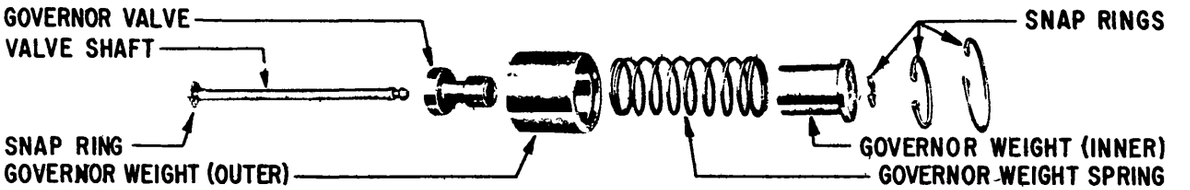
TORQUEFLITE SIX VALVE BODY ASSEMBLY

CAUTION - Do not rotate converter r drive plate by prying with a screwdriver r other tool. DO NOT ngag starter if drive plate is not attached t converter with at least on bolt r if transmissi n case-to- ngin bolts have been loosened.

CONTINUED ON NEXT PAGE

TORQUEFLITE SIX (Continu d)

4) Position control cable for removal by depressing "1" (Low) pushbutton, then disconnect negative cable from battery. Remove starter motor assembly, then remove starter neutral safety switch from transmission case. Remove pushbutton control cable-to-transmission adjusting wheel lockscrew and insert a screwdriver through neutral starter switch opening and push gently against upper projecting portion of cable lock-spring, then pull outward on cable to remove it from adaptor and transmission case.



5) Remove throttle link and lever assembly from transmission throttle shaft, then disconnect oil cooler lines at transmission and remove oil filler tube. Remove speedometer pinion and sleeve assembly. On Lancer and Valiant, loosen transmission parking brake cable clamp where cable enters cover, then remove housing cover lower plug. Insert a screwdriver through hole, then gently exert pressure against projecting portion of cable lock-spring and withdraw brake cable.

6) On Dodge and Plymouth, remove parking brake adjusting nut cover plate and loosen cable clamp bolt on brake support. Disengage ball end of cable from operating lever and remove cable from brake support. On all models, disconnect propeller shaft at front universal and secure shaft out of way.

7) Remove nut and washers securing transmission extension housing insulator to crossmember, then install support fixture C-3806 and raise engine slightly. Remove crossmember, then place a transmission jack under transmission to support the assembly. Attach a small "C" clamp to edge of bell housing to hold converter in place during removal.

8) Remove bell housing retaining bolts, then carefully work transmission and converter assembly toward rear off engine block dowels and disengage converter hub from end of crankshaft. Remove transmission and converter from under car. To remove converter assembly, remove "C" clamp from edge of bell housing, then carefully slide converter assembly out of transmission.

INSTALLATION: Reverse removal procedure and note the following: To install converter on transmission, rotate front pump rotors with Tool C-3756 until two small h les in tool handle are vertical, then carefully slide converter assembly over input shaft and reaction shaft, making sure that converter impeller shaft slots are also vertical and engage front pump inner rotor lugs. *CAUTION - Check for full engagement by placing a straightedge across fac of case. Surface of converter front cover lug sh uld be at least ½" to rear of straightedge when converter is pushed all the way into transmissi n.* Attach a "C" clamp in same manner as for removal. After transmission is installed on engine, install bell housing bolts and tighten to 25-30 ft. lbs. Install and tighten converter-to-drive plate bolts to 200 inch pounds. Tighten crossmember-to-frame nuts to 20-35 ft. lbs. To install control cable, have an assistant engage "R" (Reverse) button and hold it firmly depressed, then insert pushbutton control cable in transmission case and push inward on cable, making sure lock-spring engages cable. Install adjusting wheel retaining screw.

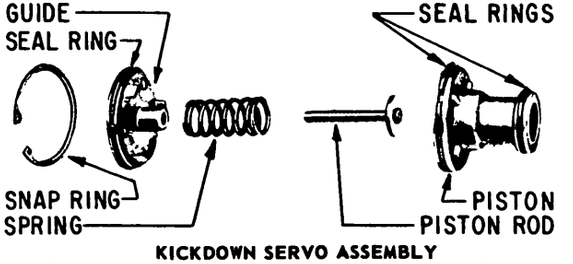
TORQUEFLITE SIX GOVERNOR VALVE ASSEMBLY

OVERHAUL

See "Torqueflite Six" in 1960 Annual Data or later Manual edition and note the following:

Front Pump & Torque Converter: Driving lugs on front pump inner rotor are located in center of inner rotor and both faces of lugs are square. The diameter which pilots rotor on converter impeller hub is also located at center of rotor. Converter impeller has two slots to drive rotor instead of two tangs used on previous models. There is no difference between front and rear side of rotor, however, marks (made at time of disassembly) must be aligned when reassembled.

Reaction Shaft Support-to-Front Clutch Thrust Washer: A fibre thrust washer has been added between reaction shaft support and front clutch assembly. This washer is .043-.045" thick and should be replaced if worn or damaged.



Checking Transmission Alignment: 1) Remove transmission and torque converter, then remove flexible drive plate. Check dowels in rear face of cylinder block and make sure they extend at least 5/16" out of block. *CAUTION - Drive plate will be damaged if one or both dowels are missing or if they are not positioned properly.*

2) Slide converter assembly out of transmission, then tighten front kickdown band adjusting screw to 47-50 inch pounds (see "Band Adjustment" above) to prevent front and rear clutch retainers from moving forward during removal of front pump. Remove front pump, then install a dial indicator on crankshaft (use a 5½" long rod, having 7/16"-20 threads cut in one end, screwed into crankshaft flange bolt hole to mount dial indicator).

3) Clean cylinder block face and transmission flange face, then bolt transmission to engine being careful not to strike indicator when raising transmission into place. Tighten attaching bolts to 25-30 ft. lbs. Position dial indicator plunger against bore diameter which pilots front pump (do not allow plunger to rest on chamfered edge of bore). Reach into case from below and adjust dial and plunger so plunger can travel in each direction.

4) Rotate crankshaft with a wrench on bolt in front end of crankshaft. *NOTE - If bolt not on crankshaft, install bolt, Part No. 2128569.* Measure bore runout by rotating crankshaft slowly, recording readings every 45° of rotation. Also record points of maximum and minimum readings. *NOTE - Use a mirror, if necessary, to see dial as it is being rotated.* Total runout of bore should not exceed .015".

Transmission Alignment: If runout is excessive, reduce within limits by using offset dowels which are available in .007", .014" and .021" offsets. After determining amount and direction of transmission case bore runout, select a pair of offset dowels with the offset nearest to one-half the amount of runout. Drive original dowels from engine block and install offset dowels with slots parallel and the offset in direction of runout. *NOTE - Upper dowel must be installed with slotted end into block flange (toward front of engine). Install lower dowel with slotted end toward rear of engine. Install both dowels up to shoulder of offset.* Reinstall transmission case and tighten attaching bolts to 25-30 ft. lbs. *CAUTION - Do not force bolts as case might be binding on dowels.* Recheck bore runout, then make small corrections with a screwdriver bit and a wrench by loosening case bolt slightly (support transmission) and turn dowels to obtain as near zero runout as possible. *NOTE - Dowel slots must be kept as near parallel as possible to maintain proper distance between dowels.* When transmission is properly aligned, remove assembly without disturbing dowels, then install front pump and reaction shaft support assembly. Back off adjusting screw 2 1/8 turns (Dodge & Plymouth), 2 5/8 turns (Lancer & Valiant), then tighten locknut to 20-25 inch pounds.

KICKDOWN SERVO ASSEMBLY

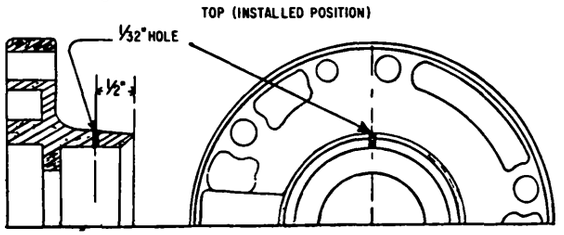
Checking Converter Hub Runout: *NOTE - If flexible drive plate is cracked or broken, install a new plate. Do not use lockwashers on retaining bolts.* Install converter on drive plate and tighten bolts to 270 inch pounds (do not install lockwashers on bolts). Attach a dial indicator to engine block flange so dial plunger rests on converter hub (just ahead of pump drive slots), then rotate crankshaft with a wrench on bolt at front of crankshaft and check converter hub runout. *CAUTION - Do not rotate converter by hand or with a turning tool as flexing of plate will give a false reading.* Total runout of hub should not exceed .015". Runout less than .050" may be corrected by attaching a large "C" clamp in front of engine block flange and behind starter ring gear on converter. Draw ring gear adjacent to low runout point of converter hub toward the engine. Release clamp and recheck runout. *CAUTION - DO NOT pry converter away from engine and be careful to avoid over-correction.* If necessary to correct crankshaft runout, flange runout should not exceed .002".

CHRYSLER CORP. TORQUEFLITE EIGHT

Chrysler, Imperial, DeSoto, Dodge, Plymouth (1961)

►CHANGES, CAUTIONS, CORRECTIONS

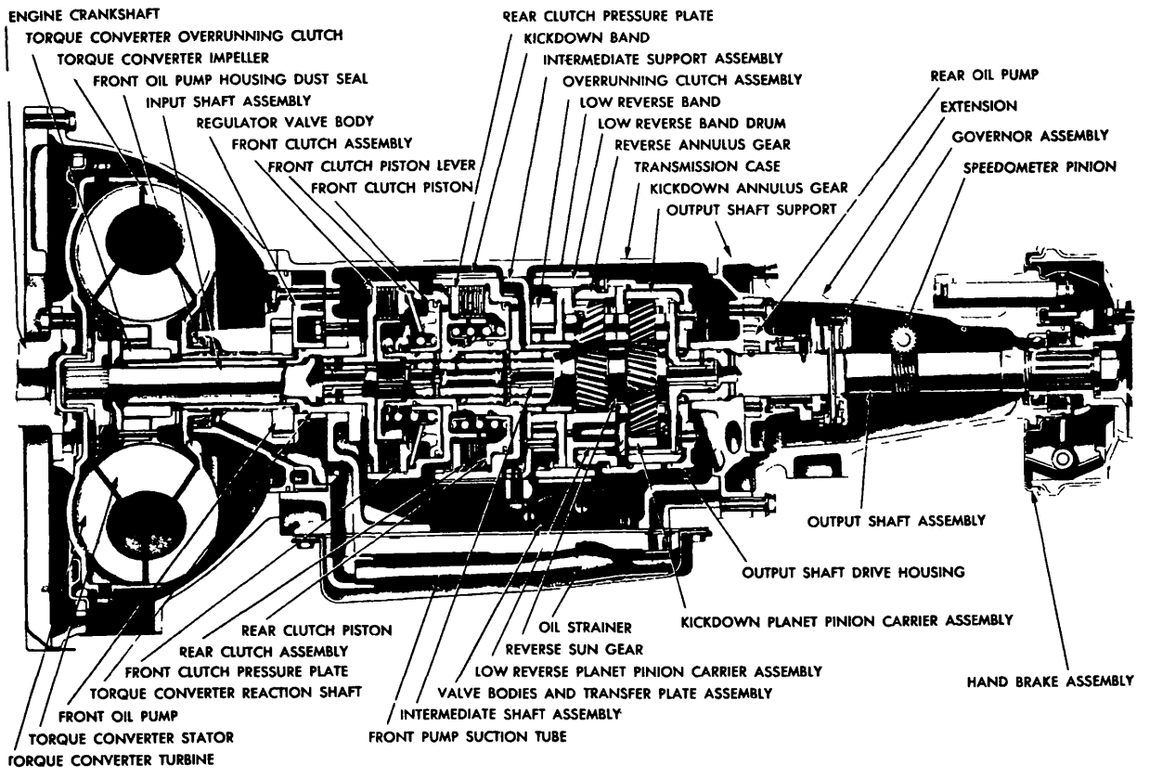
►*STARTING ENGINE BY PUSHING CAR: (Towing car to start is not recommended because of sudden surge of power when engine starts).* Turn ignition switch on, then push the "1" (Low) button in and depress accelerator pedal slightly. After car attains a speed of 15 MPH, the transmission will start engine.



►*TOWING TORQUE-FLITE CARS: Following procedure is recommended:*

Transmission Operating Properly—Car may be towed safely in "N" (Neutral) position at moderate speeds. For long distance towing (over 100 miles), the propeller shaft should be disconnected.

Transmission Inoperative—Tow car with rear end raised or remove the propeller shaft.



►*1961 TORQUEFLITE 8 TRANSMISSION HARSH 1-2 UPSHIFT ON LIGHT THROTTLE CORRECTION:* **With transmission at normal operating temperature, fluid level at proper height and engine at proper idle speed, adjust throttle valve linkage (see "CARBURETOR" on Car Model pages). Road test car and if condition still exists, proceed as follows: Adjust kickdown band (see below) as outlined. If harsh upshift still exists and transmission serial number is between 1,765,601 and 1,780,390, change throttle valve adjustment by shortening carburetor-to-bellcrank rod 1/8-1/4". *CAUTION - Do not shorten rod in excess of 1/4" as this may cause excessive delay in shift pattern.***

►*1961 TORQUEFLITE 8 TRANSMISSION GOVERNOR BUZZ CORRECTION (Transmissions up to Trans-Serial No. 1730284):* **Make sure buzz is not caused by incorrect fluid level (either overfilled or insufficient fluid), or missing oil inlet strainer seals. If buzzing exists after making necessary corrections, proceed as follows: Remove transmission extension housing, governor and rear oil pump housing, then drill a 1/32" hole in top of pump housing (see illustration). Thoroughly clean housing and reassemble transmission. When installing governor and governor support, be sure sealing ring gaps are 180° apart. *NOTE - "Buzzing" may also be corrected by installing a new front and rear pump check valve (see "Production Change" following).***

PUMP HOUSING

►*1961 TORQUEFLITE 8 TRANSMISSION FRONT & REAR PUMP CHECK VALVE PRODUCTION CHANGE:* **A new check valve assembly, Part No. 2204843 is being used in production beginning with Transmission Serial No. 1730284 to keep rear pump filled at all times and prevent air getting into governor hydraulic circuit. This new valve assembly may be installed on earlier cars to prevent governor "buzz". *NOTE - When installing valve, make sure drilled hole is toward outside of regulator body.***

TORQUEFLITE TRANSMISSION SECTIONAL VIEW

►*1960-61 TORQUEFLITE 8 TRANSMISSION "NO REVERSE" CONDITION CORRECTION & CONTROL VALVE BODY PRODUCTION CHANGE:* **Beginning with Transmission Serial No. 1821718, a new lip type seal has been added to bottom of blocker valve and a new transfer plate (with a smaller opening into the bore for governor pressure) has been incorporated in production to prevent reverse blocker valve from sticking. Later transmission with the above changes are identified by a "W" stamped on transmission case rail. On earlier transmissions, a sticking reverse blocker valve can be corrected by installing Blocker Valve Spring & Seal Package, Part No. 2275523 as follows: Remove valve body, then remove reverse blocker end plate, valve and spring from transfer plate. Separate valve body and steel plate from transfer plate. *NOTE - Unl ss oil is v ry dirty, it is not n c ssary t remov ther valves from valv body.* Clean reverse blocker valve bore with crocus cloth, then allow parts to soak in a suitable solvent for a few minutes. Wash all parts and blow dry with air. Assemble valve body using parts in the above service package and install valve assembly in transmission. Adjust transmission as necessary and check operation.**

►*TORQUEFLITE BAND ADJUSTMENT NOTE:* **Kickdown band adjusting screw back-off specifications will be stamped on right side pan rail of transmission between transmission serial number and transmission part number (forward end of case). Reverse band adjustment is 2½ turns. Adjustment procedures remain the same as previous models.**

DESCRIPTION: **Design is same as used on previous models except that rear clutch piston retainer and pressure plate have been modified by decreasing the clearance between pressure plate drive lugs and grooves in piston retainer. The new pressure plate is also used in front clutch assembly.**

LUBRICATION

Checking Fluid Level: Check fluid level every 1000 miles with transmission at normal operating temperature. Apply parking brake and idle engine, then depress each button, returning to neutral after button is pushed in. Fluid level should be at "F" (Full) mark or slightly below (never above "F" mark). Add or remove transmission fluid as necessary.

R c mm nd d Fluid - Automatic Transmission Fluid Type "A" (Suffix "A").

►*NOTE: If fluid is check d with transmissi n c ld, fluid l v l should be at "L" (L w) mark r slightly below.*

CONTINUED ON NEXT PAGE

TORQUEFLITE EIGHT (C nt.)

℄T rqueFlite Fluid Capacity

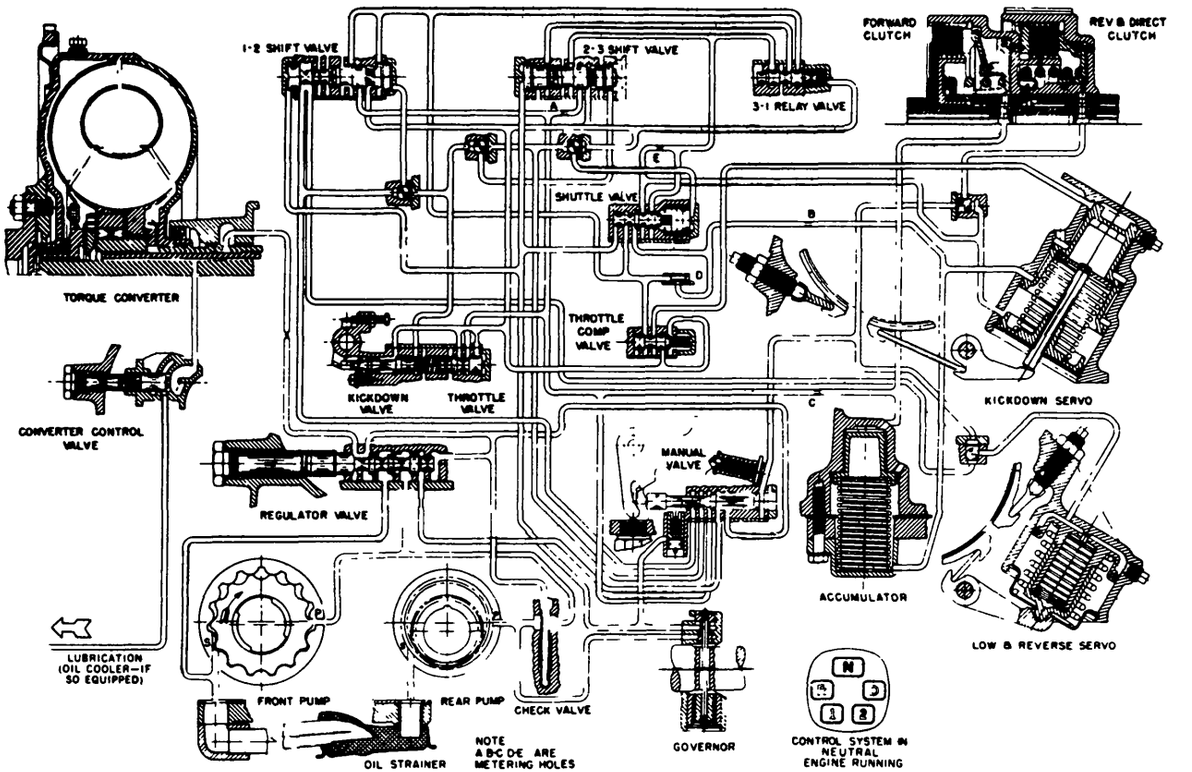
Engin	Capacity
318"	18 pts.
All Others	21 pts.

℄ - Approximate capacity. Total fluid required should be determined by measuring with dipstick. See *"Checking Fluid Level" above.*

Draining & R filling: Drain transmission every 10,000 miles. To drain, remove oil filler tube from transmission oil pan, then remove access plate at flywheel cover and drain torque converter by removing plug. After draining, replace converter plug and oil filler tube and aud 5 qts. of Automatic Transmission Fluid Type "A" (Suffix "A") through transmission oil filler tube. Start engine and run at idle speed for two minutes (depress each button for at least two seconds while engine is idling), then add three quarts of fluid. Check fluid level and add necessary fluid to bring level to within ¼" of "Add One Pint" mark but never above the mark.

►*TRANSMISSION MAINTENANCE NOTE:* It is recommend d that when transmission is drained, oil pan should be r moved and cleaned, oil screen cleaned, and transmission bands and linkage adjusted.

►*CONVERTER FLUSHING NOTE:* Converter assembly can be flushed as follows: With transmission removed (converter attached to engine), drain converter and install drain plug. Reach through starter hub with a screwdriver and lift on side of hub spline to turn starter counterclockwise. Sight through opening and make sure rectangular slots on rear face of starter are aligned vertically. Use a container with a long spout and slowly pour two quarts of clean kerosene into converter. Tape hub opening, then disconnect coil wire and rotate engine with starter for approximately 10 seconds. Drain converter and repeat the flushing procedure as necessary. To completely drain converter, remove drain plugs and use starter to rotate converter until all kerosene is thrown out of openings.



LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See "Carbur tor" on car model pages.*

Manual C ntr l Cable Adjustment: 1) With car raised on a hoist, have an assistant fully depress "R" (Reverse) pushbutton and hold it down. Remove pushbutton control cable adjustment wheel lock screw at left side of transmission case.

2) Back adjustment wheel off on cable guide (turn counterclockwise) until only two or three threads are showing behind the wheel on the guide. *CAUTION - Ch ck wheel for fr turning on guide and remove any burrs in thr ads that might interfere. Lubricate threads with a f w dr ps of transmission fluid.*

3) Hold cable guide center in hole of transmission case and apply only enough inward force to bottom the assembly at reverse detent. While holding cable bottomed, rotate adjustment wheel clockwise until it just contacts case. Turn wheel just enough clockwise to make next adjustment hole in wheel line up with screw hole in case.

TORQUEFLITE TRANSMISSION HYDRAULIC CIRCUITS

4) Counting this hole as number one, continue turning the wheel clockwise until the fifth hole lines up with screw hole in case. Install lockscrew and tighten to 30-50 inch pounds.

Neutral Safety Switch Adjustment: With concave spring (cupped) washer installed on neutral safety switch with cupped side of washer toward transmission case, install "O" ring seal up against the washer. Install switch into case until spring washer contacts case, then tighten **one-third of a turn.** Refill transmission to proper level and check operation of switch. Engine should start only when "N" (Neutral) pushbutton is in depressed position.

BAND ADJUSTMENT

►*KICKDOWN BAND ADJUSTMENT NOTE:* Kickdown band adjusting screw back-off specifications will be stamped on right side pan rail of transmission between transmission serial number and transmission part number (forward end of case). Reverse band adjustment is 2½ turns.

Kickdown (Front) Band: Kickdown band adjusting screw is located on left side of transmission case. With a ¾" wrench, back off locknut approximately 5 turns. Check freeness of adjusting screw in transmission case, then tighten adjusting screw to **70-75 inch p unds** using torque wrench (Tool C-3380). *NOTE - If Adapt r,* C-3583 or C-3705 (depending on accessibility) is used with torque wrench, tighten until reading on torque wrench is 47-50 inch pounds. Adapter Tool C-3583 or C-3705 must be used if band is adjusted with transmission in car. Using a reference mark of chalk or colored pencil on corner of adjusting screw and transmission case, **back the adjusting screw out exactly th number of turns indicated in table below.** While holding adjusting screw stationary, tighten locknut to 35-40 ft lbs.

Kickdown Band Adjustment

Car Model	Adjustment
Chrysler & DeSoto (All Models)	2½ turns
Dodge & Plymouth (318" Engine)	2½ turns
Dodge & Plymouth (361", 383", 413" Engs.)	2 turns

Low-Reverse (Rear) Band: Low-reverse band adjusting screw is located on right side of transmission case. With a ¾" wrench, back off locknut approximately 5 turns. Check freeness of adjusting screw in transmission case, then tighten adjusting screw to **70-75 inch pounds** using torque wrench (Tool C-3380). *NOTE - If Adapter, C-3583 is us d with t rqu wr nch, tight n until reading on torque wrench is 47-50 inch p unds. Adapter, Tool C-3583, must be used if band is adjusted with transmissi n in car.* Use a reference mark of chalk

or colored pencil on corner of adjusting screw square and transmission case, then **back adjusting screw out exactly 2½ turns** (all models) While holding adjusting screw stationary, tighten locknut to 35-40 ft lbs

TESTING

ROAD TESTING TRANSMISSION: *NOTE - Before road testing, engine must be properly tuned and idle speed set to correct specifications* With engine at normal operating temperature and fluid at proper level, all shifts and kickdowns should occur within the speed ranges given in "Shift Pattern" tables below

►*ROAD TESTING NOTE- All shift speeds may vary somewhat due to production tolerances, type of engine, rear axle ratios and tire sizes All shifts, however, should be smooth, responsive and without noticeable engine runaway*

HYDRAULIC CONTROL PRESSURE TESTS: *NOTE-Use Pressure Gauge C-3293 (300#) for all the following tests.*

Line Pressure: Remove the 1/8" pipe plug from line pressure take-off hole located on left side of transmission case (lower plug forward of control lever and cable connection) Install pressure gauge at this point and make the following tests.

Line Pressure Tests (Cars Without Ram Manifold)

Pushbutton Depressed	Rear Wheels	Engine Speed (RPM)	Pressure (Lbs.)
R	Free	1600	200-240
N		1200	85-95
D	Free	1200	89-91
2	Free	1200	85-95
1	Free	1200	85-95
D	Free	3500	95-100

SHIFT PATTERN TABLE (MPH)

SHIFT CONDITION	CHRYSLER					DESOTO	
	Newport	Windsor	New Yorker	Imperial	300-G ①	2.93-1 ② Axle	3.31-1 ③ Axl

① - Ram Manifold. ② - Standard. ③ - Optional.

Line Pressure Tests (Cars with Ram Manifold)

Pushbutton Depressed	Rear Wheels	Engine Speed (RPM)	Pressure (Lbs)
R	Free	1600	235-275
N		1200	100-110
D	Free	1200	104-106
2	Free	1200	100-110
1	Free	1200	100-110
D	Free	3500	108-115

Line Pressure Adjustment: With transmission in "D" (Drive) range and engine operating at 1200 RPM, turn adjusting screw in regulator valve spring retainer (on right side of transmission directly below torque converter control valve) clockwise to increase pressure and counterclockwise to decrease pressure, until pressure is within specified limits as indicated in tables

CONTINUED ON NEXT PAGE

TORQUEFLITE EIGHT (C nt.)

G v rn r Pr ssur : Remove 1/8" pipe plug from governor pressure take-off hole located on lower left side of transmission case (at rear of case in output shaft support) Install pressure gauge at this point and make the following tests:

(Chrysler)

Pushbutton Depr ssed	Car Speed Newp rt	Windsor	Governor Pressure
2	18-22 MPH	18-22 MPH	15 psi
D	41-50 MPH	43-51 MPH	50 psi
D	69-77 MPH	72-80 MPH	75 psi

2	860-970	15 psi
D	1830-2100	65 psi
D	2550-2800	85 psi

℄ - Tests are made with rear wheels free to turn.

►*NOTE: If governor pressure is not correct and does not correspond to engine RPM or car speed (see tables above), refer to "Trouble Shooting & Diagnosis".*

Lubricati n Pressur : Remove 1/8" pipe plug from pressure take-off hole located on left side of transmission case (middle plug forward of control cable and lever connection) Install pressure gauge at this point and proceed as follows: With engine running at 800 RPM in neutral, lubrication pressure should be approximately 10-30 lbs If pressure is incorrect, check line pressure and see "Trouble Shooting & Diagnosis" below. If pressure is extremely high, it is an indication of a restriction due to dirt or foreign matter in lubrication passages.

TORQUEFLITE OIL PASSAGES IN TRANSMISSION CASE

Throttle Pressure: With car off floor and wheels free to turn, install a 100 lb. pressure gauge (Tool C-3292) at throttle pressure take-off plug at top of kickdown servo on right side of transmission. Disconnect bellcrank-to-throttle linkage at transmission, then start engine and place transmission in "2" (second) position. While holding transmission throttle lever **toward closed throttle position** (against internal stop), increase engine speed slowly (using accelerator or suitable throttle control fixture) to approximately 850 RPM to obtain upshift into second speed. After shift takes place, compensated throttle pressure should read 10-16 lbs. As throttle lever at transmission is advanced toward full throttle, compensated throttle pressure should begin to rise after approximately 5° of movement. If compensated throttle pressure rises immediately when lever is moved or if pressure is incorrect or fails to rise after approximately 5° movement, adjust throttle valve pressure (see below) Before stopping engine, advance throttle control lever at transmission slowly, then return to closed position. Pressure should rise to 80-90 lbs., then fall smoothly without hesitation and return to consistent reading at closed throttle. If necessary, clean valve body assembly and repeat tests.

Throttle Valve Pressure Adjustment: Adjust throttle valve link at slotted end to obtain correct throttle valve pressure *NOTE - To aid in future adjustments, it is recommended that the throttle valve stopscrew inside transmission be correctly set as follows: Push in "N" (Neutral) button, then block carburetor choke valve in wide open position Drain transmission fluid and remove oil pan Adjust transmission throttle valve stopscrew so that end of stopscrew just contacts throttle lever with the accelerator pedal released, then tighten stopscrew lockout. Install transmission oil pan and refill transmission.*

AIR PRESSURE TESTS: The front clutch, rear clutch, kickdown servo, and low and reverse servo may be checked by applying air pressure to their respective passages when valve body is removed *(CAUTION – Air supply must be free of all dirt and moisture).* Refer to "Oil Passages in Transmission Case" illustration for location of air passages.

1) Raise car on hoist, drain transmission fluid and remove transmission oil pan.

2) **Front Clutch**–Remove accumulator cover. Apply pressure to front clutch passage. Listen for a dull thud which indicates that front clutch is operating. Hold air pressure on for a few seconds and check for excessive oil leaks in system.

3) **Rear Clutch**–Remove valve body assembly and apply air pressure to rear clutch passage. Listen for a dull thud which indicates that rear clutch is operating. Check for excessive oil leaks.

4) **Kickdown Servo**–Apply air pressure to kickdown "apply" (line)) pressure passage. Observe operation of kickdown servo, lever and band when air pressure is applied. Apply air pressure to "apply" (compensated throttle) pressure passage and observe operation of kickdown servo.

5) **Low & Reverse Servo**–Apply air pressure to low & reverse servo passage and observe operation of servo, lever, and band.

►*AIR PRESSURE TEST NOTE: If all the above units operate properly, "no drive" "erratic" and "no up-*

CONTINUED ON NEXT PAGE

TORQUEFLITE EIGHT (C nt.)

shift" conditions are caused by trouble in the control valve assembly.

TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Except where noted, the following operations can be performed without removing the transmission from the car.*

LINE PRESSURE INCORRECT: Oil level incorrect. Check for stuck or scratched regulator valve or buckled spring. Check kickdown servo for broken seal rings, stuck piston or broken linkage. Check low & reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Check for possible leak at front pump suction tube, tube elbow or rear pump suction tube. Check for loose bolts, burrs or scratches on mating surfaces of valve body. Clean valve assembly and check for stuck valves, dirt, scratched valve or body, and burrs on valves. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Check regulator valve body for scratches and scoring on valve bores and face which bears against front pump housing. Examine regulator valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

GOVERNOR PRESSURE INCORRECT (Does not correspond to car speeds): Clean governor assembly, and check weight assembly and valve for burrs, scratches or sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. Clean and inspect rear pump assembly for side or diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring.

LUBRICATION PRESSURE INCORRECT: Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter control valve or buckled spring. *Transmission must be removed for the following.* Clean and inspect front pump and drive sleeve for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings Flush out converter and check converter-to-housing runout.

HARSH NEUTRAL-TO-DRIVE OR NEUTRAL-TO-REVERSE SHIFT: Check hydraulic control pressures. Adjust low and reverse band Adjust engine idle speed. Check Low & Reverse servo for torn seal, stuck piston sleeve, broken band or broken linkage. Check accumulator cover screw torque and piston for broken rings. *Transmission must be removed for the following:* Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage Clean and inspect rear discs, plates, return spring and piston Check rear clutch circuit for leakage

DELAYED NEUTRAL-TO-DRIVE SHIFT: Check transmission oil level. Check hydraulic control pressures. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for the following.* Clean and inspect front pump and drive sleeve assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage.

RUNAWAY ON UPSHIFT & 3-2 KICKDOWN: Check transmission oil level. Adjust throttle linkage *(see "Carburetor" on car model pages).* Check hydraulic control pressures. Adjust kickdown band. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for the following* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage

HARSH UPSHIFT & 3-2 KICKDOWN: Adjust throttle linkage *(see "Carburetor" on car model pages).* Check hydraulic control pressures. Adjust kickdown band. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. *Transmission must be removed for the following* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

NO UPSHIFT: Proceed as for "Runaway on Upshift & 3-2 Kickdown" above, and clean governor assembly and check weight assembly and valves for burrs, scratches and sticky operation Examine governor valve shaft, shaft snap rings and seal rings

NO KICKDOWN OR NORMAL DOWNSHIFT: Proceed as for "Runaway on Upshift & 3-2 Kickdown" above Check control cable adjustment Adjust low and reverse band *Transmission must be removed for the following* Clean and inspect overrunning clutch assembly for brinnelled rollers and cam, and improperly assembled rollers and springs

SHIFTS ERRATICALLY: Check transmission oil level Adjust throttle linkage *(see "Carburetor" on car model pages).* Check control cable adjustment Check hydraulic control pressures Check for stuck or scratched regulator valve or buckled spring Check output shaft rear bearing for roughness or an unseated snap ring Check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube Check control valve body for loose bolts, burrs or scratches on mating surfaces Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Test transmission units with air pressure (see above) Clean governor assembly and check weight assembly and valve for burrs, scratches and sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. *Transmission must be removed for the following* Clean and inspect front pump and drive sleeve assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings.

SLIPS IN FORWARD DRIVE POSITIONS: Check transmission oil level. Check hydraulic control pressures. Check control valve body for loose bolts, burrs or scratches on mating surfaces Check for stuck valves, dirt, scratched valves or body, and burrs on valves Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings Test transmission units with air pressure. *Transmission must be removed for the following* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston Check rear clutch circuit for leakage. Clean and inspect the overrunning clutch assembly for brinnelled rollers or cam, and improperly assembled rollers and springs.

SLIPS IN LOW-REVERSE ONLY: Check hydraulic control pressures Adjust low-reverse band. Check low-reverse servo for torn oil seal, stuck piston sleeve, broken band or linkage. Check control valve body for loose bolts, burrs, scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves Tighten valve body bolts to correct specifications Test transmission units with air pressure. *Transmission must be removed for the following:* Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump Examine valve body to determine if the secondary reaction orifice is free of dirt. Check gasket for uniform compression by valve body

SLIPS IN ALL POSITIONS: Check transmission oil level. Check hydraulic control pressures Check for a stuck or scratched regulator valve or buckled valve spring. Check control valve body for loose bolts, burrs or scratches on mating surfaces Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Test transmission units with air pressure (see above). *Transmission must be removed for the following* Clean and inspect front pump and drive sleeve assembly for side and diametral clearance Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump Examine valve body to determine if the secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body

NO DRIVE IN ANY POSITION: Proceed as for "Slips in all Positions" above, and in addition, check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube

NO DRIVE IN FORWARD RANGES: Check hydraulic control pressures Adjust kickdown band Check kickdown servo for broken seal rings, stuck servo piston or broken linkage Check control valve body for loose

CONTINUED ON NEXT PAGE

TORQUEFLITE EIGHT (C nt.)

bolts, burrs or scratches on mating surfaces Check for stuck valves, dirt, scratched valves or body, and burrs on valves Tighten valve body bolts to correct specifications Check accumulator cover screw torque and piston for broken rings Test transmission units with air pressure (see above) *Transmission must be r moved for the following* Clean and inspect front clutch discs, plates, drive hub, return spring and piston Check front clutch circuit for leakage. Clean and inspect rear clutch discs, plates, drive hub, return spring and piston Check rear clutch circuit for leakage Clean and inspect overrunning clutch assembly for brinnelled rollers or cam, and improperly assembled rollers and springs

NO DRIVE IN REVERSE: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect rear clutch disc, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

DRIVES IN NEUTRAL: Adjust gearshift control cable. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications *Transmission must Le removed for the following:* Clean and inspect front clutch disc, plates, drive hub, return spring and piston. Check front clutch circuits for leakage.

DRAGS OR LOCKS: Adjust kickdown band and the low-reverse band. Check handbrake for excessive drag. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check low-reverse servo for torn oil seal, stuck piston sleeve, broken band or linkage. *Transmission must be removed for the following* Clean and inspect discs, plates, drive hub, return spring and piston of both front and rear clutches. Check front and rear clutch circuits for leakage. Clean and inspect planetary gear set for worn thrust washers, nicked or rough gear teeth, and excessive pinion clearance. Clean and inspect overrunning clutch assembly for brinnelled rollers and cam and improperly assembled rollers and spring

GRATING & SCRAPING NOISES: Check handbrake for excessive drag. Check output shaft rear bearing for roughness or an unseated snap ring. Clean governor assembly, and check weight assembly and valves for burrs, scratches, or sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. Clean and inspect rear pump assembly for side or diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support for scoring. *Transmission must be removed for the following* Clean and inspect front pump assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect front and rear clutch discs, plate, drive hubs, return spring and pistons. Check front and rear clutch circuits for leakage. Clean and inspect planetary gear set for worn thrust washers, nicked or rough gear teeth, and excessive pinion clearance.

BUZZING NOISES: Check transmission oil level. Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter valve or buckled spring. *Transmission must be removed for the following:* Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump housing. Examine valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

TRANSMISSION HARD TO FILL (Oil blow out filler tube): Check transmission oil level. Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter valve or buckled spring. Check to determine whether tube is free of dirt. Check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube. *Transmission must be removed for the following:* Clean and inspect front pump assembly for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against front pump housing. Examine valve body to determine if secondary reaction orifice if free of dirt. Check gasket for uniformness of compression by valve body.

TRANSMISSION OVERHEATS: Check transmission oil level. Adjust kickdown band and low-reverse band. Check handbrake for excessive drag. Check regulator and converter valves for stuck or scratched valves or buckled springs. Check for mud, dirt, or other foreign material on screens or torque converter cooling fins. Clean and inspect rear pump assembly for side and diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side and diametral appearance. Examine oil pump inner and outer rotor for scoring. Check drive sleeve seal rings. Check and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump housing. Examine the valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body. Clean and inspect front and rear clutch discs, plate, drive hubs, return spring and piston. Check front and rear clutch circuits for leakage.

IMPOSSIBLE TO PUSH CAR: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Check valve body for loose bolts, burrs or scratches on mating surfaces. Clean valve body assembly, check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Clean and inspect rear pump assembly for side and diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring.

STARTER WILL NOT ENERGIZE: Adjust gearshift control cable. Adjust engine idle speed.

GEARSHIFT CONTROL UNIT

PUSH BUTTON CONTROL UNIT: R m val (All Mod ls) - Disconnect battery cable, then disconnect back-up light switch wire at push button control and illuminating lamp leads at rear of instrument panel *NOTE - On Imperial, remove speedometer for access to rear of control unit* Remove screws of push button face plate and remove push buttons by pulling them off button slide Remove lamp bulb Remove control housing stud nuts and remove control and cable from rear of instrument panel Remove clip attaching control cable to actuator and the screws holding cable bracket to control housing

Installation: Insert end of cable on actuator and install clip, then place cable bracket on control unit and install screws securely Carefully guide unit from rear of instrument panel and install nuts Install lamp bulb and pushbuttons Replace front plate, then connect back-up switch wires and illuminating lamp wires Connect battery cable On Imperial models, reinstall speedometer

MANUAL CONTROL CABLE: Removal - Drain approximately 2 quarts of fluid from transmission, then engage the "1" (first) push button Remove control cable adjustment wheel lockscrew, then remove neutral starter switch, cupped washer and seal With a screwdriver inserted through neutral starter switch opening, push gently against upward projecting portion of control cable adapter spring and pull outward on cable and remove the assembly from case

Installation: Have an assistant hold "R" (Reverse) button firmly depressed, then back adjusting wheel off on cable guide until two or three threads are showing behind wheel on guide Lubricate cable guide threads and "O" ring with a few drops of transmission oil Insert cable end in adapter, and slide cable assembly into case until manual lever assembly bottoms on reverse detent At this point, cable will lock to the adapter Pull out on cable assembly to make sure that adapter spring has engaged cable end Adjust cable, see "Linkage Adjustment" above Reinstall neutral starter switch and refill transmission to proper level

GEARSHIFT UNIT LAMP BULB REPLACEMENT: Remove gearshift housing and plate (see above) Remove one or more push buttons for clearance Replace defective or burned out bulb Replace control housing and plate assembly Test operation of unit

BACK-UP LIGHT SWITCH REPLACEMENT: Remove gearshift control housing and plate (see above) Back-up light switch is fastened to control unit by four tabs Remove lead wires, then straighten tabs to remove switch. To install, position switch and bend tabs to secure switch to housing Reconnect lead wires Check reverse slide action (slide should freely return for full travel) Install gearshift control housing

GEARSHIFT CONTROL UNIT TROUBLE SHOOTING & DIAGNOSIS

LOW & REVERSE BUTTONS REQUIRE HEAVY PRESSURE TO LOCK: Adjust manual control cable. S *"Manual Control Cable Adjustment" abov* .

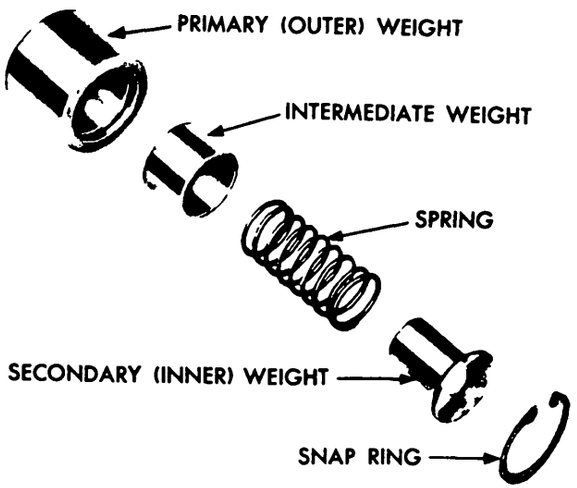
CONTINUED ON NEXT PAGE

TORQUEFLITE EIGHT (C nt.)

"CLUNKING" NOISE WHEN BUTTON RETURNS: Remove control unit and replace rubber bumper if missing or damaged.

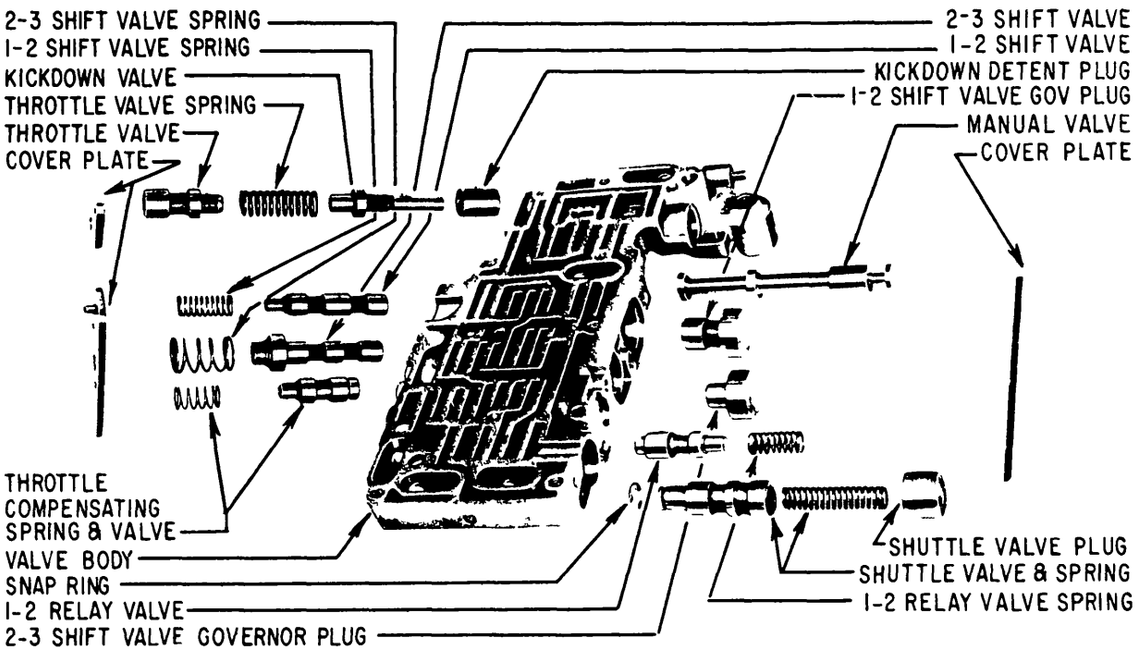
PUSH BUTTON WILL NOT RETURN: Remove control unit and replace broken or defective return spring.

PUSH BUTTON WILL NOT LOCK: Replace operating slide.



PUSH BUTTON BINDS: Replace operating slides if warped. Align bezel so push buttons are centered. Position light lead wire as outlined under "Gearshift Control Unit Installation" above. Carefully relieve area where push button contacts felt. This can be done by inserting a .005" feeler gauge between push button cover and the felt mask. Gently moving the gauge in and out in this area will usually relieve the binding condition. Should it become necessary to replace or reglue the mask, use a suitable adhesive and place glue in an area where it will not interfere with operation of the push buttons.

LOOSE PUSH BUTTON COVER: Remove bezel to expose push button. Using a small screwdriver, exert sufficient pressure to force tang into plastic recess on push button.



TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

Procedures are the same as for previous models except as indicated *See "TorqueFlite Transmission" in 1958 Annual Data or later Manual edition and note the following*

VALVE BODY & TRANSFER PLATE: Removal - *NOTE - It is not necessary to disconnect control cable at transmission to permit removal of valve body with transmission in car* Drain transmission and remove oil pan, then engage the "R" (Reverse) push button Disconnect throttle linkage and remove throttle valve lever and washer Remove manual control lever-to-control cable adapter stud nut and remove oil strainer transfer plate bolts and lower valve body and transfer plate assembly

TORQUEFLITE GOVERNOR ASSEMBLY

TORQUEFLITE CONTROL VALVE ASSEMBLY

Installation: Clean mating surfaces and check for burrs on transmission case and valve body transfer plate. Place manual lever in reverse position (all the way in), then install accumulator piston spring into recess in top of transfer plate and carefully guide the spring up into accumulator piston as transfer plate and valve body are placed up against transmission case. At the same time, index cable adapter stud into manual control lever. Install transfer plate bolts and washers (leave four holes open to attach oil strainer) and draw down evenly and tighten to 14-16 ft. lbs. Install oil strainer and tighten the four bolts in the same manner. Install cable adapter stud nut securely and tighten, then install throttle valve lever and washer and reconnect throttle linkage. Install oil pan and fill transmission with recommended lubricant. See "Draining & Refilling" above.

TRANSMISSION REMOVAL & INSTALLATION

REMOVAL: 1) Disconnect battery, then push in the "R" (Reverse) button on control panel and raise car on a hoist Drain transmission and torque converter After draining, replace converter drain plug and tighten

2) Disconnect front universal joint and secure propeller shaft out of way Remove brake adjusting screw cover plate and loosen cable clamp bolt on parking brake support Disengage ball end of cable from operating lever and remove cable from brake support

3) Disconnect speedometer cable and housing at transmission, then disconnect neutral switch wire and throttle control linkage from throttle lever Remove push button control cable adjustment wheel locking screw and neutral starting switch

4) Insert a screwdriver through neutral starting switch hole, contact top end of cable-to-adapter locking spring and while releasing the lock, pull out cable Disconnect oil cooling lines from transmission

5) Install engine support, Tool C-3487 *NOTE - On some models it may be necessary to remove starter to provide clearance for fixture* Adjust tool to support engine, then raise engine slightly and remove crossmember to torsion bar bracket bolts *CAUTION - When using Tool C-3487, do not lower engine more than three inches from floor pan*

6) *NOTE - Rear motor support and bracket may be left on transmission extension during repairs* Remove the two transmission case to torque converter housing screws and lockwashers from right side and install guide studs, Tool C-3276 With transmission supported, remove two transmission to torque converter housing screws and lockwashers from left side Slide transmission straight back to avoid damage to front oil pump driving sleeve, then lower to floor

INSTALLATION: 1) Install guide studs, Tool C-3276, in two transmission mounting holes in right side of torque converter housing, then with front oil pump drive sleeve lubricated, install it making sure the driving lugs are properly engaged with oil pump pinion *NOTE - Main portion of drive sleeve will be flush with front of pump housing when properly installed*

2) Note position of driving lugs inside torque converter hub, then position front pump drive sleeve on transmission accordingly to aid in proper engagement when

CONTINUED ON NEXT PAGE

TORQUEFLITE EIGHT (C nt.)

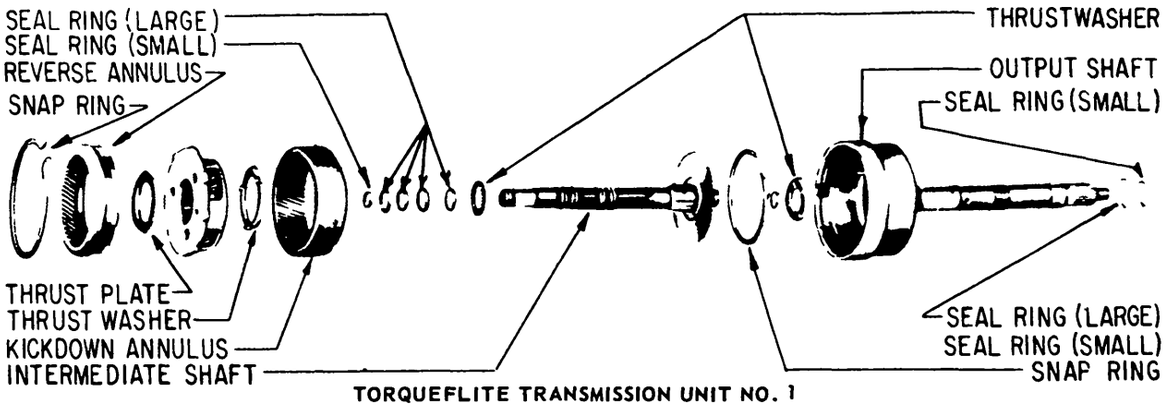
transmission installed Slide transmission over guide studs and into position against converter housing Make sure driving lugs on front oil pump drive sleeve properly engage torque converter *CAUTION - To avoid damage to front oil pump, do not use transmission-to-torque converter housing screws to force transmission and housing togeth r*

3) Install two transmission-to-torque converter housing screws on left side but do not tighten Remove guide studs and install the other two bolts on right side Tighten all four bolts evenly to 40 ft lbs

4) Place crossmember in position and tighten crossmember-to-torsion bar bracket bolts securely Lower the engine and at the same time align mounting bolts in insulator bracket with holes in rear spring mount plate Install nuts and tighten to 35 ft lbs then remove Tool C-3276

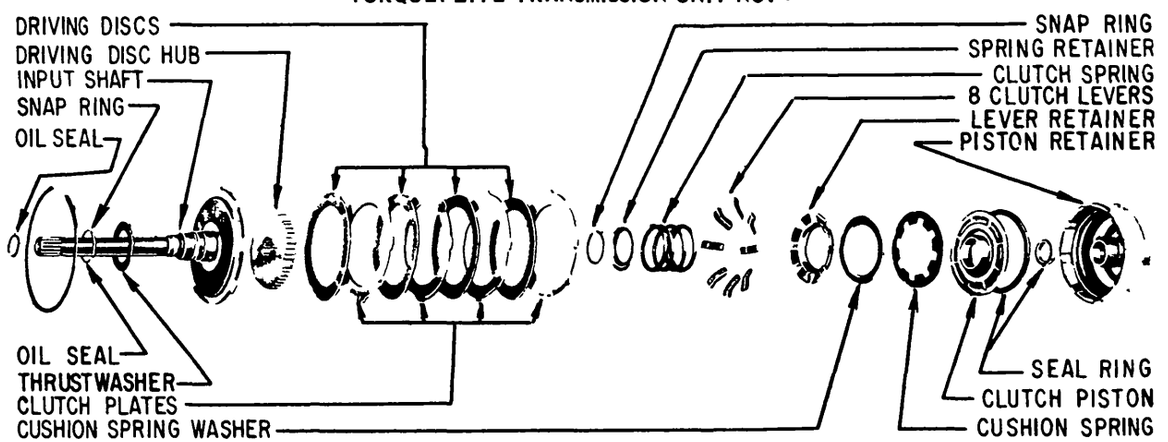
5) Install oil cooling lines and connect neutral starting switch wire Install oil pan filler tube nut and tighten to 40 ft lbs Connect speedometer cable, then engage ball end of parking brake cable in operating lever and tighten cable clamp bolt Install brake adjusting screw cover plate on parking brake support Connect front universal and tighten nuts to 37 ft lbs Install starter (if removed)

6) Connect throttle control linkage to throttle lever on transmission, then install push button control cable in adapter, making sure spring lock engages cable Adjust manual control cable (see above) Connect battery, refill transmission with fluid (see above), then adjust throttle linkage



OVERHAUL

See "Torqu Flite Transmission" in 1957 Annual Data r lat r Manual diti n and note the following:



FRONT & REAR CLUTCH ASSEMBLIES: The number of clutch plates and discs in each unit is dependent on car model. Reinstall the same number of plates and discs as removed from clutch assembly.

VALVE BODY & TRANSFER PLATE (ONE-PIECE TYPE): Disass mbly - 1) Place valve body and transfer plate assembly in stand, Tool C-3528, with operating lever shafts downward. *CAUTION - Do not clamp any porti n f valv body assembly in a vise or use f rc wh n r moving r installing valves andplugs.*

2) Remove reverse blocker valve retainer plate, blocker valve and spring, then remove cross recess screws holding valve body, valve body steel plate, and transfer plate together. *NOTE - Whil removing, h ld valv body to prev nt l ss f any f th six ball checks. Not the l cati n f thes balls for proper installation. All ch ck valv balls ar th sam size.*

TORQUEFLITE TRANSMISSION UNIT NO. 1

TORQUEFLITE TRANSMISSION UNIT NO. 3

3) Remove shuttle valve and governor plug cover plate, then remove shuttle valve plug and spring. Remove 1-2 relay valve spring, valve and governor plug. Remove 2-3 shift valve governor plug, then remove manual valve and shuttle valve.

4) On opposite side of valve body, remove shift valve cover plate, then remove 1-2 shift valve spring, 2-3 shift valve spring, 1-2 shift valve, and 2-3 shift valve Remove throttle compensating valve spring and valve Remove throttle valve cover plate, throttle valve and spring Remove kickdown valve and detent plug.

Reassembly: Reassemble valve body by reversing disassembly procedure (see above), then set valve body steel plate and transfer plate over stand pilots, Tool C-3528 With all ball checks in place, position valve body up against transfer plate and valve body steel plate, then install attaching recess screws and washers Tighten all screws evenly to 25-30 inch pounds. *CAUTION - If this plate is incorrectly positioned, gov rnor pressure leakage willr sult. When correctly install d th edge of plate will align flush with edge of valv body transfer plat , compl tely covering blocker valv b re and governor pressure passag in transfer plate*

FRONT CLUTCH (8 LEVER): Disassembly - With front clutch assembly removed from transmission, remove input shaft fibre thrust washer and snap ring, then remove input shaft from piston retainer Invert retainer and remove driving discs, plates, pressure plate and hub Install spring compressor, Tool C-3533 and compress spring retainer Use snap ring pliers and remove spring retainer snap ring Remove compressor tool, then remove spring retainer, spring, levers, lever retainer, cushion spring washer, and cushion spring from retainer With a twisting motion, remove piston from retainer Remove outer seal ring from piston, then remove inner rubber seal ring from hub of retainer

Reassembly: Lubricate and install inner rubber seal ring on hub of retainer, making sure lip of seal is facing rear of retainer and seal is seated in groove Lubricate and install seal ring on piston with lip of seal towards rear of piston Place piston assembly in retainer using a twisting motion to seat piston in bottom of retainer Install cushion spring with dished (concave) side facing piston, then place cushion spring washer with chamfer towards front of retainer Place lever re-

CONTINUED ON NEXT PAGE

TORQUEFLITE EIGHT (C nt.)

tainer over hub of piston and install levers. Install return spring over hub of retainer and position spring retainer and snap ring on spring. Use compressor, Tool C-3533 and compress spring sufficiently to seat snap ring with snap ring pliers. Remove compressor tool and install pressure plate (smooth side up) in retainer. Install discs and plates by first placing one of the discs in piston retainer followed by a steel plate. Repeat this procedure until all plates and discs have been installed. Check and adjust clutch clearance *(see "Front Clutch Pr ssure Plate Travel Check & Adjustment" below).* Install driving disc hub, then install input shaft by placing input shaft and retainer assemblies in an arbor press with the rear of piston retainer resting on a suitable support. Make sure ball check at rear of retainer does not contact support during pressing operation. Press input shaft into retainer until snap ring can be installed. Remove assembly from arbor press and place thrust washer over input shaft and against thrust surface on input shaft flange.

Front Clutch Pressure Plate Travel Check & Adjustment: To check front clutch clearance, install Rear Clutch Pressure Plate Part No. 1732114 (Used in transmission prior to early 1957), or Rear Clutch Pressure Plate, Part No. 1824319 (Used in Dodge Trucks). *CAUTION– Front Clutch Pressure Plate, Part No. 1736408 (also used in Rear Clutch Assemblies after Late 1957) cannot be used to check front clutch clearance.* Hold this plate firmly in position and insert a feeler gauge between plate and top disc in the assembly. Total clearance should be .020–.040". If measured clearance is not within these limits, the clutch discs should be replaced with any combination of new discs which are furnished in thicknesses of .060–.063", .073–.076", .087–.090" to provide for proper clearance. Remove rear clutch plate (used for checking) and install front clutch hub. Complete assembly as indicated above.

EXTENSION HOUSING BUSHING: R m val - Remove bushing in same manner as for bearing used on previous models. *See "TorqueFlite Transmission" in 1957 Annual Data or later Manual edition.*

Installation: *CAUTION - When positioning bushing in extension housing, make sure lubrication hole in bushing will index with lubrication hole in housing wh n bushing has been driven into position. Pulling the tool out of the bushing seats bushing prop rly and removes any slight irregularities. Do not ream bushing after installation.* Place a new bushing on Tool C-3692, and install in extension housing. Use driver, Tool C-3691, and install oil seal with metal portion of seal facing in, until driver bottoms on extension. Install brake support grease shield with indent on shield matching groove in extension.

CHRYSLER CORP. POWERFLITE AUTOMATIC TRANSMISSION

Dodge V8 & Plymouth V8 (1961)

►CHANGES, CAUTIONS, CORRECTIONS

►*PUSHING CAR TO START ENGINE:* Pushing is recommended rather than towing. With the "N" (Neutral) button pushed in, turn the key to "ON" position. When car reaches a speed of approximately 25 MPH, push in the "L" (Low) button. This will allow the transmission to crank the engine.

►*TOWING POWERFLITE CARS:* Following procedure recommended.

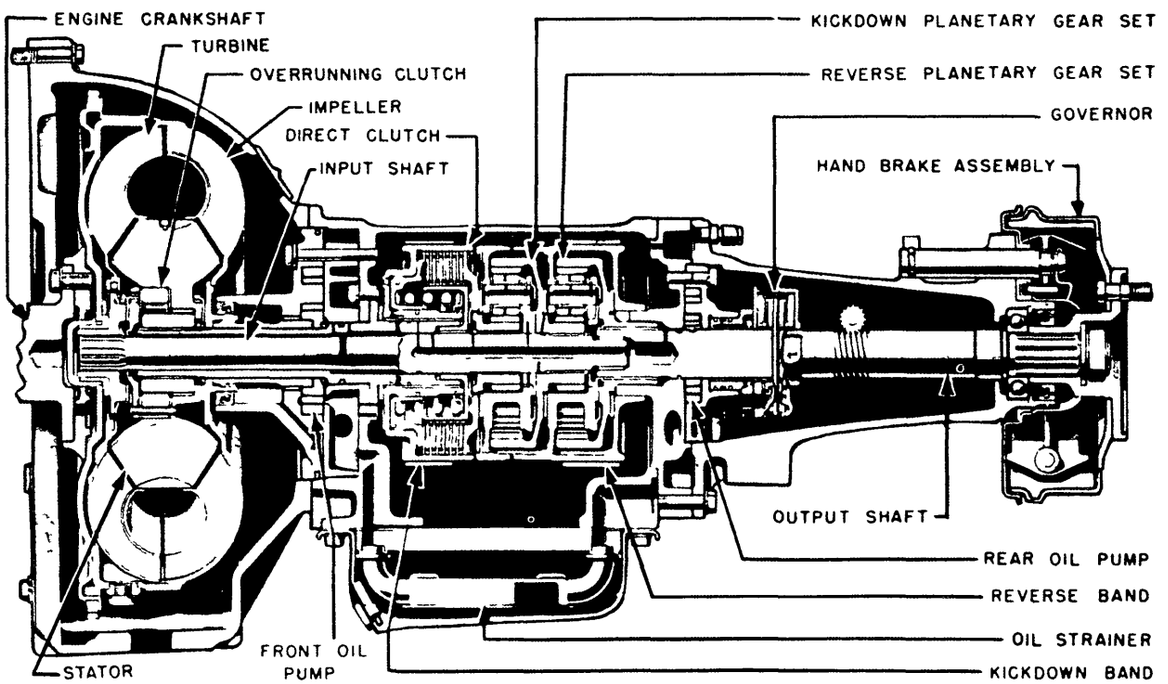
Transmission Inoperative – Disconnect propeller shaft or tow car with rear end raised.

Transmission Operating – The car may be safely towed at moderate speeds with the "N" (Neutral) button pushed in. For long distance towing (over 100 miles), the propeller shaft should be removed.

DESCRIPTION: Same design as used on previous models. Transmission consists of a torque converter and two speed hydraulically operated planetary transmission.

LUBRICATION

Ch cking Fluid Level: Check fluid level every 1000 miles with transmission at normal operating temperature. Apply parking brake and idle engine, then depress each button, returning to neutral after button is pushed in. Fluid level should be at "F" mark or slightly below (never above "F" mark). Add or remove transmission fluid as necessary.



R commended Fluid - Automatic Transmission Fluid Type "A" (Suffix "A").

►*NOTE: If fluid is checked with transmission cold, fluid l vel should be at "L" (Low) mark or slightly below.*

Capacities - 20 pts. (Dodge Dart & Plymouth); 22 pts. (DeSoto); 23 pts. (Dodge).

►*NOTE: Th above ar appr ximat capaciti s. T tal fluid r quir d should be d t rmined by measuring with dipstick. S e "Ch cking Fluid L v l" abov .*

Draining & R filling: Drain transmission every 10,000 miles. To drain, remove oil filler tube from transmission oil pan, then remove access plate at flywheel

POWERFLITE TRANSMISSION SECTIONAL VIEW

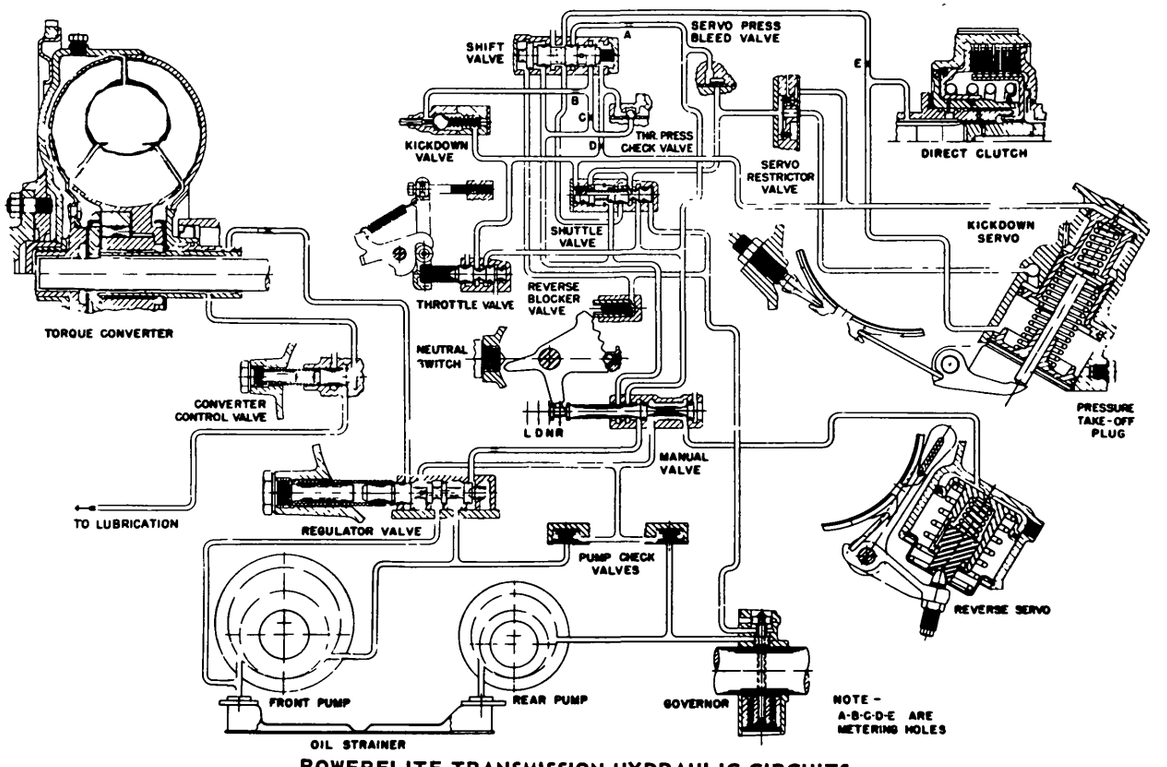
cover and drain torque converter by removing plug. After draining, replace converter plug and oil filler tube and add 5 qts. of Automatic Transmission Fluid Type "A" (Suffix "A") through transmission oil filler tube. Start engine and add approximately 3 qts. while engine is idling. Allow engine to idle for two minutes, then operate all pushbuttons, pausing momentarily at each position, and ending with the "N" (Neutral) button pushed in. Check fluid level and add sufficient fluid to bring level to "L" (Low) mark on dipstick.

►*TRANSMISSION MAINTAINANCE NOTE: It is r commended that when transmission is drain d, oil pan should be removed and clean d, oil scr n cl an d, and transmission bands and linkag adjust d.*

►*CONVERTER FLUSHING NOTE:* Converter assembly can be flushed as follows: With transmission removed (converter attached to engine), drain converter and in-

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)



stall drain plug. Reach through starter hub with a screwdriver and lift on side of hub spline to turn starter counterclockwise. Sight through opening and make sure rectangular oil slots on rear face of starter are aligned vertically. Use a container with a long spout and slowly pour two quarts of clean kerosene into converter. Tape hub opening, then disconnect coil wire and rotate engine with starter for approximately 10 seconds. Drain converter and repeat the flushing procedure as necessary. To completely drain converter, remove drain plugs and use starter to rotate converter until all kerosene is thrown out of openings.

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See "Carburetor" on car mod l pages.*

Manual C ntrol Cabl Adjustment: Remove neutral safety starting switch from side of transmission. Loosen adjustable mounting bracket capscrew and move cable and bracket assembly (manually) as required, to position the manual valve lever in neutral position. Hold the "N" (Neutral) button tightly in at full travel (the neutral starting switch cam should then be practically centered in neutral starting switch mounting hole). Use a free fitting flat-faced shaft inserted through the neutral mounting switch hole, and apply very light pressure against the manual valve lever to maintain the neutral detent position of lever. *(NOTE* - If tool is not available, lever may be held by finger pressure). Carefully move cable assembly "in" and "out" **without moving** the manual lever, to determine total free-play travel of cable. Locate the cable midway in the free-play range, release pressure against the manual lever and tighten mounting bracket securely. *Do not allow cable t mov wh n tight ning the bracket.* Install neutral starting switch and check transmission fluid level.

Thr ttl Pr ssur Adjustment: With throttle linkage properly adjusted and tachometer attached, start engine and adjust idle speed to 475-500 RPM (with transmission in neutral and hand brake set). Stop engine and raise car on a hoist, then remove throttle pressure take-off plug located between reverse and kickdown servos on right side of transmission case. Connect gauge, Tool C-3292, then start engine and push in the "D" (Drive) button on instrument panel. Engine speed will drop 50 RPM and pressure reading on gauge should be 13-15 lbs. If pressure not within specifications, remove throttle valve adjusting screw access hole plug (approximately 1 quart of fluid will drain out) and insert Adjusting Screw Wrench, Tool C-3279A. Adjust pressure as necessary. *NOTE - Turn screw OUT to increase pressure and IN to decr ase pressure.* Replace throttle valve adjusting screw access hole plug and tighten to 25 ft. lbs. Recheck throttle pressure. Move accelerator pedal very slowly. If throttle pressure and linkage properly adjusted, pressure will rise 6-8 lbs. the instant engine RPM is increased. *NOTE - D not us throttl rod when making this ch ck. Instead, use accelerator pedal lev r located on und rsid of floor pan.* Stop engine and remove oil pressure gauge, then install plug. Tighten to 10-12 ft. lbs. If necessary, replace fluid that drained out.

POWERFLITE TRANSMISSION HYDRAULIC CIRCUITS

Neutral Starter Switch Adjustment: Install mounting washer on switch so that concave side is away from switch, then place rubber "O" ring on switch and install switch in transmission case. Turn switch in until washer contacts case, then tighten switch an extra 1/3 to 1/2 turn. Connect wire and recheck switch operation.

BAND ADJUSTMENT

BAND ADJUSTMENT: *Kickdown (front) band can be adjusted externally. Reverse (rear) band adjustment requires removal of transmission case oil pan.*

Kickdown (Front) Band: Working from beneath car, loosen kickdown band adjusting screw locknut (located on left side of transmission case). Check freeness of adjusting screw in transmission case. If free, use inch-pound torque wrench, Tool C-3380 and tighten adjusting screw to 72 inch-pounds *(NOTE - If Extension, Tool C-3583, is used with torque wrench, tighten adjusting screw to 40-43 inch-pounds).* Use a reference mark of chalk or colored pencil on a corner of adjusting screw square and the transmission case. Using extreme care, back adjusting screw out exactly 2¾ turns. Hold adjusting screw with wrench and tighten locknut.

R v rs (R ar) Band: Drain transmission and remove oil pan. Loosen band adjusting screw locknut and tighten adjusting screw to 20-25 inch pounds. Mark a reference point and back off adjusting screw **12 turns.** Hold adjusting screw and tighten locknut to 30-35 ft. lbs. Replace oil pan and refill transmission.

TESTING

Transmission Shift Speeds (MPH)
(All Models)

Throttle Position	Upshift	Downshift
Wide Open	51-61	9-17
Light	14-19	9-11
Kickdown Limit		41-47

ROAD TESTING TRANSMISSION: *NOTE - Before road testing, engine must be properly tuned and idle speed set to correct specifications.* With engine at normal operating temperature and fluid at proper level, all shifts and kickdowns should occur within the speed ranges given in "Transmission Shift Speeds" table above.

►*ROAD TESTING NOTE: All shift speeds may vary somewhat due to production tolerances, type of engin , rear axle ratios and tire sizes. All shifts, however, should be smooth, responsive and without noticeabl engine runaway.*

STALL TEST: Use an accurate tachometer to check engine speed. With engine idling, push in the "D" (Drive) selector button and note smoothness of shift. Set hand brake firmly and apply foot brakes to hold car. Accelerate engine to wide open throttle and check engine speed which should be 1400-1500 RPM (All models). If speed is in excess of maximum RPM, bands may be

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

slipping *CAUTION - D not hold ngine at wide pen throttle more than a few seconds*

► *CAUTION – When making stall test, do not hold throttle wid open for more than a few seconds.* If engine speed excessive and is not corrected by band adjustment, make additional checks as follows: Check for incorrect manual control cable adjustment, leakage at valve body mating surfaces, defective throttle valve, defective shuttle valve or valve body and cover plug, defective kickdown servo parts.

HYDRAULIC PRESSURE TESTS: *CAUTION* - Pressure differences from 15 lbs. to 250 lbs. will be found in making following tests and correct pressure gauge must be used.

Gauge No. C-3292 (100 lbs.) – Use for throttle pressure, governor pressure, and lubrication pressure checks.

Gauge No. C-3293 (300 lbs.) – Use for line pressure check.

Line Pressure: Remove 1/8" pipe plug from line pressure take-off hole (front left side of transmission case), install C-3293 (300 lb.) pressure gauge at this point. Check reverse oil pressure first (brakes off), then apply brakes to hold car and check the other points. Run engine at speed indicated in table below, check line pressure for each selector button position

Line Pressure

Selector Button Engaged	Eng. RPM	Pressure
"R"	1400	225-275 lbs.
"N"	800	85-95 lbs.
"D"	800	85-95 lbs

► *NOTE:* If line pressure not correct, check for Low oil level or clogged strainer, defective regulator valve and spring, manual valve and lever, throttle valve, cam and spring, oil leakage at valve body, or regulator body mating surfaces, defective kickdown piston and related parts, worn front pump or defective front pump drive sleeve or pinion.

Throttle Pressure: Remove 1/8" pipe plug from throttle pressure take-off hole (right center of transmission case between the servos), install C-3292 (100 lb. gauge at this point. Apply brakes to hold car, push in the "D" (Drive) selector button, run engine at speed indicated in table.below and note throttle pressure at each speed.

Throttle Pressure

Throttle Opening	Eng. RPM	Pressure
Closed	Idle	13-15 lbs
Wide Open	1400-1500	80-90 lbs

► *CAUTION: When making the above test, do not hold throttle wide open for more than a few seconds If ngine speed exceeds maximum RPM, check the cause in same manner as for "Stall Test" above*

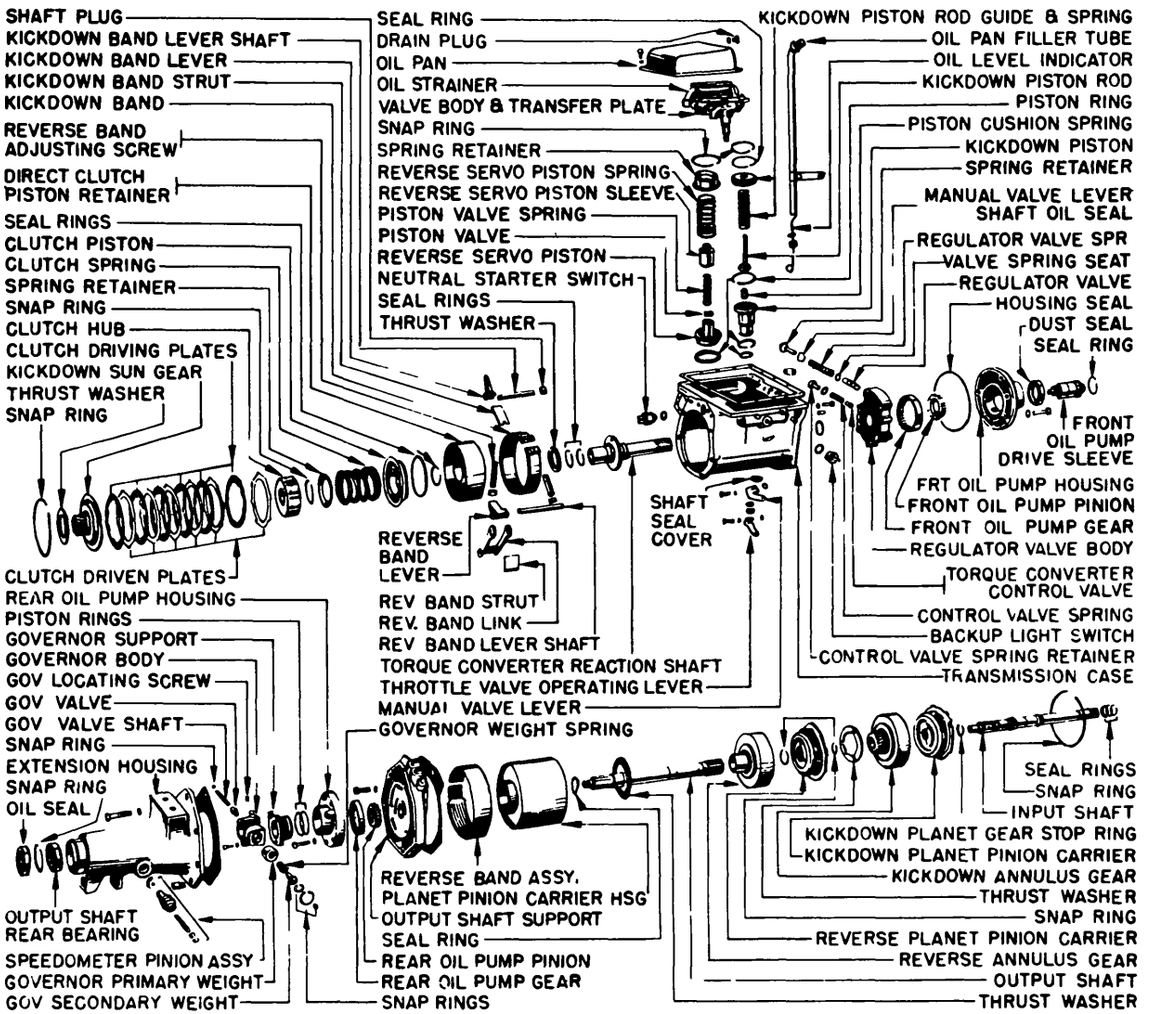
► *NOTE* If throttle pressure not correct, check line pressure (above) and also check the following points Incorrect throttle linkage adjustment, leakage at valve body mating surfaces, defective throttle valve, cam & spring, defective throttle pressure check ball or kickdown valve ball and rod, defective kickdown piston or related parts.

Governor Pressure Remove 1/8" pipe plug from governor pressure take-off hole on lower left side of output shaft support (plate between transmission case and extension housing), install C-3292 (100 lb.) gauge at this point. Support car securely with rear wheels off floor so that they are free to turn, push in the 'D' (Drive) selector button and run engine at speed indicated (as noted on speedometer). Note governor pressure in each speed range.

Governor Pressure ℂ

Axle Ratio	15 Lbs.	45 Lbs.	60 Lbs.
2 93-1	13-17 MPH	24-36 MPH	57-69 MPH
3 31-1	12-16 MPH	23-34 MPH	54-65 MPH
3 58-1	10-15 MPH	20-30 MPH	48-58 MPH
3 91-1	10-14 MPH	19-29 MPH	46-56 MPH

ℂ - Governor Pressure at indicated speed



► *NOTE* If governor pressure not correct, check for leakat valve body mating surfaces or output shaft support gaskets, defective governor assembly, or defective rear pump.

Lubricati n Pr ssure: Check only when there is reason to believe that it is incorrect Remove pipe plug at upper left side of output shaft support and install 1/8' flared tube connector Connect Gauge C-3292 With engine running at 800 RPM in 'N' (Neutral) position lubrication pressure should not be less than 10 lbs

► *NOTE* If lubrication pressure is not correct, check for leakage at regulator body mating surfaces or at output shaft support gasket, defective converter control valve, defective front pump drive sleeve, defective reaction shaft bore, defective input shaft seal rings, plugged lubrication holes.

Clutch Pr ssure Remove the 1/8' pipe plug fitting from pressure take-off hole tapped in kickdown servo (clutch pressure take-off plug on forward right hand side of transmission case) and install gauge C-3292 With rear wheels free to turn, accelerate the engine slowly until

CONTINUED ON NEXT PAGE

POWERFLITE TRANSMISSION EXPLODED VIEW

POWERFLITE (Cont.)

an upshift occurs. During the upshift, the pressure gauge attached to the kickdown servo should show a very rapid rise from 0 to final clutch or line pressure (see "Line Pressure Table" above). This rise should not take more than 1½-2 seconds. With engine speed not less than 650 RPM (trans. upshifted), the direct clutch pressure should not read lower than 10 lbs. below line pressure. Should a slow rise in clutch pressure be observed or a clutch pressure of more than 10 lbs. lower than line pressure be obtained, it is an indication of abnormal leakage.

► *NOTE* – If clutch pressure not correct, check oil level; throttle linkage adjustment; converter control valve; valve body mating surfaces; throttle valve, cam and spring; kickdown piston and guide; regulator valve body mating surfaces; front pump drive sleeve, clutch retainer bushing and reaction shaft seal rings, clutch discs and plates; clutch piston, seal rings and check valve ball.

TROUBLE SHOOTING & DIAGNOSIS

EXCESSIVE SLIPPAGE:

All Ranges—Inspect oil level. Adjust gearshift linkage Check oil pressure; if low, inspect regulator valve and torque converter control valve for sticking Inspect valve body in transmission case mating surfaces for evidence of oil leakage

Kickdown—Readjust throttle linkage and kickdown band Inspect valve body to transmission case mating surfaces for evidence of oil leakage Check operation of throttle valve and note wear of valve bore and cam Check spring Check valve body end cover for oil leakage Check shuttle valve for free movement Inspect kickdown piston and guide for binding Inspect spring Inspect band lining for wear and band lever for free movement

Kickdown (Over 25 MPH)—Inspect valve body end cover for oil leakage Inspect shuttle valve and plug for free movement Inspect spring

Direct—Inspect valve body to transmission case mating surfaces for evidence of oil pressure leakage Check kickdown piston for binding Check shaft seal rings and clutch retainer bushing for wear Check clutch discs, piston and clutch check valve

Reverse—Check reverse band adjustment Inspect transmission case to valve body mating surfaces for evidence of oil pressure leakage Inspect reverse servo assembly for wear or binding Inspect reverse lever and linkage for free movement

Hill Climbing—Insufficient oil will result in low pressures to kickdown servo or direct clutch if oil level is low

SHIFT PATTERN:

No Upshift—Check oil level and gearshift linkage adjustment Check governor and throttle pressure If there is no pressure rise when accelerating engine in direct drive, governor valve may be stuck closed Check valve body to transmission case for parallelism Check manual valve and lever for correct detent engagement Check shift valve for free operation and shift valve spring for breakage Check kickdown piston assembly Check rear pump drive pinion Drive pinion ball may be cracked or broken, permitting pinion gear to slip Inspect clutch ball check for proper operation Ball check valve must operate freely and seat properly.

No Shift in "D" (Drive) Range and an Upshift In Low Range—The cause is the governor valve sticking open. This can be verified by checking governor pressure (see "Governor Pressure Test" above) If governor pressure exceeds the pressures indicated in table, governor valve is possibly stuck and in most cases can be corrected in the following manner Clean off area around governor pressure take-off plug and remove plug. Cover oil filler tube with a cloth or plug and hold firmly to prevent air from forcing transmission oil out through filler tube. Screw a piece of ⅛" pipe into hole to help direct air into unit Apply clean filtered air to pipe in short blasts, tapping parking brake drum at same time with a rubber hammer just enough to jar governor After applying air pressure, recheck governor pressure and see if valve has been freed up. In cases where governor pressure is still to high, it will be necessary to remove transmission extension case for further inspection

Low Upshift Pattern—Readjust throttle linkage Check governor pressure Governor valve may be binding or sticking Inspect the rear pump assembly Check valve body to transmission case for parallelism Check operation of throttle valve and inspect cam and spring Check shift valve for free operation and spring for breakage

Low Upshift Pattern at Heavy Throttle—Inspect regulator valve, throttle valve, and governor for burrs or dirt which may cause binding or sticking. Inspect the regulator spring

High Upshift Pattern—Readjust throttle linkage and check both throttle and governor pressures. Adjust throttle pressure if necessary. If throttle pressure does not rise according to speeds on chart (see "Throttle Pressure" above), throttle valve may be sticking Inspect for dirt or burrs. Inspect throttle cam for wear Check valve body to transmission case for parallelism Check shift valve spring If governor pressure does not correspond to pressures indicated in "Governor Pressure" table above, remove governor and inspect valve for sticking Check rear pump gears for wear, broken teeth or excessive clearance. Inspect pump drive pinion ball.

All Upshifts Below 14 MPH—Inspect throttle valve, cam and spring Check throttle pressure check ball Check governor valve for sticking

Erratic Shifting—Check oil level. Inspect valve body to transmission case for parallelism Check action of shift valve Inspect governor support gaskets for oil leakage

No Downshift—Check governor pressure. High initial pressure indicates valve is stuck open. Remove governor and inspect Inspect shift valve action, check spring.

Low Downshift Speed—Governor valve is stuck open Remove and clean and check for burrs and dirt

High Downshift Speed—Readjust gearshift linkage Inspect valve body to transmission case for parallelism Inspect manual valve and lever. Inspect kickdown valve and ball

No Kickdown—Adjust throttle linkage Inspect valve body to transmission case for parallelism Inspect throttle valve, cam and spring. Also inspect kickdown valve and shift valve components.

Low Kickdown Limit—Check governor pressure Governor valve may be sticking due to dirt Inspect regulator valve and spring for proper operation. Inspect rear pump gears and drive pinion ball. Check valve body cover plate for parallelism.

SHIFT QUALITY:

Harsh Shift from Neutral to Reverse—Adjust engine idle speed. Readjust rear band. Inspect condition of the reverse band, strut and linkage. Inspect the reverse servo piston, spring valve and rings.

Harsh Shift from Neutral to Drive—Adjust engine idle speed. Adjust throttle linkage. Inspect kickdown servo pistons, springs, guide, rod and piston rings

Delayed Shift from Neutral to Drive—Adjust kickdown band Inspect condition of band, strut, lever and lever shaft

Excessive Engine Speed Increase on Upshifts—Check oil level and adjust throttle linkage. Inspect regulator valve and spring and check operation of valve in regulator body. Check valve body mating surface for parallelism. Inspect throttle valve, cam and spring Check operation of valve in valve body. Inspect kickdown piston components. Check mating surfaces of regulator valve body and transmission for parallelism. Inspect reaction shaft seal ring for deterioration. Inspect input shaft oil seal rings for wear or breakage and condition of reaction shaft bore Inspect clutch retainer bronze bushing If worn below bronze surface, replace retainer. Inspect condition of reaction shaft oil seal rings for wear or broken ends Inspect condition of clutch plate and condition of friction material on seal ring. Check clutch check valve ball.

Excessive Engine Speed Increase on Upshifts at Light Throttle—Check line pressure. Inspect front oil pump gears for wear and excessive clearance.

Harsh Upshift—Adjust throttle linkage Inspect regulator valve and spring Check for sticking shuttle valve. Check valve body mating surfaces for parallelism Inspect throttle valve, cam and spring. Inspect kickdown piston components. Check regulator valve body mating surfaces for parallelism. Inspect direct clutch spring, spring retainer, and snap ring.

Harsh Lift Foot Shift—Adjust throttle linkage. Check valve body mating surface Check operation of throttle valve Inspect valve, valve bore, cam and spring. Inspect servo pressure bleed valve for dirt Check operation of shuttle valve. Inspect shuttle valve, plug, inner and outer springs, and guide pin.

Excessive Engine Speed Increase on Downshift at Part Throttle—Check oil level and adjust throttle and gearshift linkage. Check valve body mating surface Check operation of manual valve and valve lever Inspect servo restrictor valve and operating plug Check plug for free operation. Check valve spring for distortion or looseness

Harsh Downshift—Adjust engine idle speed and throttle linkage Inspect valve body mating surface Inspect throttle valve, cam and spring for proper operation Inspect for dirt, burrs or wear, or breakage. Inspect servo restrictor valve for proper operation Inspect clutch plates and disc friction material Inspect the piston for wear or scoring Check seal for wear or deterioration which would result in leakage Inspect thrust washers for excessive wear

Excessive Increase in Engine Speed on Kickdown—Readjust kickdown band. Check regulator valve

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

and spring for proper operation Inspect for dirt, wear, or breakage. Check valve body mating surface for nicks, burrs and trueness, which would cause leakage. Check operation of servo restrictor valve and shuttle valve Inspect valve and plug for dirt, burrs or wear Inspect all parts of kickdown piston assembly. Inspect piston rings for excessive wear or broken ends Check governor valve for wear, dirt, binding or sticking. Inspect rear pump gears for excessive wear or broken teeth Check pump clearance, drive pinion gear and pinion ball

Harsh Kickdown—Adjust kickdown band. Inspect regulator valve and spring. Inspect for dirt, burrs or breakage Inspect servo pressure bleed valve for dirt. Check operation of shuttle valve. Check valve and plug for burrs, dirt or excessive wear. Inspect all parts of kickdown piston assembly Inspect piston rings for scoring, wear or broken ends. Inspect regulator valve body mating surface for nicks, burrs and trueness which would cause leakage. Inspect reaction shaft neoprene seal for deterioration. Inspect governor valve for free operation. Check for dirt which would cause sticking. Inspect rear pump gears for excessive clearance, worn or chipped teeth Inspect drive pinion gear and drive pinion ball. Inspect the input shaft seal rings for excessive wear or broken ends, and reaction shaft bore for scoring. Inspect all parts of the direct clutch assembly.

OIL PRESSURE:

No Governor Pressure—Governor valve may be stuck in closed position due to dirt. To free valve, apply a short spurt of high air pressure (90 lbs.) to governor pressure take-off hole and at same time tap transmission extension housing with a rubber mallet. Before applying air pressure, cover filler tube with a cloth. In addition, drain two or three quarts of oil from transmission oil pan. After air is applied, reinstall governor pressure take-off plug and run transmission in Reverse a few seconds. Recheck governor pressure. This corrective procedure may not be permanent. If valve becomes stuck again, remove governor for servicing. If pressures do not correspond to those indicated in "Governor Pressure" table above, the governor may need service. However, before servicing governor, check the other points in the transmission that could cause low pressure as follows: Check the valve body mating surface for trueness, nicks or burrs. These could cause oil leakage. Check both output shaft support gaskets for evidence of internal leakage. Check operation of governor valve and inspect for foreign matter. Check the rear pump gears for broken teeth, wear, and excessive clearance. Check the mating surface of output shaft for trueness, burrs or nicks.

High Initial Governor Pressure—High governor pressure at low engine speeds is due to the governor valve being stuck in the open position, usually caused by dirt *(see "No Governor Pressure" above)*, for clearing with air pressure.

Line Pressure—If line pressure does not correspond to pressures indicated in "Line Pressure" table above, it will be necessary to investigate and make the following adjustments or corrections: Check transmission oil level. Inspect regulator valve for free operation, dirt or burrs, and condition of valve spring. Check valve body mating surface for trueness, nicks or burrs. Check operation of manual valve and lever. Inspect front pump gears for worn or chipped gears. Check clearance between gears and face of housing.

Throttle Pressure—If throttle pressures do not correspond to pressures indicated in "Throttle Pressure" table above, check line pressure and make the following adjustments and corrections: Adjust throttle linkage. Inspect operation and condition of regulator valve and spring. Check valve body mating surfaces for nicks, burrs and trueness. Check operation and condition of throttle valve, cam and spring. Check throttle pressure check valve ball for nicks and dirt. Inspect condition of kickdown rod and ball.

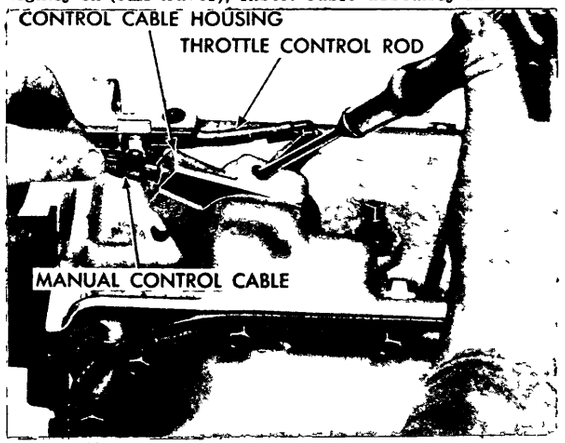
Direct Clutch Pressure—Direct clutch pressure should be approximately 10 lbs. lower than line pressure with transmission upshifted and engine speed not lower than 650 RPM. If not, refer to "Excessive Engine Speed on Upshifts" above A pressure drop between line pressure and direct clutch pressure as high as 25 lbs. may be due to broken or damaged seal rings in the direct clutch circuit These are: three interlocking type input shaft seal rings; the direct clutch piston retainer seal ring, direct clutch piston neoprene seal ring, the neoprene reaction shaft seal ring, and the two interlocking type reaction shaft seal rings.

Lubrication Pressure—Lubrication pressure is checked at the upper left side of the output shaft support, Remove the ⅛" pipe plug and use 100 lbs., pressure gauge C-3292 to check pressure. Lubrication pressure should be 35 to 50 lbs. pressure with transmission in neutral and engine speed at fast idle. If pressure readings are incorrect, check line pressure and inspect torque converter control valve. Low pressures may be due to internal oil leakage at the following points: drive sleeve seal ring, regulator valve body mating surface, reaction shaft seal ring, output shaft support gaskets, input shaft seal rings, and reaction shaft bore. Low oil pressure may also be caused by plugged lubrication lines.

IMPROPER RESPONSE TO GEARSHIFT SELECTOR LEVER POSITIONS:

Moves Forward in "N" (Neutral)—Adjust gearshift linkage. Adjust kickdown band. Inspect manual valve lever assembly. Check valve body mating surface for nicks, burrs and trueness which would cause leakage Check operation of manual valve. Inspect all parts of kickdown piston. Check regulator body mating surface for nicks, burrs and trueness. Check clutch discs and plates for warpage which would cause dragging. Inspect clutch ball check.

Car Moves Forward in "N" (Neutral) at High Engine Speed—Clutch check valve ball bleed hole may be plugged causing centrifugal oil pressure to partially engage the direct clutch. A slight surge which is not continuous is normal.



Car Moves Backward in "N" (Neutral)—Readjust gearshift linkage and inspect manual valve and valve lever for proper engagement. Adjust reverse band, levers, strut, and shaft. Check for binding, dirt, excessive wear.

GEARSHIFT CONTROL UNIT REMOVAL & INSTALLATION

MANUAL CABLE ADJUSTMENT: *See "Manual Cable Adjustment" above.*

CABLE ASSEMBLY: Removal (Transmission End) - Push in "R" (Reverse) button, then remove neutral safety starter switch from transmission case. *NOTE - Approximately one quart of oil will drain out* Loosen cable-to-transmission adjustable mounting bracket screw, then place a screwdriver through neutral starting switch hole and push against cable lock spring. Withdraw cable assembly from case. Check cable ferrule "O" ring for roughness, shredding or deterioration and replace if necessary Make sure slot in bracket fits just freely into ferrule groove to full depth of slot.

Installation: Push in "L" (Low) pushbutton and then place transmission manual valve lever in reverse detent by moving neutral switch contact part of lever full travel toward rear using a screwdriver inserted in neutral starting switch hole. With "L" (Low) button held tightly in (full travel), insert cable assembly into case

TRANSMISSION GEARSHIFT CONTROL (CABLE RELEASING PROCEDURE)

engaging cable ferrule groove with lock spring in cable adapter. Make sure groove in cable properly engages lock spring. Replace adjustable mounting bracket and tighten capscrew finger tight. Refill transmission and adjust manual cable (see above).

PUSHBUTTON CONTROL UNIT: Removal (All Models) - Disconnect battery cable, then disconnect back-up light switch wire at pushbutton control and illuminating lamp leads at rear of instrument panel. Remove screws of pushbutton face plate and remove pushbuttons by pulling them off button slides. Remove lamp bulb. Remove control housing stud nuts and remove control and cable from rear of instrument panel Remove clip attaching control cable to actuator and the screw holding cable bracket to control housing.

Installation: Insert end of cable on actuator and install clip, then place cable bracket on control unit and install screws securely. Carefully guide unit from rear of instrument panel and install nuts. Install lamp bulb and pushbuttons. Replace front plate, then connect back-up switch wires and illuminating lamp wires. Connect battery cable.

OVERHAUL

OVERHAUL: Service procedures are the same as for previous models. *See "Powerflit Transmission" in 1956 Annual Data or later Manual editions.*

① - Manual throttle control.
② - Vacuum throttle control.
③ - Early cars.
④ - Later cars.

►*1961 2-SPD. AUTO. TRANS. PRODUCTION CHANGE:* Later transmissions have been changed to provide automatic control of transmission throttle valve, eliminating the necessity of external linkage for throttle valve control. Engine vacuum, operating a diaphragm assembly located at rear of transmission case, controls transmission throttle valve movement. A separate downshift rod, connected to accelerator pedal linkage allows transmission to be shifted into "kickdown" by depressing accelerator pedal fully. *See "Description" below for detail changes in later transmission.*

►*1961 TRANSMISSION NOT DRIVING IN "DR" RANGE CORRECTION:* If this condition exists in "Dr" range but car will drive in manual "L" or "R" ranges, it may be due to ball check valve in low servo piston not seating properly. If pressure and stall tests along with linkage adjustment check do not indicate any change from specifications, the low servo piston should be removed and, if ball check valve is not operating properly, replace low servo piston.

2-SPEED TRANSMISSION SECTIONAL VIEW
(MANUAL THROTTLE CONTROL TRANSMISSION)

►*TOWING CAR CAUTIONS: If transmission in working condition, car may be towed for a distance not to exceed 15 miles and at a speed not greater than 30 MPH with transmission selector lever in "N" (Neutral). If transmission inoperative, disconnect and remove propeller shaft or tow with rear wheels off ground.*

DESCRIPTION

DESCRIPTION: Two-speed hydraulically controlled planetary transmission and torque converter similar to design used on previous models. Transmission fluid in all transmissions except those used with 144" (Comet & Falcon) engines is circulated through a cooler in car radiator lower tank. *NOTE - On 144" engines, the transmission has an external bypass for recirculation of transmission fluid.* The torque converter assembly on 144" and 170" engines is air cooled. Transmission throttle and control pressures are controlled manually by linkage on early models and by engine vacuum on later models. *See "1961 Transmission Production Changes" for differences between early and later transmissions.*

►*1961 TRANSMISSION PRODUCTION CHANGES:* Beginning approximately March 20, 1961, transmission employing engine manifold vacuum instead of mechanical linkage to control transmission throttle and operating pressures entered production. Differences between early and later transmissions are as follows:

Transmission Case - On later type case, low servo apply orifice is incorporated into main control assembly (located in transmission case on early transmissions). Addition of diaphragm assembly threaded into left rear of case. Filler tube threaded directly into transmission case without use of a separate adaptor. Early and later cases are not interchangeable.

External Kickdown Lever - Replaces throttle control lever used on early transmissions. This lever is not interchangeable with previous throttle control lever.

Throttle Control Valve Rod - Incorporated between vacuum diaphragm and throttle control valve.

Main Control Valve Assembly - In later type control valves, a compensator valve spacer replaces former compensator throttle actuated valve sleeve. Compensator valve bore is also changed. A throttle boost valve has been added and the vacuum throttle valve is revised dimensionally and is relocated in valve body. An "L" shaped retainer for throttle pressure boost valve plug is bolted to lower valve body (holds boost valve plug, valve and spring in bore). *NOTE -- This retainer cannot be used on early transmissions.* An upper valve body reinforcement (left rear) is used to minimize leakage and to retain throttle valve within its bore.

CONTINUED ON NEXT PAGE

2-SPEED AUTOMATIC TRANSMISSION (Continued)

Front Servo Release Spring - Later type front servo piston return springs are different than springs used on early units.

Governor Assembly - A new shorter governor valve (1" long) is used on later transmissions and is not interchangeable with early transmission governor valve.

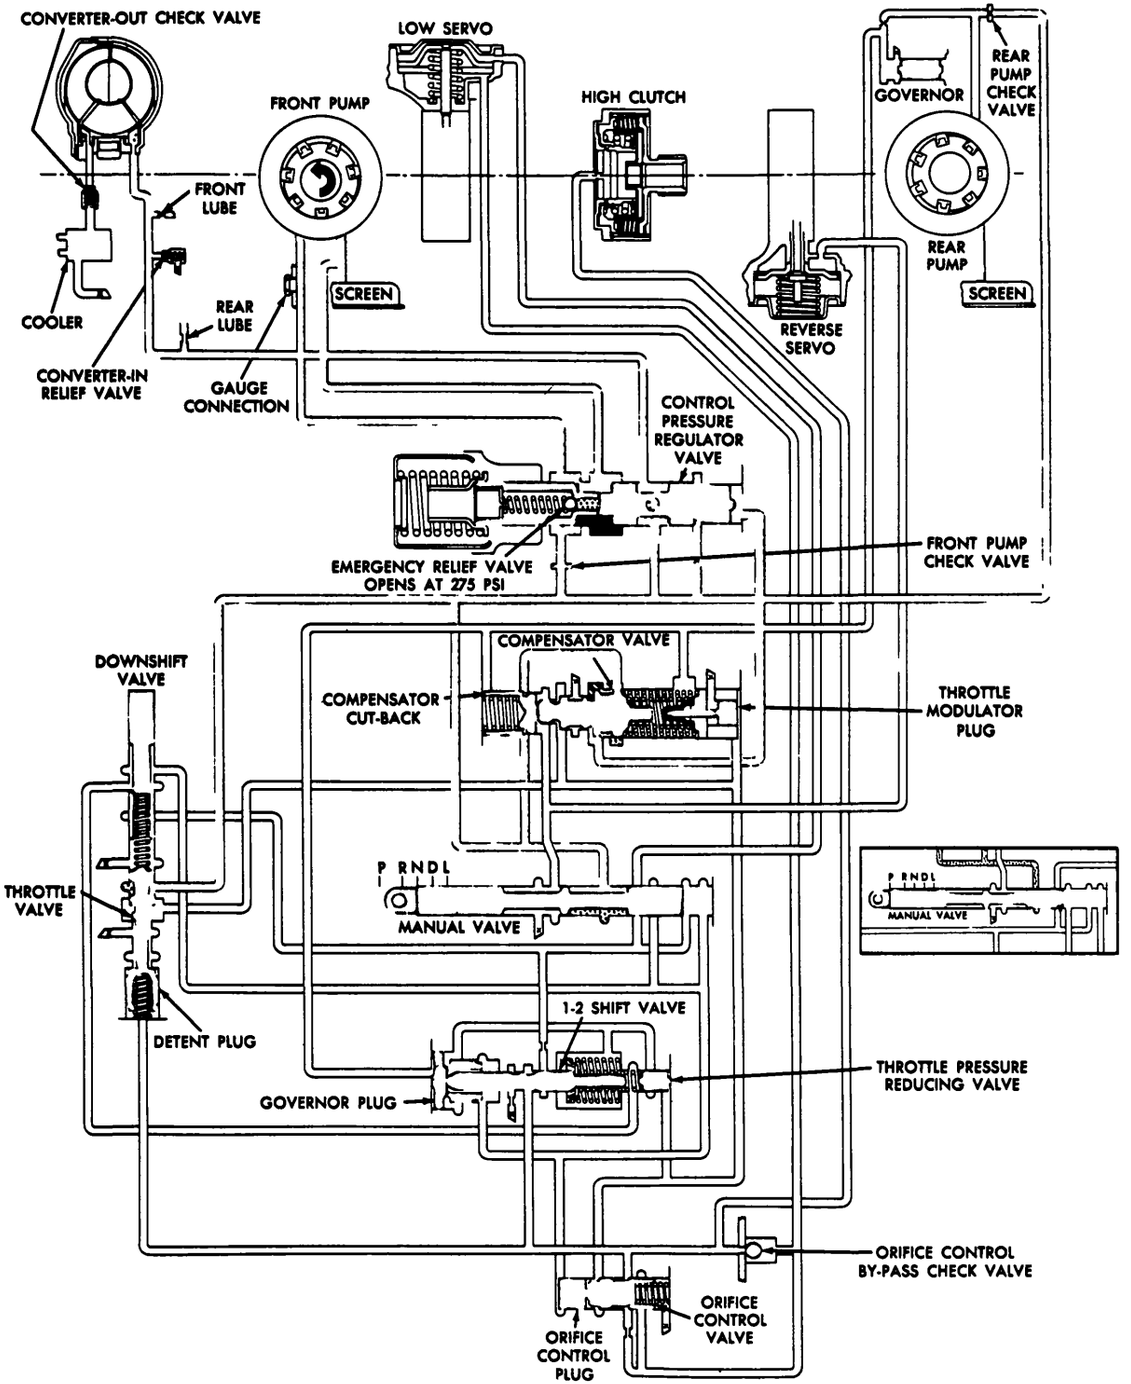
LUBRICATION

Check fluid lever every 1000 miles (Comet), every 4000 miles (Falcon, Ford, Mercury). *CAUTION - Make sure dipstick is locked in position.*

Recommended Fluid - Ford & Mercury Part No. C1AZ-19582 or Automatic Transmission Fluid Type "A" (Suffix "A").

Checking Fluid Level: With parking brake applied, engine at normal operating temperature, and car standing on a level floor, shift selector lever through all positions, then place selector lever in "P" (Park) position. Check fluid level on dipstick. Add sufficient fluid through filler tube to bring level to "F" (Full) mark on dipstick. *CAUTION - Do not overfill transmission.*

Capacity - 6¼ qts. (Comet & Falcon), 9 qts. (Ford & Mercury 223" & 292" Engs.), 10 qts. (Ford & Mercury 352" Eng.).



Draining & Refilling: *NOTE - Periodic draining and refilling not required.* To drain and refill for service operations, proceed as follows: Remove cover from lower front side of converter housing and remove one converter drain plug. Rotate converter 180° and remove other plug, then remove drain plug from oil pan. *NOTE - If oil pan not equipped with oil plug, start at either corner of oil pan and alternately remove bolts so oil pan can tilt down at one corner.* After draining is completed, remove and clean oil pan and screen. Reinstall oil pan and screen using a new gasket and tighten oil pan bolts to 10-13 ft. lbs. Tighten oil drain plug to 10-15 ft. lbs. Install drain plugs in converter and tighten to 15-28 ft. lbs., then install converter cover. Add 4 qts. of recommended fluid (see above) and run engine at idle speed for about 2 minutes, then add 2 qts. (Comet & Falcon); 3 qts. (Ford & Mercury 223" & 292" Engs.) 4 qts. (Ford & Mercury 352" Eng.) more fluid. Run engine at fast idle until normal operating temperature is obtained. Shift selector lever through all positions, then place in "P" (Park) position and check fluid level on dipstick. Add sufficient fluid to bring fluid level to "F" (Full) mark on dipstick. *CAUTION - Do not overfill transmission.*

ADJUSTMENT

LINKAGE ADJUSTMENT: Throttle Linkage Adjustment - *See CARBURETOR on car model pages.*

Manual Linkage: With engine stopped, loosen shift lever clamp at lower end of steering column so that shift rod is free to slide in clamp. Position selector lever so pointer lines up over "D" (Drive). *NOTE - Lever must be held against quadrant stop (between "D" & "L") during linkage adjustment.* Position transmission detent lever on transmission into "D" (Drive) detent position (second from rear), then tighten clamp on shift rod.

CONTINUED ON NEXT PAGE

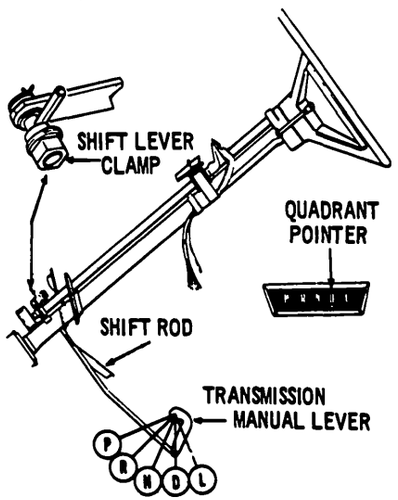
2-SPEED AUTOMATIC TRANSMISSION HYDRAULIC CIRCUITS (MANUAL THROTTLE CONTROL TRANSMISSION)

2-SPEED AUTOMATIC TRANSMISSION (Continued)

Check pointer alignment for all selector lever detent positions.

FORD PASS. CARS

NEUTRAL SAFETY SWITCH ADJUSTMENT: Check starter circuit in all selector lever positions. The circuit must be open in all positions except "N" (Neutral) & "P" (Park). To adjust, loosen switch-to-steering column attaching screws, then shift selector lever to "N". Rotate switch as far as it will go in either direction, then insert a .060" pin through switch housing at gauge pin hole. *NOTE - This hole will be located at nd of switch housing or on the upper side of housing d pending upon typ of switch used.* Hold pressure against gauge pin and rotate switch in the free rotation direction until pin engages hole in plate. With gauge pin through housing and into plate, tighten attaching screws and remove gauge pin. Check starter circuit in all selector lever positions. Starter must operate with selector lever in "N" (Neutral) or "P" (Park).



COMET, FALCON & MERCURY

NEUTRAL SAFETY SWITCH ADJUSTMENT: Check starter circuit in all selector lever positions. The circuit must be open in all positions except "N" (Neutral) and "P" (Park). To adjust, loosen screws securing switch to mounting bracket on lower end of steering column and rotate switch as required to obtain starter operation in "N" or "P" positions. Tighten screws.

ALL CARS

BAND ADJUSTMENT: Periodic band adjustment not required. Check band adjustment each time oil pan is removed and adjust as necessary.

Front Band (L w Rang): Loosen locknut on adjusting screw on left front side of transmission case, then tighten adjusting screw with Tool T59P-77370-A (Falcon & Ford) or Tool 7345 (Comet & Mercury) until tool handle snaps (breaks) over center. *NOTE - Th s tools ar pre-set torque wrench s which ov rrun wh n torqu on scr w r ach s 10 ft. lbs.* Back off adjusting screw **exactly two turns**. Hold adjusting screw at this point and tighten locknut to 35-40 ft. lbs.

MANUAL LINKAGE ADJUSTMENT (TYPICAL)

Rear Band (Reverse Range): Drain transmission and remove oil pan and screen. Loosen rear servo piston rod locknut and adjusting nut, then install tool as follows: If Falcon and Ford Tool T59P-77409-A is used, place tool on rear servo rod so two forks straddle band apply lever. *NOTE - Inner fork must engage flat on servo piston rod. The outer fork is a ¼" spacer and must be inserted between piston rod seat and adjusting nut.* If Comet & Mercury Tool 7355-A is used, insert tool between adjusting nut and piston rod-to-actuating lever seat, with opposite end of tool resting on raised boss on control valve assembly. With wrench T59P-77423-A (Falcon & Ford), or No. 7355-B (Comet & Mercury), tighten nut until wrench handle snaps (breaks) over center. *NOTE - These tools are pre-set torque wrenches which overrun when torque on screw reaches 45-50 in. lbs.* Back off adjusting screw **exactly two turns**. Hold adjusting screw at this point and tighten locknut to 15-18 ft. lbs. Remove tools from servo piston rod. Install oil pan and screen using a new gasket. Refill transmission with recommended fluid *see "Draining & Refilling" above.*

TESTING

►*TRANSMISSION TESTING NOTE: Testing procedures for early transmissions (manual throttle control) are different than procedures for late transmissions (vacuum throttle control) as indicated below. Before proceeding with tests, check fluid level and bring transmission to normal operating temperature, then connect a suitable pressure gauge to pressure take-off hole on left side of transmission case (Falcon & Ford), to pressure checking tube at rear of engine on firewall (Comet & Mercury). Install a tachometer on engine, and on models with vacuum throttle control, install a manifold vacuum gauge. Adjust engine to correct idle speed.*

LINE PRESSURE: Manual Throttle Control Transmissions - With engine at correct idle speed, move selector lever through all detents and check pressure which should be 40-48 lbs. (144" Eng.); 46-56 lbs. (all others). *NOTE - As selector lever is moved to each detent position, check alignment of pointer in relation to quadrant and transmission detent positions. If manual linkage not properly set, see "Manual Linkage Adjustment" above.* With parking brake and foot brake set firmly, place selector lever in "D" (Drive) position and increase engine speed to 1000 RPM (Ford & Mercury); 1200 RPM (Comet & Falcon). Line pressure should be 53-57 lbs. (144" Eng.); 78-82 lbs. (170" Eng.); 77-84 lbs. (223", 292" & 352" Engs.). If line pressure not within specifications, adjust throttle valve rod (see "Throttle Valve Adjustment" on car model pages), to correct line pressure readings.

Vacuum Throttle Control Transmissions: With engine at normal idle speed (engine vacuum 15" Hg. or higher), move transmission selector lever through all detents. Reading on pressure gauge should be 40-48 lbs. (144" & 170" Engs.); 46-60 lbs. (223", 292" & 352" Engs.). Position selector lever in "D" (Drive), then open throttle gradually and watch pressure gauge. Operating pressure should remain within limits indicated for idle speed (above) until vacuum drops between 15" and 12.5"Hg., then it should start to rise. *NOTE - With selector lever in "L" (Lo) or "R" (Reverse), pressure should start to rise at same point as with selector lever in "D" (Drive).*

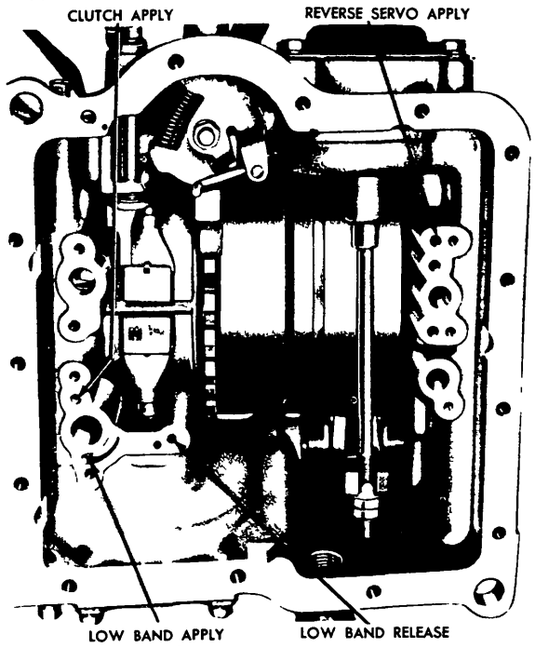
STALL TEST: Manual Throttle Control Transmissions - *NOTE - Make separate stall test in "D" (Drive), "L" (Lo), and in "R" (Reverse).* With parking and service brakes applied and selector lever in "D", "L", or "R", open throttle through detent and note engine speed and line pressure. Engine speed should be as indicated in table below, and line pressure should be 135-155 lbs. (144" Eng.); 170-192 lbs. (170", 223", 292" & 352" Engs.). *CAUTION - Do not stall test for more than 5 seconds. Between tests, run engine for at least 2 minutes at 1200 RPM with selector lever in "N" (Neutral) to prevent transmission overheating.* If engine runs away on a stall test in "D" or "L", but is held within limits in "R", the low band is slipping. If engine runs away in "R" during a stall test, but is held within limits in "D" or "L", the reverse band is slipping. *NOTE* - Transmission "high" clutch cannot be stall tested since the clutch applies only at road speeds above 15 MPH.

Vacuum Throttle Control Transmissions: *NOTE - Mak separate stall test in "D" (Drive), "L" (Lo), and in "R" (Reverse).* With parking and service brakes applied and selector lever in "D", "L", or "R", open throttle through detent and note pressure and vacuum gauge readings and engine RPM. Vacuum should drop below 1.5" Hg. and the pressure should reach maximum limits of 145-170 lbs. (144" & 170" Engs.); 175-200 lbs. (223" & 292" Engs.); 200-215 lbs. (352" Eng.). Engine speed at stall should be as indicated in table below. *CAUTION - Do not stall test for more than 5 seconds. Between tests, run engine for at least 2 minutes at 1000 RPM with selector lever in "N" (Neutral) to prevent transmission overheating.* If engine runs away on a stall test in "D" or "L", but is held within limits in "R", the low band is slipping. If engine runs away in "R" during a stall test, but is held within limits in "D" or "L", the reverse band is slipping. *NOTE* - Transmission "high" clutch cannot be stall tested since the clutch applies only at road speeds above 15 MPH.

ENGINE STALL SPEEDS

Engine	Low Limit - RPM	High Limit
144" (Manual Throttle)	1645	1845
144" (Vacuum Throttle)	1600	1800
170" (Manual Throttle)	1840	2040
170" (Vacuum Throttle)	1750	1950
223" (All Models)	1300	1500
292" & 352" (All Models)	1550	1750

AIR PRESSURE TESTS (With Transmission in Car): Raise car on hoist, then remove transmission oil pan and control valve assembly. Proceed as follows:



Clutch Apply: Apply pressure to front clutch passage (see illustration). A dull thud indicates that clutch is operating. Retain air pressure in passage for several seconds to check for leakage.

CONTINUED ON NEXT PAGE

2-SPEED AUTOMATIC TRANSMISSION (C ntinu d)

Low & Reverse Servos: Apply pressure to "Low Band Apply" and "Reverse Band Apply" holes in case (see illustration). Band operation can be observed.

SHIFT TEST: Shift points and low gear operation should be as indicated in table below. *NOTE - These speeds are approximate.*

AIR PRESSURE TEST POINTS

CONTROL PRESSURE RISE TEST: Manual Control Throttle Valve Transmissions - *NOTE - If control pressure rises with transmission selector lever in "D", "L", r "R" as determined in "Line Pressure (Manual Control Throttle Transmissions)" above, is normal in any one position, throttle linkage, throttle and compensator pressures, and pump capacity are probably normal. The probable cause of no pressure rise in the other selector lever positions is leakage in hydraulic system upstream from manual valve.* To check operation of throttle linkage, disconnect transmission throttle rod from accelerator shaft and lever, then place selector lever in "P" (Park) position. Adjust engine speed to 1000 RPM (Ford & Mercury), 1200 RPM (Comet & Falcon), then push downward (Ford & Mercury), pull upward (Comet & Falcon) on throttle control rod and check pressure gauge. Control pressure should rise to 170-192 lbs. (170", 223", 292" & 352" Engs.); 135-155 lbs. (144" Eng.). If pressure rises to this range, pump capacity, main system leakage, throttle and compensator pressures are normal. Trouble is probably due to leakage in low servo apply line.

GOVERNOR PRESSURE TEST: ttach Pressure Gauge T57L-77820-A at connection on left side of transmission case, then place gauge so it can be read inside the car. Check gauge reading at stall (see table for pressure limits). Check control pressure on the road at speeds indicated in table, **at full throttle.** *NOTE - Hold car to the exact speed indicated by applying service brakes.* Allow sufficient time between tests for transmission, engine, and brakes to cool. If gauge readings do not drop with road speed, the governor or compensator valve may not be operating properly. *NOTE - If readings were normal (car standing) at idle and stall, the compensator valve is operating properly and the trouble is indicated to be lack of governor pressure at compensator valve.*

TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Same for "Manual Throttle Control Transmission" and for "Vacuum Throttle Control Transmission" except where noted.*

HARD SHIFTING (VACUUM THROTTLE CONTROL TRANSMISSIONS): Vacuum supply tube disconnected. Throttle valve sticking. Vacuum diaphragm not operating properly. Vacuum diaphragm loose in transmission case. Engine idle speed too high. Engine operation faulty, resulting in loss of vacuum.

CONTINUED ON NEXT PAGE

GOVERNOR PRESSURE SPECIFICATIONS

CAR & ENGINE	AXLE RATIO	Govern r (Control) Pressure (At Wide Op n Throttl) 10 MPH	20 MPH ℂ	30 MPH

Form 15-A

2-SPEED AUTOMATIC TRANSMISSION (C ntinued)

ENGINE OVERSPEEDS DURING 1-2 UPSHIFT (VACUUM THROTTLE CONTROL TRANSMISSIONS): Vacuum diaphragm throttle valve rod bent or missing. Throttle valve sticking. Vacuum diaphragm connected to constant vacuum source (power brake or windshield wiper lines).

HARSH INITIAL ENGAGEMENT IN "D", "L", OR "R": Check engine idle and fluid level.

SLIPS OR CHATTERS IN "D" OR "L": Check fluid level, throttle linkage, control pressure, low band adjustment. Make an air pressure check. Inspect for loose or worn engine or transmission mounts. Check operation of low servo and band. Check for leakage in low servo apply circuit.

SLIPS OR CHATTERS IN "R": Check fluid level, throttle linkage, control pressure, reverse band adjustment. Make an air pressure check. Inspect for worn or loose engine mounts. Check operation of reverse servo. Check for leakage in reverse servo apply circuit.

CREEPS EXCESSIVELY IN "D": Engine idle speed too fast.

ENGINE OVERSPEEDS DURING 1-2 SHIFT: Check fluid level. Check fluid odor for possibly burned clutch plates. Check throttle linkage adjustment, control pressure, low band adjustment. Make an air pressure check. Check control valve body for malfunction. Check for leakage in clutch apply or low servo release circuit. Check planetary gears.

MOMENTARY LOCKUP DURING 1-2 SHIFT: Check fluid level, throttle linkage, control pressure and low band adjustment. Low servo and band not operating properly. Check high clutch for malfunction. Check for possible broken low servo return spring.

SEVERE 2-1 SHIFT DURING COAST-DOWN: Check engine idle speed and throttle linkage. Check control valve body for malfunction. Make a control pressure check.

NO 1-2 SHIFT IN "D": Check fluid level. Check fluid odor for possibly burned clutch plates. Check manual linkage adjustment. Check for improperly operating governor. Check for leakage in control pressure main circuit. Check high clutch and low servo and band for improper operation.

DELAYED 1-2 UPSHIFT: Check throttle linkage. Check for improperly operating governor. Check for leakage in control pressure main circuit.

SLIPS CONTINUOUSLY AFTER 1-2 SHIFT: Check fluid odor for possibly burned clutch plates. Check throttle linkage adjustment and fluid level. Make a control pressure check and an air pressure check. Check high clutch for improper operation and for leakage in clutch apply or low servo release circuit.

NO 2-1 FORCED DOWNSHIFT (KICKDOWN): Check throttle linkage adjustment. Check control valve body for malfunction. Check for leakage in control pressure main circuit.

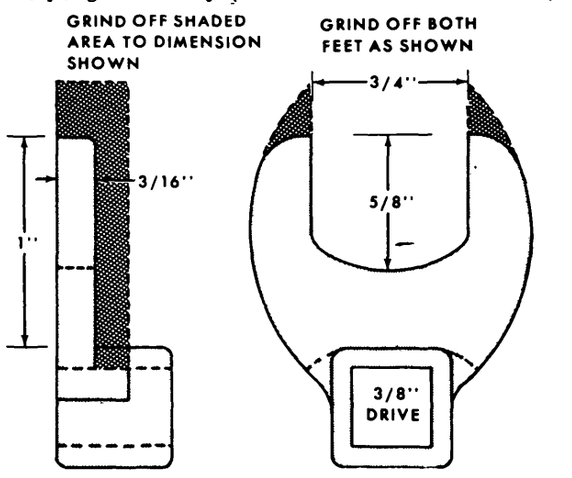
NO 2-1 SHIFT DURING COAST-DOWN: Check for malfunction in control valve body or governor.

FLUID FORCED OUT FILLER TUBE OR VENT: Check fluid for contamination by engine coolant. Transmission external vent plugged. Check fluid for aeration.

TRANSMISSION OVERHEATS: Check control pressure. Check oil cooler flow.

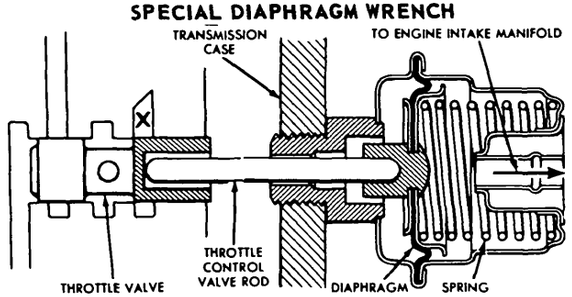
ACCELERATION NORMAL (MAXIMUM SPEED APPROXIMATELY 45 MPH): Converter one-way clutch not operating properly.

ACCELERATION VERY POOR (OPERATION ABOVE 30 MPH AT STEADY THROTTLE IS NORMAL): Converter one-way clutch not operating properly.



ENGINE DOES NOT START BY PUSHING CAR: Check fluid level and manual linkage adjustment. Check for malfunction in control valve body. Rear pump not operating properly. Check for leakage in control pressure main circuit.

PARKING LOCK DOES NOT HOLD OR BINDS: Check manual linkage adjustment. Check parking linkage.



MINOR REPAIRS (TRANSMISSION IN CAR)

Vacuum Diaphragm: Removal - To remove diaphragm assembly without removing oil pan and throttle valve body, modify a ¾" "Crow-foot" wrench as illustrated below and use it on "hex" portion of diaphragm to turn diaphragm assembly out of transmission case. The diaphragm assembly can also be removed by removing oil pan, throttle valve assembly, and throttle control valve rod, then insert a 3/16" Allen wrench into end of diaphragm assembly (from inside transmission case) and turn diaphragm assembly out of case. *CAUTION - Do not apply any pressur to diaphragm housing.*

Installati n - Reverse removal procedure and tighten diaphragm assembly to 15-18 ft. lbs.

SPECIAL DIAPHRAGM WRENCH

THROTTLE CONTROL VACUUM DIAPHRAGM

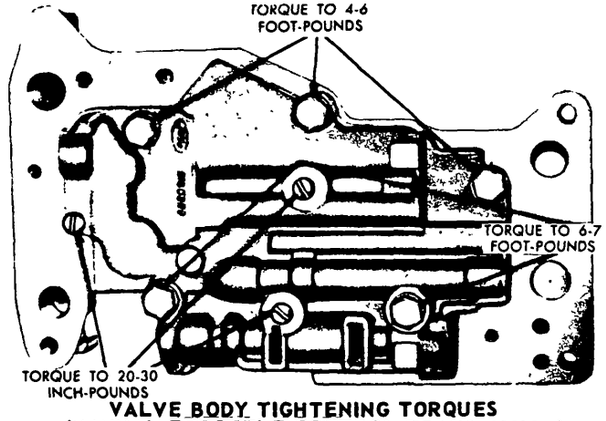
Control Valve Body: Removal - Drain fluid from transmission, then remove oil pan and gasket. Remove fluid screen retaining clip and screen. Remove six bolts attaching control valve body to transmission case, then lower control valve body and work the manual shift valve link out of manual valve.

Installation - Position control valve assembly in transmission case, then connect manual valve shift link to manual valve, and position the throttle valve lever between downshift valve and the stop plate on upper valve body. Install control valve attaching screws and tighten to 8-10 ft. lbs. Install fluid screen and oil pan, using a new gasket. Tighten attaching bolts to 10-13 ft. lbs. Install drain plug and tighten to 10-13 ft. lbs. Refill transmission with recommended fluid and adjust throttle linkage and manual linkage.

Front Servo Piston Assembly: Removal - Drain fluid from transmission, then remove oil pan and gasket. Remove fluid screen retaining clip and screen. Remove main control valve assembly (see above), and disconnect fluid filler tube from transmission case. Remove two opposing bolts from front servo cover, then install two longer bolts (5/16" - 18 x 2") and nuts to hold cover in position against servo spring tension while removing remaining servo cover bolts. Remove servo cover by slowly unscrewing nuts on long bolts until all servo spring tension is released from cover. Remove the long bolts, nuts and servo cover. *NOTE - Before removing servo cover, note position of front band actuation struts. This will aid in reassembly in case struts are dislodged.* Remove servo piston assembly and servo spring from transmission case and remove servo piston seal ring from piston.

Installation - Inspect front servo piston for nicks, burrs and a warped or bent condition. Inspect servo piston bore for burrs, wear, and scoring. Install new seal ring on servo piston and install servo piston spring and piston assembly in servo bore with air bleed hole toward top of case. Clean servo cover and mounting face and position new "O" ring seal on cover, then place servo cover on servo piston. Retain servo cover in place with the two long bolts used at disassembly (5/16" - 18 x 2"), and nuts. Pull servo cover partially into position by turn the nuts on long bolts to compress servo spring. Install regular cover attaching bolts in the open threaded holes. Remove both long bolts and nuts and install remaining two cover attaching bolts. *NOTE - Check position of front band actuating strut while tightening servo cover bolts to assure that servo piston rod enters actuating strut properly. If struts have been dislodged, loosen front servo band adjusting screw and position them correctly.* Tighten servo cover attaching bolts evenly to avoid distorting cover, then when cover is firmly seated, tighten bolts to 12-15 ft. lbs. *CAUTION - Use care when positioning "O" ring seal and servo cover to prevent futur leakage.* Install main control valve assembly, then connect manual shift valve link to manual valve and position throttle lever

CONTINUED ON NEXT PAGE



2-SPEED AUTOMATIC TRANSMISSION (Continued)

between downshift valve and stop plate on upper valve body. Tighten control valve attaching bolts to 8-10 ft. lbs. Adjust front and rear bands (see "Adjustments" above). Install fluid screen and transmission oil pan and refill transmission. Adjust Linkage.

►*FRONT SERVO COVER GASKET REPLACEMENT:* Remove low band adjusting screw locknut and tighten adjusting screw with wrench, Tool T59P-77370-A (Ford), Tool 7345 (Edsel) until wrench overruns. Loosen cover capscrews approximately two turns each, then tighten band adjusting screw until wrench overruns. Repeat this procedure until servo cap is removed (low band strut will be seated against bottom of servo casting and will be held in place). To install cover, use two 5/16" - 18 x 1¼" hex head bolts in place of the regular bolts, then place servo cover over piston and start the two bolts. Tighten bolts snugly to bring cover into contact with piston and to position piston stem in band strut (piston stem will be back in position in cup face of band strut). Loosen band adjusting screw two turns, then tighten servo cover capscrews approximately two turns or until they are snug (band will again be tight against drum). Repeat this procedure until cover is drawn close enough so that regular cover capscrews can be installed in rest of cover holes, then remove the two temporary bolts and replace them with regular bolts. Continue to repeat the above procedure until cover is fully installed. Install low band adjusting screw locknut and adjust the band.

Rear Servo Piston Assembly: Removal - Disconnect accelerator pedal connecting rod, then raise car and remove transmission oil pan, fluid screen and main control valve. Remove four bolts and remove rear servo cover, "O" ring seal, and servo piston spring. *CAUTION - Servo cover is spring loaded.* Remove locknut, adjusting nut, and half-ball rod seal from rear servo piston rod. Remove rear engine mount from under transmission housing, then lower extension onto frame crossmember. Remove piston rod from transmission case. Remove servo piston and seal ring from piston bore. *NOTE - Push outward on piston stem from inside transmission case or apply air pressure to reverse servo apply passage in transmission case to remove piston.* Remove seal ring from piston.

Installation - Inspect piston, stem and rod for nicks or burrs. Check rod for wear or for a bent or warped condition. Inspect piston bore, for burrs, wear and scoring. Install new seal on piston, then install piston assembly into bore in case. Push piston to bottom of bore. Install piston rod through piston, then position band operating lever and install the half-ball rod seal, adjusting nut, and locknut loosely. Raise transmission from frame crossmember and install rear engine mount. Install new "O" ring seal on servo cover, then install servo cover, maintaining pressure against cover while tightening the attaching bolts. Tighten bolts slowly and evenly until cover is firmly seated, then tighten bolts to 12-15 ft. lbs. Adjust front and rear bands (see "Adjustments" above). Install main control valve assembly, fluid screen, transmission oil pan, and drain plug. Refill transmission (see "Draining & Refilling" above). Connect accelerator rod and adjust pedal to 3½" above floor. Adjust throttle and manual linkage.

VALVE BODY TIGHTENING TORQUES (MANUAL THROTTLE CONTROL TRANSMISSION)

EXTENSION HOUSING & GOVERNOR: Removal - Raise car and drain fluid from transmission, then disconnect driveshaft at rear universal and remove driveshaft. Remove bolts attaching rear engine support to transmission, then use a transmission jack and raise transmission until extension housing clears rear engine support and frame crossmember. Remove extension housing from transmission case. To remove governor, remove snap ring from output shaft and remove governor and governor drive ball. *NOTE - Replace output shaft seal if worn or damaged.*

Installation - Reverse removal procedure.

Extension Housing Bushing and/or Seal Replacement: With drive shaft and universal joint assembly removed from transmission, proceed as follows: Remove bushing and seal together with Tool 7000-AF (Comet); T60K-7691-A (Falcon); T52L-7000-GAE (Ford); 7000-G (Edsel). *CAUTION - Do not damage spline seal when tool is installed.* Install new bushing with Tool 7657-F (Comet); T60K-7697-G (Falcon); T52L-7000-HAE (Ford); 7000-HF (Edsel). To remove seal only, use seal puller 1175-AE or W (All models). To install seal, use Tool 7657-G (Comet); T60K-7657-A (Falcon); T57P-7657-A (Ford); 7657-F (Edsel). Coat outer diameter of seal with a non-hardening sealing compound.

TRANSMISSION OVERHAUL

See "Ford & Edsel 2-Speed Automatic Transmission" in 1959 Annual Data.

REMOVAL & INSTALLATION

COMET & FALCON

REMOVAL: Transmission and converter are removed as an assembly.

1) Place car on a hoist (do not raise), then pull back floor mat and remove the two upper converter housing-to-engine attaching bolts. From under the hood, remove bolts attaching throttle linkage bracket to converter housing, then remove starter.

2) Raise car and drain converter and transmission. *CAUTION - Do not attempt to turn flywheel with a wrench on converter-to-flywheel stud nuts.* Disconnect driven shaft at rear axle pinion flange and remove drive shaft. Install extension housing seal replacer in extension housing *(see "Extension Housing Bushing and/or Seal Replacement" above for tool number).*

3) Disconnect manual and throttle linkage at transmission, then disconnect speedometer cable at extension housing. Disconnect oil filler tube (on Comet, disconnect pressure checking tube at transmission).

4) Remove two lower stud nuts attaching rear support insulators to support crossmember, then disconnect parking brake cable rod at equalizer lever. Position a transmission jack under transmission and raise it slightly to take weight off support member, then remove support member.

5) Lower transmission and support rear end of engine, then remove converter-to-flywheel stud nuts and move converter away from flywheel as far as it will go. Remove the two lower converter housing-to-engine block bolts and work converter housing off engine block dowel pins, then work converter pilot out of engine crankshaft. Secure converter to converter housing and lower transmission from car.

INSTALLATION: *See "Ford & Mercury below".*

FORD & MERCURY

REMOVAL: Transmission and converter are removed as an assembly.

1) Raise car and drain transmission and converter, then disconnect drive shaft at pinion flange and remove shaft. Install extension housing seal replacer in extension housing seal *(see "Extension Housing Bushing and/or Seal Replacement" above for tool number).*

2) Disconnect manual and throttle linkage at transmission, then disconnect speedometer cable from extension housing. Disconnect oil cooler lines at transmission, then remove lines from clamp at engine block. Disconnect oil filler tube at transmission case. On Edsel, disconnect pressure checking tube at transmission.

3) Remove starter from converter housing and disconnect parking brake cables at the equalizer. Remove two engine rear support bolts from extension housing and remove support clamp.

4) Position a transmission jack under transmission and raise it slightly to take weight off crossmember. Support rear of engine in this position with an engine support bar or stand, then remove crossmember.

5) Remove bolts attaching converter-to-flywheel and remove converter housing-to-engine block bolts. Secure converter to transmission so it will not fall out when transmission is separated from engine, then work transmission off engine block dowel pins and toward rear until converter pilot clears crankshaft. Lower transmission and remove it from car.

INSTALLATION: Reverse removal procedure and note the following: Tighten insulator-to-crossmember bolts to 23-29 ft. lbs. Tighten converter-to-flywheel stud nuts to 23-28 ft. lbs. With transmission completely installed, and filled with fluid, run engine at idle speed and shift selector lever from "N" to "D" and from "D" to "N" at least 10 times to fill low servo release cavity with fluid. Adjust manual and throttle linkage.

FORD MOTOR SINGLE & DUAL RANGE

FORDOMATIC
F rd Trucks, F-100
CRUISE-O-MATIC
F rd V8 Pass. Cars (1961)

① – "Twin-Range" transmission
② – "Single-Range" transmission

►CHANGES, CAUTIONS, CORRECTIONS

►*FAST IDLE OPERATION (FOR SUSTAINED PERIOD) CAUTION:* To prevent transmission overheating, do not operate car with transmission in Neutral or Park for periods longer than 10 minutes unless fluid level, manual and throttle linkage, and parking brake adjustments are within specifications. It is suggested that the car be raised and properly supported, and operated in gear if long periods of operation at fast idle are required.

FORD & MERCURY 3-SPEED (TWIN RANGE) AUTOMATIC TRANSMISSION

►*1961 TRANSMISSION EXTENSION HOUSING SQUEAL CORRECTION:* Apply a light coat of Lubricant, Part No. B8A-19589-A, on front driveshaft yoke.

►*1961 "PCE" (390" ENG.) TRANSMISSION REAR BAND ACTUATING LEVER PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* If actuating lever breakage occurs, replace broken lever with Part No. C1SP-7A169-A. This new lever entered production at Transmission Serial No. PCE-B-26650.

►*1961 "DUAL-RANGE" TRANSMISSION DIPSTICK IDENTIFICATION:* Dipstick cap is copper plated and distance from lower end of dipstick to upper end (point where it is riveted to handle) should be 16.74". *CAUTION* – The use of the longer 2-Speed Transmission dipstick will result in lower than indicated oil level.

►*1961 "DUAL-RANGE" TRANSMISSION NOT DOWNSHIFTING OR UPSHIFTING CORRECTION:* This condition may be caused by throttle and kickdown linkage binding. To correct, free up all linkage and lubricate all pivot points.

►*1961 "DUAL-RANGE" TRANSMISSION FRONT CLUTCH PISTON PRODUCTION CHANGE:* To reduce possibility of front clutch failure under server "rocking" conditions, front clutch piston assemblies have been revised to incorporate a centrifugally operated ball check bleed valve in place of the former mechanically operated valve. Later type front clutch pistons may be used on previous "Dual-Range" transmissions.

►*STARTING ENGINE BY TOWING OR PUSHING CAR:* Pushing is recommended. Place selector lever in Neutral "N" position. When car reaches 20 MPH speed, turn on ignition, move selector lever to "LO", depress accelerator pedal to half throttle position until engine begins to run. *NOTE-On ice or snow where traction not good, move selector lever to "DR" position to crank engine.*

►*TOWING CAR CAUTIONS: Do not tow at speed great r than 40 MPH and observe following precautions:*
If Transmission Operating Properly-Place selector lever in Neutral "N" position. Car can be towed normally for distances not to exceed 12 miles. **F r gr at r distanc s, us same proc dur as for in p rativ transmissi n.**

CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (C nt.)

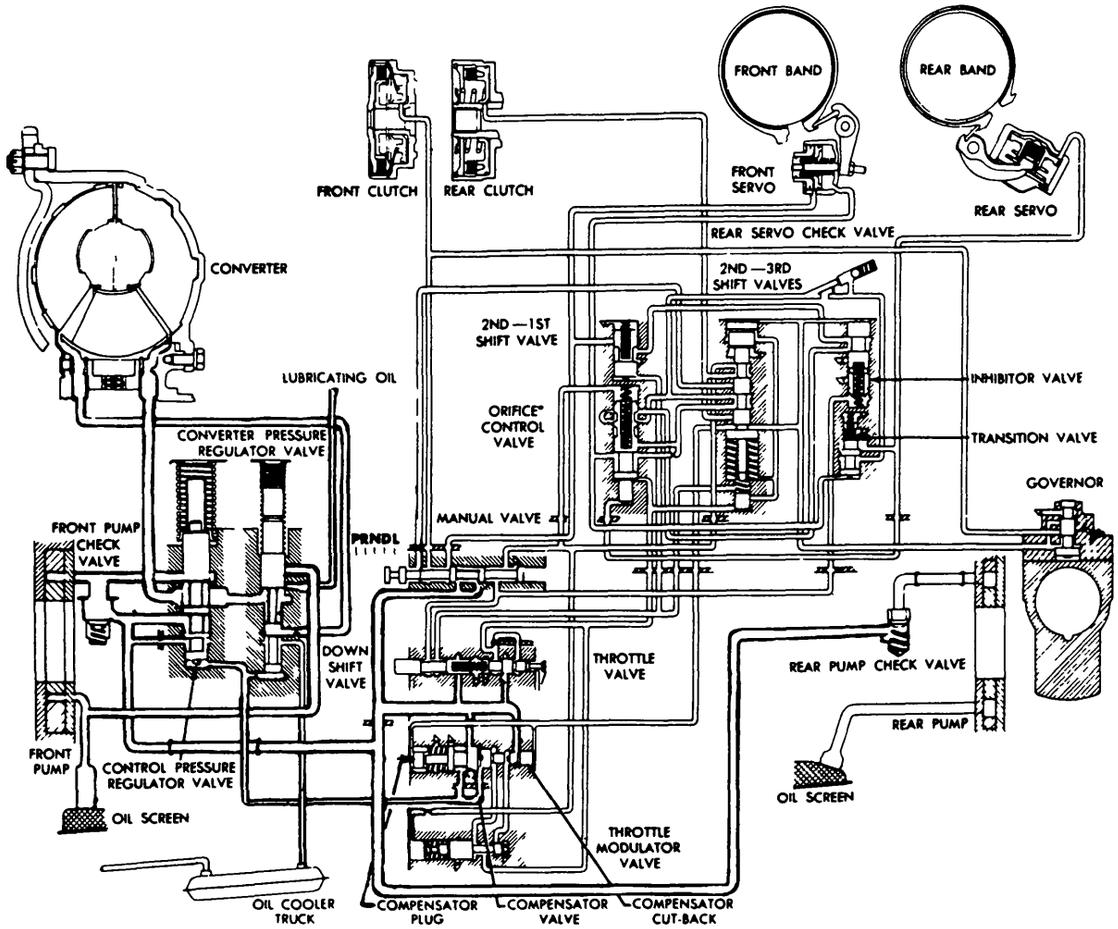
If Transmission Inoperative—Tow car with rear wheels lifted off road, or disconnect and remove propeller shaft and protect rear end of transmission from entry of dirt (U-joint Knuckle, Part No. 1M-4841 can be installed and wired in place for this purpose).

DESCRIPTION

DESCRIPTION: Single—Range and Dual—Range transmissions are similar in design to previous transmissions except that dual—range transmissions used on passenger cars have a vacuum controlled throttle valve. The spring loaded vacuum diaphragm unit mounted on rear of transmission case is actuated by engine vacuum against spring pressure. At high vacuum, diaphragm moves against spring pressure to move pushrod away from throttle valve, cutting off throttle pressure. As vacuum drops, spring loaded diaphragm moves pushrod to open throttle valve and increase throttle pressure. A transmission oil cooler is provided on all models.

OPERATION

OPERATION: *See Fordomatic, Merc-O-Matic & Turbo-Drive Transmissions" in 1957 Annual Data or later Manual edition and note the following:* On twin-range type transmissions, with selector lever in "Dr. 1" range, the car starts in first gear and upshifts to 2nd, then to 3rd gear. With selector lever in "Dr. 2" range, the car starts in 2nd gear (same as single range transmission) and upshifts to 3rd gear. Power flow through the twin range type transmission is the same as for single range type transmissions except that with selector lever in "Dr 1" range, the pinion carrier is held against rotation by the one-way sprag clutch instead of by the rear band. First gear in "Dr 1" range is the only gear that uses the one-way sprag clutch



LUBRICATION

Checking Fluid Level: Check fluid level every 4000 miles (Ford, Thunderbird, Mercury); 1000 miles (Ford Truck—On highway operation; Daily (Ford Truck—Off highway operation). Apply hand brake, place selector lever in "N" position, then run engine at fast idle speed to bring transmission to normal operating temperature. Move selector lever through all positions in turn, then move selector lever to "P" (Park) position. Check fluid level and add recommended transmission fluid as required to bring level to "F" (Full) mark on dipstick. **Recommended Fluid** – Automatic Transmission Fluid Type "A" (Suffix "A").

► *TRANSMISSION DRAINING & REFILLING NOTE: Periodic draining and refilling is not recommended, except at time of overhaul.*

Capacity (All Models) – 10 qts. (drain & refill); 11½ qts. (transmission dry).

Draining & Refilling: *NOTE – Not recommended except at time of transmission overhaul.* Remove converter housing lower cover and drain converter by removing one drain plug, then rotate engine 180 and remove second drain plug. Disconnect oil filler tube from transmission oil pan to drain fluid from transmission. Tighten converter drain plugs to 15—28 ft. lbs., then install transmission filler tube. Install 5 qts. of recommended fluid, then start engine and allow to run 2—4 minutes at idle speed. Add remaining amount of fluid (see above) and bring engine and transmission to normal operating temperature. Place transmission in "P" (Park) position and check fluid level. Add fluid to bring level up to "F" (Full) mark on dipstick. *CAUTION – Correct fluid level should be determined by dipstick reading rather than actual quantity of fluid installed.*

"SINGLE-RANGE" TRANSMISSION HYDRAULIC CIRCUITS

LINKAGE ADJUSTMENT

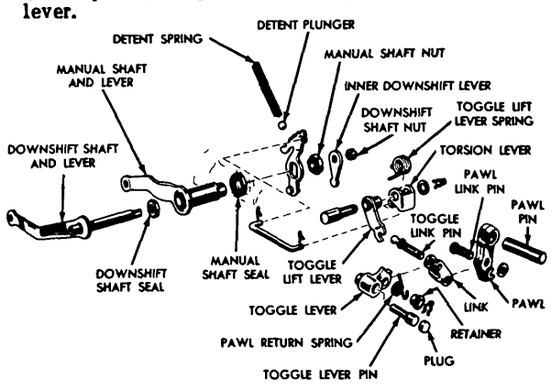
Throttle Linkage Adjustment: *See CARBURETOR on car model pages.*

FORD PASS. CARS & MERCURY (EXC. THUNDERBIRD)

Manual Linkage Adjustment: With engine stopped, loosen clamp at shift lever on lower end of steering column so shift rod is free to slide in clamp. Position selector lever in "D1" position, then shift manual lever on transmission to "D1" position (second from rear). Tighten clamp on shift rod, then check pointer alignment for all selector lever detent positions.

THUNDERBIRD

Manual Linkage Adjustment: With engine stopped, loosen nut at lower end of manual shift rod on transmission shift lever. Position manual selector lever so pointer is against steering column stop in "D1" position (large green dot is "D1" position). Move shift lever on transmission to "D1" detent position (second from bottom), then tighten nut on shift rod and shift lever. Check pointer alignment for all positions of selector lever and reset if necessary.



FORD TRUCK

Manual Linkage Adjustment: With engine stopped, disconnect upper end of manual shift rod from selector lever, then position lever so pointer is down against steering column stop in "Dr" position (Fordomatic); "D1" position (Cruise-O-Matic). Shift manual lever on transmission to second detent position from bottom. Rotate adjusting sleeve on manual shift rod until pin can easily be inserted in lever, then lengthen rod by turning adjusting sleev tw full turns. Lock adjusting

CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (Cont.)

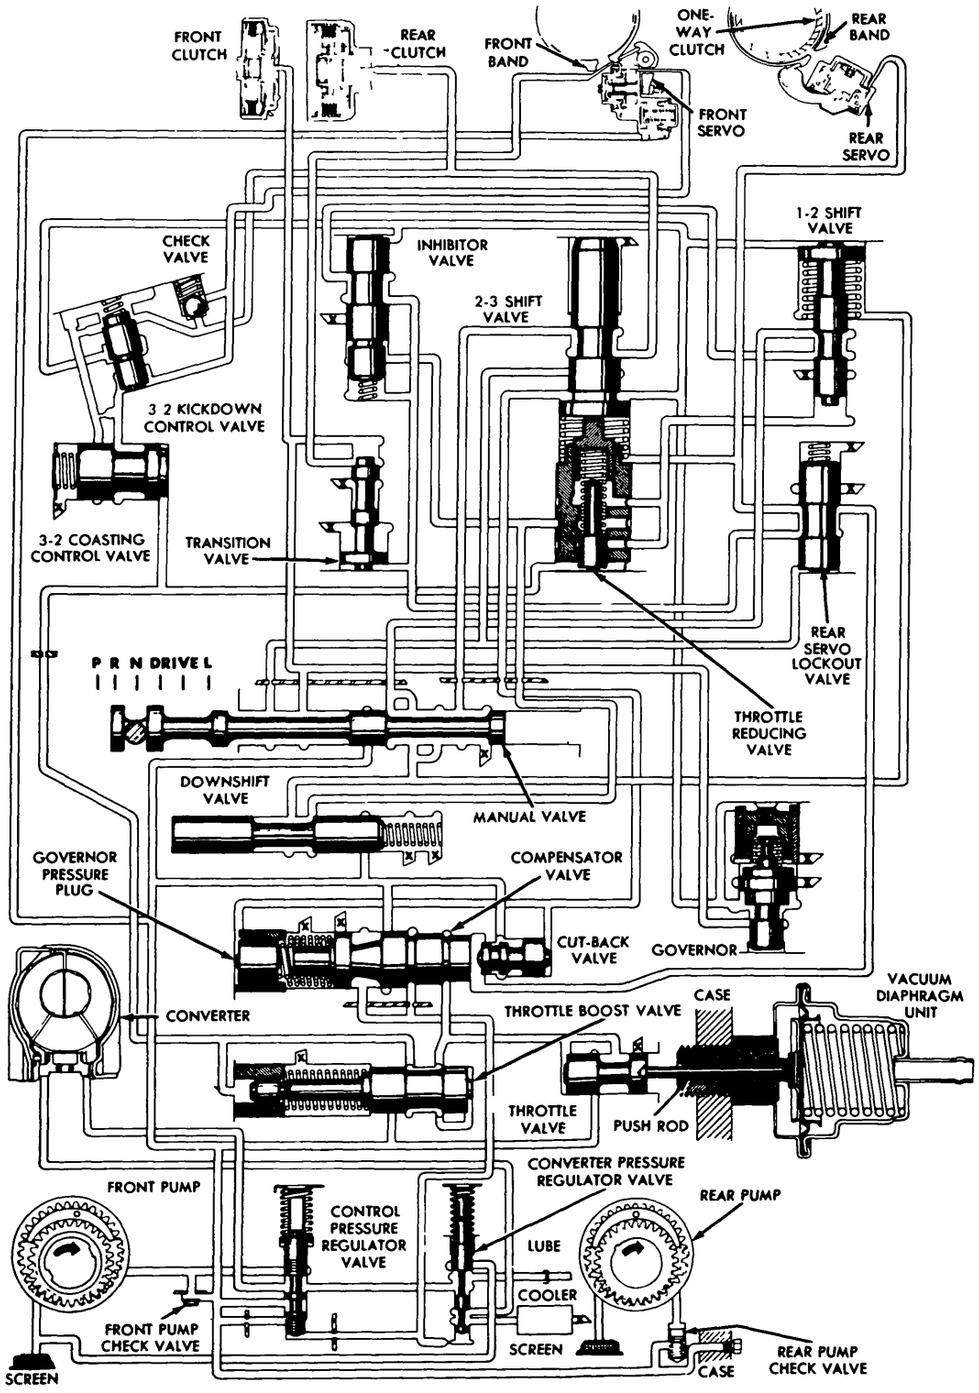
sleeve in position and connect rod to selector lever. Check pointer alignment for all positions of selector lever.

FORD & MERCURY 3-SPEED AUTOMATIC TRANSMISSION MANUAL & KICKDOWN LINKAGE

NEUTRAL SAFETY SWITCH ADJUSTMENT

Ford Pass. Cars & Mercury (Exc. Thunderbird & Mercury Series 800 & Monterey): Loosen neutral switch-to-steering column attaching screws at lower end of steering column, then shift selector lever to "N" (Neutral) position. Move switch in elongated mounting holes until a .060" gauge pin can be inserted through hole in switch housing and into switch plate. With gauge pin in place, tighten attaching screws, then remove gauge pin. Check starter circuit in all lever positions. The circuit should be open in all positions except "N" or "P".

Thunderbird & Mercury (Series 800 & Monterey): Switch is located on lower side (Thunderbird), upper side (Mercury) of steering column (inside passenger compartment). To adjust, loosen steering column-to-switch attaching screws and position switch so starter circuit is closed when selector lever is in "N" or "P" positions, then tighten attaching screws. *NOTE - Starter circuit must be open in all positions except "N" or "P".*



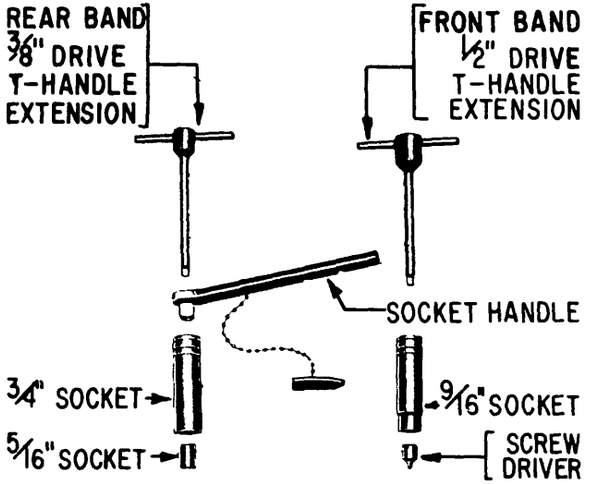
Ford Trucks: Loosen screws attaching switch to bracket on steering column, then position switch so that starter circuit is closed when selector lever is at "N" or "P". *NOTE - Circuits must be open in all other positions.* Tighten attaching screws and check operation in all lever positions.

BAND ADJUSTMENT

►*BAND ADJUSTMENT NOTE: Adjust bands every 12,000 miles under normal operation. For severe operation, adjust bands more frequently as required.*

FRONT BAND ADJUSTMENT (Except Mercury): Drain fluid from oil pan and remove pan and oil screen. Loosen front servo adjusting screw locknut two full turns and check adjusting screw for free rotation in actuating lever. Pull adjusting screw end of actuating lever away from servo body and insert adjusting tool gauge block (part of Tool T58L-7195-A) between servo piston stem

CONTINUED ON NEXT PAGE



FORD & MERCURY 3-SPEED (TWIN RANGE) AUTOMATIC TRANSMISSION HYDRAULIC CIRCUIT

FORD MOTOR SINGLE & DUAL RANGE (Cont.)

and adjusting screw. *NOTE – See illustration for details of Tool T58L–7195–A and other tools required for front band adjustment.* Install special ½" drive socket handle on 9/16" deep socket, then insert special T–handle extension through socket handle and socket, and install screwdriver socket on end of T–handle extension. Place assembled tools on adjusting screw so screwdriver socket engages adjusting screw and 9/16" socket engages adjusting screw locknut. With a torque wrench on T–handle extension, tighten adjusting screw to 10 inch pounds, then **back off screw exactly one full turn.** *CAUTION – Damage will result if transmission if adjusting screw is not backed off exactly one full turn.* Hold adjusting screw stationary and tighten locknut to 20–25 ft. lbs. Remove gauge block, install screen and oil pan and refill transmission with fluid.

Mercury: Drain transmission and remove oil pan and screen, then loosen front servo adjusting screw locknut two full turns. Pull back on actuating rod and insert Gauge Block, Tool 7225–C13–B (part of Tool T–7225–C) between front servo piston stem and adjusting screw. Tighten adjusting screw until wrench overruns, **then back off adjusting screw exactly one complete turn,** hold adjusting screw and tighten locknut to 20–25 ft. lbs. *CAUTION – Damage will result to transmission if adjusting screw is not backed off exactly one full turn.* Install screen and oil pan and refill transmission with fluid.

REAR BAND ADJUSTMENT (Except Mercury): On all models except Thunderbird, fold back floor mat at right side of floor pan and remove access hole cover. On Thunderbird, remove console and right side heater duct floor director, then remove access hole cover. On all models, place socket handle (part of Tool T58L–7195–A) on ¾" deep socket. *NOTE – See illustration for details of Tool T58L–7195–A and other tools required for rear band adjustment.* Insert special 3/8" drive T–handle extension through handle and socket, then install 5/16" 8–point socket on extension. Insert assembled tools in access hole so that adjusting screw and locknut are engaged. Loosen adjusting screw locknut and tighten adjusting screw to 10 ft. lbs. Remove torque wrench from T–handle extension and **back off adjusting screw exactly 1½ turns.** *CAUTION – Damage will result to transmission if adjusting screw is not backed off exactly 1½ turns.* Hold adjusting screw stationary and tighten locknut to 35–40 ft. lbs.

TOOL T58L-7195-A

FORD AUTOMATIC TRANSMISSION BAND ADJUSTING TOOL

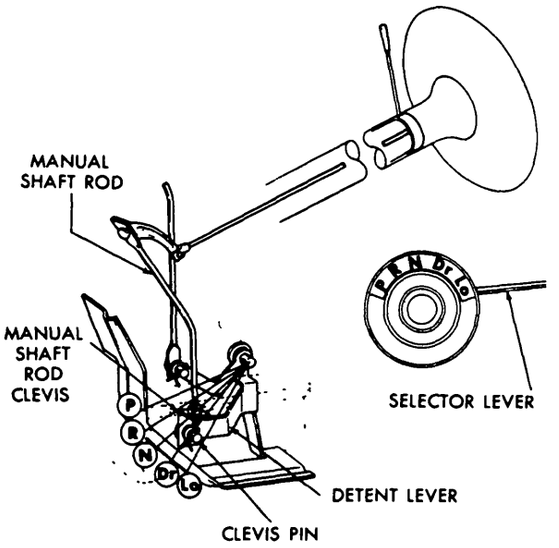
Mercury: Fold back floor mat on right side and remove access hole cover. Loosen band adjusting screw locknut with Tool 7195–C, then use T–handle portion of tool to tighten adjusting screw until wrench overruns. *CATUION – If screw is found to be tighter than wrench capacity (10 ft. lbs.), loosen screw and retighten until wrench overruns.* **Back off adjusting screw 1½ turns,** then tighten locknut to 35–40 ft. lbs. while holding adjusting screw stationary. *CAUTION – Damage will result to transmission if adjusting screw is not backed off exactly 1½ turns.*

TESTING

► *TRANSMISSION STALL TEST NOTE: Stall test procedures are the same for "Single–Range" and "Twin–Range" transmissions. When making the stall test, never hold throttle open longer than 5 seconds.*

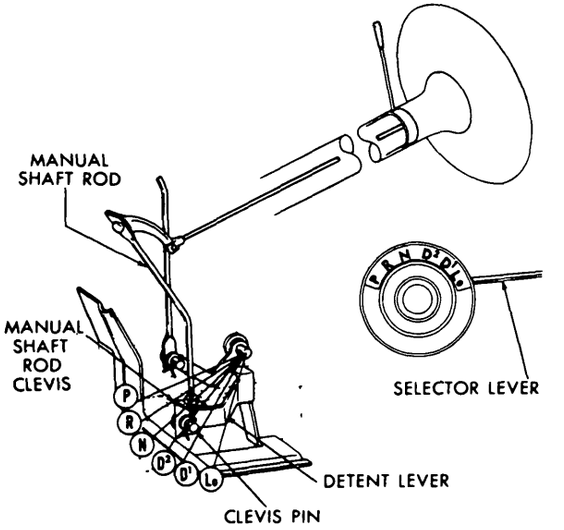
STALL TEST: With engine at normal operating temperature and at slow (hot) idle speed, install a tachometer on engine and apply service and parking brakes. Stall test transmission in each driving range at full throttle (do not depress accelerator through detent into kickdown position), and note engine speed (see Stall Speed Table below). *CAUTION – If engine speed exceeds maximum limits in table, release accelerator immediately.* Clutches and bands are applied in each selector lever position as follows: **"D1"** – Front clutch and one–way clutch engaged at all accelerator pedal positions. **"D2"** – Front clutch and front band applied at all accelerator pedal positions. **"L"** – Front clutch and rear band applied. **"R"** – Rear clutch and rear band applied. *NOTE – Engine over–speeding is an indication of clutch or band slippage.*

ENGINE STALL SPEEDS



Engine	Engine RPM
Pass. Car 292" Eng	1500–1700
Pass. Car 352" Eng	1600–1800
Pass. Car 390" Eng (Std.)	1800–2000
Pass. Car 390" Eng (Police)	1850–2050
Truck 223" Eng	1400–1600
Truck 292" Eng	1520–1720

SHIFT TESTS (Single Range Transmission): Select a smooth road for tests. Make test as outlined below and see "Shift Point Table" for correct speed where shift should occur.



2–3 Upshift (Minimum Throttle): Place selector lever in "DR" range, and starting from a standstill, apply accelerator lightly but steadily.

3–2 Downshift (Minimum Throttle): Permit car to decelerate (from speed attained in above test) until downshift occurs from high to intermediate.

3–2 Downshift (Forced): Reduce car speed below 45 MPH then press accelerator pedal to floor (through detent).

"SINGLE-RANGE" TRANSMISSION LINKAGE

"TWIN-RANGE" TRANSMISSION LINKAGE

Transmission should shift from high to intermediate. This shift should occur only with transmission in high gear.

2–1 Downshift (Forced): With selector lever in "DR" range and car speed below 18 MPH, quickly press accelerator fully to the floor. This action shifts transmission from intermediate to low.

2–3 Upshift (Maximum Throttl): Place selector lever in "DR" range, and starting from a standstill, press accelerator to the floor. Full throttle upshift should occur as indicated

CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (Cont.)

1-2 Upshift (Maximum Throttle): With accelerator fully pressed to floor for above test (2-1 Downshift, Forced), transmission should upshift from low to intermediate when car speed indicated in table is reached. The 2-3 Upshift will occur at same speed as for 2-3 Upshift (Maximum Throttle).

"DR" to "LO" Manual Shift: With car speed between 40–45 MPH, manually shift selector lever from "DR" to "LO". Instead of shifting to low gear, the transmission should shift from high to intermediate. When car speed is reduced within the range indicated in table, transmission should shift into low range.

"R" Shift: Bring car to a stop and place selector lever in "R" range. The car should move in reverse direction smoothly, upon light throttle application.

SHIFT TESTS (Twin-Range Transmissions With Vacuum Thr ttl C ntrol):

1–2, 2–3 Upshift (Minimum Throttle): Place selector lever in "D1" range. Starting from a standstill, transmission should start in first gear and shift to second, then at a higher speed, shift to third.

3–2, 2–1 Downshift (F rced): With transmission in third gear, depress accelerator pedal to floor (through detent). Transmission should shift from third to second, or from third to first, depending on car speed.

3–1 Downshift (Minimum Throttle): Coasting down from approximately 30 MPH in third gear, transmission should downshift from third to first. *NOTE – A 3–2–1 downshift may b xperienced under the above c nditions.*

3–2, 2–1 Downshift (Partial Throttle): With transmission selector lever in "D1" position and car speed at approximately 30 MPH, depress and hold accelerator at half throttle position and at the same time apply service brakes to a point where road speed is slowly decreased. The 3–2 and 2–1 shifts should occur as road speed decreases.

CONTROL PRESSURE TESTS (PASS. CARS): Attach tachometer and vacuum gauge to engine, then attach a pressure gauge to control pressure outlet at rear of transmission case. Apply parking brake and adjust idle speed to 450–475 RPM with transmission selector lever in "D1" or "D2" position. *NOTE – If idle speed cannot be brought within limits by adjusting carburetor throttl st pscr w, ch ck throttle and downshift linkage for binding and check for vacuum leakage at transmission diaphragm unit.* With engine at indicated idle speed and engine vacuum at 18.0"Hg(minimum) and with transmission in either "D1", "D2" or "N", pressure should be 57–69 lbs. (Exc. Police Interceptor); 70–95 lbs. (Police Interceptor). With transmission selector lever in either "P", "R" or "L", pressure should be 57–213 lbs. (Exc. Police Interceptor); 70–228 lbs. (Police Interceptor). If control pressures are within limits, apply service brakes and advance throttle until engine vacuum reading falls below 16–13.7" Hg. As vacuum reading passes through this range (16–13.7"), transmission control pressure should start to rise and continue to rise with throttle opening, reaching a maximum pressure of 145–170 lbs. on all models except Police Interceptor, 170–200 lbs. on Police Interceptor (with transmission selector lever in "D1" or "D2"). With transmission selector lever in "L" or "R", maximum pressure should be 201–213 lbs. (Exc. Police Interceptor); 212–228 lbs. (Police Interceptor). At maximum pressure, vacuum reading should be 1.5" Hg or less on all models. *NOTE – With selector lever in "P", "L" or "R", control pressure rise is not dependent on diaphragm unit. When selector lever is shifted into any of these positions and engine RPM is increased, control pressure should rise immediately and reach its maximum before engine speed reaches stall RPM.* If control pressures are not correct, erratic, or fail to rise with increased engine speed, see "Trouble Shooting & Diagnosis".

CONTROL PRESSURE TESTS (Single–Range & Truck Twin–Range Transmissions): Install a pressure gauge in pressure take–off hole located either near throttle lever or at rear of transmission case, then install a tachometer on engine and bring engine to normal operating temperature. Adjust engine to correct idle speed and set hand brake, then place transmission selector lever in "DR", "D1" or "D2" and check idle pressure which should be within specifications (see tables below). Increase engine speed and note control pressure indicated on gauge. If pressure is not within limits (see tables below) adjust throttle control rod to obtain required pressure, then recheck idle pressure. With selector lever in one of the above positions, increase engine speed to stall condition and note pressure and engine RPM which should be within specifications (see tables below).

► *CONTROL PRESSURE DIAGNOSIS NOTE: If contr l pr ssur s ar n t within sp cificati ns as indicated in "Line Pressure Range" tables, perform "Shift T st" and "Stall Test".*

LINE PRESSURE RANGE TABLE

Ford Trucks (Single–Range Transmission)

Engine Speed	Lever Position	Pressur
Idle	All	56–67 lbs.
1000 RPM	Dr	80–85 lbs.
Stall	Dr or Lo	153–170 lbs.
Stall	R	203–214 lbs.

Ford Trucks (Twin–Range Transmission)

Engine Speed	Lever Position	Pressur
Idle	All	56–67 lbs.
1000 RPM	D1 or D2	80–85 lbs.
Stall	D1 or D2	153–170 lbs.
Stall	R or Lo	203–214 lbs.

Mercury (Single Range Transmission)

Engine Speed	Lever Position	Pressure
Idle	All	56-72 lbs.
1000 RPM	D	80-85 lbs.
Stall	D or L	150-170 lbs
Stall	R	196-216 lbs.

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Raise car on hoist and remove transmission oil pan, and control valve assembly. Proceed as follows:

CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (C nt.)

Fr nt Clutch: Apply pressure to front clutch and governor input passage (see illustration). Listen for dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of system.

Governor Valve: Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

Rear Clutch: Apply air pressure to rear clutch oil passage (see illustration). Listen for a dull thud to indicate clutch is operating Check for leaks in same manner as for front clutch (above).

Rear Band & Servo: Apply pressure to rear servo oil passage (see illustration), and observe band application.

Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application.

►*TESTING NOTE: If servos, bands, clutches, and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" in OVERHAUL BELOW.*

TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Make corrections in sequence shown, testing operation of transmission after each correction.* For inspection of fluid distributor sleeve, see "Overhaul" below.

CONTROL PRESSURE LOW: If pressure is low at idle speed in all selector lever positions, check for excessive leakage in front oil pump, case, and control valve body. *NOTE – Control pressure in "P", "L" & "R" is regulated entirely by control pressure regulator valve and its spring.*

CONTROL PRESSURE HIGH: If pressure is high at idle speed with transmission selector lever in "N", "D1" & "D2", trouble may be in diaphragm unit or its connecting tubes and hoses. Check engine manifold vacuum. Check diaphragm pushrod for bends and for corrosion. Install diaphragm unit with pushrod removed and recheck control pressure in "N", "D1" or "D2". If control pressure is still too high, trouble is in transmission control system. If pressure is within limits, diaphragm unit is not operating properly.

CONTROL PRESSURE DOES NOT RISE WITH THROTTLE OPENING: If control pressure does not rise in "D1" or "D2" as engine vacuum falls below 16–13.7" Hg, check transmission pressure rise capacity by shifting to "R" or "L". In these positions, maximum control pressure should be obtained at not more than engine stall RPM. If pressure rise is normal in "R" or "L", remove hose from diaphragm unit and check hose and tube. *NOTE – To check, hold thumb over end of hose and check for vacuum. If engine speeds up when hose is disconnected and slows down as thumb is held against end of hose, vacuum source is satisfactory.* If vacuum reading at end of hose is 18" Hg or greater, change diaphragm unit and recheck pressure rise with throttle opening in "D1" and "D2". If control pressure does not rise now, trouble is in transmission. Check for internal leakage in components that have pressure in them in "D1" and "D2" but do not have pressure in them in "R" and "L".

CONTROL PRESSURE IS EXTREMELY ERRATIC: If control pressure is erratic in "N", "D1" and "D2", check diaphragm unit tubes, hoses and diaphragm pushrod (see "Control Pressure High" above). If vacuum is satisfactory, replace diaphragm unit and retest control pressure. If no improvement noted, clean and inspect control valve body and pressure regulator.

SEVERE ENGAGEMENT ("Lo", "Dr", or "R" Ranges): Check engine idle speed and throttle linkage adjustments. Adjust rear band. Perform a control pressure test. Remove and clean main control valve assembly and pressure regulator valve.

1-2, 2-3 SHIFT POINTS LOW, HIGH, OR ERRATIC: Check fluid level. Adjust throttle and manual linkage. Check governor operation. Perform a pressure control test. Remove and clean main control valve assembly and pressure regulator valve.

SEVERE 2-3 SHIFT: Adjust throttle linkage. Adjust front band. Remove and clean main control valve assembly and pressure regulator valve. Remove and inspect front servo.

ENGINE OVERSPEEDS (2-3 SHIFT): Adjust front band. Remove and clean main control valve assembly.

NO 1-2 OR 2-3 SHIFTS: Remove and inspect governor. Remove and clean valve assembly. Rear clutch slippage. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

NO FORCED DOWNSHIFTS: Adjust throttle linkage. Perform control pressure check. Remove and clean main control valve assembly. Check operation of inner and outer throttle levers.

SEVERE 3-2 OR 3-1 SHIFTS (CLOSED THROTTLE): Check engine idle speed and throttle linkage. Remove and clean main control valve assembly.

SLIPPAGE OR CHATTER IN 2ND SPEED: Check fluid level. Adjust throttle linkage. Adjust front band. Check control pressure. Clean main control valve and pressure regulator assemblies. Front servo not performing properly. Front clutch slipping. Leakage in hydraulic system.

SLIPPAGE OR CHATTER IN 1ST SPEED: Check fluid level. Adjust throttle linkage. Adjust rear band. Clean main control valve and pressure regulator assemblies Check inner and outer throttle levers. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

SLIPPAGE OR CHATTER IN REVERSE: Check fluid level. Adjust throttle linkage. Adjust rear band. Check control pressure. Clean main control valve and pressure regulator assemblies. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty

NO DRIVE IN "DR" OR "D2" RANGE: Adjust front band. Clean main control valve assembly. Make an air pressure check. Front clutch slipping. Leakage in hydraulic system. Fluid distributor in output shaft faulty.

NO DRIVE IN "D1" RANGE: Adjust manual linkage. Rear pump not operating properly. Planetary one-way clutch not operating properly.

NO DRIVE IN "R" RANGE: Adjust rear band. Rear servo not operating properly. Clean main control valve assembly. Make an air pressure check. Rear clutch not operating. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

NO DRIVE IN "LO" RANGE: Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Clean main control valve assembly. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

NO DRIVE IN ANY RANGE: Check fluid level. Adjust manual linkage. Check control pressure. Clean main control valve and pressure regulator assemblies. Make an air pressure check. Leakage in hydraulic system.

LOCKUP IN "DR" RANGE: Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Front servo not operating properly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

LOCKUP IN "R" RANGE: Adjust front band. Front servo not operating properly. Front clutch slipping. Check parking linkage. Leakage in hydraulic system.

LOCKUP IN "LO" RANGE: Adjust front band. Front servo not operating properly. Clean main control valve assembly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

PARKING LOCK BINDS OR WILL NOT HOLD: Adjust manual linkage. Check parking linkage.

UNABLE TO START ENGINE BY PUSHING: Check fluid level. Adjust manual linkage. Clean main control and pressure regulator valve assemblies. Rear pump not operating. Leakage in hydraulic system.

TRANSMISSION OVERHEATING: Converter cooling air passages blocked. Oil cooler and connections faulty. Clean pressure regulator assembly. Converter one-way clutch slipping or faulty.

ENGINE RUNAWAY ON FORCED DOWNSHIFT: Adjust front band. Clean main control valve and regulator valve assembly. Front servo not operating properly. Leakage in hydraulic system.

MAXIMUM SPEED BELOW NORMAL (POOR ACCELERATION): Converter one-way clutch not operating properly.

NO 2-1 DOWNSHIFT: Adjust throttle linkage. Clean main control valve assembly. Rear servo not operating properly.

NO 3-1 DOWNSHIFT: Adjust engine idle speed and throttle linkage. Remove and clean main control valve assembly.

NOISE IN NEUTRAL: Clean and inspect pressure regulator. Engine rear oil seal faulty. Front clutch not releasing properly. Front pump faulty.

NOISE IN 1ST, 2ND OR REVERSE SPEEDS: Clean and inspect pressure regulator. Fault in planetary assembly. Front or rear clutch faulty. Front pump faulty.

NOISE IN PARK RANGE: Clean and inspect pressure regulator. Front pump faulty.

NOISE WHEN COASTING IN NEUTRAL (20-30 MPH) WITH ENGINE OFF: Rear pump faulty.

MINOR REPAIRS (TRANSMISSION IN CAR)

Se 1958 Annual Data, Pag 466, r lat r Manual ditions.

CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (C nt.)

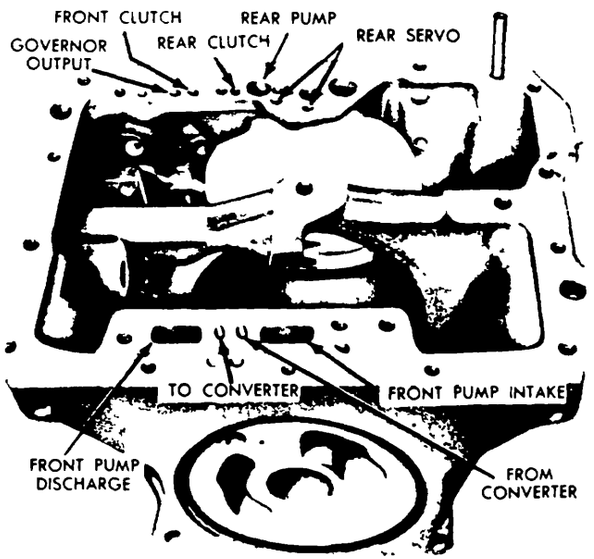
TRANSMISSION & CONVERTER REMOVAL

FORD PASS. CARS (EXC. THUNDERBIRD)

1) Place car on hoist but do not raise. Pull back floor mat and remove converter access hole covers, then remove two upper bolts attaching converter housing to engine.

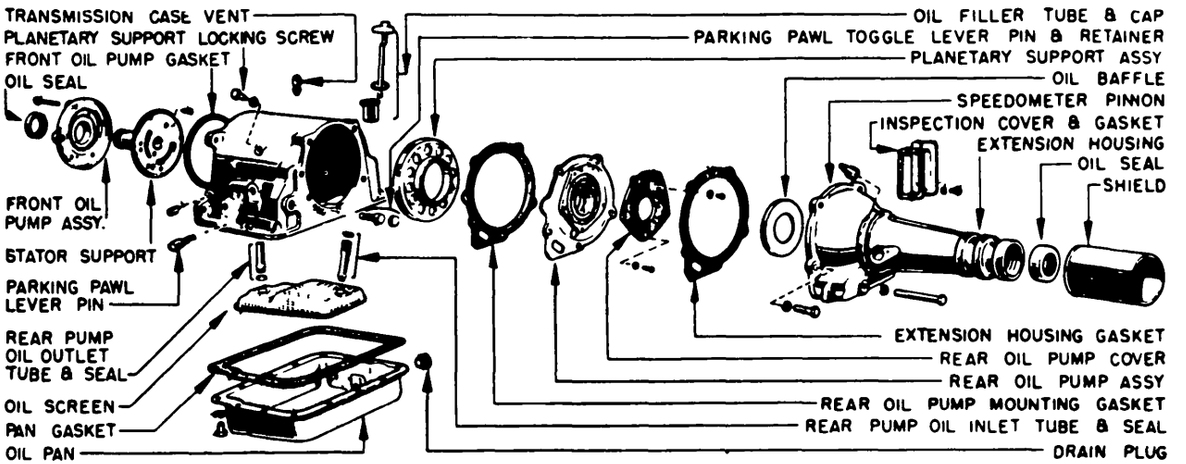
2) Raise car, and remove cover from lower front side of converter housing, then drain converter and transmission *(see "Draining & Refilling" above).* Remove vacuum hose from vacuum diaphragm unit.

3) Remove flywheel to converter bolts. *NOTE – On "Dual-Range" typ transmissions, install converter housing front plate to hold converter in place when transmission is removed.*



4) Disconnect battery cable at starter, and transmission to body ground cable from transmission, then remove starter.

5) Disconnect oil cooler lines from transmission, then disconnect manual and throttle linkage from transmission levers.



6) Disconnect speedometer cable from extension housing, and remove drive shaft. Remove remaining converter housing-to-engine attaching bolts. Remove two engine rear support-to-transmission bolts, and raise transmission slightly to take weight off crossmember, then remove crossmember.

7) On V8 models with single exhaust, loosen and drop exhaust system to allow converter to clear muffler inlet pipe.

8) If clearance needed to remove transmission and converter assembly from car, tilt rear of assembly upward slightly and to rear of car (enough to allow removal of flywheel-to-crankshaft bolts). Move assembly to rear and remove it. *NOTE - If there is enough clearance, remove flywheel-to-converter attaching bolts, then move assembly toward rear and lower it, leaving flywheel attached to crankshaft.*

TRANSMISSION TEST POINTS

TRANSMISSION CASE & EXTENSION HOUSING ASSEMBLY

9) To install transmission and converter assembly, reverse removal procedures and note the following. Tighten flywheel housing-to-engine block bolts to 45-50 ft. lbs. Tighten flywheel-to-crankshaft bolts to 75-85 ft. lbs.

Torque Converter Removal (From Transmission): See *"Torque Converter Overhaul" below.*

THUNDERBIRD

►*NOTE: Transmission and torque converter must be removed as separate assemblies. See "Transmission Removal (Without Converter)" below.*

FORD TRUCKS

1) Place truck on hoist, but do not raise. Remove converter access hole convers in floor pan and remove two upper converter housing-to-engine bolts. Raise truck on hoist and remove cover from lower front side of converter housing. Drain transmission and converter, *(see "Draining & Refilling" below).*

2) Remove flywheel-to-converter bolts. On V8 models, install converter housing front plate to hold converter in place during transmission removal. On 6 cyl. models, wedge converter in place.

3) Disconnect starter cable at starter, then disconnect body ground cable at transmission. Remove starter. On 6 cyl. models, remove linkage splash shield. On trucks with oil cooler, disconnect water hoses at cooler.

4) Disconnect manual and throttle linkage from transmission levers, then disconnect speedometer cable from extension housing. Remove drive shaft.

5) Remove both engine rear support bolts, then raise engine and transmission high enough to remove engine rear supports. Lower engine against floor stand or engine support bar so converter housing is clear of crossmember when all weight is off transmission jack. Remove remaining converter housing-to-engine attaching bolts.

6) On V8 models with single exhaust system, loosen and drop exhaust system, to allow converter to clear muffler inlet pipe.

7) If clearance is needed to remove assembly, tilt rear of assembly upward slightly and to the rear (enough to allow removal of the six flywheel-to-crankshaft bolts). Move assembly to the rear. *NOTE. If there is enough clearance, remove flywheel-to-converter attaching bolts, then move assembly toward rear and lower it, leaving flywheel attached to crankshaft.*

8) To install transmission and torque converter assembly, reverse removal procedures and note the following: Tighten converter housing-to-engine bolts to 45-50 ft. lbs. Tighten converter-to-flywheel bolts to 25-28 ft. lbs.

Torque Converter Removal (From Transmission): See *"Torque Converter Overhaul" below.*

MERCURY

1) Connect a starter remote control to starter solenoid, then remove three converter housing–to–engine attaching bolts and the starter motor upper bolt at right side of engine.

2) Raise car and remove converter housing lower plate and drain oil from converter assembly. *NOTE – Use starter remote control to rotate converter.* Disconnect selector rod and downshift control rod at transmission, then disconnect speedometer cable and vacuum diaphragm engine vacuum tube.

3) Drain transmission and remove filler tube from transmission. Disconnect oil cooler lines at transmission, then disconnect parking brake cables at equalizer. Disconnect drive shaft at rear universal and remove driveshaft.

4) Remove converter–to–flywheel retaining nuts. *NOTE – Use starter remote control to turn flywheel.* Remove starter cable at starter and remove starter. Position a

CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (C nt.)

transmission jack under transmission and slightly raise transmission.

5) Remove engine rear support insulator bolts and engine rear support crossmember bolts and remove crossmember. *NOTE – If car is equipped with dual exhaust system, it may be necessary to disconnect exhaust pipes at exhaust manifolds and lower pipes to obtain clearance for removal of crossmember.*

6) Remove converter housing–to–engine lower retaining bolts, then remove transmission and converter assembly from under car.

7) To install converter and transmission assembly, reverse removal procedures and note the following Tighten rear support insulator bolts and converter housing lower bolts to 40–45 ft. lbs. Tighten converter–to–flywheel retaining nuts to 20–25 ft. lbs.

Torque Converter Removal (From Transmission): See *"Torque Converter Overhaul" below.*

TRANSMISSION REMOVAL (WITHOUT CONVERTER)

FORD PASS. CARS & FORD TRUCKS

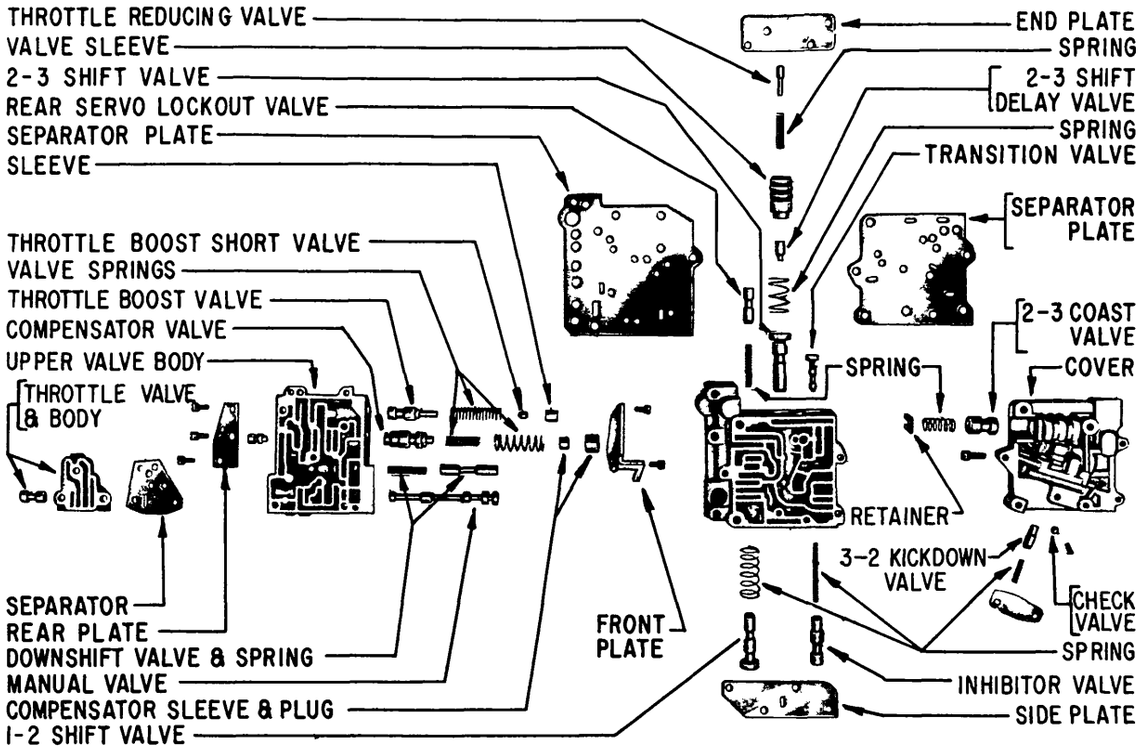
►*NOTE: Transmission and torque converter must be removed as an assembly on Sunliner models.*

1) Raise car or truck on a hoist and drain transmission and torque converter, then disconnect oil cooler lines. On truck models, disconnect water hoses from oil cooler. On Pass. Cars, disconnect vacuum tube from vacuum diaphragm unit.

2) Remove linkage splash shield then disconnect manual and throttle linkage from transmission levers Disconnect speedometer cable from extension housing

3) On passenger cars remove engine rear support to transmission bolts On all cars and trucks position a transmission jack under transmission On passenger cars raise jack slightly to take weight off crossmember then remove crossmember On all models with transmission jack in position remove four transmission to converter housing bolts

4) Tilt rear of transmission assembly slightly upward and with a jack move assembly toward rear of car until input shaft is clear then lower assembly and remove



5) To install, reverse removal procedures and tighten transmission to converter housing bolts to 40-45 ft lbs. *NOTE - Two guide pins installed in the top transmission to converter housing bolt holes will aid in installation*

THUNDERBIRD

1) Raise car on a hoist and drain transmission and converter *(see "Draining & Refilling" above).* Disconnect drive shaft at pinion flange and remove drive shaft. *NOTE* – Install seal replacer, Tool T57L–7657–A in extension housing seal.

2) Disconnect pitman arm–to–idler arm rod at pitman arm end. Remove one bolt on each muffler inlet pipe–to–chassis bracket (toward rear of chassis), then disconnect muffler inlet pipes from exhaust manifold.

3) Disconnect oil cooler lines and manual and downshift control rods at transmission. Remove diaphragm unit tube from clip on oil pan and from diaphragm unit. Disconnect speedometer cable at extension housing.

FORD & MERCURY AUTOMATIC TRANSMISSION (TWIN RANGE) CONTROL VALVE

4) Remove engine rear support bolts, then place a transmission jack under transmission and raise it slightly to take weight off crossmember. Remove transmission rear support bracket–to–chassis bracket bolts. Remove support and hand brake cables from equalizer and allow support and equalizer to hang down from front brake cable.

5) With transmission jack in position, remove four transmission–to–converter housing bolts. Tilt rear of transmission assembly slightly upward, and with jack move the assembly toward rear until clear of converter housing. Lower transmission and remove from car.

6) To install, reverse removal procedure and note the following Tighten transmission–to–converter housing bolts to 40–45 ft. lbs.

MERCURY

►*NOTE – Transmission and torque converter must be removed as an assembly on convertible models.*

1) Raise car on hoist and disconnect vacuum tube from vacuum diaphragm, then drain fluid from transmission *(see "Draining & Refilling" above).*

2) Disconnect selector rod and downshift control rod at transmission. Disconnect speedometer cable at extension housing and oil cooler lines at transmission. Disconnect parking brake cables at equalizer, then disconnect drive shaft at rear universal joint and remove driveshaft.

3) Remove engine rear support insulator bolts, then position a transmission jack under transmission and slightly raise transmission. Remove crossmember bolts and crossmember. *NOTE – If car is quipped with dual exhaust system, it may b n c ssary to disconn ct exhaust pipes at exhaust manifolds and low r pip s to obtain clearance for removal of crossmemb r.*

4) With transmission jack in position, remove transmission–to–converter housing bolts, then support engine and move transmission toward rear until clear of turbine shaft. *NOTE – Tilt rear of transmission up slightly for necessary clearanc .*

TORQUE CONVERTER OVERHAUL

TORQUE CONVERTER OVERHAUL *Se "Edsel, Ford, Lincoln, Mercury Automatic Transmission" in 1958 Annual Data or later Manual edition and note the following*

►*NOTE Converter assembly on all models, exc pt Ford 6 Cyl Trucks, is of welded construction and cannot be disassembled for service The only service required is the inspection of one-way clutch and converter end play check (converter thrust wash r insp ction) as noted below*

►*DISASSEMBLY & REASSEMBLY CAUTION Cl anliness is extremely important wh n opening up transmission Thoroughly clean utside of cas first, and clean each part as removed*

ALL MODELS

TORQUE CONVERTER REMOVAL (Fr m Engin): Remove transmission (see above), then remove stud nuts attaching converter to flywheel Replace converter

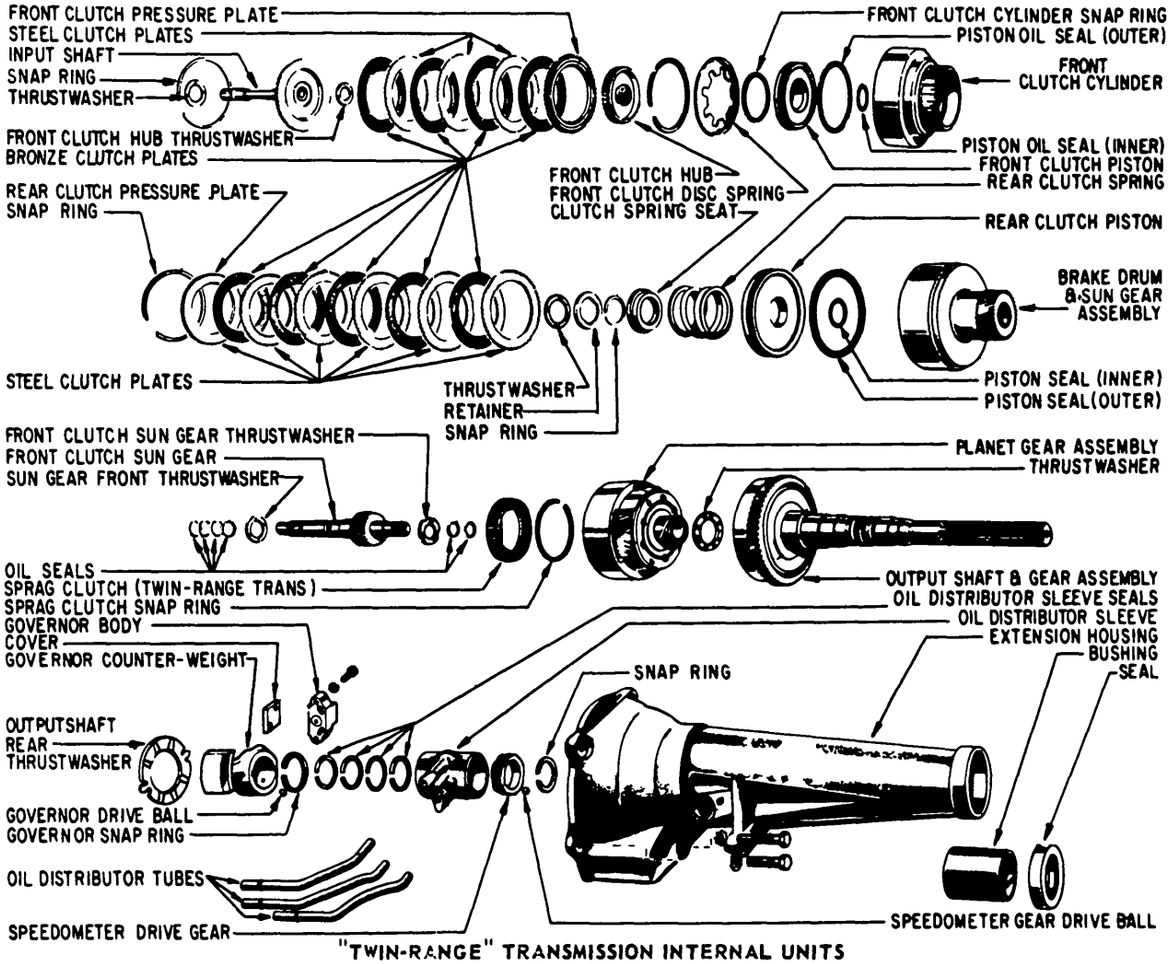
CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (C nt.)

housing lower front cover to prevent converter from falling when housing is removed. *NOTE – On Ford 6 Cyl. Trucks, w dg c nverter in place to prevent it falling out f housing.* Remove starter motor, then remove converter housing–to–engine bolts. Work converter off engine dowel pins and remove housing and converter.

TORQUE CONVERTER INSTALLATION (On Engine): Place converter in housing and retain it there by installing lower front cover. *NOTE – On Ford 6 Cyl. Trucks, w dg conv rt r in place.* Raise housing and converter into position and start housing on engine dowel pins. Start converter housing–to–engine bolts. Remove converter housing front cover (or wedge) and position converter on flywheel. Install converter–to–flywheel stud nuts and tighten to 20–25 ft. lbs. Tighten converter housing–to–engine bolts to 40–45 ft. lbs., then install converter front cover. Install transmission.

FORD 6 CYL. TRUCKS



TORQUE CONVERTER REMOVAL (From Transmission): Grasp converter cover with both hands and pull straight out (*CAUTION*–To prevent damage to front seals, do not rock assembly from side to side) Remove converter housing attaching bolts and remove housing from transmission

DISASSEMBLY: Remove converter cover attaching bolts and nuts Remove cover and "O" ring seal Remove bronze thrust washer from turbine and remove turbine. Remove stator from pump housing *(CAUTION–Check and locate the balancing marks on cover and stator so they may be replaced in the exact same position)* Remove thrust washer from pump hub and from turbine hub. Remove sprag clutch inner race and remove snap ring retaining outer hub to stator *(CAUTION–Do not burr snap ring groov).* Remove outer hub, sprag assembly, outer race and inner hub as an assembly Separate hubs and sprag assembly from outer race Remove snap ring retaining inner hub to stator

INSPECTION: Inspect converter blades for looseness, and check thrust surfaces for scores and splines for burrs and wear Inspect seal surfaces and front pump driving lugs for wear Inspect sprag assembly for worn or broken sprags or broken or distorted spring. Inspect bushings for wear or scoring (if bushings worn, polish bearing surface of journal with crocus cloth to eliminate possibility of wear having been caused by rough bearing surface)

REASSEMBLY; Install stator inner hub and snap ring Turn assembly over, install outer race in stator Install sprag assembly in outer race making sure that sprags are pointed in the right direction Install outer hub and outer hub snap ring Insert Tool No 7946, tapered side first, into sprag assembly while rotating tool counter-clockwise to position sprags Install inner race with spline section up Guide tool No. 7946 with hand while pushing inner race into position. Check stator for clockwise rotation while holding the inner race Install new seal in pump hub and install hub in pump Tighten hub capscrews to 8-10 ft lbs Install thrust washer into hub of converter pump and install stator with the word "front" (stamped into face of stator) upward Install thrust washer in hub of turbine and install turbine Install bronze thrust washer on turbine hub. Position converter cover on pump housing with new "O" ring seal and properly align balance marks on cover and housing *(CAUTION–Cover and housing must be installed in the same position noted when these parts disassembled).* Install all converter bolts and tighten to 25-28 ft. lbs. in the sequence indicated below. Install converter housing on transmission case and tighten attaching bolts to 40-45 ft. lbs Install converter assembly and press it firmly into position on turbine shaft *(CAUTION–Do not "rock" converter assembly while installing it on shaft (will damage oil seals)*

►*COVER BOLT TIGHTENING SEQUENCE (To prevent leaks):* Tighten two nuts directly opposite each other just snug, tighten two nuts 90° from first two similarly, tighten two nuts 45° from first four nuts similarly, Continue this sequence until all nuts have been tightened just snug, then torque all nuts in same sequence to 25-28 ft lbs torque

"TWIN-RANGE" TRANSMISSION INTERNAL UNITS

FORD V8 CARS & TRUCKS MERCURY

TORQUE CONVERTER REMOVAL (From Transmissi n): Same as for Ford 6 cyl models (above)

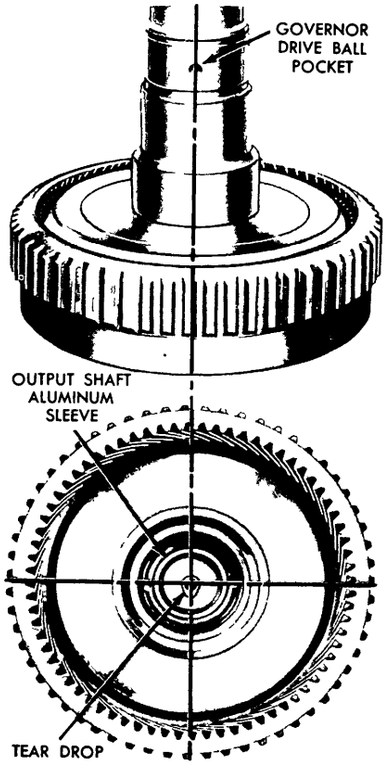
CONVERTER ONE-WAY CLUTCH INSPECTION: Ford V8 Cars & Trucks - Install stator outer race holding tool in one of the four holes provided in stator, then install Tool T58L-7902-A in converter pump drive hub (As tool enters converter, Allen screw heads will enter stator clutch inner race splines) Place a torque wrench on tool Tool (and stator inner race) should turn freely **clockwise** (from pump drive hub side of converter) It should lock up and hold a 10 ft lb pull when wrench is turned counterclockwise Try clutch for lockup and hold in at leas five different locations around converter If clutch fails to lockup and hold 10 lb torque, replace converter unit

CONTINUED ON NEXT PAGE

FORD MOTOR SINGLE & DUAL RANGE (C nt.)

Mercury – Install Tool 7946–A in converter hub, then install torque wrench on tool. Rotate torque wrench in a clockwise direction (viewed from rear). Tool should rotate freely. If tool cannot be rotated, overrunning clutch is binding and converter clutch must be replaced. Swing tool so steel rod positions against opposite pump drive lug. Apply 10 ft. lbs. torque while attempting to rotate counterclockwise (converter viewed from rear). Rotate tool clockwise and attempt to turn converter counterclockwise at least five times. If tool fails to hold on any attempt to turn converter counterclockwise, the one–way clutch is slipping and converter must be replaced. *NOTE – One–way clutch inspection can be performed with converter installed on ngine (with transmission removed).*

CONVERTER ENDPLAY CHECK: Ford V8 Cars & Trucks - Install Tool T58L-7902-A into converter pump drive hub until it bottoms then install guide over converter pump drive hub Expand split fiber bushing in turbine spline by tightening adjusting nut until tool is securely locked in spline Attach a dial indicator to tool and position indicator button on converter pump drive hub lug, then set dial indicator to zero Lift tool upward as far as it will go and note indicator reading If total endplay exceeds 060", replace converter unit



Mercury – Install Thrust Washer Check Tool 7937–A (Endplay Checking Tool), into converter pump drive hub. Tap lightly on end of tool to drive it forward to eliminate end thrust movement. Install dial indicator on rod so indicator lever rests against outside surface of converter. Pull tool toward rear of converter and note movement on dial indicator. If movement exceeds .060", replace converter assembly. *NOTE – Converter ndplay can be checked with converter installed on ngine (with transmission removed).*

TRANSMISSION OVERHAUL

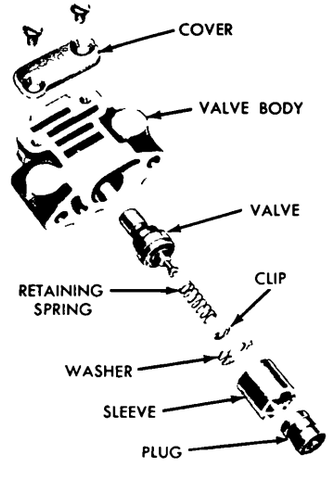
See 1958 Annual Data, Page 466, or later Manual editions.

OUTPUT SHAFT (ALUMINUM SLEEVE) & DISTRIBUTOR SLEEVE INSPECTION: Inspect for scores, broken teeth, and burrs. Inspect output shaft aluminum sleeve for alignment with governor drive ball (see illustration). *NOTE – Aluminum sleeve must be in proper alignment with passages in shaft to provide unrestricted flow of transmission fluid.* Make sure distributor sleeve passages are open and that fluid tubes fit properly in sleeve.

MAIN CONTROL VALVE (TWIN–RANGE TRANS.): Installation – Before installing valve body, check for bent manual valve by rolling valve on a flat surface. Align front servo tubes with holes in valve body, then shift manual valve lever to "L" detent and place inner downshift lever between downshift lever stop and downshift valve. *NOTE – Manual valve must engage actuating pin in manual d tent l ver.* Install but do not tighten control valve body attaching bolts. Install two tubes to pressure regulator and control valve body, then move control valve body toward center of case as far as attaching bolts will permit. Tighten valve body attaching bolts to 8–10 ft. lbs. Turn manual valve one full turn in each manual lever detent position. If manual valve binds against actuating pin in any detent position, loosen valve body attaching bolts and move body away from center of case. *CAUTION – Move body only enough to relieve binding.* Retighten attaching bolts and check manual valve operation.

OUTPUT SHAFT SLEEVE ALIGNMENT

VACUUM DIAPHRAGM UNIT (TWIN–RANGE TRANS.): Installation – Position pushrod in bore of diaphragm unit, then using diaphragm unit as a guide, insert pushrod into threaded opening of case. Tighten diaphragm unit to 18–27 ft. lbs. and connect vacuum hose.



MAIN CONTROL VALVE (SINGLE–RANGE TRANS.): Installation – Install control valve assembly, aligning servo tubes with control valve. Align inner throttle lever between throttle lever stop and downshift valve, and at same time push throttle valve in to clear transmission case. Align manual valve with actuating pin in manual detent lever, then install attaching bolts but do not tighten. Install large control pressure tube in valve body and regulator, then install small control pressure compensator tube in valve body and regulator. Install lubrication tube in rear pump and regulator body. Tighten control valve body attaching bolts to 8–10 ft. lbs. If manual valve binds in any detent position, loosen main control valve attaching bolts and move control valve away from center of case. *CAUTION– M v b dy nly enough t r li v binding.* Retighten attaching bolts and check manual valve operation.

GOVERNOR: Removal - Remove inspection cover from extension housing, then remove two screws retaining governor body to counterweight and remove governor assembly through inspection opening.

Disassembly: *NOTE - Some early production governors, identified by a daub of blue paint, were built with th governor sleeve staked into governor body Units of this type cannot be disassembled for complet inspection, however, they may be cleaned by removing cov r and plug and washing passages and bor s with solvent.* To disassemble units that are not staked, remove governor plug, sleeve, slotted washer, valve and spring assembly from body. Remove spring retaining clip from valve. *CAUTION - Do not distort or str tch spring* Remove spring from valve, then remove valve body cover from governor. Inspect all parts for burrs and scores and inspect valve and governor plug for free movement in their respective bores.

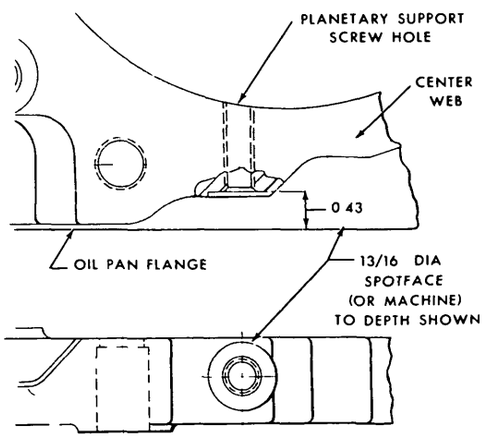
Reassembly: Install cover on body and tighten screws to 20-30 inch pounds, then place spring on valve stem and install retaining clip. Lubricate all parts with transmission fluid and install valve in valve body. Install slotted washer, then install governor sleeve so that legs on sleeve enter slots in washer and seat against body. *NOTE - When properly install d, legs on xpos d end of sleeve will be below gov rnor body-to-count r-weight mating surface* Install governor plug in sleeve.

Installation: Position governor assembly on counterweight with cover toward rear of car (opposite to previous models), then install attaching screws and tighten evenly to 50-60 inch pounds Install inspection cover and gasket and tighten screws to 50-60 inch pounds.

GOVERNOR VALVE ASSEMBLY

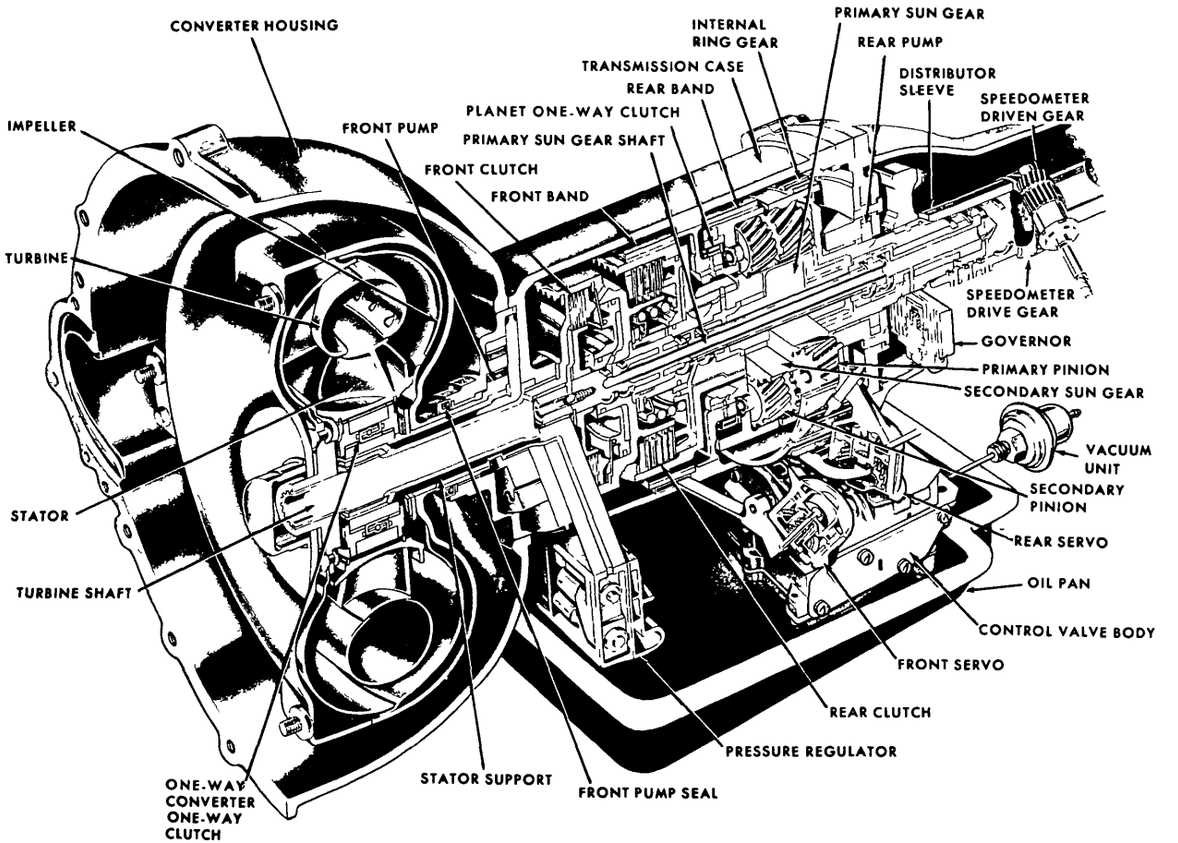
LINCOLN AUTOMATIC TRANSMISSION

Lincoln Contin ntal (1961)



►CHANGES, CAUTIONS, CORRECTIONS

►*TRANSMISSION IDENTIFICATION NOTE: An identification tag fastened to oil pan attaching bolt is stamped with Transmission Model letters "PCA–B" which may be followed by an additional figure indicating changes in transmission construction.*



►*1961 TRANSMISSION CASE & CENTER SUPPORT BOLT PRODUCTION CHANGE & CORRECTION TO PREVENT INTERFERENCE BETWEEN SUPPORT SCREW AND FRONT CLUTCH DRUM:* A new transmission case, Part No. C1VP–7005–N having a spot faced center support screw hole, and using a shorter center support screw, Part No. C1VP–7A291–B, is used in production after Transmission Serial No. PCA–B–10083. Later type transmissions are also identified by the number "1" added as a suffix to identification tag (PCA–B–1). Earlier transmission cases can be reworked to eliminate interference between support screw and front clutch drum by spot facing an area 13/16" in diameter to a depth of .430" measured from machined surface of transmission oil pan flange to bottom of spot faced counterbore *(see illustration).* A shorter center support screw, Part No. C1VP–7A291–B, must be used when center support is spot faced.

►*1961 TRANSMISSION OIL FILTER & OIL SCREEN PRODUCTION CHANGE:* Later transmissions identified by "PCA–B–2" (or later) on transmission identification tag have a new internal oil screen covered with a dacron material replacing the earlier wire mesh oil screen and external filter. *NOTE – The external filter is not used when the internal dacron type filter is used. Lat r type dacron filter is not interchangeable on earlier models except by replacement of all related parts individually designed for use with the new filter.*

►*1961 TRANSMISSION FRONT CLUTCH PISTON PRODUCTION CHANGE:* To reduce possibility of front clutch failure under severe "rocking" conditions, front clutch piston assemblies have been revised to incorporate a centrifugally operated ball check bleed valve in place of the former mechanically operated valve. Later type front clutch pistons may be used on earlier transmissions.

LINCOLN AUTOMATIC TRANSMISSION CASE REWORK

LINCOLN AUTOMATIC TRANSMISSION.

►*1961 TRANSMISSION OIL COOLER & EXTERNAL FILTER CONNECTION LEAKAGE CAUTION:* Due to critical fluid level tolerance of ONE PINT in this transmission, a slight leak may cause extensive transmission damage if not corrected immediately. To prevent leakage at external connections, note the following: Use only hose material, Part No. C1VV–7B093–B for replacement. Use either a No. 10 Corbin clamp or a suitable screw–type hose clamp. *NOTE – Do not use a hose material that is not impervious to automatic transmission fluid.*

►*1961 EARLY PRODUCTION TRANSMISSION OIL FILTER HOSE CAUTION:* Inspect the short (3") hose connector at oil filter to make sure it is fabric covered. If exterior of hose is smooth rubber, discard and replace with approved fabric covered hose, Part No. C1VV–7B093–B.

►*1961 EARLY PRODUCTION TRANSMISSION PRESSURE REGULATOR ASSEMBLY SERVICE REPLACEMENT CAUTION:* When replacing pressure regulator assembly on early transmission (with metal oil pan screen) use Pressure Regulator, Part No. C1VP–7A139–F and rework as follows: Remove pressure regulator cover from old assembly and install on the new pressure regulator. *NOTE – This is necessary because of difference in oil pickup tube bore size.*

►*1961 TRANSMISSION OIL PAN INSTALLATION & BOLT TIGHTENING CAUTION:* A new oil pan gasket material is being used which has a tendency to "flow" from under oil pan bolts after they are initially tightened and may result in bolt torque being slightly less than specified 10–13 ft. lbs. when rechecked after use. DO NOT overtighten at any time to compensate for "flow" of oil pan gasket material. Whenever oil pan is removed, inspect flange around bolt holes for distortion. Flatten if necessary to provide a smooth mating surface for gasket.

►*1961 EARLY TRANSMISSION "MOAN" OR "WHINE" (AT 700–1000 RPM) CORRECTION:* On early cars with external transmission oil filter, this noise may occur at 700–1000 RPM with transmission in "D" range and is caused by a restriction in the filter. To correct, remove external oil filter and connect oil cooler line directly to oil cooler.

CONTINUED ON NEXT PAGE

LINCOLN AUTOMATIC TRANSMISSION (Cont.)

► *1961 TRANSMISSION FLUID LOSS CORRECTION:* A fluid loss through transmission vent may be caused by improperly installed transmission fluid dipstick. Correct by installing and locking the dipstick.

► *TOWING CAR CAUTIONS: Do not tow car at speed greater than 40 MPH and observe following precautions:*

Transmission Operating Properly – Place transmission in "N" (Neutral) position. Car can be towed normally for distances not to exceed 12 miles. **For great distances, use same procedure as for inoperative transmission.**

Transmission Inoperative – Tow car with rear wheels lifted off ground or disconnect and remove propeller shaft. *NOTE – Be sure and protect rear end of transmission from entry of dirt.*

DESCRIPTION

DESCRIPTION: Three speed hydraulically controlled planetary transmission and torque converter which provides automatic shifting between low, intermediate and high (selector lever in "D1"), and between intermediate and high (selector lever in "D2"). "Lo", "R", & "P" are controlled manually. Transmission throttle valve is controlled by engine vacuum operating a diaphragm assembly at rear of transmission, eliminating throttle control linkage. A downshift lever actuated by accelerator pedal allows transmission to be downshifted by depressing accelerator pedal past the full throttle detent position. Front and rear servos are machined into transmission and external front and rear band adjusting screws have been provided. Transmission fluid is filtered through an external filter (early cars); internal filter (later cars), and is cooled in an oil cooler located in car radiator.

LUBRICATION

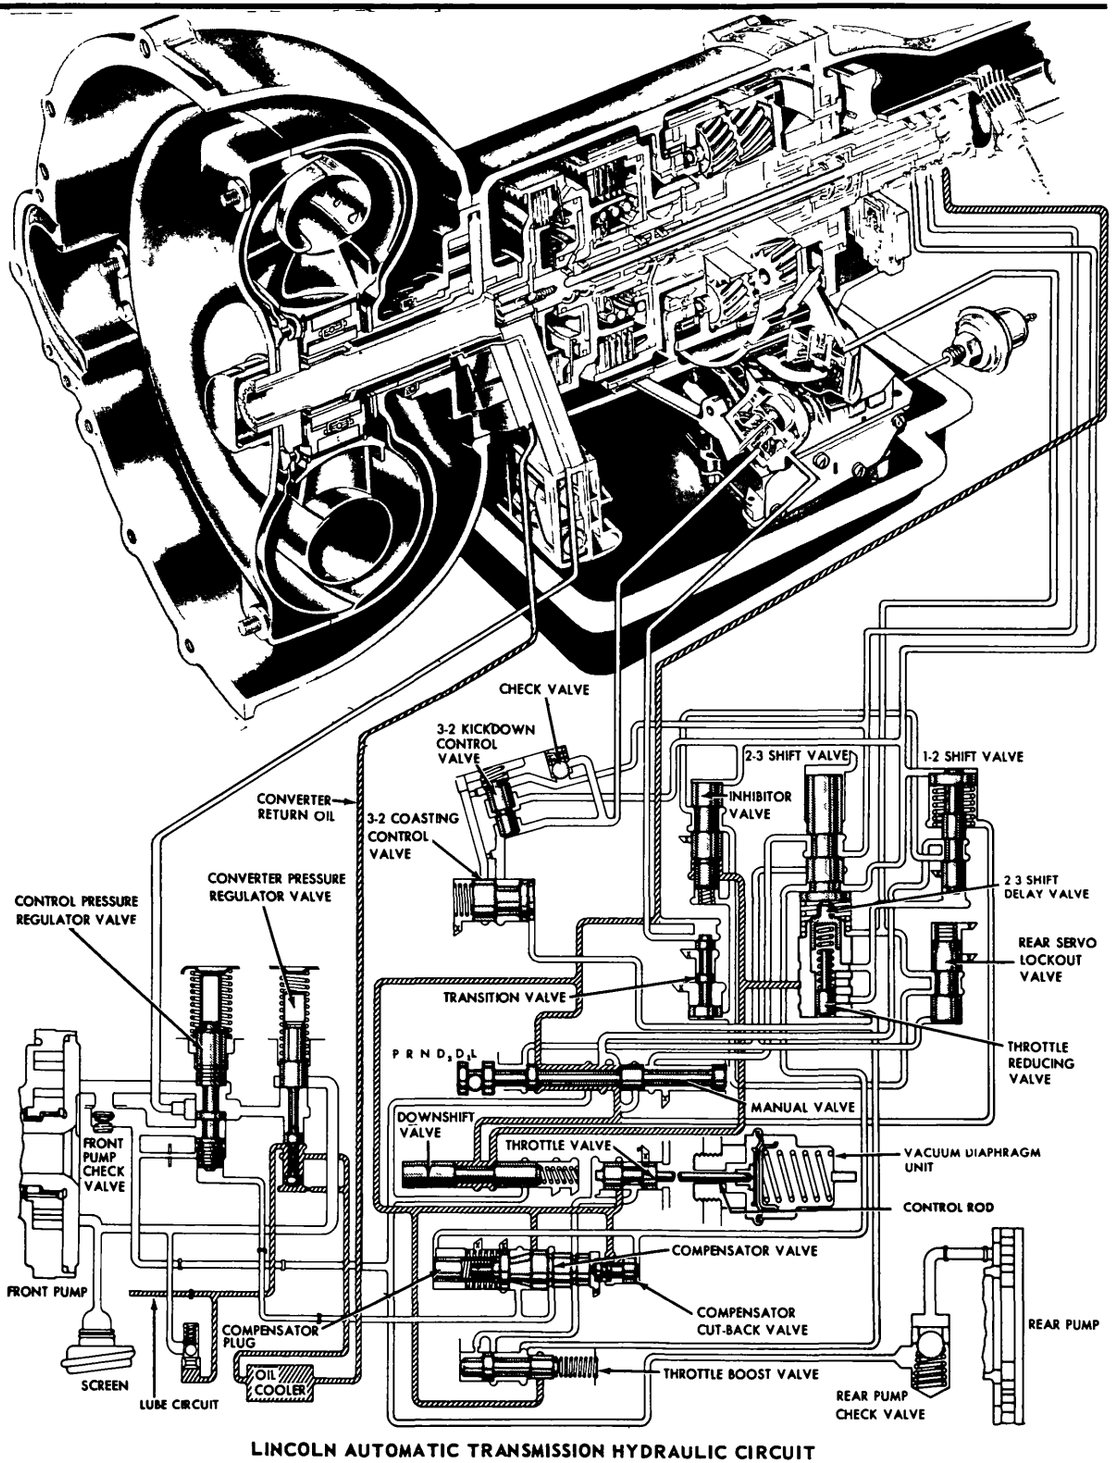
► *TRANSMISSION FLUID LEVEL CAUTION: Transmission fluid level must not be allowed to drop more than ONE PINT below normal FULL level.*

Checking Fluid Level: Check fluid level every 6000 miles. With engine and transmission at normal operating temperature, shift transmission through all ranges, then place selector lever in "P" (Park) position. Check fluid level on dipstick and add sufficient recommended fluid to bring level up to FULL mark on dipstick. *CAUTION – Do not overfill.*

Draining & Refilling: Periodic fluid changes not recommended except at time of transmission overhaul.

Capacity: 23 pints (transmission and torque converter dry).

Recommended Fluid: Lincoln Part No. C1AZ–19582 or Automatic Transmission Fluid Type "A" (Suffix "A").



Transmission Fluid Filter: External Type Filter (Early Cars) – Replace filter every 12,000 miles.

Internal Type Dacron Filter (Later Cars) – Not necessary to change periodically. If necessary to change because of transmission failure and filter contamination, replace filter assembly. *DO NOT attempt to clean old filter.*

LINKAGE ADJUSTMENT

Throttl Linkag Adjustm nt: *See CARBURETOR on car model pages.*

CONTINUED ON NEXT PAGE

LINCOLN AUTOMATIC TRANSMISSION HYDRAULIC CIRCUIT

LINCOLN AUTOMATIC TRANSMISSION (C ntinued)

Manual Linkage Adjustm nt: With engine off and transmission selector lever in "D1" position against stop, raise car and remove splash shield. Disconnect adjustable link from transmission manual shift lever on transmission and make sure shift lever is fully engaged in second detent from bottom. Loosen locknut on adjustable link, then pull downward on link to hold selector lever against stop. Adjust rod length as necessary until hole in link aligns with stud on transmission manual lever, then lengthen link one–half turn additional and connect to transmission shift lever. Check selector lever through all positions. *CAUTION – Do not make compensating adjustments in manual control linkage to overcome misalignment of selector lever indicator or starter n utral switch.*

NEUTRAL SAFETY SWITCH ADJUSTMENT

Linc ln (1961): Remove lower radio speaker and grille, then remove hood release handle from instrument panel. On convertible models, remove top control switch from instrument panel. On all models, remove lower left instrument panel cover and lower section of left vent. Remove wire connector from neutral safety switch, then position transmission selector lever in "D1" or "D2" range and loosen screws attaching neutral switch to steering column. Connect a self–powered test lamp to lower two terminals (back–up lamp) on neutral safety switch. Position selector lever in "R" position and pull switch to its farthest downward position. Slowly move switch upward until test lamp goes on. Tighten one switch mounting screw and move selector lever up and down without moving it out of "R" position. Test lamp should remain on. Attach test lamp lead to upper two terminals on switch and shift selector lever to "P" or "N" position. Test lamp should light. Apply a slight up and down pressure on selector lever while in "P" and "N" positions. Test lamp should not go out. Tighten switch attaching screws and connect wire connector to switch, then install vent extension, lower instrument panel cover, hood release handle, and lower radio speaker and grille.

BAND ADJUSTMENT

► *BAND ADJUSTMENT NOTE: Adjust bands every 12,000 miles und r normal operation. For severe operation, adjust bands v ry 6,000 miles.*

FRONT BAND ADJUSTMENT: *NOTE – Front band adjusting screw is locat d on left side of transmission case (above plug for line pressure check). It is not n c ssary to remove oil pan for front band adjustment.* Raise car and remove transmission linkage splash shield, then remove all dirt from adjusting screw threads and oil threads. Loosen adjusting screw locknut, then install Tool 7345 and tighten adjusting screw until handle "breaks" over center. *CAUTION – If adjusting screw is tighten than wrench capacity (10 ft. lbs.), loosen adjusting screw and readjust.* **Back off adjusting scr w xactly thr full turns.** Hold adjust-screw stationary and tighten locknut to 35–40 ft. lbs. *CAUTION – Damag may r sult to transmission if adjusting scr w is not back d off xactly thr e full turns.*

TRANSMISSION SHIFT POINTS

RANGE THROTTLE SHIFT	AXLE RATIO	SHIFT SPEEDS (RPM)								MANUAL SHIFT
		D1	D1	D1 or D2	D1 or D2	D1	D1 or D2	D1	D2	Lo
		Min. 1-2	Max. 1-2	Min. 2-3	Max. 2-3	Min. 3-1	Max. 3-2	Max. 2-1	Min. 3-2	2-1
Continental	2 89-1	8-11	40-50	11-25	65-77	7-9	62-72	21-32	7-11	19-28

► *FRONT BAND ADJUSTING TOOL NOTE·* Tool 7345 consists of two parts, adjusting screw locknut wrench (Tool 7345–L) and adjusting screw ratchet wrench (Tool 7345). Adjusting screw wrench is designed to be inserted through locknut wrench.

REAR BAND ADJUSTMENT: *NOTE – Rear band adjusting screw is located on right side of transmission and is accessible through a hole in floor pan.* Fold back floor mat on right side and remove cover from access hole in floor pan. Remove dirt from adjusting screw and oil the threads, then loosen adjusting screw locknut with Tool 7195–C. Use T–handle of tool and tighten adjusting screw until wrench overruns. *CAUTION – If adjusting screw is tighter than wrench capacity (10 ft. lbs.), loosen adjusting screw and readjust.* **Back off adjusting screw exactly 1½ turns** and tighten locknut to 35–40 ft. lbs. *CAUTION – Damage may result to transmission if adjusting screw is not backed off exactly 1½ turns.*

TESTING

► *TRANSMISSION STALL TEST NOTE: When making stall test, never hold throttle open longer than 5 seconds.*

STALL TEST: With engine at normal operating temperature and at slow (hot) idle speed, install a tachometer on engine and apply service and parking brakes. Stall test transmission in each driving range at full throttle (do not depress accelerator through detent into kick-down position), and note engine speed which should be 1600–1800 RPM *CAUTION – If engine speed exceeds maximum limits, release accelerator immediately.* Clutches and bands are applied in each selector lever position as follows **"D1"** – Front clutch and one–way clutch engaged at all accelerator pedal positions. **"D2"** – Front clutch and front band applied at all accelerator pedal positions. **"L"** – Front clutch and rear band applied. **"R"** – Rear clutch and rear band applied. *NOTE – Engine overspeeding is an indication of clutch or band slippage.*

SHIFT TESTS: Select a smooth road for tests. Make tests as outlined below and refer to "Shift Speed Table" for correct speed where shift should occur.

1–2, 2–3 Upshift (Minimum Throttle): Place selector lever in "D1" range, and starting from a standstill, transmission should start in first gear and upshift to second, then at a higher speed, upshift to third.

2–3 Upshift (Minimum Throttle): Place selector lever in "D2" range, and starting from a standstill, transmission should start in second gear and upshift to third gear.

1–2, 2–3 Upshift (Maximum Throttle, Through Detent): Place selector lever in "D1" range, then depress accelerator through detent and hold there. Transmission should upshift at speeds indicated. *NOTE – 2–3 Upshift with s l ctor l v r in "D2" rang will ccur at sam sp d as for "D1" rang .*

3–2, 2–1 Downshift (Forced): With transmission in third gear, depress accelerator pedal to floor (through detent). Transmission should shift from third to second, or from third to first, depending on car speed.

3–1 Downshift (Minimum Throttle): Coasting down from approximately 30 MPH in third gear, transmission should downshift from third to first. *NOTE – A 3–2–1 downshift may be experienced under the above conditions.*

"DR" to "LO" (Manual Shift): With car speed approximately at 50 MPH, shift selector lever from "D1" or "D2" to "Lo". Transmission should shift from high to second. When car speed is reduced within range indicated in table, transmission should shift to low gear.

CONTROL PRESSURE TESTS: Attach a tachometer and vacuum gauge to engine, then attach a pressure gauge to control pressure outlet on side of transmission (directly below front band adjusting screw on left side of case). Apply parking brake and adjust idle speed to 450–475 RPM with transmission selector lever in "D2" position. With engine at indicated idle speed and engine vacuum above 16" Hg, and with transmission in either "D1", "D2" or "Lo", pressure should be 57–69 lbs. In "P", "N" or "R", pressure should be 57–213 lbs. If control pressures are within limits, apply service brakes and place transmission selector lever in "D1" or "D2", then increase engine speed slowly until line pressure starts to rise. At this point, manifold vacuum should be 16.0" to 13.7" Hg. As vacuum reading passes through this range, transmission control pressure should start to rise and continue to rise with throttle opening, reaching a maximum pressure of 145–170 lbs. At maximum pressure, vacuum reading should be 1.5" Hg. *CAUTION – Do not hold transmission under stall condition for more than five seconds.* If control pressures are not correct, erratic, or fail to rise with increased engine speed, *see "Trouble Shooting & Diagnosis".*

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Raise car on hoist and remove transmission oil pan and control valve assembly, then proceed as follows.

Front Clutch: Apply pressure to front clutch and governor input passage (see illustration). Listen for a dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leakage in this part of system.

Governor Valve: Remove governor inspection cover, then apply air pressure to same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

Rear Clutch: Apply air pressure to rear clutch oil passage (see illustration) and listen for a dull thud to indicate clutch is operating. Check for leakage in same manner as for front clutch (above).

CONTINUED ON NEXT PAGE

LINCOLN AUTOMATIC TRANSMISSION (C ntinu d)

Rear Band & Servo: Apply pressure to rear servo oil passage (see illustration) and check band application.
Front Band & Servo: Apply pressure to front servo apply hole and check band application.

TROUBLE SHOOTING & DIAGNOSIS

CONTROL PRESSURE LOW: If pressure is low at idle speed in all selector lever positions, check for excessive leakage in front oil pump, case, and control valve body. *NOTE – Control pressure in "P", "L", & "R" is regulated entirely by control pressure regulator valve and its spring.*

CONTROL PRESSURE HIGH: If control pressure is high at idle speed with transmission selector lever in "N", "D1" & "D2", trouble may be in diaphragm unit or its connecting tubes or hoses. Check engine manifold vacuum. Check diaphragm pushrod for bends and for corrosion. Install diaphragm unit with pushrod removed and recheck control pressure in "N", "D1" or "D2". If control pressure is still too high, trouble is in transmission control system. If pressure is within limits, diaphragm unit is not operating properly.

CONTROL PRESSURE DOES NOT RISE WITH THROTTLE OPENING: If control pressure does not rise in "D1" or "D2" as engine vacuum falls below 16–13.7" Hg, check transmission pressure rise capacity by shifting to "L" or "R". In these positions, maximum control pressure should be obtained at not more than engine stall RPM. If pressure rise is normal in "R" & "L", remove hose from diaphragm unit and check hose and tube. *NOTE – To ch ck, hold thumb over end of hose and check for vacuum. If engine speeds up when hose is disconnected and slows down as thumb is held against end of hose, vacuum source is satisfactory.* If vacuum reading at end of hose is 18" Hg or greater, change diaphragm unit and recheck pressure rise with throttle opening in "D1" or "D2". If control pressure does not rise now, trouble is in transmission. Check for internal leakage in components that have pressure in them in "D1" and "D2" but do not have pressure in them in "R" or "L".

CONTROL PRESSURE IS EXTREMELY ERRATIC: If control pressure is erratic in "N", "D1" and "D2", check diaphragm unit tubes, hoses and diaphragm pushrod (see "Control Pressure High" above). If vacuum is satisfactory, replace diaphragm unit and retest control pressure. If no improvement noted, clean and inspect control valve body and pressure regulator.

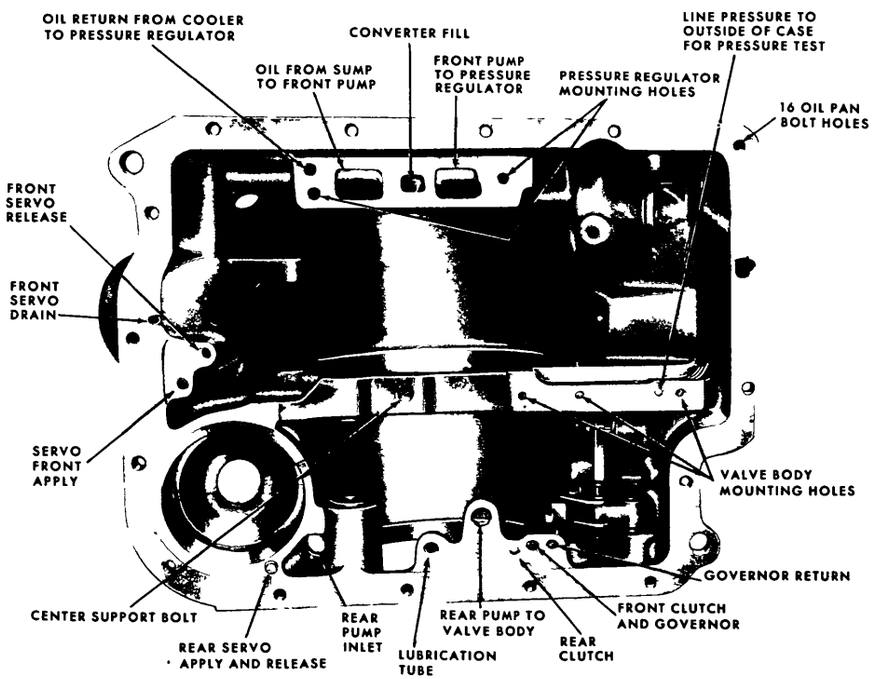
ROUGH INITIAL ENGAGEMENT: Adjust engine idle speed. Check throttle linkage, manifold vacuum and vacuum diaphragm unit. Check control pressure. Adjust front and rear bands.

SHIFT POINTS INCORRECT OR NO SHIFT POINTS: Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm unit. Check for sticking governor valve or plug. Check control pressure. Check position of valves in control valve body (Check control pressure at each detent position during road test).

ROUGH SHIFT POINTS: Check engine idle speed, throttle linkage, manifold vacuum and vacuum diaphragm. Check control pressure. Check for sticking governor valve or plug. Check control valve body. Adjust front band. Check rear servo accumulator.

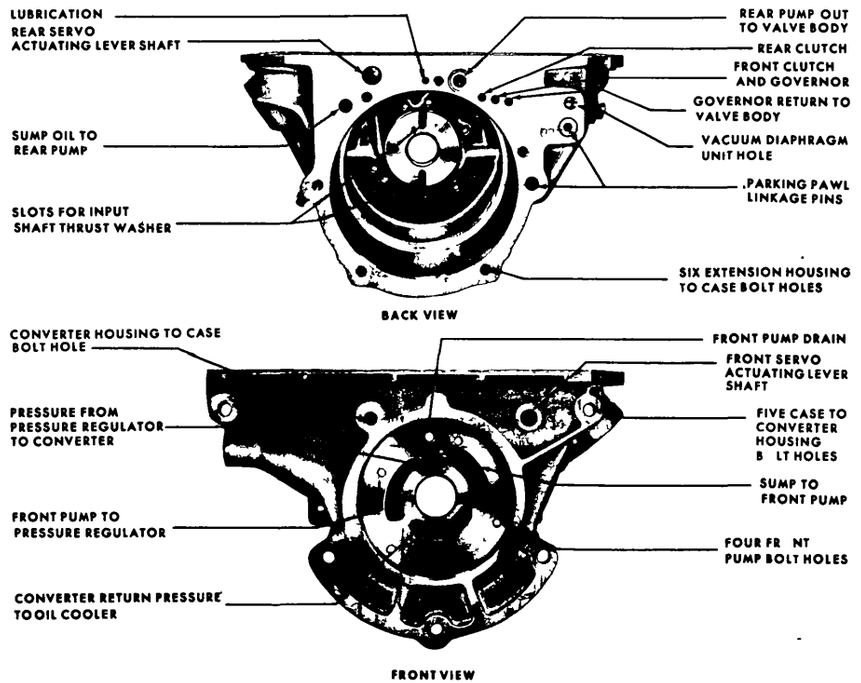
SLIPPAGE DURING SHIFTS: Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check for sticking governor valve or plug. Check control valve assembly. Adjust front band. Check front servo circuit (air pressure check). Check rear clutch and circuit (air pressure check).

SLIPS (INITIAL ENGAGEMENT "D2", "D1" & "L": Check transmission fluid level. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check control pressure. Check front clutch and circuit (air pressure check).



SLIPS (REVERSE ONLY – OR NO REVERSE): Check control pressure. Adjust rear band. Check rear servo circuit (air pressure check). Check control valve body. Check rear clutch and circuit (air pressure check). Check for turned oil distributor sleeve in output shaft.

SLIPS ("D1" LOW GEAR ONLY – OR NO DRIVE IN "D1"): Check operation of planet carrier one–way clutch. Check adjustment of manual and transmission linkage.



LOSS OF INTERMEDIATE GEAR IN "D1" & "D2": Check front band adjustment. Check front servo circuit (air pressure check). Check control valve body.

SLIPS IN REVERSE (OR IN HIGH GEAR IN "D1" & "D2"): Check rear clutch and circuit (air pressure check). Check control valve body. Check control pres-

CONTINUED ON NEXT PAGE

LINCOLN AUTOMATIC TRANSMISSION CASE PASSAGES

LINCOLN AUTOMATIC TRANSMISSION PASSAGE IDENTIFICATION

LINCOLN AUTOMATIC TRANSMISSION (C ntinued)

sure. Check for turned oil distributor sleeve in output shaft.

NO CLOSED THROTTLE DOWNSHIFTS: Check for sticking governor valve or plug. Check control pressure. Check control valve body.

NO FORCED DOWNSHIFT: Check for correct accelerator pedal height. Check throttle linkage, manifold vacuum and vacuum diaphragm. Check control valve body.

ENGINE RUNAWAY ON FORCED DOWNSHIFT: Check control pressure. Check control valve body. Check front servo circuit (air pressure check). Adjust front band. Check operation of planet carrier one–way clutch.

CAR CREEPS EXCESSIVELY (SELECTOR LEVER IN ANY DRIVING RANGE): Excessive engine idle speed.

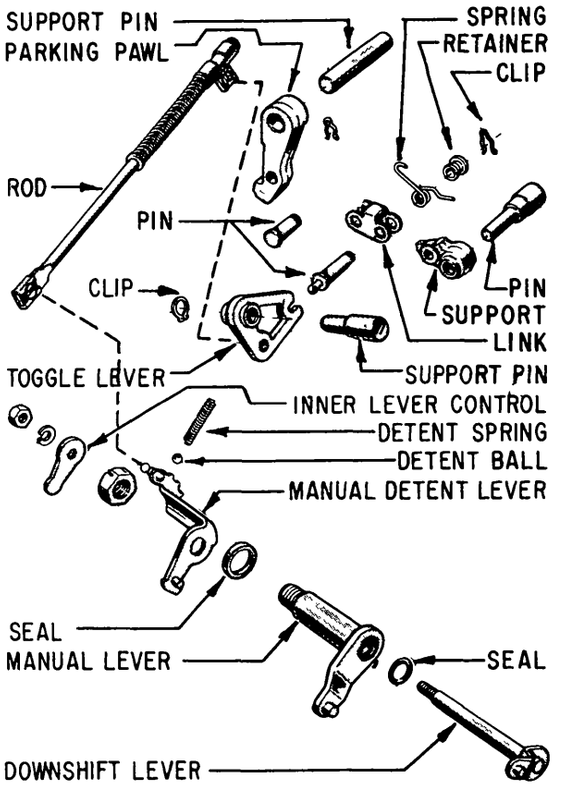
CAR MOVES FORWARD IN NEUTRAL: Check manual and transmission linkage adjustment. Check front clutch and circuit (air pressure check).

NO DRIVE IN ANY RANGE: Check transmission fluid level. Check manual and transmission linkage adjustment. Check control pressure. Check for broken converter lugs or input shaft.

COMPLETE LOCK–UP IN ANY RANGE: Check for wrong clutch and/or band application. Check control valve body. Check operation of planet carrier one–way clutch. Check for turned oil distributor sleeve in output shaft. Check front clutch and circuit (air pressure check). Check rear clutch and circuit (air pressure check). Check for release of parking linkage.

UNABLE TO START BY PUSHING: Check transmission fluid level. Check rear pump assembly. Check for broken converter lugs or input shaft. Check front clutch and circuit (air pressure check).

PARK LINKAGE WILL NOT HOLD: Check manual and transmission linkage adjustment. Check parking linkage.



TRANSMISSION OVERHEATS: Check transmission fluid level. Check control pressure. Check for restricted or leaking oil cooler and lines. Check converter one–way clutch operation. Check front band adjustment. Check rear band adjustment.

POOR ACCELERATION (MAXIMUM SPEED TOO LOW): Check transmission fluid level. Check operation of converter one–way clutch. Check engine performance.

TRANSMISSION NOISY ON COASTING 40–20 MPH: Check rear pump assembly.

MINOR REPAIRS (TRANSMISSION IN CAR)

PARKING PAWL REPLACEMENT: Loosen locknut on rear band adjusting screw and tighten adjusting screw with Tool 7195–C until wrench overruns. *NOTE – This holds plan t carri r, front and rear clutch assemblies in plac during parking pawl replacement.* Raise car on a hoist and support front of transmission with a jack stand and wooden block, then drain transmission oil pan. Mark drive shaft and rear companion flange (for reassembly at same location), then remove drive shaft. Remove oil pan and screen. Remove three short tubes from main control valve that directs rear clutch, front clutch and governor return pressure to case. Remove cross member at extension housing and remove extension housing. Remove distributor sleeve snap ring and move distributor back until rear clutch, front

LINCOLN AUTO. TRANS. INTERNAL LINKAGE

clutch and governor return tubes are removed from case. Remove output shaft and rear pump, then remove toggle return spring from lever pin, and remove .328" diameter washer and pin. Remove parking pawl support pin with a magnet and remove parking pawl parts. To reassemble, reverse disassembly procedure using new gaskets. Adjust rear band and fill transmission case with fluid.

GOVERNOR REPLACEMENT: Raise car and remove inspection cover from extension housing. Rotate drive shaft until governor is in line with inspection hole in housing, then remove two governor valve body retaining bolts and governor from counterweight. *CAUTION– Do not drop any parts into extension housing.* Make sure all parts are thoroughly cleaned and that governor valve moves freely in valve body before valve body assembly is assembled to counterweight. Install governor valve assembly to counterweight so that valve body cover is faced toward rear of car, then tighten attaching bolts to 50–60 inch pounds. Install a new gasket on inspection cover and install cover.

TRANSMISSION & CONVERTER REMOVAL & INSTALLATION

REMOVAL: *NOTE – Transmission and c nv rt r must be r moved as an ass mbly. On additi nal convert r housing–to–transmission cas bolt is l cated behind conv rter ass mbly wh r it is not acc ssibl until aft r converter is r mov d.*

1) Remove upper converter housing–to–engine bolts (from under hood), then install starter remote control so engine can be rotated from under car. Place transmission selector lever in "N" (Neutral), then raise car and drain transmission oil pan.

2) Remove converter access cover from front of converter housing and remove transmission linkage splash shield. Mark drive shaft and rear companion flange for installation in same position and remove drive shaft.

3) Remove parking brake equalizer bar retracting spring and disconnect parking brake cables and equalizer assembly. Disconnect transmission downshift rod and manual linkage parts at transmission levers, then disconnect vacuum line hose at vacuum diaphragm and speedometer cable at transmission.

4) Remove engine stabilizer bar from converter housing and converter–to–flywheel retaining nuts. *NOTE– As converter is rotated, remove converter drain plugs and drain converter.* Turn front wheels fully to right and remove starter motor, then disconnect oil cooler lines at transmission and remove transmission filler tube and underbody reinforcement plate.

5) Position transmission jack, with Adapter Kit 7000–EG and Bracket Kit 7000–LC, under transmission and raise transmission slightly. Remove rear support crossmember and brackets from extension housing and car underbody.

6) Detach vacuum line at converter housing, then remove manual linkage equalizer assembly mounted between transmission and underbody. Remove remaining converter housing–to–engine retaining bolts and move transmission and converter toward rear and from under car.

INSTALLATION: Reverse removal procedure and note the following: Tighten crossmember–to–underbody bolts to 13–18 ft. lbs. and body bracket–to–body bolts to 20–30 lt. lbs. Tighten rear universal joint bolts to 15–20 ft. lbs. Tighten converter housing retaining bolts and underbody reinforcement plate bolts to 40–50 ft. lbs. Tighten converter housing–to–flywheel retainbolts to 20–25 ft. lbs.

CONVERTER & HOUSING: Removal – With transmission removed from car, hold converter assembly with both hands and pull converter directly forward. *CAUTION – To prevent damage to front pump seal, do not rock converter assembly from side to side.* Remove one bolt from inside converter housing (holding converter housing to transmission case). Remove remaining five bolts holding converter housing to transmission case and remove housing.

Installation: Position converter housing on case and install five bolts and washers from outside converter housing and one self–locking bolt from inside housing. Install converter so drive lugs on converter are between lugs on front pump drive gear. *CAUTION – Do not move converter from side to side or up and down when it is being assembled.*

TRANSMISSION DISASSEMBLY

DISASSEMBLY (Removal of Components): 1) Place transmission in a suitable holding fixture, then remove oil pan, gasket and oil screen. Remove all oil passage tubes. *CAUTION – Avoid bending or damaging il tub s during removal.* Remove throttle valve vacuum diaphragm assembly and throttle control valve rod, then remove main control valve body assembly from

CONTINUED ON NEXT PAGE

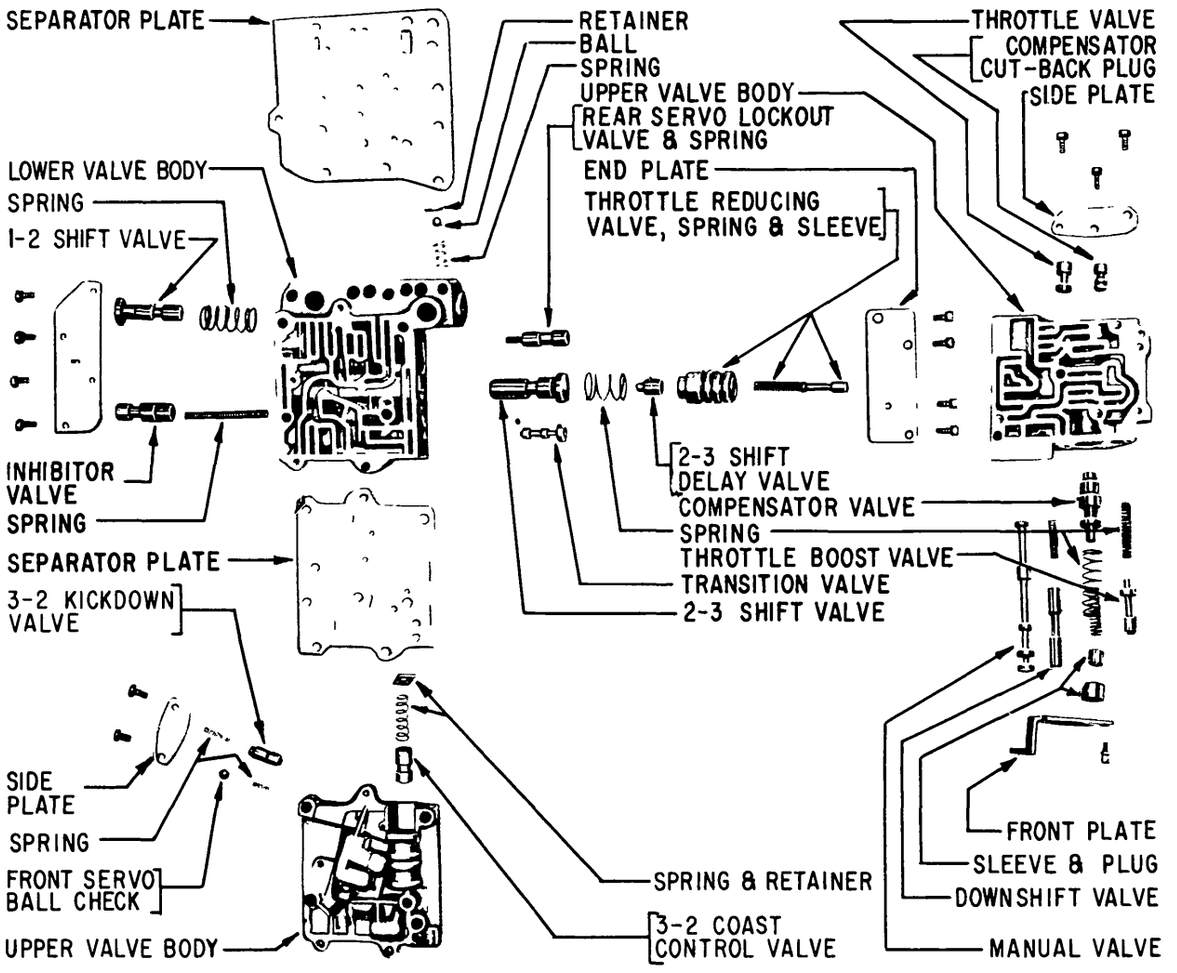
LINCOLN AUTOMATIC TRANSMISSION (Continued)

mounting pad on case. *CAUTION – Hold manual valve in place as assembly is removed.*

2) Remove pressure regulator spring retainer and springs and remove pressure regulator assembly, then loosen front and rear band screws several turns.

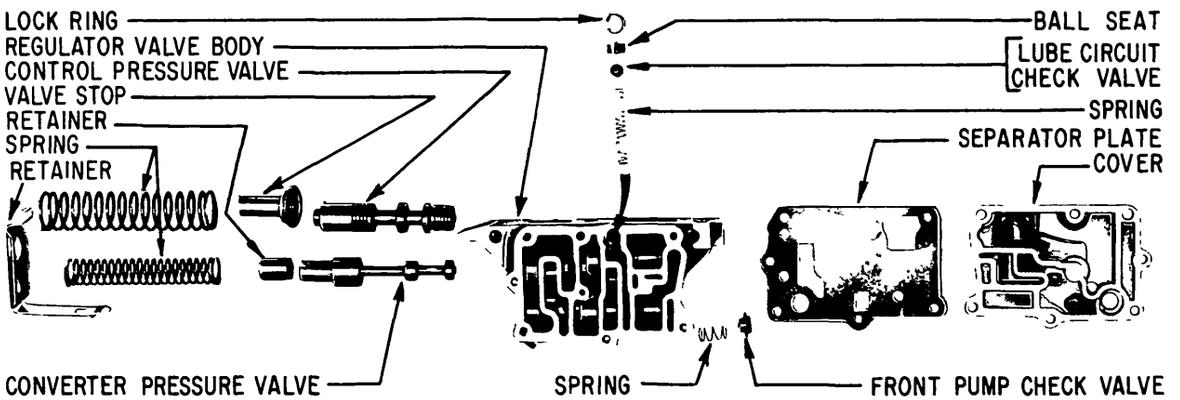
3) *CHECK TRANSMISSION ENDPLAY BEFORE PROCEEDING WITH DISASSEMBLY.* Remove one front pump attaching bolt and mount Dial Indicator Support Tool 77067 in this bolt hole so Dial Indicator 4201-C can be installed on support tool in a position to allow contact button to rest on end of turbine shaft. Pry front clutch cylinder toward rear of transmission, then set dial indicator to zero while maintaining a slight pressure on clutch cylinder. Remove tool used for prying clutch cylinder toward rear and insert it between large internal gear and case and pry units toward front of case. Record indicator reading for use at reassembly. This endplay should be .010–.029". Remove dial indicator and support.

4) Remove front pump attaching bolts and remove front pump from case. Remove extension housing seal with Tool 1175–AE, then remove extension housing from transmission. Remove distributor sleeve retaining snap ring and remove distributor sleeve and tubes from output shaft by tapping with a soft hammer on sleeve. *CAUTION – Do not bend or distort tubes.* Remove all four rings and spacer washer from output shaft. Remove governor snap ring and slide governor off shaft, then remove governor drive ball.



5) Remove rear pump from transmission case, then remove discharge port "O" ring seal. Remove output shaft rear thrust washer from pump, and remove output shaft front thrust washer (selective). Remove two oil seal rings from front clutch sun gear shaft, then use a brass drift and tap rear band actuating lever shaft out through rear of case. Remove rear band actuating lever, strut and rear band anchor strut. Remove center support bolts.

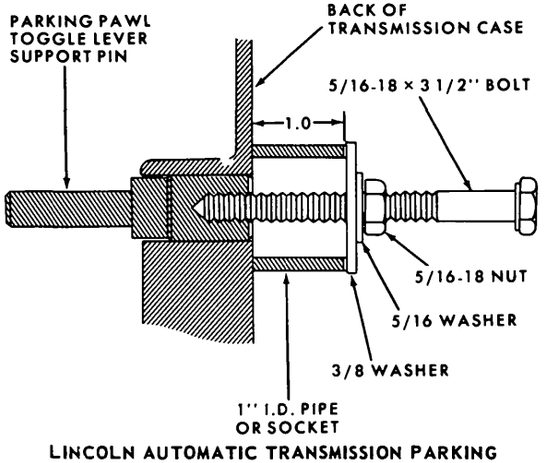
6) Expand rear band with snap ring pliers and use actuating lever strut as a spacer to hold rear band in a spread position. Slide clutch assemblies, center support and planet carrier out rear of case. Remove rear band through bottom of case, then remove front band, anchor strut and actuating lever strut from case. *NOTE – For disassembly and reassembly of Power Train (clutch assemblies, center support and planet carrier), see "Power Train" below.*



7) To remove rear servo assembly, hold and compress spring retainer with a large "C" clamp or a valve spring compressing tool. After removal of snap ring, release pressure slowly on tool so that compressed return spring does not release too quickly. Remove rear servo spring retainer, spring, and piston from case. Remove accumulator piston, check valve, spring and "O" ring.

8) Remove front servo cover with a screwdriver and remove front servo retainer snap ring. Remove front servo piston assembly and return spring. Drive out front band actuating lever shaft access hole plug on front face of case (near front pump) and remove front band actuating lever retaining clip, then remove actuating lever shaft through hole in front face of case. Remove front servo actuating lever.

CONTINUED ON NEXT PAGE

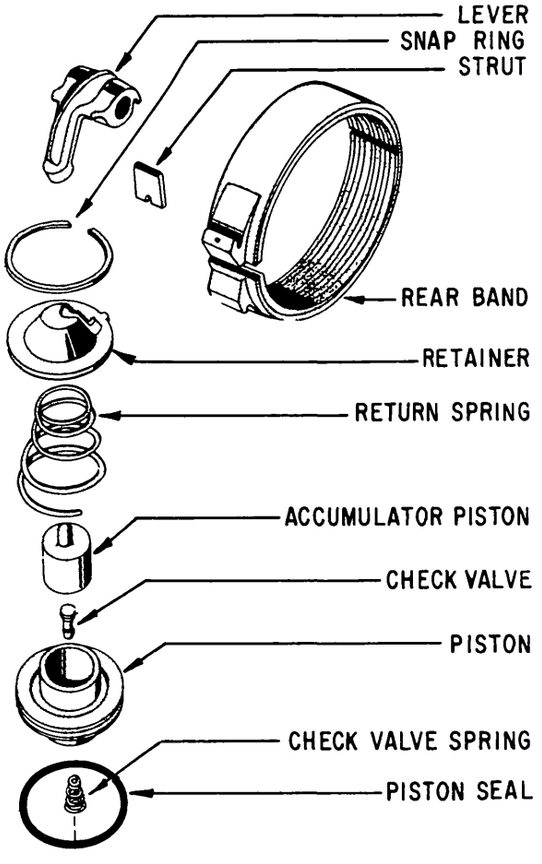


LINCOLN AUTOMATIC TRANSMISSION CONTROL VALVE

LINCOLN AUTOMATIC TRANSMISSION PRESSURE REGULATOR

LINCOLN AUTOMATIC TRANSMISSION (C ntinued)

9) If necessary to remove manual and parking pawl linkage, proceed as follows: Detach parking pawl toggle operating rod from manual detent lever and parking pawl toggle operating lever assembly. Remove throttle control inner lever nut, detent lever, ball, spring and outer lever from case. To remove parking pawl toggle lever support pin from back face of case, use special tool (see illustration). Remove parking pawl support pin and parking pawl assembly from case. Remove parking pawl operating lever retaining clip from support pin, then remove lever. Tap out toggle operating lever support pin using a brass drift to drive pin into case. Remove manual lever oil seal from case. To install manual and parking pawl linkage, reverse removal procedure. Make sure that parking pawl toggle lever support pin is installed so it is flush with back face of case. *NOTE – If pin is pressed in too far, parking pawl lever will bind and not release.*



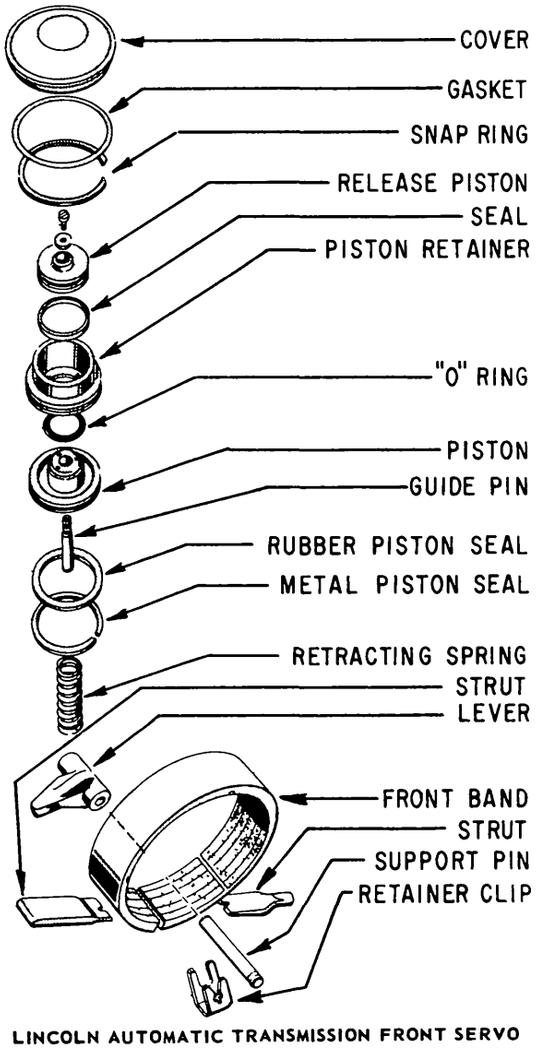
LINCOLN AUTOMATIC TRANSMISSION PARKING TOGGLE SUPPORT REMOVAL TOOL

INSPECTION: Wash all parts and blow dry with air, then inspect for damage. Lubricate all mating surfaces with automatic transmission fluid before reassembly.

REASSEMBLY: 1) Assemble front servo, using new oil rings, then install servo release spring and piston assembly in front servo bore in case, compressing piston ring while installing the assembly. Depress piston retainer and install snap ring. Install seal on front servo cover and press cover into its bore in case being careful not to damage rubber seal.

2) Assemble rear servo piston, using new oil rings, then install servo assembly in its bore in case. Position spring on piston and retainer on spring, then compress retainer and install snap ring. Install front and rear bands in case and expand rear band, using actuating lever strut as a spacer.

3) Install input shaft thrust washer in case. *CAUTION – Make sure tangs on washer hold it in place as gear train is assembled.* Install complete gear train (clutches, center support, planet carrier and output shaft) into case. *NOTE – Center support can be positioned only one way to line up bolt holes.* Install center support bolts and washers and tighten bolts to 28–33 ft. lbs.



LINCOLN AUTOMATIC TRANSMISSION REAR SERVO

4) Remove spacer from rear band, then install rear band anchor strut and position band on strut. *NOTE – Make sure slot in strut and pin in band are in alignment.* Position rear band actuating lever and strut in case and install rear band actuating lever shaft.

5) Install front band actuating lever, pin and retaining clips, then install metal plug in case at lever pin hole. Install front band actuating and anchor struts.

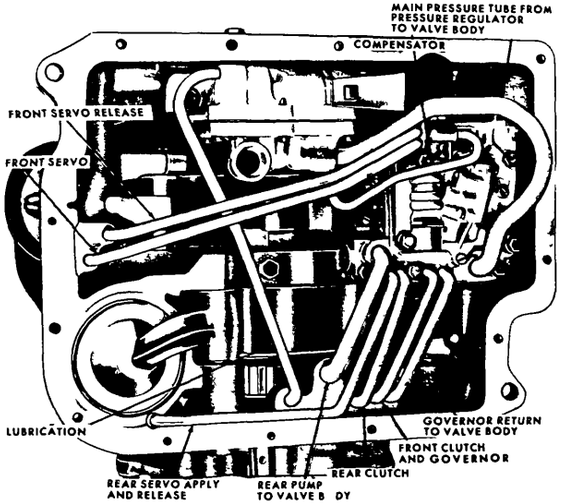
6) Make sure rear pump drive key is in output shaft, then install rear pump discharge port "O" ring seal in case. Position selective fit output shaft rear thrust washer on rear pump. *NOTE – This washer controls transmission endplay.* With tangs of thrust washer in holes in pump, install gasket on pump, then install pump on output shaft with keyway of pump and key in shaft in alignment. Install governor drive ball, governor and snap rings on output shaft.

7) Install rear pump–to–extension housing gasket on rear pump and install distributor sleeve (with tubes assembled) on output shaft, with inside diameter chamfer toward front of transmission. Guide distributor tubes into transmission case as distributor is moved forward, over the oil rings and against spacer washer. Install distributor sleeve retainer snap ring, then install extension housing and tighten bolts to 28–33 ft. lbs. Install front pump and gasket and tighten bolts to 17–22 ft. lbs.

LINCOLN AUTOMATIC TRANSMISSION FRONT SERVO

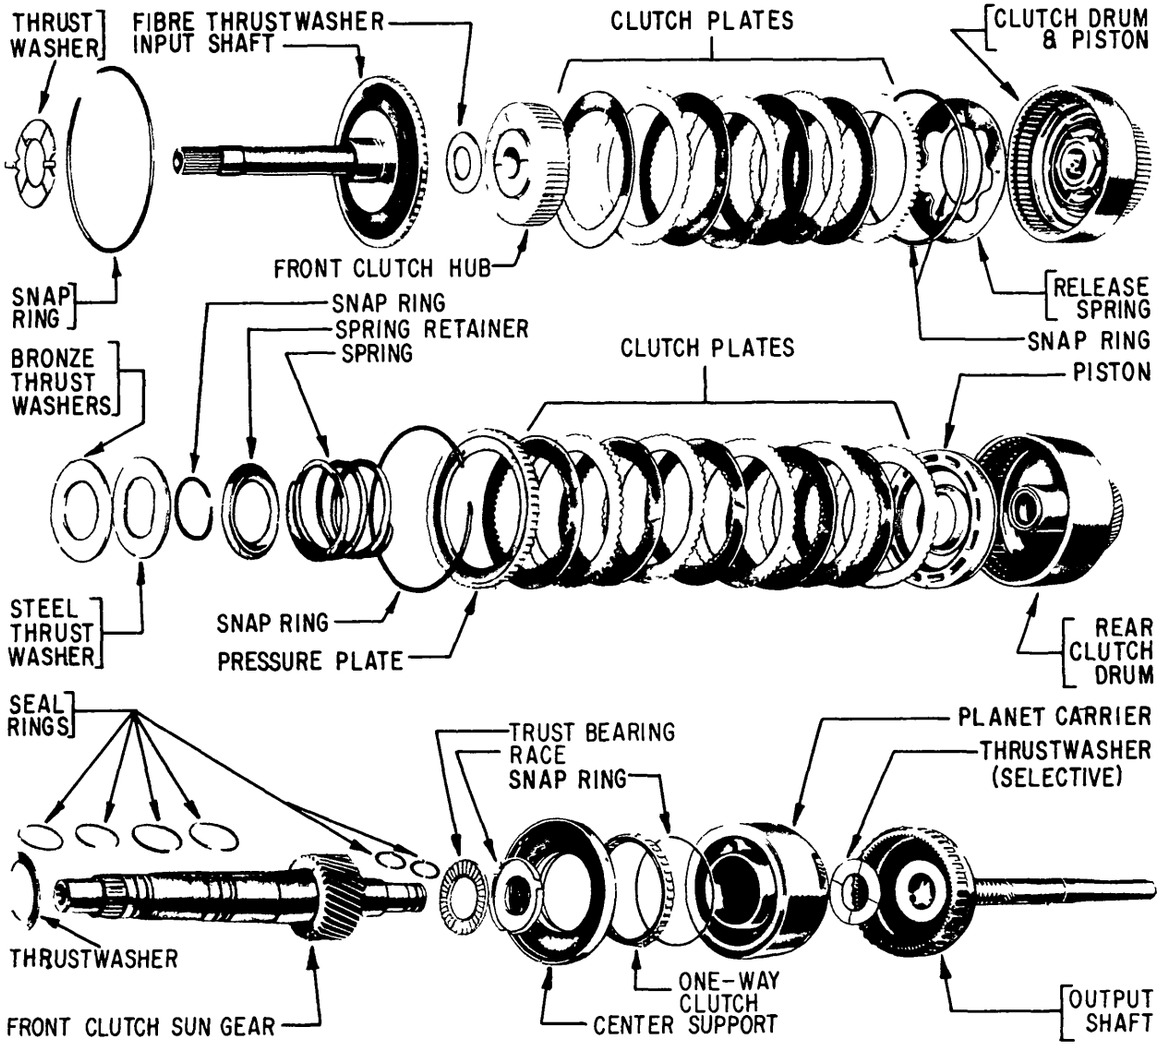
8) Recheck transmission endplay and correct, if necessary, by replacing selective fit output shaft thrust washer. Adjust front & rear bands *(see "Band Adjustment" above).* Install pressure regulator assembly springs, spacers and retainer and tighten bolts to 17–22 ft. lbs. Install main control valve assembly, spacing it so that maximum contact is obtained between manual lever and detent lever when it is placed in each detent position. *CAUTION – Manual valve should not bind in casting as detent lever is moved to each detent position.*

CONTINUED ON NEXT PAGE



LINCOLN AUTOMATIC TRANSMISSION (C ntinu d)

9) Install hydraulic pressure tubes in following order, making sure tubes are set firmly in place to eliminate any leakage. *NOTE – Refer to "Hydraulic Pressure Tube" illustration.* (a) Lubricating Pressure Tube. (b) Rear Clutch, Front Clutch & Governor Return Tube. (c) Rear Servo Apply & Release Tube. (d) Rear Pump Pressure Tube. (e) Compensator Tube. (f) Main Pressure Tube. (g) Front Servo Apply & Release Tube.



10) Install seal on front pump inlet tube on screen and install screen. Install oil pan gasket, pan and service identification tag.

POWER TRAIN: Disassembly - Place power train (clutch) assemblies, center support, and planet carrier) in a suitable holding fixture (Tool 77530–A), then remove bronze and steel thrust washers from clutch assembly. Remove oil seal rings from primary sun gear shaft, and remove rear clutch from sun gear shaft. Remove rear clutch seal rings from sun gear shaft and the thrust washer between rear clutch and primary sun gear. Remove front clutch snap ring which holds turbine shaft to front clutch hub, then remove turbine shaft. Remove front clutch plates and internal hub, then using an arbor press and Tool 77565, remove Belleville spring. Use air pressure and Tool 7000DE (or other suitable nozzle) and force piston out of drum. Remove rear clutch pressure plate snap ring and rear clutch plates, then compress rear clutch spring with an arbor press and Tool 77515–A and remove snap ring, spring retainer and release spring. Remove piston in same manner as for front piston (above).

R assembly – Reverse disassembly procedure, making sure that one–way clutch is assembled with drag strips toward front of center support, and that thrust washers between clutch assemblies are properly positioned.

LINCOLN AUTOMATIC TRANSMISSION HYDRAULIC PRESSURE TUBES

LINCOLN AUTOMATIC TRANSMISSION POWER TRAIN

TORQUE CONVERTER

Needle thrust washer and race must be positioned between planet assembly and front clutch sun gear.

TORQUE CONVERTER: Torque converter is a welded unit and cannot be disassembled for repair. Check converter operation as follows and replace complete assembly if not within specifications.

Stator One–Way Clutch: Install Tool 7946–A into stator hub from rear of converter, then install a suitable torque wrench on tool. Rotate torque wrench handle in a clockwise direction (viewed from rear of converter). If tool does not rotate freely, overrunning clutch is binding or is installed backwards and must be replaced. Swing tool so steel rod (part of tool) positions against opposite pump drive lug, then apply 10 ft. lbs. torque while attempting to rotate tool counterclockwise (converter viewed from rear). Rotate tool clockwise and attempt to turn converter counterclockwise at least five times. If tool fails to hold on any attempt to turn converter counterclockwise, then one–way clutch is slipping and the converter must be replaced.

End Play Check: Install Tool 7937–A into stator hub, then tap lightly on tool to drive it forward, eliminating forward end thrust movement. Install a dial indicator on rod so indicator contact button rests against outside surface of converter, then pull tool toward rear of converter. *CAUTION – Do not rock or tip tool sideways.* Movement indicated on dial indicator should not exceed .060". If endplay is greater, thrust washers are worn and converter must be replaced.

DUAL-COUPLING HYDRA-MATIC TRANSMISSION

Cadillac (1961)
Pontiac (1961)

►*TRANSMISSION IDENTIFICATION NOTE: A serial number prefix stamped on the serial number plate located at lower left hand corner on rear face of transmission case identifies the various transmissions as indicated in table below.*

Car Model	Serial Number Prefix
Cadillac Series 60 & 62	"C"
Cadillac Series 75	"CA"
Pontiac, 2-Bbl. Carb	PS-61
Pontiac, Triple Carburetors	PAS-61
Pontiac, 4-Bbl. Carb.	PBS-61
Pontiac, Economy Eng.	PES-61

►CHANGES, CAUTIONS, CORRECTIONS

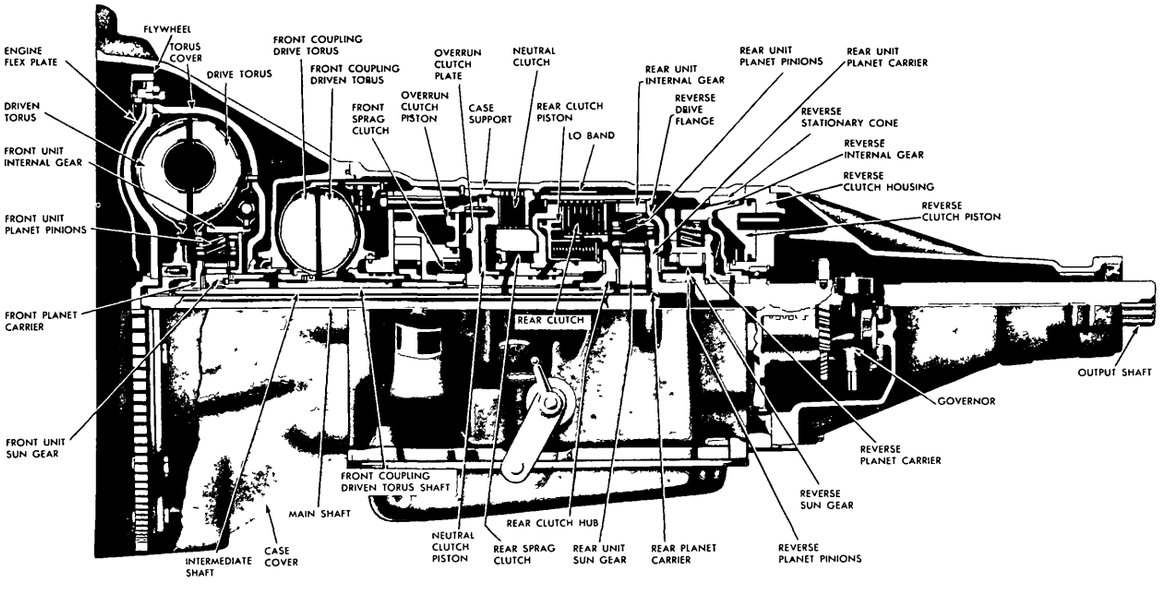
►*STARTING ENGINE BY PUSHING CAR NOTE: Due to the elimination of the rear pump in this transmission, it is not possible to start the engine by pushing, towing, or coasting the car.*

►*TOWING HYDRA-MATIC DRIVE CARS: Car may be towed at speeds up to 30 MPH for distances up to 50 miles if there is nothing wrong with the transmission. When towing at speeds above 30 MPH or if transmission known to be out of order, disconnect propeller shaft from transmission. CAUTION - After towing, check fluid level and if necessary, bring to proper level.*

►*1961 CADILLAC HYDRA-MATIC REAR UNIT GEAR NOISE NOTE:* Rear unit gear noise developing after transmission has been overhauled or disassembled and reassembled may be caused by rear unit sun gear and rear unit internal gear being installed improperly. Both of these gears have a definite front and rear side. Rear unit sun gear has a drilled spot to indicate **rear face** of gear. The internal gear has a 15° chamfer machined on **front** outside diameter of drive lugs.

DESCRIPTION: Four-speed hydraulically controlled planetary type transmission of same design used on previous models.

LUBRICATION



LUBRICATION: Check fluid level each time engine oil is changed (Cadillac); at every 2000 mile chassis lubrication (Pontiac). Drain and refill every 16,000 miles (Cadillac), every 25,000 miles (Pontiac). *CADILLAC NOTE: Original factory fill should be changed at 30,000 miles or one year, whichever occurs first.*

►*1961 PONTIAC TRANSMISSION DIPSTICK NOTE: Dipstick must be inserted in filler tube and rotated 1/8 turn to lock it in position. When checking fluid level, make sure dipstick is in locked position*

►*FLUID LEVEL CAUTION: Due to the smaller size of this transmission, it is extremely important that the proper fluid level be maintained. DO NOT check or change the fluid level when transmission is extremely hot or cold because of fluid expansion and contraction.*

Recommended Lubricant: Use Automatic Transmission Fluid Type "A" (Suffix "A"). *NOTE - On Pontiac, Automatic Transmission Type "A" may be used.*

CHECKING FLUID LEVEL: With transmission selector lever in "N" or "P" position and transmission at normal operating temperature (engine at idle speed), check fluid level on dipstick. Add oil with engine running to bring level up to "Full" mark on dipstick. *NOTE - It requires approximately 1 pint of fluid to bring level from "Low" to "Full". DO NOT OVERFILL TRANSMISSION.*

DUAL-COUPLING HYDRA-MATIC SECTIONAL VIEW

Capacity: Refill - 9 qts. (Cadillac & Pontiac).
After Overhaul - 10 qts. (Cadillac), 10½ qts. (Pontiac). *CAUTION - The transmission fluid capacities indicated above are approximate, follow procedure outlined above (see "Checking Fluid Level").*

►*CADILLAC TRANSMISSION OIL FILTER: A paper element type oil strainer on oil intake pipe (in oil pan) should be replaced every 30,000 miles or when any major transmission failure has occurred.*

LINKAGE ADJUSTMENT

►*THROTTLE VALVE LINKAGE ADJUSTMENT NOTE: See "Carburetor" on individual car model pages for throttle valve linkage adjustment.*

CADILLAC

MANUAL LEVER LINKAGE ADJUSTMENT: Remove slush deflector, then remove clevis from manual lever on transmission. Loosen adjusting nuts on transmission manual rod and place manual lever in DR-4 position. Place selector lever on steering column in DR-4 position, then adjust length of manual rod until hole in manual lever lines up with hole in clevis. Increase length of rod **one turn.** Install clevis and tighten adjusting nuts. Check operation of selector lever. It should be free to enter "P" (Park) position and DR-4 stop in steering column should correspond to DR-4 detent position in transmission. Readjust if necessary.

Neutral Safety Switch Adjustment (Combination Neutral Safety Switch, Back-up Light Switch): Located on steering column forward of instrument panel. Loosen attaching screw on switch and position it on jacket so starter is not operative in any position except "N" (Neutral) or "P" (Park).

PONTIAC

MANUAL LEVER LINKAGE ADJUSTMENT: Place selector lever and transmission manual lever in "P" (Park) position; and with outer transmission shift lever trunnion nuts backed off clear of trunnion, pull shift rod down toward transmission as far as possible. While holding in this position, run the upper trunnion nut down to just contact trunnion, then run lower nut up to contact trunnion and lock nuts securely.

Neutral Safety Switch Adjustment: Located at lower end of steering column in engine compartment. Place selector lever in "N" (Neutral) position, then loosen switch mounting screws. Adjust switch to index with

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC TRANSMISSION (Cont.)

selector lever. *NOTE - Starter must not operate when ignition key is turned to start position with selector lever in "D" (Drive) position.* Test to see that engine starts when selector lever is in "P" (Park) or "N" (Neutral) position. Tighten switch mounting screws securely.

TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. *See "Dual-Coupling Hydra-Matic" Shift Point Table for correct shift speeds.*

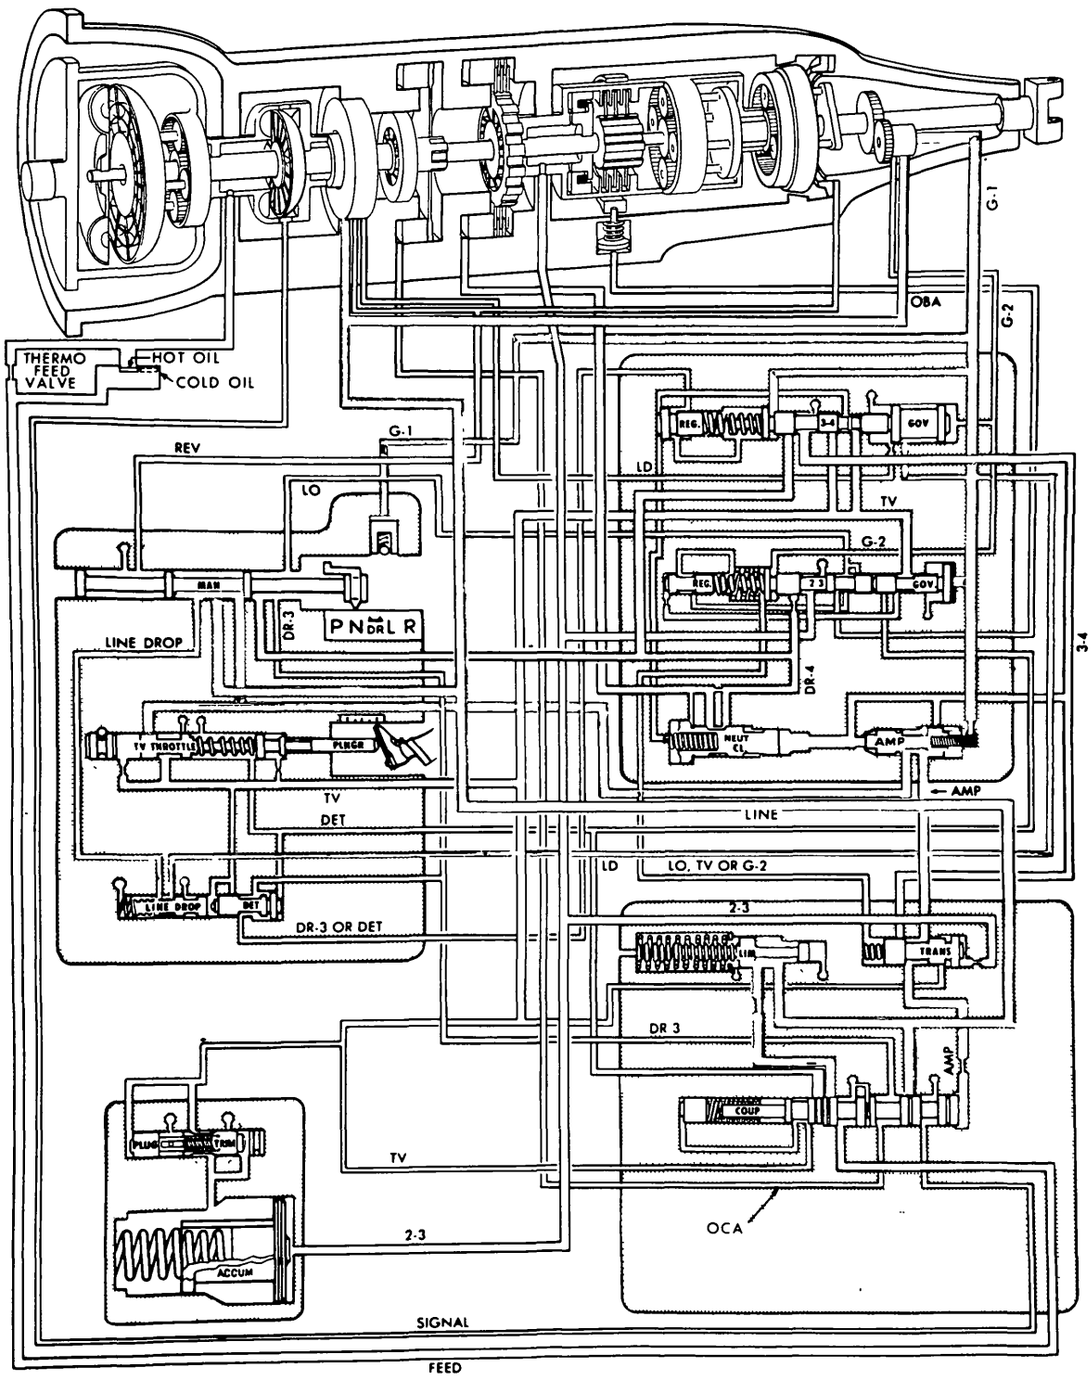
OIL PRESSURE TEST: Connect oil pressure gauge, Tool J-2540-A (Cadillac), J-5907 (Pontiac) to take-off hole at bottom of reverse clutch housing using a hose and fitting. Drive car until normal operating temperis reached, then test as follows:

Zero Throttle Pressure (Pontiac): Check pressure in all ranges. Pressure should be 50 lbs. minimum in all ranges with a maximum variation of 10 lbs. (may be higher in reverse).

Drive "Right" Pressure (Pontiac): With transmission selector lever in Drive "Right" position and car speed at approximately 25 MPH, pressure should be 90-100 lbs. *NOTE - Pressure at any speed is constant regardless of throttle pressure as throttle valve pressure is not used to modulate line pressure.*

Drive "Left" Pressure (Pontiac): While driving at 25 MPH, move selector lever to Drive "Left" position so that transmission will shift into 4th Speed. Oil pressure should drop to 60-70 lbs. in 4th.

Full Throttle Pressure Test (Cadillac): In any drive range, pressure should be at least 30 lbs. higher than zero throttle pressure test reading (see above).



Reverse Pressure Test (Cadillac): Place selector in "R" (Reverse) position and apply foot brake. Increase engine speed to half throttle. Pressure range under these conditions should be 150-200 lbs.

Ⓒ - When this shift occurs, transmission will freewheel and it is not possible to observe shift with throttle closed. To check for shift, decelerate, with throttle closed, to specified speed, then accelerate to determine which speed transmission is in.
② - Forced.

TROUBLE SHOOTING & DIAGNOSIS

NO UPSHIFTS OR ERRATIC: Governor valves stuck. Broken governor rings. Sticking valves or dirt in valve body. G-2 bushing turned. Front unit internal gear bushing seized on shaft.

MISSES 2ND SPEED: Governor boost valve stuck. Transition valve stuck away from plate. Sticking valves or dirt in valve body. Governor sticking.

MISSES 3RD, OR 2-4-3: Transition valve sticking. Sticking valves or dirt in valve body. Throttle valve adjustment too long. Rear clutch or transition valve spring faulty.

LOCKS UP IN 2ND AND 4TH: Front sprag clutch broken. Overrun clutch applied or sticking.

LOCKS UP IN 3RD OR 4TH: Rear sprag clutch broken. Low band not releasing.

ROUGH 2-3 SHIFT: Accumulator valve stuck or accumulator piston stuck. Accumulator gasket broken or leaking. Restricted or leaking oil passages. Broken accumulator spring. Broken or leaking piston oil seal rings. Control valve faulty or throttle valve adjusted improperly. Rear clutch pack faulty. Case passages restricted or leaking.

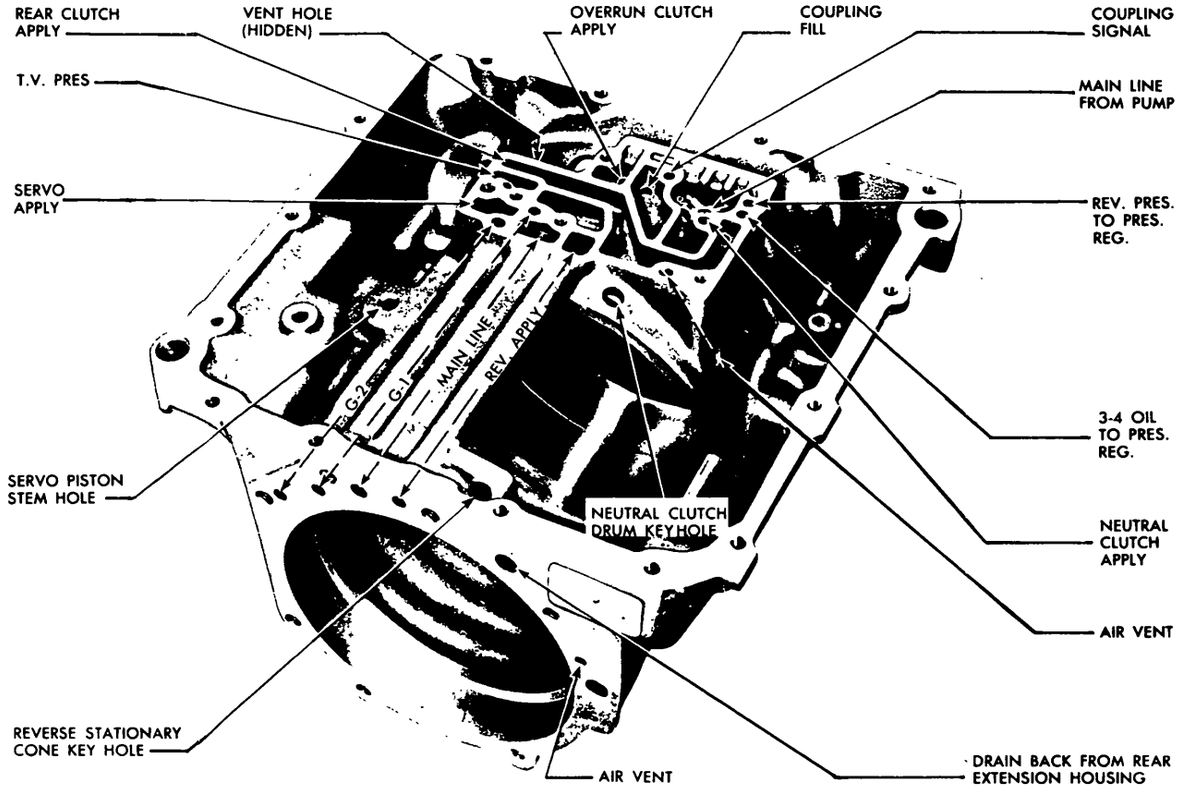
UPSHIFTS ROUGH: Throttle linkage adjusted short. Governor valves sticking. Broken governor rings. Sticking valves or dirt in valve body. Leaking or restricted main line feed to governor.

UPSHIFTS LOW: Throttle linkage adjusted long. Governor valves sticking. Broken governor rings. Sticking valves or dirt in valve body. Leaking throttle valve oil.

NO REVERSE, SLIPS OR LOCKS UP: Manual linkage incorrectly adjusted. Manual valve not engaged with drive pin. Reverse piston apply restricted or leaking. Low oil pressure. Overrun clutch apply leaking. Pressure regulator faulty. Neutral clutch not released. Flash restricting neutral clutch exhaust port or manual body.

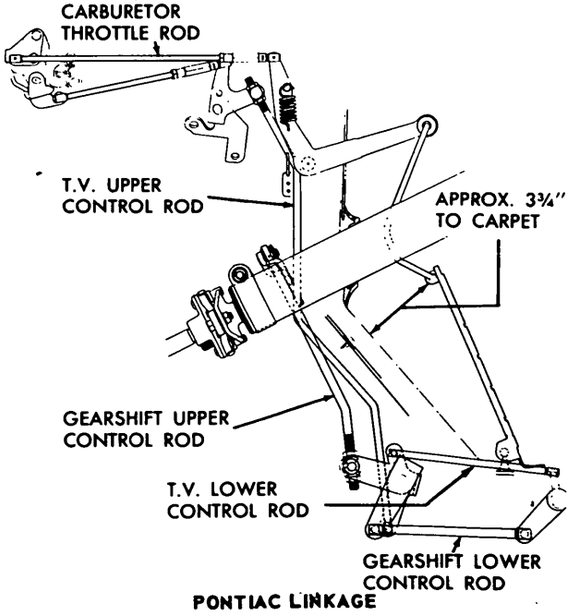
SELECTOR LEVER WILL NOT GO INTO REVERSE: Governor valves sticking or broken governor rings. Reverse blocker piston stuck. Manual linkage interference.

REVERSE DRIVE IN NEUTRAL: Reverse stationary cone sticking.



DELAYED 1-2 SHIFT: Coupling valve sticking. Governor boost valve sticking. G-1 valve sticking. Wrong spring on coupler valve.

SLIPS IN 1ST AND 3RD: Front sprag clutch slipping. Front sprag clutch broken.



SLIPS IN OR MISSES 2ND AND 4TH: Front unit torus cover seals leaking. Front unit torus cover exhaust valves sticking or missing. Front unit torus cover feed restriction or leak. Front unit torus cover signal restriction or leak. Low oil pressure. Coupling valve sticking. Sticking valves or dirt in valve body. Coupling snap ring improperly installed, or missing. Limit valve faulty. Coupling passage restricted or leaking. Front unit torus vanes damaged.

SLIPS IN ALL DR RANGES: Manual linkage improperly adjusted. Neutral clutch clipping or burned. Neutral clutch apply restricted or leaking (case support or valve body). Incorrect number of neutral clutch plates. Low oil pressure. Control valve faulty. Torus members (check valve) faulty. Intake pipe "O" ring damaged or

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC OIL PASSAGES

PONTIAC LINKAGE

DUAL-COUPLING HYDRA-MATIC TRANSMISSION (C nt.)

missing. Pressure regulator valve stuck in pump. Pump slide stuck.

SLIPS IN 1ST OR 3RD (DR RANGE): Rear sprag clutch slipping or improperly assembled. Rear sprag clutch broken. Neutral clutch burned, restricted or the piston is sticking.

SLIPS IN 3RD OR 4TH: Rear unit clutch slipping or burned. Rear unit clutch apply restricted or leaking. Incorrect number of clutch plates (rear). Accumulator faulty. Center support leakage at 2-3 passage. Low oil pressure. Accumulator valve stuck (3rd only).

SLIPS IN 3RD IN DR RIGHT ON COAST: Overrun clutch slipping or burned. Overrun clutch apply restricted or leaking. Sticking valves or dirt in valve body. Overrun clutch passages restricted or leaking.

SLIPS IN 1ST AND 2ND LO RANGE ON COAST: Low servo apply restricted or leaking. Low band not anchored to case or broken. Low servo piston and rod binding in case or servo and accumulator body. Band facing worn or loose. Anchor dowel pin loose or missing in case.

NO DRIVE IN DR RANGE: Manual linkage incorrectly adjusted or manual valve not engaged with drive pin. Low oil pressure (pressure regulator stuck). Front pump intake pipe improperly installed. Front sprag broken (front pump bushing or front unit drive torus shaft). Front and/or rear sprag not properly installed. Rear sprag broken. Front sprag inner race broken. Rear sprag outer race broken. Neutral clutch plates burned. Neutral clutch piston, control valve or front pump not operating properly.

DRIVE IN LO RANGE ONLY: Rear sprag broken. Neutral clutch not applying.

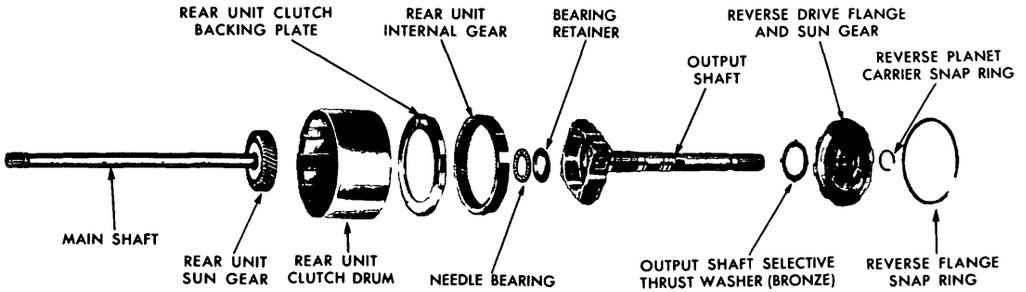
NO FORCED DOWNSHIFTS (4-3 OR 3-2): Control valve faulty or linkage not properly adjusted.

2-3 RUNAWAY OR 2-1-3 SHIFT: 2-3 passage in center bearing support restricted or leaking. Plug out of accumulator. Rear clutch burned. Valve body faulty (transition valve or case passages in the 2-3 circuit).

WILL NOT GO INTO PARK: Parking links broken. Mechanical interference. Manual linkage or parking pawl faulty.

STARTS IN 2ND SPEED: Valves sticking. Governor sticking or governor boost valve stuck.

DRIVES FORWARD IN REVERSE AND NEUTRAL: Neutral clutch piston stuck in applied position.



LUNGES FORWARD BEFORE BACK-UP WHEN PLACING SELECTOR IN REVERSE: G-2 plunger stuck in outward position. Restricted neutral clutch release oil supply.

REMOVAL & INSTALLATION

CADILLAC

REMOVAL: 1) Place car on a hoist or on jack stands and disconnect battery. Remove starter motor and slush deflector and lower flywheel cover front cover.

2) Drain transmission at oil pan and flywheel, then remove transmission filler pipe bracket bolt from right cylinder head. Clean dirt from pipe flange and slide filler pipe out of sleeve in transmission case.

1961 DUAL-COUPLING HYDRA-MATIC CASE CENTER SUPPORT, NEUTRAL & REAR UNIT CLUTCH

3) Disconnect brake cables from parking brake relay lever, then remove retracting spring and remove relay from frame. Remove propeller shaft assembly and remove intermediate frame crossmember below flywheel housing. Disconnect speedometer cable from extension housing. Remove throttle valve and manual levers from shafts.

4) Remove four nuts from flywheel-to-drive plate screws, then place a jack under rear of engine oil pan (use a wood block to prevent damage to plan). Place transmission jack under transmission and raise it just enough to take strain off rear engine support. Disconnect engine rear support at transmission extension housing and remove crossmember that carries support.

5) Disconnect oil cooler pipes from adapter on transmission case and cap the lines to prevent leakage.

6) Remove six screws holding flywheel housing to engine then remove transmission and flywheel housing as a unit by moving assembly toward rear of car, disengaging flywheel housing from locating dowels on engine, and then tilting front unit downward to lower it from car. Remove washer from pilot hole in crankshaft.

INSTALLATION: 1) Install spacer in pilot hole in crankshaft, then raise transmission into position carefully with transmission jack and align drive plate with torus cover screws and drive dowel holes in flywheel housing with dowels on engine. Install flywheel housing-to-crankcase screws, making sure that flywheel is as far forward as possible. Connect oil cooler lines and tighten securely.

2) Lift engine and transmission to about one inch above its normal height and install engine rear support bracket on frame. Tighten three bracket bolts on one side only. Install three bracket bolts on other side loosely. Lower transmission carefully and install two support screws. Remove block from engine pan and remove transmission jack.

3) Install four nuts attaching drive plate to flywheel and tighten to 15-20 ft. lbs. *CAUTION - Make sure drain plugs in flywheel and oil pan are tight.* Install flywheel housing front cover making sure to attach the two exhaust braces. Install starter motor.

4) Install filler tube in transmission with support bracket properly positioned on cylinder head. Install manual and throttle valve levers on transmission shaft, making sure that serrations on levers are lined up with serrations on their respective shafts and tighten securely. Install speedometer cable, and install slush deflector.

5) Wedge screwdriver in between frame and end of rear support bracket which was left loose, to spring frame slightly. Install frame crossmember below flywheel housing with six bolts. Remove screwdriver and tighten bolts. Tighten three remaining bolts on engine rear support bracket.

6) Install propeller shaft assembly, then install parking brake relay lever and retracting spring in position on frame. Connect brake cables to lever and adjust cable. Lower car to floor and connect battery.

7) Install filler pipe bracket to cylinder head screw, then fill transmission with fluid (*see "Draining & Refilling" above*). Adjust manual and throttle valve linkage. *See "Linkage Adjustments" abov* .

PONTIAC

REMOVAL: 1) Remove one battery cable and release the parking brake, then raise car and drain transmission (see "Draining & Refilling" above). Disconnect oil cooler lines by either removing clamps and pulling hoses or by cutting the hoses. Disconnect drive line from transmission output shaft, then remove complete drive line assembly.

2) Disconnect speedometer cable from drive gear and remove gearshift lower control rod. Remove cross shaft bracket, cross shaft lever and bushing from transmission. Remove lower end of throttle valve upper control rod (engine-to-transmission idler lever), then remove throttle valve lever control rod and throttle idler lever.

3) Remove both starter cables and remove starter and splash shield. Remove flywheel bottom cover and remove flywheel-to-flex plate attaching bolts. Position automatic transmission jack under transmission and and remove two rear support-to-frame crossmember bolts. Disconnect crossmember at each frame side rail and raise transmission so rear mount supports are clear of cross member, then rotate crossmember slightly in frame and remove parking brake return spring and cable guide rod from crossmember.

4) Remove crossmember, then lower transmission enough to remove flywheel housing-to-engine bolts. Work transmission rearward to disengage dowels from front flywheel housing and remove transmission from car.

INSTALLATION: Reverse removal procedure and note the following: With transmission in position engaging dowels into engine and torus cover bolts into flex plate, install and tighten two flywheel housing attaching screws. *NOTE - If pilot on flywheel has entered*

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC TRANSMISSION (Cont.)

end of crankshaft properly, flywheel and torus cover should move back and forth slightly. Rotate flywheel to bring one flex plate mounting pad down to lowest position, then push flywheel forward slightly to seat it against crankshaft. Measure clearance between pad on flex plate and flywheel with a feeler gauge. Minimum clearance should be .015". If less, move transmission away from engine and install special spacer over flywheel pilot. Move transmission back into position and install two flywheel housing-to-engine bolts. When installing flex plate-to-flywheel attaching nuts, tighten nuts to 15 ft. lbs. using a torque wrench with extension, Tool No. J-6498.

OVERHAUL

►*LATE 1960-61 CADILLAC 2-3 SHIFT VALVE ASSEMBLY NOTE:* Beginning with Late 1960 production an additional spacer is used between end of 2-3 Shift Valve and 2-3 Shift Valve Spring. When installing, the spacer fits on end of 2-3 Shift Valve with rim of spacer against large land on valve.

►*LATE 1960 & EARLY 1961 CADILLAC HYDRA-MATIC TRANSMISSIONS REMAINING IN 3RD GEAR WHEN CAR IS STOPPED CORRECTION:* On 1961 cars before Engine No. 024382 or on late 1960 cars using a spacer in 2-3 Shift Valve bore (see above), install 2-3 Shift Valve Spring, Part No. 8620807. This new spring with redesigned end coils eliminates possibility of spring hanging up on a step in valve bore.

►*1960-61 CADILLAC SERVO ACCUMULATOR ASSEMBLY NOTE:* When reassembling this unit, the accumulator is properly positioned when top of piston stem is below face of accumulator body. The relation of top of piston to face of accumulator body does not indicate seating of the stem.

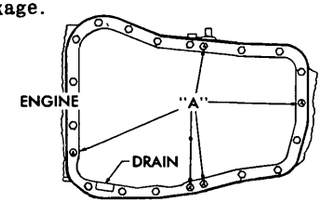
►*CADILLAC TRANSMISSION REAR CLUTCH HUB-TO-REAR CLUTCH UNIT THRUST WASHER INSTALLATION NOTE:* Beginning with Late 1960 production, a steel backing washer has been added between rear clutch hub and rear clutch cover to reduce galling of bronze thrust washer and reduce wear on the clutch cover. When installing, the bronze thrust washer is positioned next to rear clutch hub and the steel backing washer is positioned between bronze washer and rear unit clutch cover with flange on backing washer toward clutch cover. These washers, included in Service Package, Part No. 8619969, will replace and be interchangeable with single type bronze washer, and may be used on all 1956-61 transmissions.

OVERHAUL: *See "Dual Coupling Hydra-Matic Transmission" in 1960 Annual Data or later Manual edition and note the following:*

Rear Clutch Hub-to-Rear Clutch Unit Thrust Washer: Position bronze thrust washer next to rear clutch hub, then position steel backing washer between bronze thrust washer and rear unit clutch cover with flange on backing washer toward clutch cover.

3-SPEED HYDRA-MATIC TRANSMISSION

Oldsmobile 88, Super 88, 98 (1961)
P ntiac Catalina & Ventura (1961)



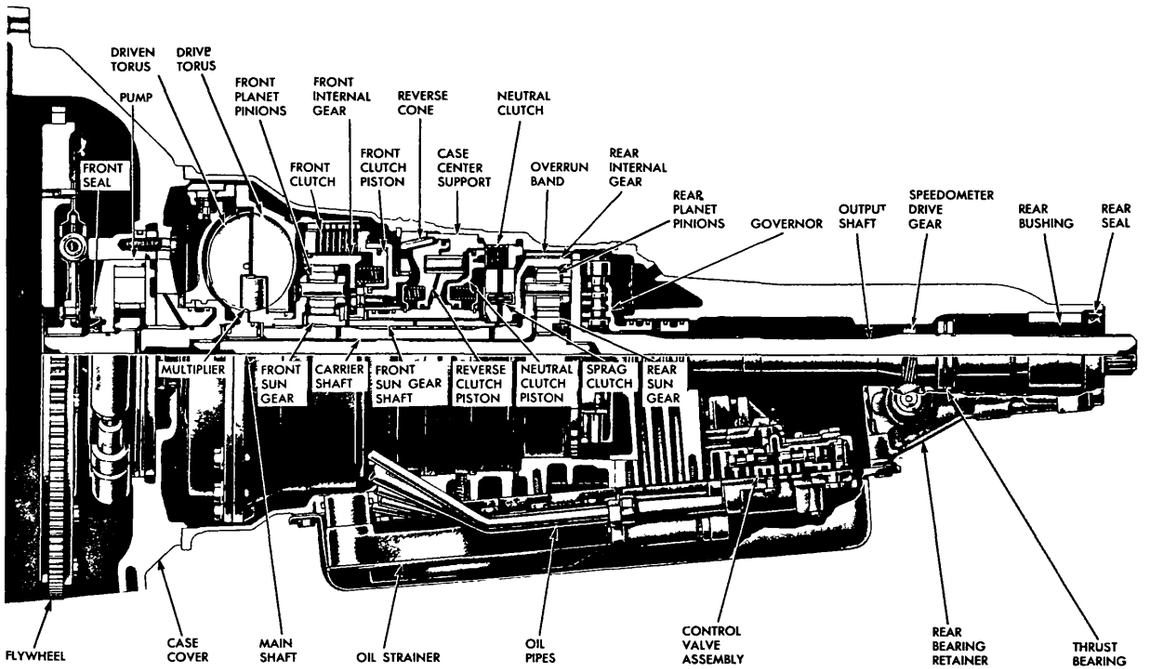
►CHANGES, CAUTIONS, CORRECTIONS

►*1961 TRANSMISSION REAR CARRIER WEAR CORRECTION:* Thin thrust washers (.025" thick), Part No. 8621901 will eliminate further carrier wear and may be used to compensate for wear that has occurred. Replace present thick thrust washers (.050" thick) with two thin washers. A maximum of two additional thin washers may be added to side of pinion where carrier has worn so that total pinion-to-thrust washer endplay is .005-.029". *NOTE - Remove burrs and sharp edge at pinion pin hole before checking endplay. See "Overhaul" below for rear carrier pinion gear removal and installation procedure.*

►*1961 FLYWHEEL DAMPER RATTLE NOTE :* Oil or grease on friction lining material of damper will destroy frictional characteristics of material and may cause damper rattle. Damper hub splines and transmission input shaft should be kept free of oil or grease that could be thrown onto damper linings.

►*1961 TRANSMISSION OIL SEAL REPLACEMENT CAUTION:* New "tumbled" (smoothed) oil seal rings, Part Nos. 8620809 (Case Cover Oil Ring); 8620812 (Governor Oil Ring); 8620813 (Multiplier Oil Ring) should be installed when transmission disassembled for any reason.

►*1961 TRANSMISSION OIL PAN ATTACHING BOLT NOTE:* Later transmissions will have five attaching bolts (with copper sealing washers), Part No. 8620721 installed as indicated in illustration. These bolts may be used on earlier transmission to eliminate possibility of leakage.



OIL PAN ATTACHING BOLTS

►*1961 PONTIAC SERVICE CHANGE TO DECREASE 1-2 SHIFT POINT:* 1-2 shift point may be lower 1 to 2 MPH and provide a lower engine RPM during shift by removing 1-2 Shift Valve Spring (See Control Valve illustration). With spring removed, adjust engine idle speed to 500-510 RPM.

►*1961 PONTIAC HIGH SHIFT POINT CORRECTION:* Excessively high 1-2 shift point speed may be caused by interference between upper throttle valve control rod and hex shoulder on idler control lever shaft at transmission. To correct, rotate idler lever shaft so that flat side is parallel to throttle valve upper rod. *NOTE - In severe cases it may be necessary to remove throttle valve rod and bend lowest section of rod at idler lever shaft so it has approximately ¼" deflection from center. R install rod and adjust linkage.*

►*1961 PONTIAC SERVO PISTON PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* Beginning with Transmission Serial No. P-76880, PE-18336, PA-2188 & PB-3345, a new servo piston and inner and outer springs are being used in production. A Service Package, Part No. 8620995, containing a new servo piston, outer spring and snap ring is furnished for service replacement on both early and later models.

3-SPEED HYDRA-MATIC DRIVE TRANSMISSION SECTIONAL VIEW

►*1961 PONTIAC FRONT CLUTCH PISTON ASSEMBLY CHANGE (To Prevent Centrifugal Apply of Front Clutch at High Speed With Selector Lever in Neutral):* Front Clutch Piston Assembly, Part No. 8620792, which includes a small one-way ball check is available for installation on "PA" transmissions used with 425A Engine, Triple Carburetor Engine, and Special Police Engine.

►*1961 PONTIAC COOLER CONTROL VALVE PRODUCTION CHANGE (To Permit Increased Cooling Under Heavy Duty Operation):* Cooler control valve has been eliminated on later cars. On early cars having the cooler control valve, additional cooling may be obtained for heavy duty operation by removing cooler control valve body, depressing plunger slightly, and removing snap ring which retains plunger in body. Remove plunger and its spring, then remove thermostatic element from body and reinstall body and gasket in case cover. Installation of body and gasket prevents oil flow through screw holes into case rather than into cooler.

►*1961 PONTIAC CASE COVER PLUG LEAK CORRECTION:* Pry out old plug, then remove old stake marks from cover with a file so they will not tear new seal. Coat sealing surface of new cover plug, Part No. 8620423 with non-hardening sealer and tap plug into case until edge is flush with cover. Use a flat tipped punch against edge of plug and tap plug until it is seated 1/16" below face of cover, then stake at four points to retain.

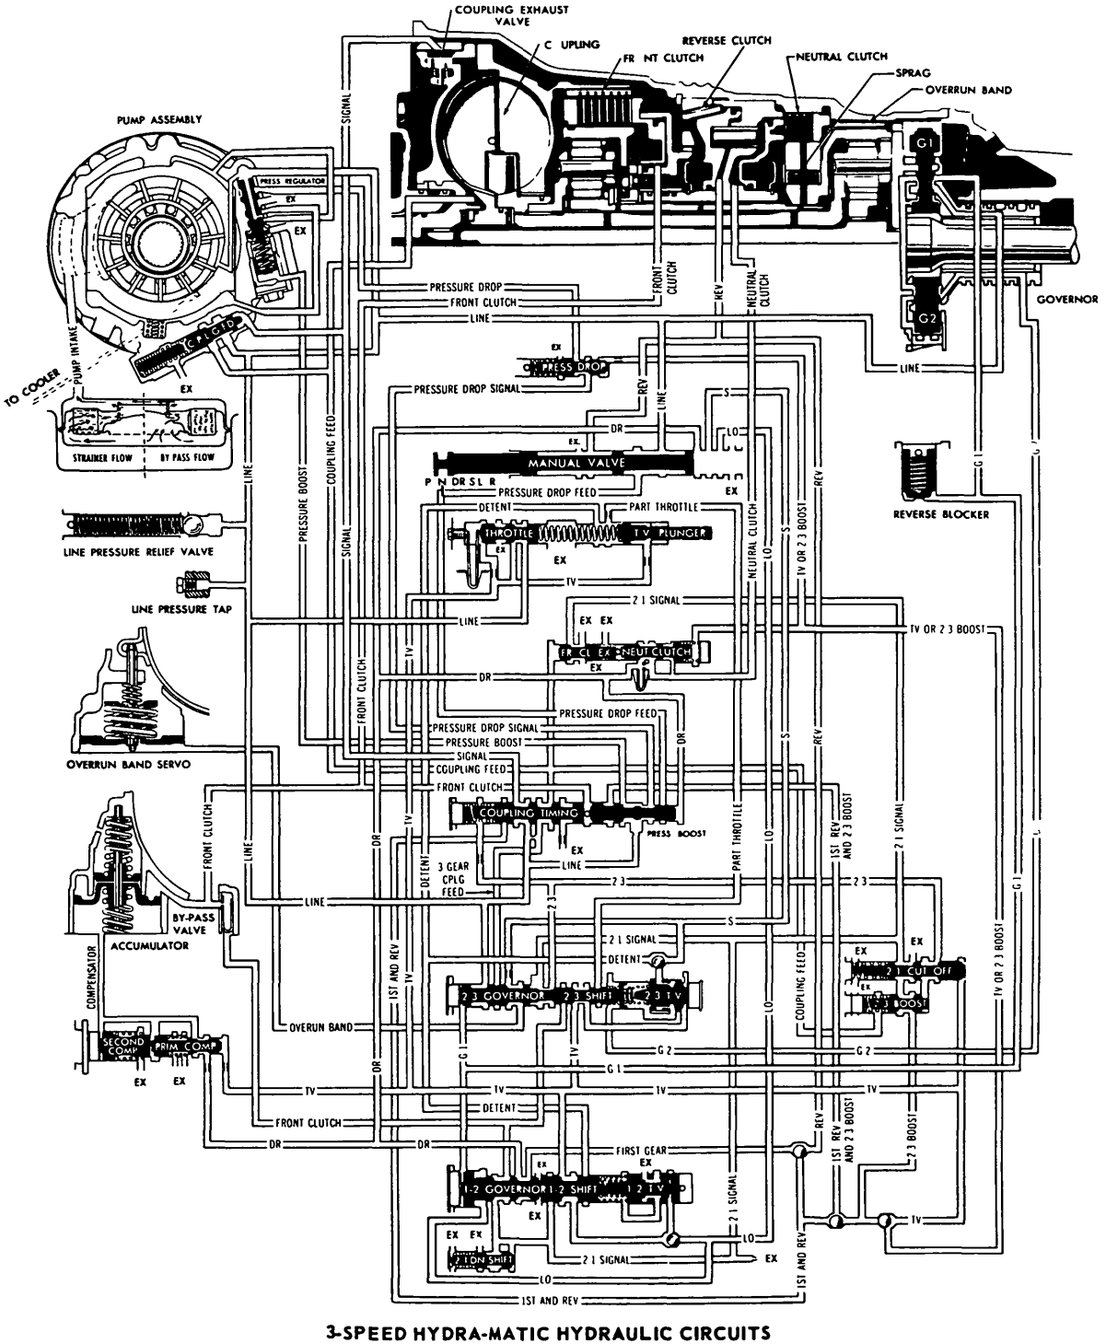
►*1961 PONTIAC TRANSMISSION CONTROL VALVE ASSEMBLY PRODUCTION CHANGE (For Improved Shift Pattern):* All Transmissions between Serial Nos. P-76001 & P-77000 and those above No. P-82314 incorporate a new control valve assembly, Part No. 8621906, identified by "P-2" stamped on valve body. With the new control valve, transmission shift pattern has been changed as follows: A closed throttle 3-2 downshift occurs at approximately 17 MPH in place of former 3-1 downshift at 14 MPH. The minimum throttle 1-2 upshift is lowered to 13 MPH and the 2-3 shift is raised to approximately 21 MPH.

►*1961 PONTIAC TRANSMISSION OIL SCREEN PRODUCTION CHANGE:* A Strainer Screen, Part No. 8620852 is being installed in governor feed line beginning with Transmission Serial Nos. P-82160, PE-19720, PA-2188 and PB-3345. The new screen cannot be installed in earlier models.

DESCRIPTION: New "split torque" type hydraulically controlled automatic planetary gear transmission and torque converter (fluid coupling and torque multiplier). Engine torque is transmitted completely by hydraulic action in first speed, and completely by mechanical action in second speed. In third speed, the torque is "split", causing the torque converter to carry only 40% of engine torque with the remaining 60% being transmitted mechanically.

CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)



OPERATION: N utral Range - Engine torque is transmitted through torus cover to drive torus member causing it to rotate driven torus and turn main shaft and rear unit sun gear in direction of engine rotation. The neutral clutch being disengaged, prevents sprag assembly from holding rear unit internal gear against turning opposite engine rotation. Therefore, as rear unit sun gear turns in direction of engine rotation, rear unit pinions turn opposite engine rotation driving rear internal gear opposite engine rotation. The front unit sun gear being mechanically connected to rear internal gear, causes front unit pinions to rotate in direction of engine rotation, driving front internal gear in same direction. With both rear unit internal gear and front unit internal gear spinning freely, there is no transmission of torque from front or rear units to carriers or output shaft.

First Sp ed - Driv Rang : Engine torque is transmitted through torus cover to torus drive member then through oil to torus driven member which redirects it through the stator (multiplier) and back to the driven member. This action multiplies the engine torque and applies it to mainshaft and rear unit sun gear. With neutral clutch applied, locking sprag outer race to case, the rear unit internal gear is held stationary. The rear sun gear, turning in direction of engine rotation attempts to drive pinions and internal gear opposite engine rotation; however, because sprag assembly holds internal gear stationary, the output shaft through the pinions is compelled to rotate in direction of engine rotation within the internal gear at a reduced speed and with increased torque. As the rear carrier and output shaft rotate in this manner, the front carrier which is mechanically connected to rear carrier, also rotates in same direction at reduced speed. Because the sprag assembly is holding front unit sun gear from turning opposite engine rotation, carriers and pinions rotate the front unit internal gear in direction of engine rotation at approximately one-half engine speed.

Sec nd Sp d - Driv Rang : Engine torque is transmitted through torus cover to torus drive member. The front clutch is applied and coupling is empty so engine torque is mechanically applied to front unit internal gear. Front unit sun gear assembly is splined to sprag inner race and is prevented from turning opposite engine rotation by sprag when neutral clutch is applied. Engine torque at front internal gear is applied to pinions, and because sun gears cannot rotate opposite engine rotation, the planet pinions and carrier are forced to rotate in direction of engine rotation around sun gear in reduction. Front carrier is splined to rear unit carrier and shaft assembly which in turn is bolted directly to output shaft.

Third Speed - Driv Range: Engine torque is transmitted through torus cover and is applied through front clutch to front unit internal gear. Front unit internal gear, through pinions, tends to turn front sun gear against the sprag, causing front unit to run in direction of engine rotation, in reduction. With rear carrier rotating in same direction at the same reduction, and rear internal gear tending to be stationary against the sprag, rear unit pinions attempt to rotate opposite engine rotation on their pins, thus driving rear unit sun gear and driven torus in direction of engine rotation faster than engine speed. However, because coupling is filled, coupling driven member and rear unit sun gear cannot revolve faster than drive torus which turns at engine speed. Therefore, rear sun gear speed is slowed down to approximately engine speed. As a result, rear unit pinions are also slowed down. The carrier and pinions change direction of load against internal gear causing it to overrun the sprag and revolve with carrier and sun gear at same speed. With output shaft and carriers connected to converter stator (multiplier), the

CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC HYDRAULIC CIRCUITS

3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

stator is also turning at same speed as drive and driven members so that it has no effect in multiplying torque in the torque converter. As a result, the entire drive train must revolve as one common unit in direct drive.

R verse Range: Engine torque is applied to mainshaft in same manner as in "First Speed - Drive Range" above. Rear unit sun gear then drives rear unit pinions as idlers which in turn drive rear unit internal gear in a direction opposite engine rotation (neutral clutch is released making sprag clutch ineffective for holding internal gear) With rear unit internal gear turning opposite engine rotation, front unit sun gear is turning in same direction. The reverse cone which is applied holds front unit internal gear stationary so that front unit pinions and carrier are forced to walk around front internal gear in a direction opposite to engine rotation, and in reduction. The output shaft being connected to front and rear unit carrier is also turning in a direction opposite to engine rotation, and in reduction.

LUBRICATION

LUBRICATION INTERVALS: Check fluid level every 2000 miles. Drain and refill every 25,000 miles.

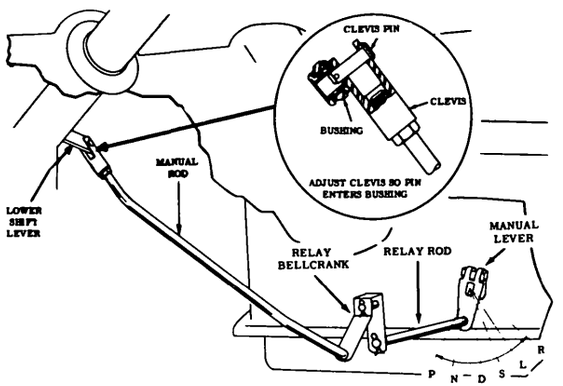
R commended Lubricant: Use only Automatic Transmission Fluid Type "A" (Suffix "A").

►*1961 OLDSMOBILE OIL SPLASH OUT OF FILLER TUBE CORRECTION:* Metal washers holding dipstick seal in position may not be properly staked allowing seal to move and permitting oil to pass Correct by installing a new dipstick

►*1961 FLUID LEVEL DIPSTICK CAUTION:* Dipstick must be fully inserted into filler tube and rotated 1/8 turn to right to properly lock it into position to prevent oil leakage from filler tube and to properly position dipstick when checking fluid level

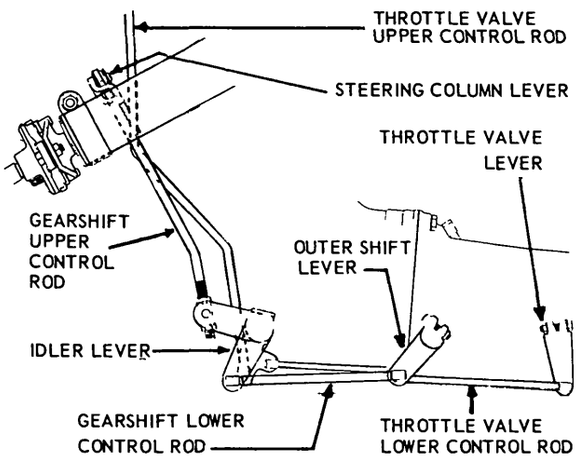
CHECKING FLUID LEVEL: With car on a level floor, transmission at operating temperature, engine idling, and selector lever in "P" (Park) position, check fluid level on dipstick located at right rear side of engine. Add recommended fluid as necessary to bring level to FULL mark on dipstick. *NOTE - 1 pint of fluid is required to bring level from ADD mark to FULL mark. With transmission cold, oil level should be at ADD mark. DO NOT OVERFILL.*

DRAINING & REFILLING: With transmission at normal operating temperature, disconnect filler pipe from right side of oil pan and drain transmission. *NOTE - Flushing transmission is not recommended.* Remove oil pan and strainer and clean oil pan, then install strainer using a new pump intake pipe "O" ring if necessary Use a new gasket and install oil pan and tighten screws securely, then connect oil filler pipe. If only oil pan has been removed, pour 4 qts. of fluid into transmission (if valve body has been removed, pour in 5 qts. or after overhaul use 8 qts.). Start engine and let idle at slow idle speed (off fast idle cam), then place selector lever in "P" (Park) position and check level on dipstick. Add sufficient fluid to bring level to FULL mark on dipstick. *CAUTION - D not ov rfill.*



Capacity: Approximately 4¼ qts. (after drain), 5¾ qts. (after removing valve body), 8½ qts. (after overhaul).

ADJUSTMENT



►*THROTTLE VALVE LINKAGE ADJUSTMENT S "Carbur t r" on individual car mod l pag s.*

►*1961 OLDSMOBILE SHIFT RELAY BELLCRANK CHECKING NOTE* Whenever linkage is disconnected from transmission, clearance between end of manual shift rod and lower auxiliary throttle valve rod should be checked to make sure there is a minimum clearance of 1/8" when throttle valve rod is pushed all the way forward To adjust clearance, bend **outer** leg of shift relay bellcrank **outward** so there is 1/8" to 5/16" clearance between cotter pin on shift rod and throttle valve rod Be sure cotter pin is correctly installed and wrapped around rod

MANUAL LEVER LINKAGE ADJUSTMENT: With transmission outer shift lever trunnion nuts backed clear of trunnion, place selector lever in "P" (Park) position and transmission lever in "P" (Park) position. Pull shift rod down toward transmission as far as possible, then while holding rod in this position, run trunnion upper nut down to just contact trunnion. Run lower nut up to contact trunnion, then tighten nuts securely.

OLDSMOBILE MANUAL SELECTOR LINKAGE

PONTIAC MANUAL SELECTOR LINKAGE

After making adjustments, check transmission parking lock with car on an incline

SELECTOR LEVER INDICATOR: Pontiac - With manual linkage adjustments completed, place selector lever in Drive Right position and check indicator pointer index. If necessary to adjust, loosen check nut above ball stud, then adjust index by rotating rod. Tighten check nut securely.

NEUTRAL SAFETY SWITCH: Place selector lever in "N" (Neutral) position, then loosen switch mounting screw on steering column jacket below instrument panel Adjust switch to index with selector lever. Starter must operate when transmission selector lever in either "P" (Park) or "N" (Neutral) position and must not operate in any other position. Tighten switch mounting screw securely

TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. *NOTE - Make sure engine is operating at peak performance.* See "Shift Speed Tables" below for correct shift speeds under different operating conditions.

►*CAUTION Do not stall test transmission under any conditions.*

OIL PRESSURE TEST: With oil pressure gauge connected to the upper of the two test holes on left-hand side of rear bearing retainer, check the oil pressure while on road test with selector lever in Drive Right position and with transmission in second speed at approximately 25 MPH. Minimum pressure should be 98.6 lbs. Maximum pressure should be 111.4 lbs. If not within specifications, check the following.

Low Oil Pressure: Oil level is low Booster plug is the wrong one or is stuck. Pressure regulator valve is not operating properly. Strainer and "O" ring are leaking Manual valve is misaligned with quadrant Fluid is foaming or cavitation is occurring Internal leakage. Stuck valve in control valve assembly. Front pump slide is stuck causing low output.

High Oil Pressure: Pressure regulator valve is stuck. Booster plug is the wrong one or is stuck. Manual valve is misaligned with quadrant. Stuck valve in control valve assembly. Front pump stuck causing high output

SHIFT SPEED TABLES

►*1961 PONTIAC SHIFT SPEED CHANGE NOTE (Later Cars With New Type Control Valve Assembly) See "1961 Pontiac Transmission Control Valve Assembly Production Change" above*

		1-2	2-3
UPSHIFTS

►*NOTE·* Minimum throttle denotes a fixed throttle opening only sufficient to provide acceleration enough to accomplish each of the shifts.

CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

TROUBLE SHOOTING

NO UPSHIFT: "G-1" valve in governor is sticking closed or the 1-2 shift valve train in control valve assembly is sticking *(NOTE - To determine if "G-1" valve is sticking, drive car between speed of 15-20 MPH, then very carefully attempt to momentarily engage the reverse position to see if reverse blocker piston is working. If selector lever can be moved beyond "LO" range position, reverse blocker is not operating properly, due in most cases to a stuck "G-1" valve. If a thorough rinsing of governor in clean solvent does not free "G-1" valve, replace governor assembly). CAUTION - When making test, DO NOT fully engage selector lever in Reverse position or leave lever in partial Reverse position.*

NO DRIVE IN DRIVE RANGE: Check Neutral Clutch, Sprag assembly (or Race), Fluid Coupling, Oil Level & Pressure, Manual Linkage, Control Valve Assembly, Sticking Reverse Cone, and for Restricted Passages.

DRIVE IN NEUTRAL: Check operation of Neutral Clutch for Manual Linkage Adjustment.

NO REVERSE: Check Manual Linkage Adjustment, Low Pressure, Restricted Passages, and check operation of Reverse Cone Clutch and Neutral Clutch.

DRIVE IN "RIGHT DRIVE" OR LOW RANGE ONLY: Check operation of Sprag Assembly and Neutral Clutch.

FORWARD DRIVE IN REVERSE: Check Manual Linkage and operation of Neutral Clutch.

REVERSE DRIVE IN NEUTRAL: Check operation of Reverse Cone Clutch.

DRIVE IN SECOND & THIRD ONLY: Check for malfunction in Control Valve Assembly.

DRIVE IN FIRST & THIRD ONLY: *NOTE - This condition may be r port d as a "1-2 Slippage".* Check for malfunction in Control Valve Assembly or Fluid Coupling.

DRIVE IN FIRST & SECOND ONLY: Check operation of Governor and for malfunction in Control Valve Assembly.

SLIPPAGE 1-2 SHIFT: *NOTE - This condition may be reported as "Driv in First & Third Only".* Check operation of front clutch, or Accumulator, and for malfunction in Control Valve Assembly. Accumulator Body Assembly not operating properly. Check Throttle Valve Linkage adjustment and for Low Oil Pressure. Check for restricted 1-2 Oil Passages.

SLIPPING 2-3 SHIFT: Check for malfunction in Fluid Coupling and in Control Valve Assembly. Front Clutch not operating properly.

SLIPPING IN ALL RANGES: Low oil pressure.

ROUGH 1-2 SHIFT: Accumulator, Compensator Body Assembly, or Front Clutch not operating properly. Malfunction in Control Valve Assembly or in Fluid Coupling. Throttle Valve Linkage not adjusted properly. Front Clutch Passage restricted.

ERRATIC SHIFTS: Governor Assembly or Control Valve Assembly not functioning correctly.

HIGH OR LOW UPSHIFTS: Throttle Valve Linkage not properly adjusted (if too short, upshifts will be high, if too long, upshifts will be low). Control Valve Assembly or Governor malfunctioning. Throttle Valve Lever bent. Governor Oil Passage restricted. Throttle Valve or Line Pressure not correct.

NO ENGINE BRAKING (INTERMEDIATE OR LOW RANGE): Overrun Band or Servo not operating.

NO PART THROTTLE OR DETENT DOWNSHIFT: Check Throttle Valve Linkage Adjustment and Accelerator Travel. Malfunction in Control Valve Assembly or Governor.

SELECTOR LEVER WILL NOT GO INTO REVERSE: Check Manual Linkage Adjustment, operation of Governor, and Reverse Blocker Valve.

SELECTOR LEVER WILL NOT GO INTO PARK: Check Parking Linkage and Adjustment of Manual Linkage.

REMOVAL & INSTALLATION

OLDSMOBILE

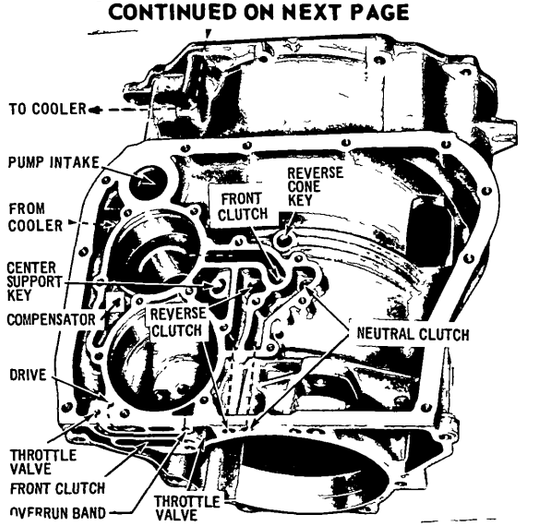
REMOVAL: Disconnect transmission vent pipe from rear of right hand exhaust manifold, then raise car on hoist and remove transmission filler pipe and drain fluid. Disconnect speedometer cable and transmission control levers at transmission, then remove propeller shaft. Disconnect exhaust pipe bracket from transmission rear housing. Install engine support bar, Tool BT 30-16, then support transmission with a suitable transmission lift. Raise engine enough to relieve weight from rear engine mounts, then remove engine mount-to-crossmember attaching bolts and lower transmission lift until it is free of transmission oil pan. Lower engine (using engine support bar attaching screws), NOT TO EXCEED 1½" to permit removal of upper transmission-to-flywheel housing bolts. Disconnect cooler lines from fittings and cap all openings. Pry bent pipe from top of transmission, then raise transmission lift until it supports transmission and remove remaining transmission-to-flywheel housing bolts. Position exhaust pipe bracket to clear transmission output shaft, then move transmission rearward to disengage input shaft hub from damper hub. Lower transmission from car.

INSTALLATION: Reverse removal procedure and note the following: Lubricate input shaft splines with a small amount of wheel bearing grease. Refill transmission with fluid. See *"Lubrication" above.*

PONTIAC

REMOVAL: Remove either battery cable from battery, then raise car on a hoist and drain transmission. Remove propeller shaft and disconnect speedometer cable from driven gear. Remove selector lever lower rod and remove lower end of selector upper rod by removing "E" ring. Remove two cross shaft bracket-to-frame bolts, then remove bracket cross shaft lever and bushings. Remove lower end of throttle control transmission rod (engine-to-transmission idler lever). and remove idler lever-to-outer transmission throttle valve lever control rod, remove throttle control idler lever. Remove parking brake return spring and brake cable guide hook from frame, then remove oil cooler lines. Loosen exhaust manifold bolts about ¼", and remove both starter cables. Remove starter and splash shield. Remove bottom cover from bottom of case cover and remove bolts holding flywheel from cover plate to transmission case cover. Support transmission with a transmission jack, then remove two rear mount support-to-frame crossmember nuts and raise transmission so studs clear transmission and remove crossmember. Lower transmission until jack is barely supporting it, then remove breather pipe. Use a long extension and a "U" joint and remove remaining transmission case cover to engine attaching bolts. Raise transmission to its normal position and slide it rearward from engine and flywheel and remove it from car. Remove rear mount support from rear mount and remove rear mount from rear bearing retainer.

INSTALLATION: Reverse removal procedures and note the following: Tighten transmission case cover to engine attaching bolts to 50-70 ft. lbs. Refill transmission and adjust throttle and manual linkage.



TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

PRESSURE REGULATOR VALVE: Removal - Remove left hand inspection cover on case cover, then remove regulator valve, plug, stop, spring, and valve from pump body.

Installation: Replace "O" ring on plug, then place valve plug in a ¾" socket (with speed handle). Place line boost plug in valve plug (hollow end facing out), then set valve stop on top of plug. With the spring attached to regulator valve, place spring through plug stop and into plug. Feed entire assembly through inspection hole and into pump. *NOTE - It may take some manipulati n to get valve and plug stop properly into their b re.* Tighten plug to 15-20 ft. lbs. and replace cover.

►*LINE BOOST PLUG NOTE:* This plug, in pressure regulator valve assembly, is furnished in three sizes for different line boost pressures. Plain plug is for normal pressure. The plug with a ring on side of cap is for lower pressure, and the plug with a groove on side of cap provides lowest pressufe. To check line boost pressure, proceed as follows: Disconnect control rod to throttle valve rod outer lever and secure throttle valve lever in full throttle valve position with a length of wire. Install oil pressure gauge in upper of two holes in rear bearing retainer, then start engine and operate at 1500 RPM. On transmissions with serial number before P61-26932; PE61-7521 & PB61-20106, place transmission selector lever in "D" (Drive) position. *CAUTION - Make sure parking brakes and servic brakes are applied so car does not move.* On all other transmissions, place transmission selector lever in "N" (Neutral) or "P" (Park) position. Pressure on gauge should be 176-183 lbs. Change line boost plug to obtain correct pressure.

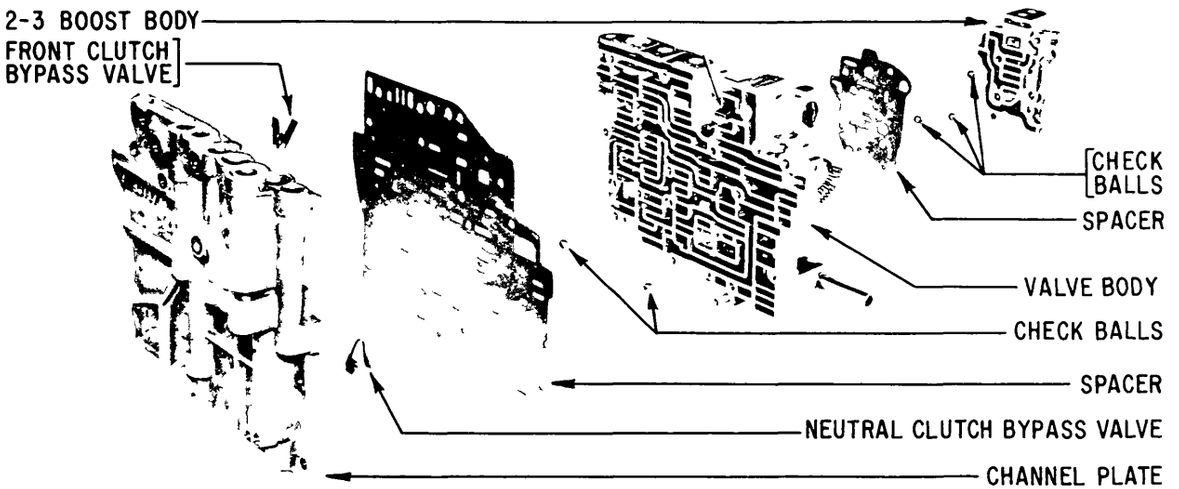
CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC TRANSMISSION CASE PASSAGES

3-SPEED HYDRA-MATIC TRANSMISSION (Cont.)

COUPLING FEED LIMIT VALVE: Removal - Remove inspection plate on right side of case cover and remove coupling feed valve plug from lower portion of pump. *NOTE - After removal of plug and pin, remove valve and spring from pump body with long nose pliers.*

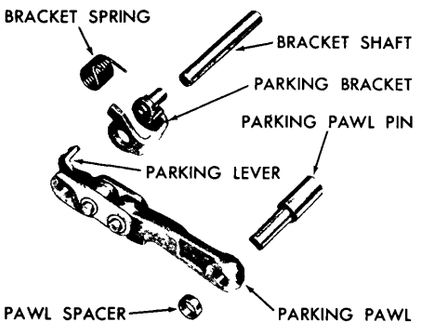
Installation: Carefully insert spring and valve together, into pump body, using long nose pliers. Replace "O" ring on plug, then place plug in socket wrench and place pin in plug. Insert plug and pin through inspection hole (with pin in center of spring) and screw plug into pump. Tighten to 15-20 ft. lbs. Replace inspection plate.



REAR SEAL & REAR BUSHING: Rear Seal Replacement - Remove propeller shaft, then remove seal with a screwdriver. To install seal, coat outer casing with sealing compound and drive it into rear bearing retainer with Tool J-5154.

Rear Bushing & Seal Replacement: Remove bushing retaining bolt from left side of rear bearing retainer and remove propeller shaft. Fit bushing remover, Tool J-8845 and slide hammer, Tool J-2619 into bushing and tighten, then remove bushing and seal. To replace bushing, install (chamfered end first) into rear bearing retainer, aligning retainer bolt slot with bolt hole, then drive into place with a slide hammer and drift. To install seal, see above.

CONTROL VALVE BODY: Removal - Drain transmission and remove outer throttle lever from shaft, then remove throttle lever seal with a small screwdriver placed behind flange. Remove oil pan and gasket and remove five valve body-to-rear bearing retainer attaching bolts. Slide valve body off pipe assembly and remove from transmission. *CAUTION - Do not let manual valve drop out of valve body during removal.*



Installation: Install manual valve in valve body, then apply petrolatum to all valve body pipe ports. Install valve body in rear bearing retainer by guiding throttle shaft through its opening and then positioning manual valve on pick-up pin (detent lever). Guide valve body over pipe assembly and slide forward to seat seals, then install five attaching bolts and tighten to 6-8 ft. lbs. Install throttle shaft seal over throttle shaft and into case. Install oil pan and gasket and tighten screws to 12-15 ft. lbs. Install oil filler pipe and refill transmission.

GOVERNOR: Removal - Drain transmission and remove oil pan, then remove throttle valve lower control rod from throttle valve outer lever, and gearshift control lower rod from outside shift lever. Remove speedometer cable and remove hand brake cable guide rod and return spring from frame crossmember. Remove propeller shaft from transmission, then place a support under front of transmission. Remove rear mount support-to-crossmember nuts, crossmember attaching bolts, and retaining clamp from rubber insulator. Raise transmission from rear mount support to clear crossmember and remove crossmember. Remove control valve assembly (see above), then lower transmission sufficiently to remove breather pipe from its bore. Reach into rear bearing retainer and remove four governor and output shaft attaching bolts (hold outside manual lever forward to engage parking brake when loosening bolts). Mark edge of output shaft flange and a corresponding spot on inside of case with a grease pencil (to match output shaft with planet carrier when reassembling). *CAUTION - These parts will fit together in one position only and it is important that the carrier not be rotated after removing output shaft, otherwise the guide marks will be of no value.* Remove rear bearing retainer-to-case attaching bolts (two bolts are inside retainer) and slide retainer rearward away from transmission. Remove rear bearing retainer cover and reach through access hole with 90° snap ring pliers and unseat snap ring from output shaft. Remove output shaft from front of retainer. *CAUTION - Do not strike inner sleeve of rear bearing retainer with speedometer drive gear when removing shaft.* Press speedometer drive gear off of shaft using suitable press plates and holder, then remove governor.

3-SPEED HYDRA-MATIC CONTROL VALVE ASSEMBLY

Installation: Place governor and gasket on output shaft, then drive speedometer drive gear onto shaft with Tool J-6133-A. *NOTE - Rear side of drive gear should be 6 9/32" from end of shaft.* Place snap ring through hole in bearing retainer and slide over end of output shaft as shaft is carefully installed into retainer. Seat snap ring in grooves against thrust bearing race, then install bearing retainer cover and gasket. Position retainer-to-case gasket on retainer (hold in place with petrolatum), making sure that manual shaft retainer is installed. Align guide marks on output shaft flange and case and place unit in position on case, being sure that parking linkage is aligned with manual lever. Install bearing retainer-to-case attaching bolts, using a short bolt in center hole on each side, and one inside rear bearing retainer. Install breather pipe and clip. Install governor attaching bolts, rotating shaft as necessary. *NOTE - Hold manual valve lever forward while tightening governor attaching bolts to 19-23 ft. lbs.* Raise transmission and install frame crossmember (brake cables go above crossmember), then lower transmission so rear mount support studs engage crossmember bracket. Install insulator retainers and crossmember attaching bolts, then install rear mount support stud nuts. Complete installation by reversing removal procedures *(see "Control Valve Body Installation" above).*

PARKING BRAKE LINKAGE

PARKING LINKAGE: Removal - Remove rear bearing retainer from transmission case and remove access hole cover *(see "Governor" above),* then push parking pawl pin from case with a small rod and remove pin and pawl pin spacer from transmission case. Balance of linkage can be removed as a unit from rear of case.

Installation: Reverse removal procedures.

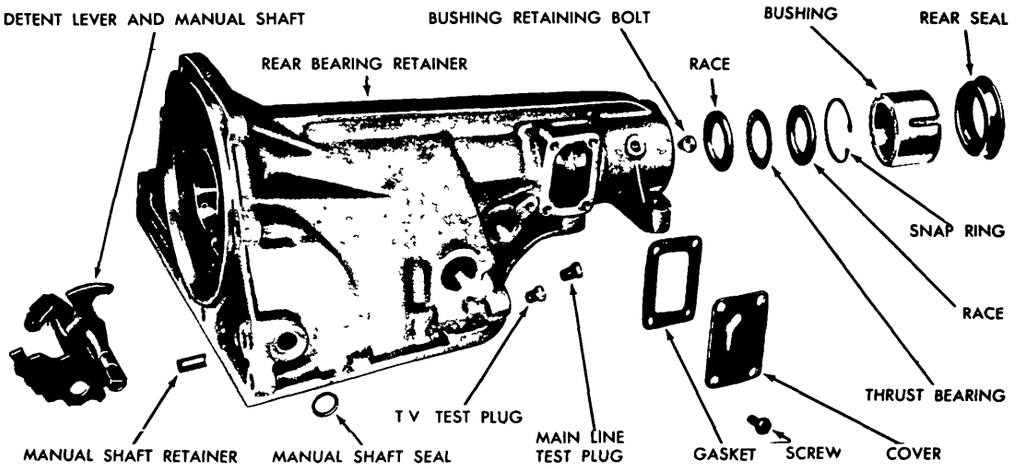
SERVO & ACCUMULATOR: Removal - Drain transmission, then remove oil pan and strainer. Remove compensator valve body (three screws and one bolt), then remove remaining servo and accumulator cover attaching bolts and remove cover. *CAUTION - Servo release spring pushes servo piston against cover. Be careful not to drop piston when cover is removed.* Accumulator lower spring and possibly the case center support springs will be removed with cover. Use accumulator pin to remove both accumulator pistons and remaining spring. Remove case center support seal springs and seal if they did not previously fall free.

Installation: *NOTE - Cut a rectangular piece of stiff sheet metal so it will hold servo piston in its bore when*

CONTINUED ON NEXT PAGE

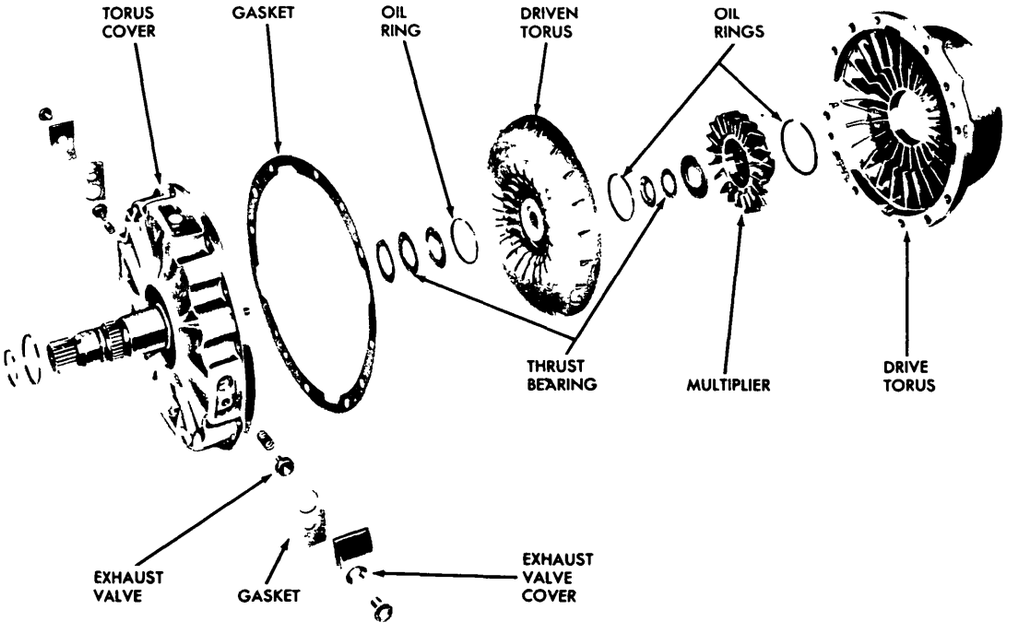
3-SPEED HYDRA-MATIC TRANSMISSION (Cont.)

bolted to right rear oil pan bolt hole. Place upper accumulator piston on piston pin and place tapered spring over pin with large end of spring against piston and piston seal facing away from spring. Install tapered spring, pin and upper piston into case with small end of spring upward. Hold these parts in case and install lower accumulator piston, pocket side down. Screw ends of case center support seal springs into seal far enough so they will not fall off easily and install seals into case so spring are suspended below them (petrolatum may be used to hold seals and springs into place). Place servo return spring over servo pin and install assembly into case. Retain it in place using the previously mentioned tool bolted to an oil pan hole. Place remaining accumulator spring in position over accumulator pin and hold in place while installing servo and accumulator cover. Attach cover with three bolts and leave just loose enough to remove servo retaining tool. *CAUTION - Make sure three seal springs enter case straight.* Remove retaining tool and install remaining cover bolts except the strainer attaching bolt and tighten all screws to 6-8 ft lbs. Install compensator, oil strainer, and oil pan, then install filler tube and refill transmission.



TRANSMISSION DISASSEMBLY

►*TRANSMISSION DISASSEMBLY NOTE: Instructions below cover removal of sub-assemblies in their proper order from transmission case. See "OVERHAUL OF UNITS" for Disassembly, Inspection, and Reassembly.*



CONTROL VALVE, SERVO & ACCUMULATOR: With transmission installed in a suitable transmission holding fixture, remove outer shift lever and throttle valve lever, then turn transmission so oil pan is upward. Remove oil pan and oil strainer from transmission. If necessary to remove oil strainer to case "O" ring, pry it out with a small screwdriver. Pry throttle shaft seal from side of rear bearing retainer with a small screwdriver. Remove control valve assembly attaching bolts and remove valve assembly from pipe assembly and rear bearing retainer, being careful not to drop manual valve, then remove manual valve from control valve assembly. Remove compensator valve body from servo and accumulator cover, then remove servo and accumulator cover. Remove three case center support springs and seals (seals may have remained in transmission case). Remove servo piston from bore in case, then remove servo release spring, lower accumulator spring and lower accumulator piston. Remove lower accumulator piston pin, and using the stem of pin as a tool, remove upper accumulator piston, then remove spring. Remove ring and seal from lower and upper accumulator pistons. Remove pipe assembly attaching bolt and seal from front side of transmission case cover and withdraw pipe assembly and seals from transmission. *NOTE - Multipl seals may have remained in transmission.*

FRONT UNIT ENDPLAY CHECK: *NOTE - Before proceeding with furth r transmission disassembly, check front unit ndplay as follows:* Remove one case cover-to-case attaching bolt and install a suitable dial indicator support, then assemble endplay adapter, Tool J-8865 on input shaft of torus cover. Clamp a dial indicator on bolt, then position a screwdriver through case, on front side of flange on output shaft, and gently pry rearward on output shaft to position units to rear of case. Index indicator with end of Tool J-8865, then position screwdriver behind flange on output shaft and gently pry forward to position units toward front of case. Record amount of endplay indicated on dial indicator. Endplay should be .004-.022". If not within specifications, carefully inspect thrust bearings, thrust washers, and races when removing units from case to determine source of endplay.

REAR BEARING RETAINER: Remove bushing and sleeve assembly and rear seal only if replacement is necessary (*see "Transmission Unit Rem val - Transmission in Car" above*). Rotate transmission to a vertical position with output shaft up, then remove speedometer driven gear. Remove eight rear bearing retainer-to-case attaching screws (six on outside and two on inside of bearing retainer). Remove retainer cover, then reach through retainer access hole and unseat rear output shaft snap ring with snap ring pliers. Move snap ring upward on shaft a short distance. Carefully remove bearing retainer and gasket upward over output shaft (this will slide rear output shaft snap ring from output shaft). *CAUTION - B car ful not to allow manual shaft r tainer from falling out of front fac of bearing r tainer.*

REAR BEARING RETAINER

TORUS & MULTIPLIER (EXPLODED)

CONTINUED ON NEXT PAGE

3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

When lifting retainer over output shaft, do not strike r tainer sleeve with speedometer drive gear on output shaft. Remove dislodged snap ring from retainer, then remove remaining snap ring from output shaft. Remove governor attaching bolts and raise governor high enough to mark one dowel pin and nearest tooth on output shaft flange with grease pencil for ease in reassembly. Remove output shaft assembly from transmission by lifting straight up. Remove speedometer drive gear from output shaft by installing it in suitable press plates and pressing gear off shaft, then remove governor assembly and gasket over output shaft.

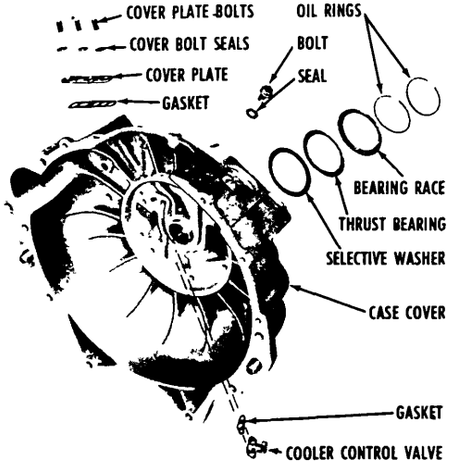
CASE COVER, PUMP & TORUS COVER: With transmission in a vertical position, input shaft upward, remove five large and three small case cover-to-case attaching bolts (two small bolts are on case side of cover). Remove case cover and pump assembly by lifting straight up (slight tapping with a plastic hammer may be necessary), then remove thrust bearing race from torus cover if it did not remain with case cover. Remove case cover gasket and discard. If necessary to replace seal, bend entire outer edge of seal in toward center with a punch or screwdriver, then remove with pliers or pry out with a long screwdriver. Remove torus cover attaching screws and then remove cover by lifting input shaft straight up. *NOTE - Some effort may be required for this operation.* Remove torus cover-to-drive member steel gasket (gasket cannot be reused), then remove race, thrust bearing, and race from either torus cover or torus member.

TORUS, FRONT UNIT & REAR UNIT: With transmission in a horizontal position, bottom up, remove driven torus member-to-mainshaft spiral snap ring with a small pointed tool, then push mainshaft through driven torus member and remove driven torus member. Remove race, thrust bearing and race from drive torus member (some of these parts may have remained with driven torus member). Remove mainshaft and sun gear from rear of transmission, then remove bearing and race from rear carrier (these parts may have remained with mainshaft). Remove sun gear from mainshaft by pushing toward splined end of shaft. From front of transmission, remove drive torus member and torque multiplier (stator) as a unit. Remove torque multiplier by pushing from rear of drive torus member. If necessary, remove oil seal rings from driven torus member and torque multiplier (three rings). Remove front carrier-to-carrier shaft snap ring and remove front unit carrier assembly. Remove race, thrust bearing and race (some of these parts may have remained with carrier). Remove rear carrier and shaft assembly from rear of transmission. Remove roller thrust bearing and race from rear unit carrier assembly (these parts may have remained with rear unit internal gear). From rear of transmission, remove rear internal gear- to-front sun gear shaft snap ring, then remove rear unit internal gear and sprag assembly, including retainer. Make sure parking pawl is disengaged. Rotate transmission to vertical position, front end upward. *CAUTION - Transmission parts ar loos and will drop out if transmissi n is n t rotat d prop rly.* Remove front unit sun gear assembly, race, roller thrust bearing and race, then remove front unit internal gear and clutch assembly from front of transmission. Remove bronze thrust washer from front unit clutch drum (bronze thrust washer may have remained on case center support).

►*DRIVE TORUS BUSHING WEAR NOTE:* Drive torus bushing may show wear caused by oil ring on torque multiplier. This ring groove will not create noise or affect transmission operation and it is not necessary to replace drive torus assembly.

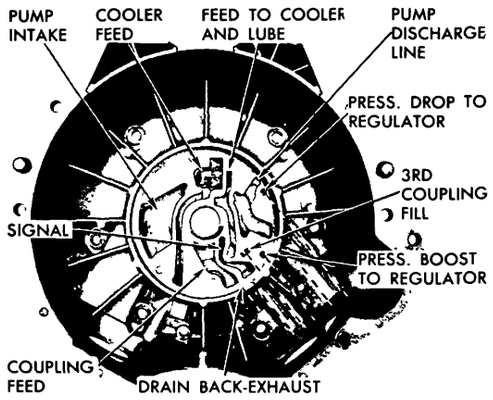
REVERSE CLUTCH & CASE CENTER SUPPORT: Remove reverse stationary cone-to-case snap ring, then use puller, Tool J-8768 to remove reverse cone and reverse stationary cone. *NOTE - Position tool under lugs of reverse cone and pull upward.* Remove reverse stationary cone key from case, then remove reverse and neutral piston and support assembly (if tight in case, tap gently with a soft hammer from the rear). Remove case center support key from transmission case and remove neutral clutch plates (four drive and four driven plates). Rotate transmission to a vertical position with rear end upward, then remove band assembly by unhooking from anchor and lifting upward.

PARKING LINKAGE: *See "Transmission Unit Removal - Transmission in Car" above.*



OVERHAUL OF UNITS

►*1961 PONTIAC CASE CENTER SUPPORT KEY PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* On later transmissions, case center support key slot and retaining key have been made narrower. When necessary to install either a new key or center support on earlier transmissions, install Service Package, Part No. 8620970 which contains a later type support and key. Later type key, Part No. 8620755 is available separately but must be used only with a narrow slot.



►*OVERHAUL NOTE:* Clean all parts thoroughly and blow out case passages with air. Inspect bolt threads for cross threading and transmission case for leaks or interconnected passages. Examine case for "hairline" cracks. Inspect case-to-strainer neck "O" ring seal for cuts, hardness or pinched seal. If parking linkage was not removed, inspect pawl pin and parking brake links for wear or bind. Inspect case support-to-case seals for hardness or cracks. Inspect seal springs for collapsed coils and for fit of seals on spring ends.

CASE COVER: Disassembly - Loosen cover-to-pump attaching bolts about four turns, then support cover so pump is off bench and gently tap loosened bolts to remove pump from case cover. Remove attaching bolts and pump. Remove two hook type oil seal rings from case cover, then remove race, thrust bearing and selective washer (race may have been removed previously). Remove two case cover-to-cooler control valve assembly screws and remove cooler control valve assembly and gasket. *NOTE - Do not disassemble cooler control valve assembly.* Remove case cover plate and gasket, then remove remaining bolts and seal in case cover.

Inspection: Clean thoroughly and inspect all passages for interconnection or restriction using an air gun or smoke. Inspect bushing for tight fit or excessive wear and inspect case cover for cracks or porosity. Inspect rings and ring grooves for nicks or burrs and case cover plate bolts for leaks or cross threads. Inspect cooler passage connection threads in case cover for cross threads. *NOTE - Worn threads may be repair d with on of th commercial thr ad repair kits.* Inspect case cover-to-coupling cover thrust bearing and the two bearing races.

CASE COVER

CASE COVER OIL PASSAGES

Reassembly: Install case cover plate and a new gasket and tighten bolts (with seal washers) to 18-20 ft. lbs. Install remaining bolt and seal washer in case cover and tighten to 18-20 ft. lbs. Attach cooler control valve assembly and a new gasket and tighten bolts to 2.5-3.5 ft. lbs. Install selective washer over tower of case cover, then install thrust bearing and cupped race (cup side over bearing on case cover). Install two hook type oil rings on tower. To install pump assembly, position cover on bench with open side up, then lay pump in its recess with coupling feed limit plug and pressure regulator plug facing their access holes. Align top structual web of pump exactly with top web in case cover. Start one attaching bolt from under side of cover to assure alignment before pushing pump to bottom of its recess in cover. Install pump attaching bolts from rear side of case cover and tighten to 15-18 ft. lbs.

CONTINUED ON NEXT PAGE

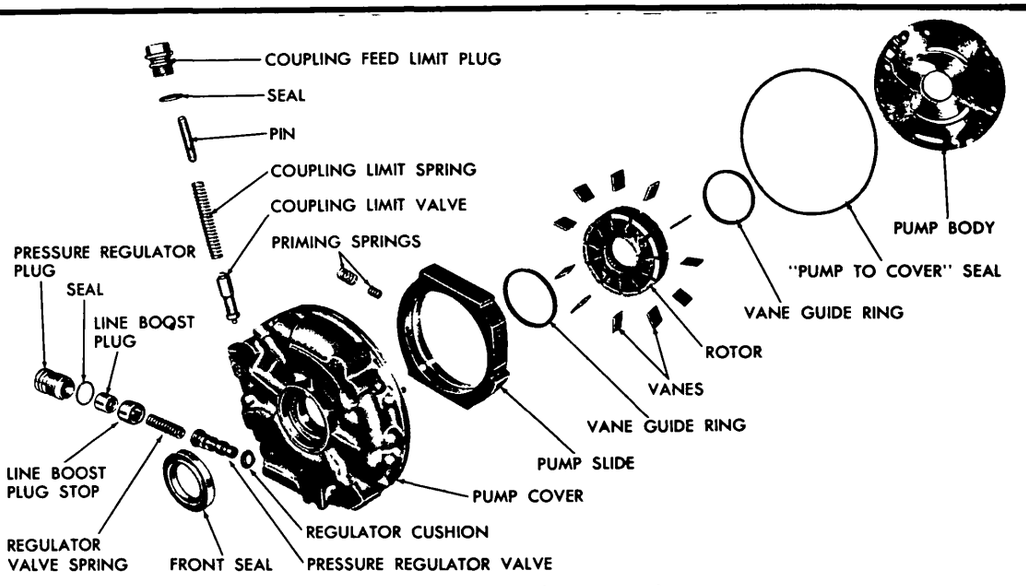
3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

PUMP: Disassembly - Inspect, and if necessary, remove pump-to-cover seal, then remove pump cover-to-body attaching screw and remove cover from pump over roll pin (do not pry to remove). Remove top vane guide ring, rotor, 11 vanes and bottom vane guide ring. Remove pump slide by compressing slide against priming springs and lift up on opp osite end. Remove inner and outer priming springs, then remove coupling feed limit plug and "O" ring. Remove coupling limit spring, guide pin and valve. Remove pressure regulator plug assembly and "O" ring, then remove line boost plug from pressure regulator plug. Remove line boost plug stop from pump. Remove pressure regulator valve spring and valve by inserting snap ring pliers into spring. If necessary, remove rubber cushion from pressure regulator valve.

Insp ction: Inspect oil passages in pump body and cover for dirt or restrictions using a tag wire and compressed air. Check for free movement of slide in pump body. Inspect pump vanes for excessive wear at guide ring contact point. *NOTE - Bright spots at the two wear points is normal unl ss deeply scored.* Check rotor for scoring and rotor splines for nicks or burrs. Inspect pressure regulator valve for nicks, scoring or burrs. Make sure valve moves freely in bore. Inspect coupling feed limit valve for nicks and burrs and make sure valve moves freely in bore. Inspect pressure regulator valve spring, inner and outer primary springs, and coupling feed limit valve spring for distortion or collapsed coils. Replace pump-to-case cover "O" ring. Inspect coupling feed limit valve plug for cross thread, and check valve plug "O" ring seal for cuts or damage.

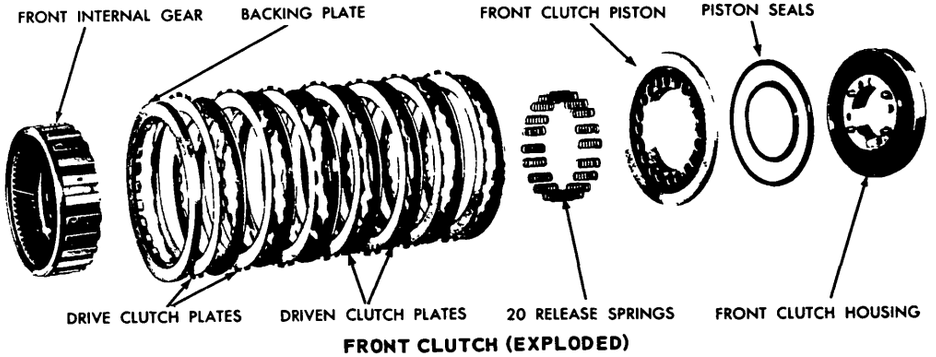
R ass mbly: Install new cushion on pressure regulator valve if previously removed, and install spring on valve, then install valve and spring in bore of pump. Install pressure regulator stop into pump over spring. Install new "O" ring on pressure regulator plug if necessary. Install line boost plug into pressure regulator plug (cup side out), then install plug assembly into pump and tighten to 15-20 ft. lbs. Install coupling limit valve, spring and pin into pump. If necessary, install a new "O" ring on coupling feed limit valve plug, then install plug into pump and tighten to 15-20 ft. lbs. Install inner and outer pump priming springs into bottom cavity of pump, then assemble slide into pump body by compressing slide against priming springs at lower end until slide can be fully installed into pump. Install bottom guide ring into pump cavity and install pump rotor (shoulder side down) in pump pocket over guide ring. Install 11 vanes into rotor with ring wear pattern on edge of vane against guide ring, then install top guide ring on rotor. Install pump cover over roll pin and secure with retaining screw. Tighten screw to 6-8 ft. lbs. If removed, install pump to-cover "O" ring on pump. *NOTE - For installation of pump in cover, see "Case Cov r R ass mbly" ab ve.*

TORUS COVER: Disassembly - Inspect and remove, if necessary, two hook type oil rings from input shaft, then remove torus exhaust valve cover screw with a clutch head socket. Remove exhaust valve cover, steel gasket, valve and spring (discard steel gasket as it cannot be reused). Repeat operation for second exhaust valve.



Inspection: Inspect splines and snap ring grooves for nicks and burrs. Check for broken rings. Check coupling signal passage for restriction, using a fine wire. Inspect coupling cover exhaust valves for nicks and burrs, making sure valves move freely in bore. Check exhaust valve spring for distortion or collapsed coil. Replace coupling exhaust valve cover gasket and inspect cover for cracks or porosity. Inspect coupling cover-to-driven torus thrust bearing and race. Inspect mainshaft pi lot bushing for excessive wear and tight fit.

Reassembly: Install exhaust valve spring and valve, then install retaining tool J-6122. Install cover and new torus cover exhaust valve gasket and retaining screw, using a clutch head socket. Tighten to 19-23 ft. lbs. Repeat above operation for second exhaust valve. Install two hook type oil rings on input shaft.

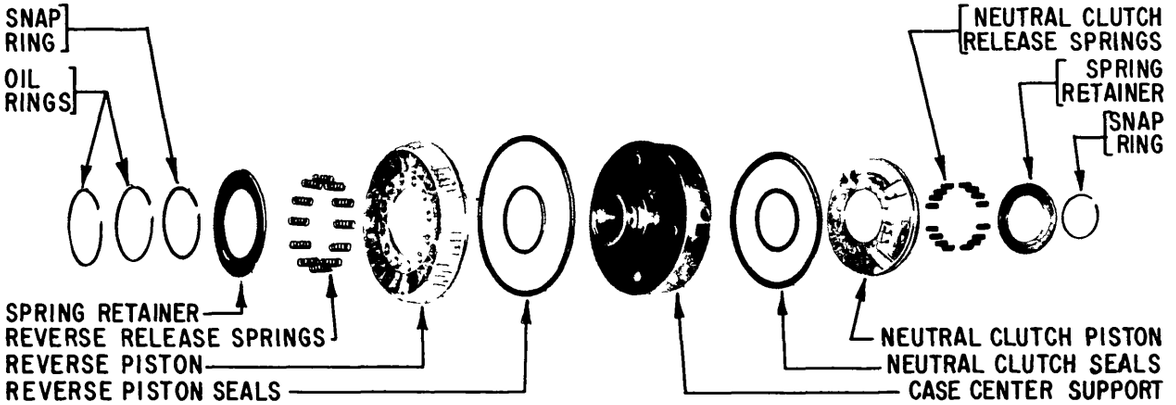


FRONT CLUTCH; Disassembly - Remove bronze thrust washer from front clutch assembly (if not previously removed), then install entire assembly in a soft jawed vise with internal gear upward and vise engaging large teeth on opposite side of assembly. Remove internal gear-to-front clutch housing attaching bolts and gently tap a dowel pin with a drift to remove front internal gear from front clutch housing. *CAUTION - Housing is spring loaded.* Remove front internal gear, then remove front clutch backing plate. Remove 7 drive and 7 driven front unit clutch plates and the 20 front clutch release springs. Remove front clutch piston from front clutch housing, then remove front clutch piston outer seal from piston and inner piston seal from housing. Discard seals.

Inspection: Inspect front unit internal gear for tooth damage, nicks, and burrs. Check internal gear bushing for wear, nicks, and burrs and make sure bushing is not loose. Inspect clutch plate splines on internal gear for free clutch plate movement. Check lubrication ports for restrictions. Inspect clutch backing plate for nicks, burrs or foreign material. Inspect drive and driven clutch plates for foreign particles imbedded in plates and for wear such as metal spots appearing through face material on drive plates or deep cuts on driven plates. *NOTE - St l driv n plat s ar wav d and a w ar patt rn will app ar at high p ints f wave (this is a normal c nditi n). Disc l ration of driv plates is*

CONTINUED ON NEXT PAGE

PUMP ASSEMBLY (EXPLODED)



FRONT CLUTCH (EXPLODED)

3-SPEED HYDRA-MATIC TRANSMISSION (Cont.)

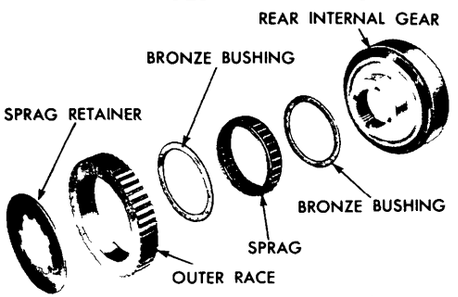
a normal condition. Inspect front clutch apply piston for scores, nicks, and burrs, and check for cracks in casting. Replace inner and outer clutch piston rubber lip type seals (make sure seal is not pinched or nicked during installation). *NOTE - Inner seal should be installed first, using clutch piston without outer seal to seat inner seal snug in ring groove by clockwise and and counterclockwise piston movement.* Inspect the front clutch housing for foreign material and clutch apply oil passages for restrictions or "off location" oil passages. Inspect bolt threads for cross threading or crossed threads. Inspect internal gear-to-center support thrust washer for excessive wear, nicks, burrs, or foreign particles imbedded in thrust face.

R assembly: Install new inner piston seal on front clutch housing with lip of seal facing down, then install new outer piston seal on clutch piston with lip facing away from spring pockets. Install clutch piston in clutch housing, carefully rotating assembly while depressing lip of piston seal with small blade screwdriver. Install piston release springs (20 springs) in to spring pockets in piston. Install front clutch backing plate on front internal gear with undercut facing flange on internal gear. Install 7 composition drive and 7 steel driven plates alternately over front internal gear starting with a composition clutch plate. *NOTE - Steel clutch plates must be installed in an un-nested position as follows: Place a composition plate and first steel plate over internal gear noticing location of slight "half moon" notch in edge of steel plate. Install another composition plate and then the second steel plate so that the "half moon" notch is located two drive lugs on internal gear away from notch in first steel plate. Continue to alternately install composition and steel plates so that notches in the odd numbered steel plates are one above the other and the notches in the even numbered steel plates are one above the other.* Hold the assembly together and position front unit internal gear, with plates, on clutch release springs aligning dowels. Place entire assembly in a soft jawed vise with vise engaging large teeth on clutch housing. Install four front unit internal gear-to-front clutch housing bolts and alternately tighten bolts to properly seat front internal gear on dowels. Check bottom steel clutch plate for freedom after tightening bolts to 22-27 ft. lbs. Install bronze thrust washer into recessed inner diameter of front clutch housing bore, using petrolatum to retain it in position.

CASE CENTER SUPPORT: Disassembly - Remove two oil delivery sleeve hook type oil seal rings from case center support. Use Clutch Spring Compressor, Tools J-4670-C and J-6129; and Reverse-Neutral Clutch Piston Adapter, Tool J-8765, remove reverse release spring retainer snap ring. *NOTE - Center tool and position ring gap between legs of tool.* Remove tools from reverse and neutral clutch assembly, then remove reverse release spring retainer. Remove 12 reverse piston release springs and reverse clutch piston. *NOTE- It may be necessary to tap housing gently.* Remove inner and outer reverse piston seal rings and discard. Reinstall the same tools as above and remove neutral clutch release spring retainer snap ring in the same manner as for reverse release spring retainer snap ring, then remove tools. Remove neutral clutch release spring retainer and 16 release springs. *CAUTION - Do not mix neutral clutch springs with reverse springs.* Remove neutral clutch piston, tapping housing gently if necessary, then remove inner and outer neutral clutch seal rings and discard.

CASE CENTER SUPPORT (EXPLODED)

Inspection: Inspect center support for nicks, burrs, damage or excessive wear on bushing. Check bushing for looseness. Check reverse apply, front clutch apply, and neutral apply passages for restrictions or interconnected passages using a fine wire and compressed air. Check two hook type oil seal rings on oil delivery sleeve for wear or damage. Inspect neutral clutch piston and reverse piston for excessive wear, burrs, cracks, or distortion. Inspect all clutch release springs for distortion or collapsed coils. Replace neutral clutch piston inner and outer seals, then inspect neutral clutch release spring retainer and snap ring groove. Inspect reverse piston spring retainer and snap ring groove.



Reassembly: Install new inner and outer clutch seals with lip of seal facing away from spring pockets, then install Tool J-8766 over neutral clutch inner hub. Install neutral clutch piston using a small screwdriver to depress lip of outer seal into case center support, then remove Tool J-8766. Install 16 release springs into spring pockets of neutral clutch piston, then install spring retainer over release springs. Use same tools used for disassembly and install retainer snap ring, then remove tools. Install Tool J-8766 over oil delivery sleeve and Tool J-8767 into case center support (oil inside of tool), then install new inner and outer reverse piston seal rings on reverse piston with lip of seals facing dowel pin holes in piston. Install reverse piston, aligning piston to index with dowels, then remove tools. Install 12 reverse piston release springs into spring pockets and install reverse piston spring retainer. Lay snap ring on top of tower, then install same tools used at disassembly and compress release springs. Install piston spring snap ring and remove tools. Check all springs for proper position in pockets, then install two hook type oil seal rings on oil delivery sleeve .

REAR UNIT PINION THRUST WASHER REPLACEMENT: With output shaft and carrier assembly removed from transmission, place carrier portion of assembly in a vise being careful not to damage ground surface, then drive pinion out with a flat punch. *NOTE - Staking on shaft side of pin will be sh ared during r moval.* Be careful when removing pin and pinion gear to prevent loss of pinion needle bearings. To install pinion gears and washers, position carrier shaft in a vise with carrier side up (do not clamp vise on ground surface of shaft), then install needle bearings in pinion gear, retaining them in place with a small amount of petrolatum. Position pinion gear, with proper number of thrust washers to provide endplay of .005-.029" *(see "1961 Transmission Carrier Wear Correction" above)* in carrier and install a 3/8" drill shank up through carrier and pinion. Install a new pinion gear pin from output shaft side and allow loading tool to back out while driving pin into position. *NOTE - Loading must remain tight against pin to prevent pinion gear bearings being dislodged.* After all pinions are installed, clamp a drift in a vise and position gear pin head on end of drift, then peen opposite end of pin with a ball peen hammer. *CAUTION - Head of pinion pin must be below carrier face.* Repeat operation for remaining pins.

REAR INTERNAL GEAR & SPRAG: Disassembly - Remove sprag retainer, then remove sprag outer race from sprag assembly and rear internal gear. Remove sprag and bushing assembly from internal gear. *NOTE - Sprag assembly consists of sprag ass mbly and two bronze bushings.*

Inspection: Inspect rear internal gear for tooth damage and gear bushing for excessive wear, nicks, or burrs. Inspect splines on inner diameter of inner sprag race for burrs or broken splines, and check both inner and

SPRAG ASSEMBLY (EXPLODED)

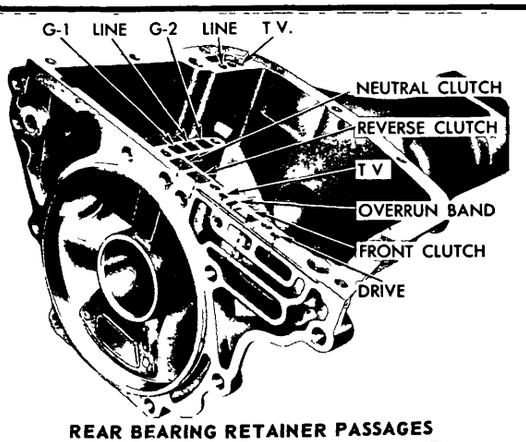
3-SPEED HYDRA-MATIC TRANSMISSION (C nt.)

outer sprag races for scoring. Inspect outer sprag race for nicks, burrs or damaged splines, then test onedrive plate for free up and down movement on splines. Inspect sprag assembly for score marks, damaged spring retainer or damaged shoulder. Test sprag action with sprag installed in outer race over the inner sprag race (shoulder of sprag should face up or toward sprag retainer). Inspect sprag retainer for bent tangs or distortion.

R ass mbly: Place one bronze bushing over inner race of intern al gear with cup side facing upward, then place sprag assembly into sprag outer race. With shoulder side of sprag up, start sprag and outer race over internal gear. slide sprag and outer race down against internal gear, then install second bronze bushing with cup side down, against sprag assembly. Apply petrolatum on sprag retainer and install retainer on internal gear, aligning tangs with internal gear slots. *NOTE - Check to mak sure sprag ass mbly is properly installed by rotating out r rac count rclockwise. Outer race should not turn clockwis .*

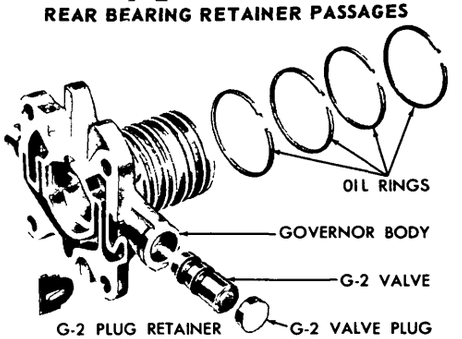
GOVERNOR: Disassembly - Compress finger of G-2 plug retainer and remove, then remove G-2 plug and G-2 valve If necessary, remove four governor oil hook type oil seal rings from governor tower.

Insp cti n: Inspect rings and ring grooves (rings should fit freely in grooves). Check G-1 and G-2 line pressure oil passages for restrictions using a fine wire. Inspect governor bushing for scores, nicks, or burrs. Check G-1 and G-2 valves for free movement. Make sure entire governor casting is free from all dirt and small chips.



R ass mbly: If removed, install hook type oil seal rings on governor tower, then install G-2 valve (small land first) into governor. Install plug with flat side out, then install retainer with finger side out. *CAUTION - Use car to pr v nt G-2 valv from dropping out of governor body.*

PARKING LINKAGE: Disassembly - Install assembly in a vise using a soft jaw vise on dowel pin, then lift hook end of bracket spring off parking lever and disassemble parts.

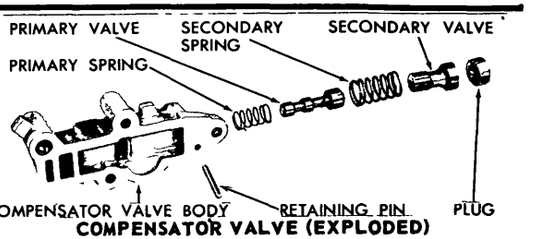


Inspecti n: Check all pins for excessive wear or binding in their bores and check bracket spring for breaks or collapsed coil.

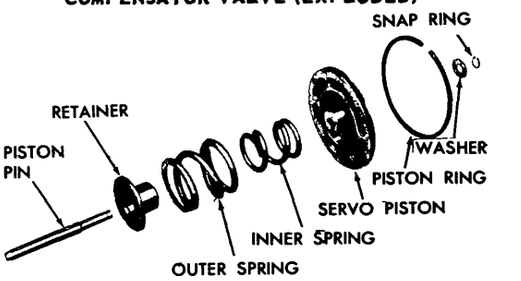
R ass mbly: Clamp dowel pin of parking bracket in soft jawed vise, then place bracket spring in bracket with straight leg of spring in narrow slot between the sides of bracket and the hook end of spring near fixed end of dowel pin. Place bracket shaft approximately half way through bracket and spring and then slide pawl and lever assembly onto shaft. Use long nose pliers and hook bracket spring over parking lever.

REAR BEARING RETAINER: Disassembly - Remove inside detent lever and shaft assembly by removing manual shaft retaining pin from case side of retai ner. *CAUTION - This is not a screw.* Rotate lever and shaft assembly to remove from rear bearing retainer. If necessary, remove manual shaft seal from bore in retainer. Remove rear thrust bearing race-to-rear bearing retainer snap ring through access hole in retainer. Remove rear race, bearing and front race from rear bearing retainer.

REAR BEARING RETAINER PASSAGES



GOVERNOR (EXPLODED)



Inspection: Inspect rear bearing retainer for "hair line" cracks or leaks and check for inter-connected passages (using air gun or smoke). Inspect rear bearing and race. Check bolt hole threads for cross threading or stripping. Check air vent passage for restriction and anti-siphoning valve for proper movement. Inspect detent lever for nicks, and burrs, and replace detent lever shaft "O" ring seal. Clean thoroughly with compressed air.

Reassembly: Install race, thrust bearing, and race into rear bearing retainer. Install snap ring (concave side toward rear and with identification side away from race), then align ear on snap ring with top slot in retainer. If removed, install bushing and sleeve assembly in rear end of rear bearing retainer, chamfered end first. Align short slot in bushing with retaining bolt hole in rear bearing retainer, then install with soft hammer and drift. Install bushing retainer bolt and tighten to 12-15 ft. lbs. Install inside detent lever and shaft assembly into rear bearing retainer, then install detent shaft retainer into hole in rear bearing retainer, aligning key with annular groove in detent shaft. If removed, install new manual shaft seal (grooved side toward retainer) over detent shaft.
